Provinces. Mention has already been made of sev. of the provs. of C. proper. They are 21 in number, and may now be briefly enumerated. The first 7 extend wholly or partly over the Great Plain, the next 2 comprehend the hilly dists., 2 others the mountainous country along the sea; the remainder comprise mainly the mountainous country in the interior and W.: (1) Hopei extends over the most N. and less fertile part of the plain. In it are situated C.'s cap., Peking, and the important tns of Tientsin and Paoting. (2) Shantung comprehends part of the plain and the peninsula of Shantung. Chief tns: Tsinan, Yenchow, and the ports of Welhalwei, Tsingtao, and Chefoo. (3) Kiangsu includes the low and swampy country on both sides of the Grand Canal. It contains the cities and tns of Chenkiang, Soochow, Nanking, and Shanghai. (4) Anhwei, on both sides of the Yangtsekiang, has for its chief tns Hefei and Hwaining (Anking). (5) Honan, on the W. margin of the plain. Chief tns: Chengchow and Kaifeng. (6) Hupei, in the centre of the plain, is one of the most fertile provs. Chief tns: Wuchang, Hankow, Hanyang, Siangyang, and Kingchow. (7) Chekiang, in the SE. of the plain, is the chief green tea prov. Chief tns: Hangchow, Wenchow, and the port of Ningpo. (8) Kiangsi, to the NW. of the Nanling range, is the great porcelain prov. Chief tns: Nanchang, Kiukiang, and Chian. (9) Hunan, in the hilly country, is rich in cereals. Wolfram is mined there. Chief tns: Changsha, Yungchow, and Hengyang. (10) Fukien, on the shores of the sea opposite Taiwan (Formosa), is the chief black tea dist., and one of the most fertile and flourishing of the Chinese provs. The chief tns are Foochow, Chuanchow, and the port of Amoy. (11) Kwangtung, the southernmost prov., contains the celebrated city of Canton, Swatow, and Luchow. Not far from Canton is the Brit. crown colony port of Hong Kong and the Portuguese

Macao. The is. of Hainan, to the S. of the Leichow peninsula, forms part of this prov. (12) Kwangsi, occupying both banks of the Sikiang R., is a mountainous prov., of which the chief tn is Nanning. (13) Kweichow is a very mountainous prov. to the N. of Kwangsi and is especially rich in minerals. Its chief tn is Kweiyang. Like Kwangsi, it contains aboriginal tribes, different from the Chinese. (14) Yunnan, the most S.-westerly prov., is an irregular table-land, and is rich in minerals; the 2 chief tns, Kunming and Yungchang, carry on a considerable trade with Burma and Indo-China. (15) Szechwan is a succession of hills and valleys, rich both in mineral and in vegetable produce. It now includes the E. part of the erstwhile Sikang prov. Its chief tns, Chengtu and Chungking, are places of great pop. and trade. Chungking, the Chinese cap. during the Second World War, stands on the Yangtse. (16) Shensi is a rugged country with wide fertile valleys; its chief tn, Sian, is very large, and was the anct. cap. of C. (17) Shansi, adjoining the Great Wall, is a mountainous but fertile prov. Its chief tns are Taiyuan and Ta-tung. (18) Kansu, in the N., is sterile and thinly peopled. Its chief tns are Lanchow, Yinchuan, and the oil industry centre Yumen. (19) Chinghai, NE. of Tibet, is sparsely populated. The prov. is mountainous and the terrain in the valleys is generally unsuited for crops, but rich in oil and minerals. The chief tn is Sining. (20) Sinkiang, comprising the greater part of the area known formerly as E. or Chinese Turkestan, is the most westerly part of C., now an autonomous region, cap. Urumchi. (21) Taiwan, or Formosa, now has the status of prov. The is. has gold- and coal-mines, but the chief industry is agriculture, tea and sugar being exported. The cap. is Taipei. The N. area of C., stretching from the E. of Sinkiang to Manchuria in the NW., is the Inner Mongolia Autonomous Region. It formerly comprised the provs. of Ningxia, Suiyuan, Chahar, and Jehol. The provs. of Heilungkiang, Kirin, and Liaoning, and the municipalities of Harbin and Shenyang (Mukden), comprise Manchuria (q.v.). The Autonomous Region of Tibet is nominally a dependency of C., but preserves a great measure of independence. In 1914 a conference of delegates of C., Tibet, and Great Britain considered a Convention recognising the autonomy of Tibet proper (outer Tibet) and created a zone (inner Tibet) under Chinese authority subject to existing Tibetan rights. The Chinese Gov. did not ratify the Convention, though they accepted its terms in all respects save the boundaries between inner and outer Tibet. Shortly after the 1949 revolution, Chinese troops entered the country and it became an autonomous region under the supervision of the Peking gov., which maintains representatives at Lhasa, the cap. (see TIBET).

CLIMATE. The climatic conditions naturally vary considerably over so large a stretch of country. In the lofty Tibetan

		Area in sq. miles	Population 30 June 1954	Capitals

NOTE. From 1951 to 1954 some provs. on the old map have been merged with those marked with * and have since lost their identity; e.g. the E. part of Sikang has been merged with Szechwan, its W. part with Tibet; Ningsia has been merged with Kansu; Jehol has been merged partly with Hopei, partly with Inner Mongolia, etc. Since the exact areas of the partitioned parts of these former provs. are not available, the areas of those provs. marked with * are provisional and subject to further confirmation. The area figure for Inner Mongolia is provisionally that of former Suiyuan. In reality it is probably much larger. The census was taken before the partition and merger of Jehol and Sikang.

plateau and the less elevated plains of Mongolia the climate is exceedingly dry, and is marked by great extremes of hot and cold. The basins of the 2 great rvs., being nearer the Pacific, are moister and more equable. In this part of C. proper the dry season lasts from Nov. to Feb., the remaining months, particularly May, being extremely wet. The rainfall S. of the Yangtze and in its valley is of a copious tropical nature. In N. C. there is little rainfall except in the summer. Generally speaking, C. is a cold country in comparison with European ters. in the same lat. From July to Sept., however, the weather is intensely hot, and the heat is accompanied by typhoons, which are much dreaded for their violent and devastating effects in the S. coastal provs.

AREA AND POPULATION. The area and estimated popa. (1954) of the provs. and municipalities of C. are given in the table above.

NATIONAL MINORITIES. The Chinese as a people are a mixed race and C. as a nation contains many nationalities. Broadly speaking most of the northerners are of Mongoloid stock, and part of the pop. of the S. coastal provs. bear distinctive features of the Malayan people. But as a result of mass migrations in the 5th, 12th, and 13th cents., when northerners were driven to the S. by the invasion of the Tartars, Nüchens, and Mongolians, and the settlement of the invaders in N. C., it is now difficult to tell whether a certain Chinese is of Mongoloid or Malayan origin. The early Tartars (and even the recent Manchus) had long been

assimilated by Chinese civilisation and they identified themselves with the Han (i.e. indigenous Chinese) people long ago. But in the mountainous hinterland and border areas there are aboriginal hill dwellers and immigrant foreign tribes who have retained their own languages, customs, religions, and costumes to the present day. In the past endeavours to assimilate them into the Han race met with little success, and discrimination against them produced much resentment. They are now recognised as national minorities and granted equal rights with the Han. They are about 40 million in all, of some 60 nationalities, constituting 7 per cent of the country's total pop. In NW. C. there are the Uighurs, Hui, Tibetans, Kazakhs, Tungshiang, Mongolians, Khalkhas, Tu, Uzbeks, Tartars, Tadiks, Manchus, Solon, and Sala, totalling 6,300,000, roughly one-fifth of the pop. in the area. In SW. C. are found Tibetans, Yi, Miao, Hui, Tai, Puyi, Minchia, Nahsi, Kawa, and others who number more than 20 million, or 20 per cent of the pop. in the area. In Central and S. C. there are the Chuang, Miao, Yao, Tung, Hui, Li, Kuolo, Ling, Lai, and Maonan, totalling 8,500,000, or 5 per cent of the pop. there. In NE. C. there are the Koreans, Manchus, Mongolians, Hui, and Tahuerh. In E. C. are the Hui and Miao, and in Taiwan are the Kaoshan. The following table gives the approximate numbers of the larger national minorities groups, with the areas in which they live:

Nationality	Population	Main Centres of Habitation
Chuang	6,600,000	Kwangsi Prov.
Uighur	3,700,000	Sinkiang Autonomous Region
Hui	3,600,000	Kansu and Chinghai Provs.
Yi	3,300,000	Liangshan Mts on Sikang-Yunnan boundary
Tibetan	2,800,000	Sikang-Tibet Plateau and Chinghai Prov.
Miao	2,500,000	Kweichow Prov., W. Hunan, and other areas in Central, S., and SW. China
Mongolian	1,500,000	Inner Mongolia and Sinkiang Autonomous Regions, Kansu, Chinghai Provs.
Puyi	1,250,000	SW. Kweichow
Korean	1,100,000	Yenpien Korean Autonomous Region in Kirin Prov.
Tung	600,000	SE. Kweichow and N. Kwangsi
Yao	600,000	Kwangsi, N. Kwangtung and S. Hunan Provs.
Tai	500,000	Border areas in Yunnan

There are 3 big autonomous regions above the prov. level for the national minorities: (1) The Inner Mongolian Autonomous Region was estab. in 1947 and is the earliest of such administrative units. (2) The Sinkiang Uighur Autonomous Region, estab. in 1955, is the largest in area, approximately the size of France, Germany, and Poland put together. As there are 16 nationalities, including Russians, in that region, different autonomous dists. and autonomous cos. have been formed in areas where compact communities of nationalities are found. (3) To the Tibetan Autonomous Region has been added the W. part of the former Sikang Prov.

where Tibetans outnumber the Han Chinese. Apart from these 3, there are over 70 autonomous areas of dist. or co. administrative unit. The governors of autonomous regions, the vice-governors of provs. where there are autonomous dists. or cos., the head administrators of autonomous dists., and the magistrates of autonomous cos. are chosen from the minorities' own leaders. They also take part in the Central People's Gov. as vice-chairmen of the National People's Congress, vice-premier, and members of the State Council and National Defence Council. Their number of seats in the National People's Congress is greater than that of the Han Chinese in terms of proportion between the seats and pop. In each autonomous area the people's statutory rights to determine their own form of gov., to use their own language, to live their own way of life, to develop their own economy and manage their own finance, to draw up special regulations, and to organise their own local defensive forces are laid down in the existing (1957) constitution.

Communications. Owing to the topography of the country the development of communications in C. has been haphazard. In the E. coastal provs. the land is comparatively level and is intersected in all directions by roads and canals. Before the 1949 revolution practically all C.'s roads (approximately 100,000 m.) and its inadequate railways (approximately 11,000 m.) were built in this area, E. of long. 110° E., leaving

three-quarters of the country with only a few roads and hill paths. There were steamships plying ports along the sea coast and the main rvs., a regular air service between the main municipalities, and over 60,000 m. of telegraph lines before the Sino-Jap. War in 1937. Much damage and disruption had been done to all communications during the Jap. occupation and the ensuing civil war (1937-49). Since the estab. of the present gov. considerable improvements have been made. (1) **Railways.** The first railway in C. was built in 1870 from Shanghai to Wusung (12 m.), but its opening to traffic in 1876 caused such trouble that no work was resumed until

1881. In 1896 Russia secured from the Manchu Gov. the right to build a railway across Manchuria, linking her Siberian line with Vladivostok to the E. and a branch line due S. to Dairen. It is known as the Chinese E. Railway and its branch line is the Chinese Changchun Railway; there is a total of nearly 1500 m. in Chinese ter. It was in Jap. hands during the war, but Russia took it in 1945 after her declaration of war against Japan. By the 1945 Sino-Soviet treaty, based on the Yalta agreement, Russia secured the joint use with C. of this and other railways in Manchuria for 30 years. When the People's Gov. came to power, new treaties between C. and Russia were signed in 1950 and 1954, and the railways were handed back to C. in 1955. Other prin. railways built before the war are the Peking-Hankow railway (809 m.), Tientsin-Pukow (760 m.), Peking-Shenyang (565 m.), Peking-Paotow (545 m.), Nanking-Shanghai (207 m.), Shanghai-Hangchow-Ningpo (260 m.), Lunghai (Paoki-Hachow, 818 m.), Kiaochow-Tsinan (256 m.), Tatung-Puchow (546 m.). Yunnan (Tonkin frontier to Kunming, 313 m.), Canton-Hankow (730 m.), and Chekiang-Kiangsi (Hangchow Chuchow, 665 m.). Of these pre-war lines the last two were built by the Nationalist Gov., and of the total mileage 40 per cent was concentrated in Manchuria. New railways built by the People's Gov. are Chengtu-Chungking (337 m.), built in 1951; Tientsin-Lanchow (231 m.) in Kansu, built in 1952; Tsinning-Erhlien (225 m.), from Inner Mongolia to Outer Mongolian border; Fengtai-Shacheng (70 m.), from Peking to Inner Mongolian border; Peking-Chengteh (111 m.), all completed in 1955; Chengtu-Paoki (453 m.), from Szechwan to Shensi, and Paotow-Polingmiao (99 m.) in Inner Mongolia, both built in 1956. The Lanchow-Sinkiang railway (1743 m.), being built along the ant Silk Route, had finished its 600-m. section in the Kansu Corridor in 1956. When completed in 1959 it will be part of the Trans-Asian-Europe main line which is the shortest distance between the 2 continents. All these lines were built in the mountainous areas W. of long. 110° E. Other railways in S. C. and in the coastal provs. are Laiping-Munankuan (to Vietnam frontier, 280 m.), built in 1951; Litang-Tsamkong (207 m.), crossing Kwangsi and Kwantung, built in 1935; Lantsun-Yentai (122 m.), connecting the 2 ports Tsingtao and Chifoo; Yintan-Amoy (466 m.), with a branch, Nanping-Foochow (116 m.), from Kiangsi to Fukien; Chinchengkiang-Tuyun (205 m.) in Kweichow, all built in 1956. Other lines were built mainly in the industrial and forest areas. In addition, 8 pre-war trunk lines were double-tracked. The double-decked Yangtze R. Bridge, the longest in the E. hemisphere, connects the Peking-Hankow and Canton-Hankow railways in the centre of C. New railways under construction are Neikiang-Kunming (526 m.), Chungking-Kweiyang (227 m.), Kweiyang-Kunming (285 m.), Hunan-

Kweichow (370 m.), and Luchyang-Hankow (710 m.) in the SW.; Paotow-Lanchow (733 m.), Lanchow-Chinghai (1100 m.), and Lanchow-Chaohwa (400 m.) in the NW. Total mileage of railways built from 1952 to 1956 amounts to 3670 m., of which 815 m. were built in 1955, 1323 m. were built in 1956. Total railway mileage open to traffic in 1956 was over 18,000 m. Those railways leading to the outside world are the Chinese Changchun Railway and Lanchow-Sinkiang to Russia, Tsinning-Erhlien to Outer Mongolia and Russia, Tungwa-Chian and Shenyang-Antung to Korea, Kunming-Tonkin and Laiping-Munankuan to Vietnam. (2) Roads. Before the war there was a network of 4 S.-N. and 3 E.-W. trunk roads across the length and breadth of C. proper: S.-N. roads (a) from Kunming via Kweiyang, Chungking, Sian, to Yulin near the Great Wall (q.v.), passing 4 provs.; (b) from Munankuan via Kweilin, Changsha, Hankow, Kaifeng, Peking, to Mongolia, passing 8 provs.; (c) from Canton via Changsha, Loyang, Tatung, Paotow, Lanchow, to Sinkiang, passing 9 provs.; (d) from Canton via Foochow, Hangchow, Nanking, to Yentai, passing 5 provs.; E.-W. roads (a) from Wenchow via Chinghsia, Changsha, Kweiyang, to Kunming, passing 5 provs.; (b) from Shanghai via Nanking, Hefei, Nanyang, Sian, Lanchow, to Sinkiang, passing 6 provs.; (c) from Jihchao (in Shantung) via Tsinan, Kailfeng, Hanchung, Lanchow, Hami, to the Russian border, passing 6 provs. The surface of the pre-war roads was bad and many of the roads were unserviceable in rainy seasons. During the war the Burma Road from Kunming to the railhead at Lashio was hastily built, but it has not been in service since the war. New roads built since 1950 are mostly in areas inhabited by national minorities where previously there were no roads at all. Most important of all are two: the Szechwan-Tibet Road (1400 m.) from Yaan to Lhasa (q.v.), and the Chinghai-Tibet Road (1300 m.) from Sining to Lhasa. From Lhasa a road to Yatung (415 m.) on the Indian border, via Shigutse, Gyantse, and Phari (qq.v.), was open to traffic in 1955. In Sinkiang over 3000 m. of roads encircling the Gobi Desert and leading to the Russian border were built in 1956. Roads scheduled in the First Five-Year Plan totalling 7200 m. were completed in 1955. In addition, 9000 m. were built by various prov. govts., especially in Kweichow and Yunnan. (3) Civil air service was first inaugurated in 1929 with Amer. and Ger. air-liners. Total length of air-mail lines in 1936 was 8250 m. During the war, as all the coastal provs. were occupied by the Japanese, only a skeleton air-lift between Chungking and Hong Kong and Lashio, and later between Chungking and Calcutta, was maintained. Since 1950 regular air service has been reintroduced between Peking and the following cities: Shanghai, Nanking, Hankow, Chungking, Kunming, Nanning, Canton, Shenyang, Harbin, Sian, Lanchow, Urumchi, Kashgar,

and Lhasa. International service includes 3 lines, via Harbin, Urumchi, and Ulan Bator, to Russia, one via Lhasa to India, and one via Kunming to Burma. The Shanghai-Hong Kong line has not been restored, for political reasons. There is a daily service between Peking and Moscow, with occasional jet liners covering the distance of 6000 m. in 8 hrs. (4) *Navigation*. Before the war C.'s inland navigation was open to foreign vessels by various treaties. In 1938, 75,000 vessels entered and cleared Chinese ports, with an aggregate tonnage of 29,430,000. The percentages of this tonnage were: British, 48; Japanese, 24; Chinese, 8; French, German, Netherlands, and Portuguese, between 3 and 4. Since 1949 all foreign vessels have ceased to sail in Chinese rivers. Total navigable routes in inland rivers amounted to 67,000 m. in 1955, of which one-third is navigable by steamships, the rest being navigable by junks and sampans only. Goods transported by ships in inland rivers in 1954 amounted to 20.5 million tons. From 1953 to 1956, 400,000 tons of new ships were put to service, but coastal navigation in the Formosan Straits is not safe owing to the state of war existing between the Formosa and Peking govts. (1957). (5) *Post and Telegraph*. Postal service in C. was first estab. in 1896 throughout the country in the ports and cities. Owing to the wartime westward migration, service was extended to small towns in W. C., but villages suffered from inadequate facilities. Village postal routes were extended from 400,000 m. in 1950 to 890,000 m. in 1955, covering 80 per cent of the villages in the whole country. The other 20 per cent were covered in 1957. The total postal route in 1957 is 1.31 million m. Up to 1955 there were estab. 3000 vil. post offices and over 30,000 postal stations which also deal with circulation and distribution of newspapers and books. The telegraph lines had a total length of 60,000 m. before the war. In recent years 42,000 m. have been added. There are telegraph and telephone lines to most of the neighbouring countries and E. European states. (6) *Radio*. There are 55 broadcast stations in the chief cities, 5000 relay stations in smaller towns, and 41,500 reception centres in the vilts. Radio Peking has a 2-programme, 19½-hour service in 3 languages: Chinese, Mongolian, and Tibetan. Overseas programmes are in English, Japanese, Korean, Vietnamese, Indonesian, Burmese, Siamese, and various Chinese dialects for overseas Chinese. These overseas programmes are mainly concerned with political propaganda and have undoubtedly had a considerable influence both on Chinese living outside C. and on non-Chinese Asiatics.

FLORA AND FAUNA. The flora and fauna are both that of the temperate and subtropic zone, so most of the common European and some African vegetables are produced and used. In the S. regions the S. fruits, such as oranges,

pomegranates, peaches, plantains, bananas, litchis, pineapples, and grapes, and the sugarcane flourish. In recent years coffee has been cultivated in Yunnan, and rubber on Hainan Is. The tea plant is extensively cultivated in the S. and W. provs. The use of tea as a beverage was mentioned in the *Book of Songs* (7th cent. bc), and it is universally used throughout the country. The larger and more ferocious kinds of carnivorous quadrupeds are not common in a country so well peopled and cultivated. The Bengal tiger sometimes appears in the forests of Yunnan and Manchuria, while the lion only occurs in sculpture. Old writers also speak of the rhinoceros, tapir, and elephant as common in C. Cattle, sheep, and horses are bred in W. C., Inner Mongolia, and Sinkiang, and the yak and the goat are bred extensively in Tibet. An animal peculiar to Tibet is the dzo, a cross between the yak and the zebu, which, however, reverts to the original types after the fourth generation. In the border of Tibet and Szechwan is found the giant panda, which was not seen alive outside C. until 1938, when some were brought to England.

AGRICULTURE. For the last 3000 years the Chinese have lived from their land. Canals for the irrigation of the paddy fields were dug in the Yangtze valley as early as the 6th cent. bc. In N. C., where wheat, millet, corn, and maize are cultivated, the Hwai R. and the Yellow R. are less manageable. The latter was known as the 'sorrow of China,' for it used to flood the countryside and had changed its colossal course 27 times from 602 bc to 1938, each time bringing disastrous loss of life and property. Famine was a frequent occurrence in the past in N. C., not because the nation did not produce enough grain to go round, but because bad transportation prevented surplus grain from being sent to deficient areas. Before the war coastal tns used to import rice from Saigon while surplus grain in Szechwan was burned as fuel. Since 1950 much irrigation work has been done and transportation of grain has been better organised. C. now claims to have some surplus grain, in addition to soya beans, to export in exchange for industrial equipment. Land reclaimed from 1953 to 1956 amounted to 8½ million ac. Her total area of arable land (in million ac.) and its production (in thousand tons) are shown in the table on p. 383.

In 1956 grain output was 199½ million tons, cotton output was 1.778 million tons. Of the grain the ratio between rice and wheat is roughly 4:1. In addition, the ann. output of soya bean is about 10 to 12 million tons.

LIVESTOCK. The steppe in NW. C. is traditionally the home of nomadic tribes. They are the Hui (Muslim), Tibetan, Uighur, Mongolian national minorities (see above) living in Chinghai and NW. Kansu, Tibet, Sinkiang, and Inner Mongolia respectively. Until recently they preferred livestock raising to agriculture. In recent years agriculture as well as livestock raising has been encouraged by the

	1949	1952	1953	1954	1955

MINERALS. Chinese bronzes dated in the 2nd millennium BC show that both copper and tin were extensively mined in ancient C., but iron was not found until the 5th cent. BC. Gold currency was widely used in the 4th cent. BC, while silver appeared 2 cents. later. The use of natural gas in Szechwan was recorded in the 11th cent. AD, and Marco Polo's *Travels* tells of the extensive use of coal in N. C. in the 13th cent. In modern times C. has been an underdeveloped country. Geological survey did not begin until the first rep. was founded in 1911, and little prospecting was done before the war. Pre-1939 estimation puts coal at 248,287 million tons, next only to U.S.A. and Canada, mostly in Shansi (1500 sq. m.), Shensi, Kansu, Hopei, Honan, Liaoning, Hunan, and Kiangsi. Recent intensive prospecting has shown that there are coal-mines in practically every prov., and C.'s coal reserve might be much greater than that of Canada. Iron reserves were previously estimated at 1200 million tons, mainly in Liaoning. Recent prospecting has discovered 2 more iron-mine centres, one on the Hopei-Kiangsi border and the other in Inner Mongolia near Paotow, each containing greater reserves than those of Liaoning. Oil was discovered before the war in Yumen, in NW. Kansu, and new discoveries have been made in the Tsaidam Basin in Chinghai, in Dzungaria in Sinkiang, and in W. Szechwan. Oil shales are found in Liaoning and Kansu. Oil fields in Sinkiang and Tsaidam began production in 1956. C. has 70 per cent of the world's antimony in Hunan, and the world's second largest reserve of tungsten was discovered in Kiangsi and Hunan in 1915. Her pre-1939 output of manganese was about 100,000 tons a year.

produced in Kweichow and Shensi. Among non-metal minerals is sulphur, found in Shansi and Kansu; and half of the world's alumina is produced in Chekiang. The Kaoling clay, raw material for porcelain manu., is supplied from Kiangsi and Anhwei. The deposit of this clay in Chingtehcheng alone is 45 million tons. Mine-salt is tapped from Szechwan, Yunnan, Kansu, and Inner Mongolia. Yunnan yields a number of precious gems, while jade is an age-old commodity from Sinkiang. Among other natural resources is a water-power potential of over 450 million kilowatts of hydro-electricity from her 1500 rivs., of which 72 per cent are in SW. C. The Tsangpo R. in its 200 m. bend downstream from Shigatse in Tibet is capable of producing 50 million kilowatts.

INDUSTRY. C. has been credited with 3 great inventions: printing, gunpowder, and the compass. Prior to the invention of printing was the invention in the 1st cent. of paper which was originally a by-product in her silk industry, which dated back to the 13th cent. BC. Printed books first appeared in the 10th cent., and a cent. later the movable type was invented by Pi Sheng. The oldest silk textile preserved in C. is a sarsenet from the 5th cent. BC, on which are painted a lady, a phoenix, and a serpent. Chinese silk textile found its way to Europe via Parthia and Persia at the beginning of the Christian era. As early as the 15th cent. C. exported a considerable amount of porcelain, the best of which is to this day unexcelled by that of any other country—indeed the very name 'china' bears witness to the credit of its country of origin. When in the last cent. Chinese ports were thrown open to the W. world, her main export items were silk and tea,

but her imports were more than her exports. After 1872 C. had an unfavourable trade balance which lasted till 1950. Her attempt to establish modern industry began in the 1880's,

export. The product of cotton yarn in million bales (10 metres to a bale) and cotton textile in million bolts (excluding production from farmers' looms) is shown in the following table:

	1949	1952	1953	1954	1955	1956
Cotton yarn	1.8	3.62	4.1	4.6	4.9	5.2
Cotton textile	30.18	89.27	107.8	122.3	140.5	176.5

but successive civil wars hampered its development. Steel production in 1907 was 8500 tons, in 1933, 25,000 tons. Not until the First World War did C. have any sizeable light industry such as flour and cotton mills, cigarette and match factories, etc., for the home market. In the treaty ports foreign-owned factories helped to develop the economy, but native industry had to face keen competition. At the turn of the cent. Chinese tea met with the competition of Indian and Ceylon teas, Chinese silk met with the competition of Jap. and It. silks, and her export of both these commodities fell rapidly. A recovery was made later, and before the Second World War a quarter of the world's supply of silk came from C. In 1937 her total export of raw silk amounted to 4 million lb. The chief silk-producing provs. are Chekiang, Kiangsu, Kwangtung, and Szechwan, where the silkworm is fed on mulberry leaves, while in Shantung and Liaoning it is fed on oak leaves. In 1955 silkworm eggs were flown to Sinkiang and skilled workers from Kiangsu were sent to build the industry there. Silk textile produced in 1956 amounted to 70 million metres. C. ranks next after the U.S.A. and India in her cotton production, but, owing to the growth of her own mills, she received supplies of raw cotton from both these countries in the past and from Pakistan and Egypt recently, in spite of the expansion of her cotton-growing acreage. C.'s total spindles in 1952 were 5,660,000. Her textile factories were at first concentrated in the trading ports, Shanghai, Tsingtao, Tientsin, and Hankow, cities remote from the cotton-growing areas. To rectify this anomaly the Ministry of Textile Industry claims to have built, 1953-5, 19 major textile mills totalling 1,420,000 spindles and 45,000 powered looms in Peking, Hantan, Chengchow, and Sian, and many small mills in other tns. Cotton was for the first time grown in 100,000 ac. in the Manass R. Basin, Sinkiang, in 1955, and in Shigatse, Tibet, in 1956. With the increase of the number of sheep to 4 times the pre-war figure, the wool textile industry in NW. C. has also been expanded. Woollen fabrics produced in 1956 amounted to 12 million metres. Tea-planting was extended to Tibet and other minority areas in 1952 where formerly the import of tea seeds was strictly forbidden. Egg products used to be a large export industry. In recent years fruits for Russia and canned food for SE. Asia have provided main items for

However, C.'s main effort is at present devoted to heavy industry. Whereas before 1914 she could hardly make any machine or vehicle, she is now exporting equipment for textile factories to Burma and Egypt, radio sets and electric equipment to SE. Asia, and making locomotives, ocean-going ships, and cutting and precision machines for her own use. Her first motor-car company, with a capacity of 30,000 cars and lorries per annum, went into production at the same time as her first jet plane was produced in 1956. The equipment for building up her heavy industry has come largely from Russia and E. European countries. This is clear from the fact that, since 1952, nearly 80 per cent of her foreign trade has been with Russia and her allies, and that her chief imported items from 1950 to 1955 were factory equipment for 245 factories, metal-cutting machines and lathes (20,693), petroleum and its products (4,850,000 tons), fertiliser (2,380,000 tons), tractors (12,000), and other things such as boring machines, cranes, locomotives, cars, steel plates, and non-ferrous metals. Her exports to Asian countries include air compressors, universal engine lathes, milking machines, drilling machines, self-raking reapers, chemical raw material, minerals, building materials, cotton yarn and cotton piece goods, silk and silk piece goods, and grains. C.'s heavy industry is located in 3 areas: the 'steel capital' Anshan in Liaoning is within easy reach of the machine-building centre in Shenyang (Mukden), the shipyards in Port Dairen, and the coal-mines in Fushun; the iron and steel complex in central C., the triple city Wuhan (Wuchang-Hankow-Hanyang) astride the R.s Yangtze and Han, is supplied with iron and coal from Tayeh and Pinghsiang and occupies the pivotal position of the country's communication system; the new steel city being built in Paotow in Inner Mongolia is connected by railways to Peking, Ulan Bator, Tatung, the coal-field, and Lanchow, the oil supply centre. In E. C. Shanghai has many shipyards and machinery factories apart from its light industry. In W. C. Chungking acquired some importance as an industrial city during the war and it is now rapidly developing into a steel and railway building supply centre. Tientsin in N. C. used to be a city of light industry, but, owing to its proximity to coal-mines in Tangshan and the new seaport in Taku, its heavy industry is growing steadily. With better distribution of heavy industry in central and W. C.,

light industry in recent years has spread to the interior. Most of the new textile mills have been built in Honan and Shensi, sugar factories have been built in Szechwan, Inner Mongolia, Hellungkiang, and Kuangtung, dairy plants in Inner Mongolia and Kansu, and fresh-water fisheries in Hupel and Kiangsi. The progress of C.'s essential industry is shown in the following table (electricity in million kwh., machines in thousands, others in million tons):

down' figures are: electricity, 19,000 million kwh.; steel, 5.2 million tons; coal, 122 million tons; metal-cutting machines, 30,000 units; power-generating equipment, 340,000 kw.; timber, 24 million cub. metres; cotton yarn, 5.6 million bales; marine and fresh-water products, 280.7 million tons; machine-made paper, 800,000 tons. Railways built in the 5 years amount to 3700 m. The total investment in the first Five-Year Plan is \$11,004 million, of which 55.8 per cent is used in fundamental

	1949	1952	1953	1954	1955	1956	1957
Electricity	4,310	7,260	9,200	11,000	12,100	14,900	19,030

Ammonium	-027	-181	-226	-298			

Figures of other industrial output in 1956 were: aluminium ingots 20,000 tons; chemical fertilisers, 570,000 tons; metal-lurgical equipment, 8000 tons; power-generating equipment, 160,000 kw.; timber, 20 million cub. metres; salt, 7 million tons; edible vegetable oil, 1.7 million tons; sugar, 1.1 million tons; machine-made paper, 650,000 tons. In the above tables, 1949 and 1952 were respectively the year in which the present gov. came to power and the year before its first Five-Year Plan.

THE FIVE-YEAR PLAN. When the People's Gov. took over in 1949 after 8 years of war against the Japanese and a further 3 years of civil war, it found most of the factories, mines, and railways destroyed or dismantled and a legacy of mounting inflation bequeathed by the National Gov. There was, moreover, a famine in the Huai R. Valley in 1949, when the unification of S. and SW. C. was yet to be completed. In the next year the Korean War broke out with subsequent Chinese intervention. The recovery of her basic economy, however, was fairly rapid. Ever since Mar. 1950 commodity prices have been stabilised. By the end of 1952 most of the industries and railways were restored and some new ones built. The first Five-Year Plan was launched in 1953. It was planned that by 1957 production in heavy industry would be doubled as compared with 1952 and agric. production increased by 23.3 per cent. In heavy industry these aims were reached or surpassed by 1956, though some agric. products such as soya-beans, peanuts, rape seed, and jute fell short of the planned output, while grains and other industrial crops just reached their set targets, and, as a result, such light industries as edible vegetable oil, cigarettes, and matches failed to fulfil the planned output. By 1957 it was estimated that ann. production in the essential industries would exceed by 15 per cent the target originally set in the plan. The 'breaking-

construction; 44.2 per cent is used in designing, prospecting, stockpiling, transportation of material, repair, etc. The appropriations for the various depts of the fundamental construction are as follows: industry, \$3601.4 million (58.2 per cent); communication, postal service, etc., \$1189.8 million (19.2 per cent); agriculture, irrigation, and forestry, \$472.4 million (7.6 per cent); culture, education, and public health, \$446.2 million (7.2 per cent); public services in cities, \$231.9 million (3.7 per cent); trading, bank reserve, etc., \$185.5 million (3 per cent); others, \$66.6 million (1.1 per cent). According to the plan, on the completion of the various industrial plants the ann. increase of the essential products will be as follows: iron, 5.75 million tons; steel, 6.1 million tons; electricity, 4 million kw.; coal, 93 million tons; metallurgical and mining equipment, 190,000 tons; power-generating equipment, 800,000 kw.; lorries, 90,000; tractors, 15,000; chemical fertilisers, 910,000 tons; cement, 3.6 million tons; spindles, 1.89 million; machine-made paper, 186,000 tons; machine-processed sugar, 560,000 tons. In the 5 years, 1953-7, students graduated from univs. numbered 283,000, of which 94,900 specialised in engineering and 59,000 in sciences; those graduated from technical schools numbered 888,300, of which 368,000 are trained in engineering and science. In addition, 920,000 technicians out of skilled workers were trained in schools set up in factories and plants. About 10,000 students were sent to Russia and E. European countries for advanced studies.

SOCIALISTIC ECONOMY. While the emphasis of the Five-Year Plan is on heavy industry, the whole plan is regarded as a blueprint of socialistic reconstruction. In industry and commerce, all the new plants and dept. stores are estab. and owned by the state. Private owners of factories and shops were encouraged to join the socialistic economy. In so doing they would

allow the gov. to invest in, and thus expand, their business, and such factories and shops would be state-private jointly owned. The original shareholder of such an enterprise will receive from the gov. a guaranteed ann. dividend of $3\frac{1}{2}$ to 6 per cent, according to the nature of the enterprise, irrespective of gain or loss in the business. By June 1956, 98 per cent of the private industrial enterprises had come under state-private joint operation and 68 per cent of shops had been transformed into state-private shops. It has been claimed that retail trade in 1956 increased by 66.3 per cent as compared with 1952, and total value of exports and imports increased by 65 per cent. In agriculture the emphasis is laid on organising the individual peasants into producers' co-operative farms in order to increase production. This has been carried out in 3 stages. After the land reform (1949-51) in which land previously owned by landlords were distributed to the tillers, the peasants were encouraged to organise their mutual-aid teams in which they own their lands but pool their labour and tools. More production in the lands of the mutual-aid teams than in the individual farms further encouraged them to form their producers' co-ops, in which they pool their lands as well as labour and tools. In distributing the profit to the peasant, the co-op takes into account the size of his land, the tools or draught animals he contributed, and his own working days in the co-op. He can put half of his land into the co-op and work on the other half by himself in order to compare the profits between the halves. By this process 90 per cent of the country's peasant households joined the co-ops in 1956. The last stage and ultimate aim is collectivisation, in which the peasants waive their land ownership. Members of co-operative or collective farms are entitled to keep part of their land for vegetable gardens, poultry-keeping, or livestock breeding. In Aug. 1955 the gov. fixed a certain quota of the co-operatives' and individual peasants' produce to be bought by the state and sold to the cities, the remainder to be disposed of by the peasants themselves. Reclaimed lands are run as state farms for mechanised farming. There were in 1954 2415 state farms, of which 97 were mechanised, with a total area of 494,000 ac.

CURRENCY, MEASURES, ETC. The coinage of C. has varied considerably during the ages. At one time the sole official monetary unit was the copper cash, of which 1000 (or in practice 1220) equalled 1 *haukwan* (or customs) *tael*. The *tael* is not a coin, but a weight of silver, and its value fluctuates with the value of silver. In 1928 the Hong Kong *tael* was equal in value to 2s. 11 $\frac{1}{2}$ d. A convention treaty with Great Britain in 1902 pledged C. to inaugurate a standard national coinage. In 1908 an imperial decree was issued, which made the silver *tael* coin of 0.98 touch, weighing 1 treasure-scale *tael*, the unit. In 1910 this decree was cancelled, and a further edict estab. the silver dollar

of 0.90 touch, weighing 0.72 treasury-weight *tael*, as the new unit. In 1928 the National Gov. decided that the *tael* should cease to be current after July, when it was proposed to mint a new uniform dollar as legal tender. The foreign dollar has had a successful career in C., and the first Chinese dollar had appeared in 1889. In 1914 a republican dollar was coined, and in 1927 this was replaced by the Sun Yat-sen dollar. The *tael*, as the commercial unit of exchange, was abolished in 1933, and the unit of currency was the silver dollar, the rate of exchange being fixed as 1 dollar to 0.715 *tael*. In 1935 the gov. adopted a scheme of monetary and banking reforms, including the following provisions: the bank-notes issued by the Central Bank of C., the Bank of C., and the Bank of Communications to be full legal tender; no use of silver dollars or silver bullion for currency purposes to be permitted. In 1939 the Brit. Gov. announced its decision to assist in establishing a £10,000,000 Chinese exchange stabilisation fund. During the Sino-Jap. War the inflation was such that, whereas before the war £1 = 15 Chinese dollars, the exchange rate fixed by the Foreign Exchange Equalisation Fund Committee (which was set up on 17 Aug. 1947), as at the end of 1947, was C. N. \$225,000 = £1 and C. N. \$73,000 = U.S. \$1. By Aug. 1948 the paper money issued by Chiang Kai-shek's gov. was virtually worthless and a new currency, the so-called 'golden yuan' note (1 = U.S. \$4), was issued. This 'golden' currency collapsed in a fortnight, and when the Communist force captured Shanghai in April 1949 prices were inflated 6 million million times as compared with commodity prices in April 1937. The Communists in N. C. had their own currency, known as the people's currency (Jen-min Piao), which also suffered inflation when they took over Chiang's cities. Commodity prices were stabilised in Mar. 1950, and the rate of exchange since 1950 has been £1 = 6.9 yuan. The old prin. weight measures are the *liang* or *tael* (1 $\frac{1}{2}$ oz. avoirdupois), of which 16 make 1 *chin* or *catty* (1 $\frac{1}{2}$ lb. avoirdupois); 100 *chin* make 1 *tan* or *picul* = 133 $\frac{1}{2}$ lb. These measures are also used for liquids. Though, in C., standards of weights, measures, and lengths vary all over the country, generally speaking 2 kinds of standards, the old and the new, are in use. The old standard was formulated from a law promulgated in 1914, establishing a double system, the standard metric unit and that based on *ying tsao ch'ih*, or 'builder's foot', for length, and on the *tael* or *liang* for weight. The law governing the new standard was promulgated in 1929 and was intended to be the legal standard of weights and measures throughout C. For convenience' sake and customary usage it also estab. a double system. One is the standard metric unit, which came into operation in the Chinese customs service in 1934. Kung Lee equals the millimetre; K. Fen, centimetre; K. Ts'un, decimetre; K. Ch'ih, metre; K. Chang, dekametre; K. Yin,

hectometre; K. Li, kilometre, which equals 2 Chinese Li. The other, which is temporary in character, is designed only for market use and is to be abolished as soon as the people grow accustomed to the new system. Other measures are: 1 mou = 0.1644 ac.; 1 tan = 100 chin = 0.9542 cwt.; 10 ts'un = 1 ch'ih = 1.0936 ft.; 1 li = 0.3107 m. Apart from the avoirdupois weight system and land measurement, all the Chinese measures are decimal.

FINANCE. Chinese gov. revenue in the past depended mainly on land tax paid in kind, part of which went to local govts., the rest being sent to Peking by canal. The amount of ann. tax varied with the farmers' output which was subject to the vagaries of nature from year to year.

The sources of the 1956 revenue were: state enterprises, 48.19 per cent; taxes, 47.02 per cent; state bonds and foreign loans, 2.5 per cent; other sources, 2.29 per cent. Items of expenditure were: economic reconstruction, 52 per cent (an increase of 33.45 per cent over the 1955 figure); defence, 19.78 per cent (a reduction of 5.52 per cent of the 1955 figure); cultural and educational services, 12.54 per cent; administration, 7.84 per cent; aid to foreign countries, 2.8 per cent; payments of state bonds and foreign loans, 2.47 per cent; general reserve, 2.57 per cent. The following table shows national production in various branches in million pounds (those figures in parentheses are consumer goods):

	1949	1952	1953	1954
Industry	£1,562 m. (£1,113 m.)	£3,914 m. (£2,359 m.)	£5,157 m. (£3,030 m.)	£6,017 m. (£3,468 m.)
Handicrafts	£469 m.	£1,061 m.	£1,322 m.	£1,516 m.
Agriculture	£4,724 m.	£7,013 m.	£7,233 m.	£7,472 m.
TOTAL	£6,755 m.	£11,988 m.	£13,712 m.	£15,005 m.

Such conditions made budget making impractical in imperial days. Since 1842 Chinese customs duties had under treaty obligations been set aside to pay foreign indemnities, foreign loans, and their interests, with the remainder going to the Treasury. Great Britain in 1930 agreed to return her share of the 1900 Boxer Indemnity, as from 1922, to the control of the Chinese Gov. for the construction of railways and for educational purposes. In the first rep. (1911-26) the country was divided up by local warlords, each of whom seized the land tax in his own area, and the Central Gov. had very little revenue apart from the remainder of the customs duties. In 1928 a Budget Committee was formed under the National Gov., but as the nation's wealth was continuously drained by civil wars and internal corruption, no budget was ever issued. In 1937-8 the revenue amounted to \$879 million (£1 = C. \$15) and expenditure amounted to \$950 million, of which military expenses occupied 39 per cent. With the estab. of the People's Gov. there have been issued budgets and final accounts every year since 1950. In the following table, from 1950 to 1957, are figures of final accounts; that of 1958 is the budget figure:

Year	Revenue	Expenditure
1950	£243,000,000	£285,000,000
1951	£1,878,000,000	£1,725,000,000
1952	£2,740,000,000	£2,363,000,000
1953	£3,500,000,000	£3,500,000,000
1954	£3,981,000,000	£3,615,000,000
1955	£4,399,000,000	£4,253,000,000
1956	£4,456,000,000	£4,602,000,000
1957	£4,400,000,000	£4,376,000,000
1958	£4,724,000,000	£4,724,000,000

CONSTITUTION. C. had a number of provisional constitutions drafted by successive govts. in the first half of this cent., but strictly speaking none has been approved by parliament or put into effect. The first draft constitution was pub. in 1906 by the Manchu court which was soon overthrown. The last was announced by the Nationalist Gov. in 1948 when two-thirds of the country was already under the Communist regime. From 1911 to 1927 C. was torn by civil wars, and there was no parliament that could claim to represent the whole country. During the Nationalist regime (1927-48) members of the legislative *yuan* were not elected, but appointed by Chiang Kai-shek. When the People's Liberation Army had occupied most provs. of C. in 1949, a People's Political Consultative Conference was formed in Sept. in Peking by deputies from the Communist party, the Revolutionary Committee of the Nationalist party (Kuomintang), the Democratic League, and 6 other smaller political parties. It was this conference, in fact dominated by the Communists and pro-Communists, which drew up a *Common Programme* to be observed by all parties, formed a coalition People's Gov. based on the *Common Programme*, elected the chairman and 6 vice-chairmen of the Central People's Gov., and declared C. to be the People's Rep. of C. This *Common Programme* served as a provisional constitution from 1949 until 1954, when election of deputies for the National People's Congress was completed and the congress held its first session to discuss the present *Constitution of the People's Rep. of C.*, which was passed on 20 Sept. 1954. This constitution of 106 articles stipulates that the power of the state lies in the whole

who are represented in the National People's Congress which meets once a year, and its 1220 deputies serve a term of 4 years before a new election takes place. If a deputy fails to represent the opinion of his constituency, the latter deposes him and replaces him by a new deputy to be elected according to legal procedure. The congress is invested with the power of amending the constitution, legislating laws and bills, of electing, approving the appointment of, and deposing the chairman and vice-chairman of the state, the ministers, and other gov. officials. The constitution protects the citizens' private property and their right to inherit private property; their freedom of speech, religious belief, public assembly, and association. Every citizen above the age of 18 is entitled to vote or be elected as a deputy, irrespective of his or her nationality (among the national minorities), racial origin, profession, social status, religious belief, educational level, amount of property, and duration of residence in his or her constituency. (The chairman of the state must be over 35.) No arrest may be made without the warrant of the People's Court.

The new constitution changes the Kuomintang system of 5 powers to the 3-power tradition: the National People's Assembly, the State Council, and the Supreme Court. The People's Political Consultative Conference, whose 670 members are elected from the various political groups, popular organisations, various vocations, and from among the intellectuals, serves as the Upper House which advises the gov. on state policies.

GOVERNMENT. Before the 1911 revolution C. had been an empire for 21 cents. The emperor appointed all ministers and governors of provs. and approved the appointment of prefects and magistrates. His unlimited power was sometimes restrained, not by any constitutional stipulations, but by the Confucian philosophy that he should obey the Mandate of Heaven which is manifested in the will of the people, and the Taoist philosophy that the less the gov. interferes with the people, the happier will the people be. If at times the people in the country enjoyed a large measure of autonomy, it was chiefly due to the sovereign's voluntary adherence to these 2 schools of thought. When the monarchy was overthrown in 1911, the rep. was not unified, and the local warlords were unscrupulous, caring neither for old principles nor modern political systems. From 1927 to 1948 C. was under the Kuomintang 'tutelage' regime, in effect a dictatorship under Chiang Kai-shek, which tolerated 'no factions within the [Nationalist] party, no parties outside it.' When the Communists came to power in 1949, they sponsored a coalition gov. with the participation of all parties, including the Kuomintang and non-party leaders. In the 1954 general election a number of non-Communist and non-party deputies were elected, and the present (1957) People's Gov. is virtually the same coalition as it was when first formed in 1949, with the

Communist party taking a leading part. Those holding ministerial posts in the gov. are members of the Chinese Communist party, the Kuomintang Revolutionary Committee, the Chinese Democratic League, the Democratic Construction Association, the Peasant-Workers' Democratic party, the Chiu-san Society (profs. and lecturers' party), the Taiwan Democratic Autonomous League, and non-party intellectuals. As the National People's Congress only meets once a year, a Presidium of 79 and sev. Standing Committees (National Minority Committee, 84 deputies; Legislature Committee, 32; Budget Committee, 26) are elected to discharge duties during the adjournment of the congress. The State Council consists of the premier, 10 vice-premiers, 35 ministers, and 5 committees. In addition there are bureaux of Civil Aviation, Broadcasting, Handicrafts Management, Statistics, etc. The National Defence Council consists of the chairman, who is concurrently the chairman of the People's Rep., 15 vice-chairmen, and 81 members. At the prov. (or autonomous regional) and lower levels there are prov., city, and co. people's congresses to which the local govts. at various levels are responsible. In the provs., municipalities, and autonomous regions there are also People's Political Consultative Conferences formed by representatives of local political parties and popular organisations. In administration, the prov. is divided into dists., the number and size of the latter varying with the size and pop. of the former. Each dist. consists of a number of cos. (*hsien*), and the co. is in turn divided into *shiang*, each comprising sev. vils. The judicial system, which is in theory but not in practice independent from administration, consists of the People's Court and the Prosecution Court. They are in 3 grades: the Supreme People's Court and Prosecution Court, the Prov. People's Court and Prosecution Court, and the Co. People's Court and Prosecution Court. No death sentence may be passed without the approval of the Supreme People's Court. The national minorities are represented in the National People's Congress and their leaders are appointed ministers in the State Council and elected chairman and vice-chairmen in their autonomous regions. In the provs. where there are national minorities they are represented in the Prov. People's Congress and their leaders take part in the prov. gov. The area where they live is carved out for an autonomous dist. or autonomous co. to be governed by themselves. In an autonomous region, dist., or co. the official language is that of the national minority.

ARMY, NAVY, AND AIR FORCE. The Chinese under the Manchu rule were not allowed to raise troops and all cities were garrisoned by Manchu armies. When the Taiping rebellion broke out in the 1850's the Manchu armies in S. and Central C. were completely destroyed. A local Chinese militia in Hunan was organised to fight the rebels and eventually it developed into an army of

formidable strength which the Manchu gov. was forced to recognise. This 'Hunan Army,' the embryo of modern Chinese land forces, was later replaced by the Peiyang New Army. In 1923 Sun Yat-sen founded the Whampoa Military Academy in Kwangtung with Chiang Kai-shek as its principal. The cadets of the academy, many of them Communists, later formed the hard core of the National Revolutionary Army which defeated the warlords and so made possible the estab. of the Kuomintang Gov. When in May 1927 the grand purge in the Kuomintang was ordered by Chiang, Communists in all armies were liquidated with the exception of 1 army which, led by Chou En-lai and Ho Lung, revolted on 1 Aug. 1927 in Nanchang, Kiangsi, and became the first Chinese Red Army. It engaged in guerrilla wars against the gov. on the borders of Kiangsi, Fukien, and Hunan, and in 1934 started its 8300-m. march to Yen-an, Shensi. At the outbreak of the war with Japan in 1937, the Kuomintang Gov. forces were estimated to be about 1,600,000. The Communist Army in Yen-an was recognised by the Chiang gov. in 1937 as the 8th Route Army and was assigned the task of fighting the Japanese on the NW. frontiers. By capturing arms from the enemy it had expanded to over 400,000 men by 1945 and by then occupied the greater part of Inner Mongolia and N. C. In the ensuing civil war in Manchuria, 1948, the People's Liberation Army, as it was then styled, destroyed 450,000 of Chiang's best troops and captured all their Amer. equipment. By 1950, when the civil war was over, it was claimed that 8,000,000 of Chiang's troops on the mainland had been destroyed, many of them in fact having crossed over to the Communist side. This figure is not reliable, however. The present size of the Chinese regular army is not known, but the gov. had announced the demobilisation of 4,500,000 up to 1956. The national service system introduced in 1954 requires the recruitment of 900,000 men at the age of 17 each year for a period of 2 years' training in the army, while those in the navy and air force are trained for 3 to 5 years. The first Chinese navy was almost completely destroyed in the 1895 Sino-Jap. War. In 1898 C. bought 5 destroyers, the largest of which, the *Hai Chi*, was 4300 tons. Further foreign purchase included 2 training-ships from Great Britain in 1911. On the invitation of the Chinese Gov. a Brit. naval mission was sent to C. in 1929 to organise the training of her fleet. As a result of the Jap. invasion C. lost most of her ships. After the war she received 2 destroyers from the Brit. Gov. and some destroyers and landing craft from the U.S.A. When Chiang was defeated in 1949 he took much of the navy with him to Taiwan. Before the war C. tried to organise an air force which later proved ineffective in fighting the Jap. invaders. From 1937 to 1940 some purchase of Russian craft was made, and from 1942 onwards U.S. craft were sent

to C. as part of the war-time lend-lease. The People's Liberation Army was at first a guerrilla force without any aircraft, but before and during the Korean War (1950-3) the Chinese rapidly built up an effective air force estimated to be 800 Mig-15 jet fighters. Its present strength, chiefly defensive in function, is estimated to be 2500 to 3000 Mig-15 and Mig-17 jet fighters; there is an unspecified number of bombers.

EDUCATION. A national system of education has been estab. in C. ever since Confucius (q.v.) founded the first academy at the beginning of the 5th cent. BC. The Imperial Academy in the cap. had been estab. since 136 BC, and schools in the provs. existed throughout the ages, while great families used to have their own clan schools. For the selection of civil servants, a system of state examination on all subjects, with emphasis on literature, hist., philosophy, and political economy, was introduced which lasted until 1905, with varying degrees of elaboration in different dynasties.

The first modern univ., the National Peking Univ., was founded in 1895; this was followed by the estab. of sev. technological institutes and teachers' colleges. Meanwhile students were sent abroad to learn modern social and natural sciences. In 1910 there were 30,000 students in Japan. In 1927, 5000 were in Japan, 2000 in the U.S.A., and 600 in Europe. The system of 6 years for primary schools, 6 years for high school, and 4 years for univ. education was copied from the U.S.A. by 'returned students.' In 1949 there were 24,400,000 pupils in primary schools, 1,268,000 in high schools, and 116,000 in univs. Since 1950 efforts have been made to re-organise and expand the existing univs. The missionary univs. in C. were taken over by the gov. in 1951 and were incorporated into some of the national univs. In 1952. There were in 1957 67,000,000 pupils in primary schools, 5,950,000 in high schools, 801,000 in technical schools, and 440,000 in univs. The Academia Sinica (Chinese Academy of Sciences) has increased from 17 in 1949 to 60 research institutes of natural and social sciences, including hist., archaeology, philology, etc., with sev. thousand research fellows. The Central Institute of Literature and History in Peking, where veteran scholars of the traditional school carry on their researches in classics, is the old Hanlin Academy in modern dress. Local scholars of the old school are assigned similar work in the Prov. Institute of Literature and Hist. in each prov. While higher education is the concern of the ministry, secondary education is financed by local govts. and trustee bodies. Both Russian and English are taught in schools as secondary languages. Mass education in the countryside, aiming at wiping out illiteracy, is conducted by agric. producers' co-operatives. For social education there are 2400 cultural institutes all over the country, one for each co., in addition to 93 public libraries, 46 museums, and 2190

theatres. Books printed in 1957 totalled 2400 million (1949: 100 million).

RELIGION. Three religions, Confucianism (if it may be called a religion), Buddhism, and Taoism, are officially recognised by the Chinese Gov. Confucianism is a moral system which definitely refuses intercourse with the unknown, and emphasises the duties of the present life. Confucius (K'ung Fu-tzu) encouraged ancestor worship as a part of filial piety, but he himself is not worshipped as a god. At the present time there is a reaction against his teachings, which uphold feudalism and the family, as being unprogressive. Confucianism makes for extreme courtesy. Taoism, taught by Lao-tzu, an older contemporary of Confucius in the 6th cent. BC, is a refreshing rationalistic philosophy. Later it degenerated into magic, concerned with the search for the elixir of life. Buddhism entered C. in the 1st cent. AD, and thence spread into Tibet, where in the form of Lamaism it now has its stronghold. Mohammedanism was introduced in the 7th cent. AD, and spread with such success that there are now 3,600,000 adherents of this faith in C. A large native literature has grown up around it. Christianity was introduced by the Nestorians in AD 635, but died out after flourishing for 2 cents. In 1247 the first Catholic missionary, Friar John of Carpini, entered C., and in 1581 the Jesuit Father Ricci made many converts. Prior to 1949, the Rom. Catholic faith had 1,250,000 adherents, while Protestantism had about 400,000. Christianity has suffered in the eyes of the Chinese owing to the variety of sects which used to have missionary H.Q. in C. The coming to power of the Chinese People's Rep. led to a widespread expulsion of foreign missionaries and church dignitaries, and the churches were taken over by native Chinese Christians. Most of the aboriginal hill tribes are still nature worshippers, and ethnically are distinct from the prevailing Mongoloid pop.

HISTORY. *Archaeological findings and early history.* The Chinese have their own traditions as to the hist. of the human race, and these show no signs of any migration. Anct legend has it that after the time of P'an-ku, the first man, there were 10 periods of sovereigns, to the reigns of whom most of the great advances in civilisation and culture are assigned. The first emperor of whom a detailed account is given is Fu-hsi, whose lifetime tradition fixes as 2852-2738 BC, but he is regarded by many as a supernatural and semi-human being. Following him, and forming with him the group known as the Three Emperors, come Sheng-nung and Huang-Ti, carrying the story down to the 24th cent. BC. Immediately following come Yao and Shun, who are regarded by popular Chinese hist. as types of perfect emperors. On their heads are heaped up piles of virtues, all, apparently, of late origin. In 2205 BC begins the Hsia dynasty, of which the first emperor, Yü, came to the throne as successor to Shun on account of his engineering ability. This dynasty is

supposed to continue till 1766 BC, when Chieh, the 18th emperor, a type of the bad king, was overthrown, and the Shang dynasty commenced. This started well with its first sovereign, Ch'eng-T'ang, but gradually degenerated until it ended with the contemptible tyrant Chou-hsin in 1122 BC. Modern archaeology, however, has thrown much light on both the prehistorical background and the dawnning period of Chinese hist. The remains of the first inhab. in C., who belonged to a race known as the 'Peking Man' or *Sinanthropus pekinensis*, were discovered in 1927 at Choukow Tien, near Peking. The 'Peking Man' lived at the beginning or middle of the Pleistocene, i.e. of the order of 400,000 BC. He was more human than *Pithecanthropus erectus*, but earlier than 'Neanderthal Man.' In Manchuria all stages of culture, from Palaeolithic to Mesolithic and Neolithic, have been found; and Neolithic sites of painted pottery have been discovered in the whole range of the Yellow R. valley, stretching from Kansu to Shantung provs. There were settlements on these anct sites from 4500 to 2000 BC, the later part of which roughly corresponds to the period of legendary rulers up to Yao, Shun, and Yü the Great. Evidence from excavations shows that they lived on agric. as well as pastoral economy and were acquainted with carpentry, textiles, and ceramics. Pictographic language is also found on pottery dated 5000 to 4500 BC. The inclusion in their diet of rice, a grain not thought to be indigenous to C., suggests a diffusion from SE. Asia. The discovery in 1900 of a language both pictographic and phonetic inscribed on oracle bones and tortoise-shells from the Shang dynasty has substantiated what is recorded in books written from the 5th to 2nd cents. BC. The bones and shells number 200,000 fragments and over 500 of them are in the Brit. Museum. The names of more than 30 Shang kings and their order of succession in the inscriptions prove that the Shang genealogy recorded in anct Chinese hist. books is astonishingly accurate. Inscribed bronze ritual vessels and carved jades show high artistic attainment by the Shang. With eclipses recorded in the Shang inscriptions, the authenticity of their hist. can be verified by modern astronomy. The Shang dynasty was overthrown by Kings Wen and Wu of Chou. The period of the Chou dynasty forms one of the classical epochs of Chinese hist. King Wu, the first emperor, aided by his brother, Chou-kung, set to work to weld the disunited members of the country into a solid whole. In doing this he made use of a system which is basically feudal. Agriculture improved, everywhere great public works were constructed, the nomadic life came to an end, and the foundation of the political system was laid. Literature and the arts flourished during the whole Chou period. The emperor was regarded as the son of Heaven, and became the mediator whom the people revered as Heaven's representative, and who at the same time sacrificed and acted as high priest for

the nation. The outlines, at any rate, of the reigns of the 35 sovereigns of the Chou dynasty are correct, and it is probable that the details are also mostly trustworthy. One, at any rate, has been tested. The record is given of an eclipse which occurred in the reign of King Yu, and astronomers have calculated that the date given for this is perfectly accurate. The date of the eclipse, 29 Aug. 776 BC, is therefore generally considered as one of the definite historical points in Chinese hist. During the cent. immediately following, disintegration set in, and the kingdom fell into 5 states, the period being known as that of the Five Leaders. The fortunes of each state varied considerably year by year, but the state of Ch'in, on the W. border, generally remains the most prominent. This was followed by a period of still greater anarchy and internecine strife known as that of the Contending States. In the midst of this disordered time come the 3 great Chinese sages, within a cent. or two of each other.

Confucius, b. 551 BC, was one of the first historians of his country. It was he who united all the traditions of gov. and conduct handed down through the ages, and welded them into the system of morality which his country has preserved since. He lays particular emphasis on the centralisation of authority, that being a particular need of his age. The father has absolute authority over his family, and the emperor is the father of the State. Lao-tzu (Laocius) (q.v.) and Mencius also belong to this period. Another sage, Moti, who taught universal love, altruism, simple life, and pacifism, was a great rival of the Confucian school. Arts, sciences, philosophy, law, etc., flourished in every state, and the logicians in Shantung were treated by the King of Ch'i with ministerial honours. This was indeed the period of a 'hundred contending schools of thought' in which philosophers debated day and night. The Chou dynasty was now very weak, and the influence of Confucianism was not strong enough to secure unity. The king of Ch'in made war upon King Nanchou and with him the Chou dynasty ended in 256 BC. For a time there was no emperor, but in 249 BC the Ch'in dynasty, from which the name of C. is derived, had its beginning. King Chuang-siang, the nominal founder of this dynasty, d. in 246 BC, and was succeeded by Shih Hwang-ti, the first of the 'universal emperors.' This emperor set himself to do away with the feudal system, and to do this he beheaded some hundreds of the scholars, among whose ranks the system found its chief supporters. To him is attributed the building of the Great Wall, and he is also said to have made many canals, etc. For many cents. the Chinese had been engaged in warfare with the Hsiung-nu, probably connected with the Huns, and Shih Hwang-ti led a successful expedition against this tribe, driving them into Mongolia. He also extended the empire southward as far as modern Kwangsi prov. On the fallure of the Ch'in dynasty, war broke out between Liu Pang and Hsiang Yu, 2 leaders of

the successful rebellion which had brought this about, and the former prince came to the imperial throne under the title of Kao Ti (c. 206 BC). He was the founder of the Han dynasty.

The unified empire. The period of the Hans was one of great progress. Shih Hwang-ti, in his enmity against the literate classes, had ordered the destruction of all the books, except those on ordinary sciences and those in the public libraries, and an effort was made to repair the effects of this wholesale destruction. The system of competitive examinations, which lasted until the 19th cent., was now instituted. Except for successful campaigns with the Hsiung-nu, the empire remained at peace.

In the reign of Wu-ti (140-86 BC) the power of the Tartar marauders was broken, and E. Turkestan was made subject to the emperor. Many states on all sides were also absorbed, and the Han period ranks as one of the greatest epochs of Chinese national prosperity and expansion. To this dynasty, which ended in AD 220, succeeded an epoch of misrule and disturbance, that of the Three Kingdoms, which lasted for 45 years. Then the dynasty of the W. Chin was estab. by Szu-ma Yen, who took the title of Wu-ti. To this succeeded a chaotic period under the E. Chin, which family lost power in 419. This period is notable for the reception at the Chinese court of an embassy from the Rom. Empire, which was then sharing with the Chinese the menace of the Tartar hordes. Confucianism was now on the decline, and Taoism and Buddhism began to flourish in C., their combined force forming the new school of metaphysics. N. C. was then overrun by 5 races of Turkish origin who divided among themselves into 16 countries. For 200 years after 419 almost all trace of ordered gov. was lost. No less than 15 dynasties in N. and S. C. succeeded to the throne during this period. In 618 Li Yuan, taking the name of Kao-Tsu, made himself the first emperor of the great T'ang dynasty. The 300 years which followed, to its fall in 907, were years of great expansion and progress. At first the power of the Turks on the W. was so great that they had to be propitiated, but it was not long before aggressive measures could be taken, and the frontier was greatly extended in their direction as far as E. Persia and the Caspian Sea. From every part of Asia ambas. were received at the Chinese court. Later the frontier was also extended on the N. to the borders of Korea by the defeats inflicted on the Khitán. This was the period when poetry flourished greatly and poets were honoured as never before. It was also in this period that the able Empress Wu, the only lady sovereign in Chinese hist., ruled for 16 prosperous years (690-705). At the end of the 8th cent. the T'ang dynasty began to decline; that which succeeded it in 960, the Sung dynasty, was far greater in cultural achievement but less great in military prestige. Between these two (907-60) come 5 minor dynasties. This is, above

all, the period of C.'s literary activity. Book-making, printing, and the formation of libraries were actively carried on throughout the country. The chief adversaries of the empire during this period were the N. Khitan Tartars. The first 3 emperors, T'ai-tsu, T'ai-tsung, and Chentung, carried on a campaign against them with gradually declining success, and the Chinese were finally compelled to call in

The war continued with Mongol victories until the death of Genghis in 1227. He was succeeded by his son, Ogdaï, who made an alliance with the Sung of S. C. against the Chins. This alliance was successful, and the Chin dynasty was entirely swept away. Quarrels, however, then arose between the allies, and the Mongols swept over most of S. C. The whole of the country was in their hands when, in

New York Times Photos

THE KIULUNG OR NINE DRAGON WALL IN PEKING

This wall of coloured tiles was built during the Liao era (916-1125) by a member of the Liao dynasty from Jehol who seized the throne. The relief work in five bright colours shows nine dragons leaping energetically over waves to catch a bouncing ball. The dragon was the symbol of Chinese dynasts; the ball, the sun, signifying the reins of power.

the aid of the Nüchen Tartars to expel the Khitán from Liaotung. This the Nüchen did, but they then refused to leave the country they had thus occupied. They took the offensive against the Chinese and ultimately possessed themselves of the whole of N. C., over which they estab. the Chin dynasty, leaving only the S. half to the Sung. Meanwhile the power of the Mongols in E. Asia was increasing, and it was the N. kingdom that first felt the approach of the new danger. In alliance with the Khitán, Genghis Khan, the great Mongol leader, invaded Liaotung and captured the cap. city, Liaoyang, in 1212-13.

1259, Kublai Khan ascended the Imperial throne. At no period did C. attain such greatness as now, under the Mongol dynasty. Its ters. extended from the Dnieper to the Pacific Ocean, and from the Arctic Ocean to the Straits of Malacca. Commerce flourished even with Europe, and it was during this period that Marco Polo, the first European to give the W. races an accurate idea of C., was in the service of the Great Khan. In 1368, when the Chinese leader Chu Yuan-Chang captured Peking, this great dynasty was succeeded by the native Ming dynasty, famous rather for the arts of peace than

for their conquests. They also strove to encourage intercourse with foreign nations, and many Portuguese and Sp. traders entered the country. The Chinese fleet, led by the eunuch, Adm. Cheng Ho, called on many countries in SE. Asia and went as far as Madagascar. Christianity was also introduced more extensively by the exertions of the Jesuit, Father Ricci. Canton became the chief port for foreign intercourse. But new foes, the Manchu Tartars, were now coming into prominence. In 1616 a force of these people, who had suffered much from Chinese oppression, entered the country and defeated the forces sent against them. In 1619 they took complete possession of Liaotung, and in the following year T'ien-ming, the Manchu king, declared himself independent. Meanwhile C. itself was in a state of disunion. There were various rebel forces, under different leaders, in arms against the gov. When the peasant leader Li Tzu-Cheng captured Peking the last emperor hanged himself. None knew where to turn for help, and the general on the Manchu frontier invited the Manchus to enter and subdue Li's peasant army. They did so, but refused to retire when their work was done. They took possession of the cap. without a struggle, and in 1644 the last dynasty of C., the Ta-Ch'ing, or 'Great Pure,' was estab. It is interesting to note that the pigtail, the plaited queue of hair worn at the back, so often considered a special mark of the Chinese, dates its introduction from this time. It was imposed on them by the Manchu conquerors, whose fashion of head-dress it was, and at first was received most unwillingly. Perhaps the greatest of the Manchu emperors was the second, K'ang-hsi (1662-1722), who is famous both for learning and for generalship. He devoted himself to study under the guidance of the Jesuits, and it is to him that the country owes the great dictionary of the Chinese language. His successor, Yung Cheng, was a monarch of a very different type, and it is from his reign that the policy of 'exclusion' clearly begins. He inaugurated a persecution of Christians, and did his best to undo the work which the Mongol emperors had started. The change was not, however, due to him alone. The conduct of Portuguese traders and the quarrels of the religious orders had not impressed the Chinese favourably. Moreover the ideas of civilisation entertained by the E. and W. races thus brought into contact were diametrically opposed on many points. Collision followed, as it was bound to do. From the 17th to the 19th cent. the attempt of C. to retire within herself and exclude the 'barbarians' marks her hist.

China's contact with the west. To Britain is due the opening of C. to Europe. Brit. trading with C. began in 1535, and for nearly 2 cents. the Brit. trade was in the hands of the E. India Co. The Chinese objected especially to the importation of opium, and the bringing in of this drug was made illegal in 1796. Mutual distrust between gov. and traders

had long been growing, and in 1837 the Chinese Gov. resolved on finally exterminating the opium trade. A governor, Lin, was sent to Canton, with orders to compel the merchants there to give up all the opium in their possession. The British were in a weak and precarious position, and the demand was complied with, but Elliott, the Brit. representative, refused to take the further step of signing a bond authorising the confiscation of all ships afterwards engaged in the trade. Negotiations continued for some time, which terminated with the Brit. Gov.'s declaration of war in 1840. The Brit. captured Chusan, stormed sev. cities, and finally threatened Nanking. A treaty was then made at the latter place by which 5 ports, Canton, Amoy, Foochow, Ningpo, and Shanghai, were opened to Brit. trade; Hong Kong was ceded to Britain, and a large war indemnity was paid. Various other questions were also settled, but not that of the opium trade.

In 1856 more complications arose, over the 'Arrow' affair, and a fresh war began. In this France joined, and after some victories by the allies the war closed in 1858 with the treaty of Tientsin. The Brit. then aided the Chinese to put down the famous Tai-ping rebellion. Till the end of the cent. the Chinese were engaged in resisting the encroachments of the Russians in III, of the Japanese in Formosa (Taiwan) and the Liukiu Is., and of the French in the S. Meanwhile Korea, nominally under the suzerainty of C., was threatening to prove the cause of a war with Japan, owing to the encroachments of the latter power, and in 1894 this actually came. After a year of conflict the Chinese signed a treaty at Chifu (1895), in which the independence of Korea was recognised by C., and Formosa and part of the Liukiu archipelago ceded to the conquerors. At this period many new treaty ports were opened to the W. powers, who aided the Chinese in return to eject the Japanese from Liaotung. C. then set to work vigorously to reorganise her military system. In 1897 Germany seized the port of Kiaochow, and in the following year C. granted the Germans a lease of this dist. for 99 years. In the same year (1898) Russia also received the lease of Port Arthur and its dist., while Britain received Weihaiwei, and a 90 years' lease of part of Kwantung. France received the lease for a similar time of the Bay of Kwangchow-wan and of the Is. near the bay. These predatory proceedings brought in their train a natural reaction against foreigners, a reaction which culminated in the Boxer rising (1900) (see BOXERS, THE). In Feb. 1904 Russia and Japan came into collision over the question of Korea, and in a series of engagements, all of which occurred in Manchuria, Korea, or on the Chinese seas, Russia was severely beaten (for details see RUSSIA). Throughout this war C. remained a passive spectator. The terms of the treaty of Portsmouth, U.S.A., which was signed on 29 Aug. 1905, in so far as they affected C., included the conveyance of the lease of Port

Arthur and Dairen (Dalny) to Japan and the recognition by Russia of Korea and S. Manchuria as being within Japan's 'sphere of influence.' Korea was finally annexed to Japan on 23 Aug. 1910, and the annexation was not questioned by the powers. In estimating the factors which led up to the revolution of 1911-12 (perhaps the greatest revolution the world has yet seen if the number of people it affected be taken into account) the weakness of the Manchu court must be borne in mind. The ambitious but youthful emperor, Kwang-Hsu, attracted by the reform plan of the able and patriotic scholar, K'ang Yu-wei, made an attempt in 1898 to introduce administrative reforms. He was, however, betrayed by the traitor Yuan Shih-kai, Viceroy of Chih-li, and the 'reform' lasted only for a 100 days. It at once led to the reins of gov. being seized by his aunt, the reactionary and aged dowager empress, the emperor being made a prisoner in everything but name. Six of the reformist leaders, including K'ang's brother and a great philosopher, Tan Ssu-t'ung, were beheaded on 28 Sept. in Peking. There is little doubt as to the complicity of the dowager empress in the Boxer rising, but even she was forced to make some concession to the forces of progress within the empire. Edicts were issued in which constitutional reforms were promised, such reforms to be effected gradually, the whole to be completed by 1917. On 14 Nov. 1908 the Emperor Kwang-Hsu *d.*, and strangely enough on the following day the dowager empress also *d.* The emperor, who had *d.* childless, was succeeded by his infant nephew, Pu-yi (*b.* 11 Feb. 1906), who was not quite 3 years of age, Prince Chun, his father, being appointed regent. Prince Chun was a man of enlightened character. Knowing too well the cause of the tragic failure and death of the former emperor, he promptly dismissed Yuan. The storm of revolution burst on 10 Oct. 1911, on the banks of the Yangtze, a dist. in which insurrections seem to be endemic. The rising in Hankow in the prov. of Hupeh was joined by the modern-drilled troops at Wuchang, near Hankow. The neighbouring arsenal of Hanyang was captured and with it funds to the extent of £400,000.

The first republic. The movement, which was more anti-dynastic (i.e. anti-Manchu) than republican, rapidly spread, and soon embraced most of the S. provs. of C. The leader of the revolt at Hankow was the able general, Li Yuan-hung, but the inspirer of the revolution was Sun Yat-sen, at that moment in America. The distraught Manchu court on 14 Oct. sent for Yuan Shih-kai, who at first refused to come to its aid, but eventually did so on the court conferring on him dictatorial powers. He dispatched Adm. Sa Chen-ping up the Yangtze with a squadron of gunboats, and proceeded to quell the rebellion at the head of the still remaining loyal troops (mostly N.). On 13 Oct. the rebels proclaimed a rep. in the prov. of Hupeh, with Li Yuan-hung as president, and notified the foreign consuls

that the property and persons of foreigners would be respected. After some indecisive fighting around Hankow, in which the advantage lay first with the rebels and then with the imperialists (Hankow being recaptured and burned on 29 Oct.), a truce was arranged. In the meantime a rebel gov. was estab. at the old cap. of C., Nanking, and a convention representative of all the S. provs. was assembled first at Shanghai and later at Nanking. Sun Yat-sen duly arrived in C., and Yuan Shih-kai secured from the royal house in the closing days of 1911 an edict pledging itself to abide by the decision of a national convention as to whether it should abdicate or not. The revolutionaries now demanded that the Manchu dynasty should abdicate and a rep. be estab., but Yuan strove hard to bring about a constitutional monarchy only. He sent Tang Shao-yi to negotiate with Wu Ting-fang (formerly Chinese ambas. at Washington), and Tang was apparently won over to the republican point of view. On the other hand, Sun Yat-sen, who had been elected president of the rep. by the Nanking Convention, by an act of patriotic self-effacement which saved much bloodshed, refused to accept the position, and urged that Yuan Shih-kai be appointed. Seeing that this was exactly what he had been striving for for some time, Yuan set himself to the task of making the change from the old regime to the new with as little damage as possible, and sought to procure some face-saving conditions for the retiring dynasty. On 12 Feb. 1912 the throne issued 3 edicts, in which it announced its will to abide by the decision of the National Convention and accept the rep., entrusting Yuan with the task of bringing about the new constitution in conjunction with the Nanking Gov., and, after exhorting all peaceably to accept the new order, announcing the abdication of the dynasty. A constitution of 70 clauses was promulgated; the emperor was to retain his title and receive a pension, and be accorded the civility due to a foreign sovereign. On 27 Feb. the Nanking Assembly endorsed this decision by electing Yuan as president, and he was formally installed on 10 Mar.; but for a long while there was a deadlock over the question whether Peking or Nanking should be the cap. of the rep., the question not being settled in favour of Peking until April. Tang Shao-yi, who subsequently resigned, was appointed premier, Li Yuan-hung vice-president, and a cabinet drawn from both govts. was constructed. The National Assembly met in Peking in April 1913, and censured Yuan Shih-kai for negotiating a foreign reorganisation loan. Foreign capital in C. had led to the system of extra-territoriality, granting of concessions, etc. Conflict between Yuan and Sun Yat-sen resulted in the second revolution in July. Sun fled to Japan, and on 6 Oct., under the guard of Yuan's own troops, the assembly 'elected' Yuan president for 5 years. His first act was to dissolve the Kuomintang and expel its members from Parliament. The Kuomintang originated with the youth

movement. In 1894 Sun founded the Shing Chung Hwei (C. Revival Society), which gained many supporters owing to the feeling aroused by the 'unequal treaties' contracted between the powers and the enfeebled Manchu Gov. In 1905 the society was reorganised, and in 1911 was called the Kuomintang (People's National party). From 1913 to 1916 the party showed no activity beyond secret propaganda against Yuan's monarchical ambitions. In 1914 the U.S.A. proposed an agreement to neutralise the Far E. Japan took exception and, following an ultimatum to Germany, attacked the Ger. leased ter. of Kiaochow and, on 7 Nov. 1914, captured Tsingtao. Japan also occupied Chinese dists. in Shantung, thus violating Chinese neutrality. Protests were met by the notorious twenty-one Demands, which meant the control of C. by Japan. An ultimatum forcing acceptance of these was delivered to C. on 7 May 1915. Yuan partly accepted Japan's demands on 9 May, on condition that the latter would recognise him as the Emperor of C., a position he had been working for from the time he betrayed Emperor Kwang-Hsu to the dowager empress. To this condition Japan readily agreed in secret, and in Aug. Yuan announced that people in many provs. had 'requested' that 'the republic be abolished' and that he should be the 'emperor,' which title he was ready to assume on 1 Jan. 1916. However, opponents of this scheme, led by Prof. Liang Chi-ch'ao and his disciple, Gen. Ts'ai K., rallied in Yunnan and revolution broke out there on 25 Dec. 1915. In 2 months half of the country joined the revolt and Yuan was forced to revoke his scheme and 'resumed' his presidency on 22 Mar. 1916. On 6 June he d. and Li Yuan-hung became president. In a dispute with the premier, Tuan Chi-jui, over C.'s participation in the First World War, Li called in Gen. Chang Hsun as mediator. Chang's first act was to dissolve Parliament, and many members left Peking to form a constitutional gov. at Canton under Sun Yat-sen. Tuan Chi-jui was still premier, and war was declared on Germany and Austria on 14 Aug. 1917. The revolutionary gov. at Canton also declared war. In Aug. 1918 the warlords or *tuchuns* assembled the 'bogus' Parliament and elected Hsu Shih-chang as president. At the Versailles peace conference C. was represented by delegates from both the Peking and Canton Govs. France and England were bound by secret treaty to support Japan's claims to the former Ger. ters., and Shantung was accordingly awarded to Japan by the Council of Three, 30 April 1919. Thereupon the Chinese delegates refused to sign the treaty of Versailles. When it was revealed that what Japan asked for in Paris was no more than part of her previous '21 demands,' secretly accepted by Yuan Shih-kai in exchange for Japan's recognition of Yuan's 'empire,' an anti-Jap. movement was launched by Peking students on 4 May. It rapidly spread all over the country, and all the

factories and shops in Shanghai, the biggest city in C., struck from 3 to 9 June. The gov. was forced to dismiss the minister of foreign affairs and 2 other junior ministers previously responsible for the negotiations with Japan. The students and their tutors realised, however, that C.'s backwardness was deep-rooted and that the whole pattern of Chinese feudal thought was an anachronism in the modern world. The student movement, known as the 'May 4th Movement,' then turned to questioning the value of the whole traditional pattern of Chinese thought and custom. The most remarkable achievement of this movement, however, was the reform of the education system. Hitherto the Chinese pupils from the univ. down to the primary school had been taught in every subject in the classical language of Confucius' times, and literacy in the country was extremely low. The exponents of the movement now advocated that the written language should be identical with the spoken language and that vernacular literature instead of Confucian Classics should be taught in primary and secondary schools. Within a year over 400 newspapers and magazines changed their style from the classical language to the vernacular, and since then a huge amount of literature, including short stories, novels, plays, and poetry, has been produced in the vernacular. At the same time a phonetic script was devised with a view to changing in the future the ideographic Chinese characters into an alphabetic language. The movement was hailed with some justification as the 'Chinese Renaissance,' for it is through the official adoption of the vernacular as the standard national language that mass education has been made possible. On the political side, it was in this movement that some young intellectuals, among whom was Mao Tse-tung, started the pioneer work of organising, first a Marxism Study Group, and then the Chinese Communist party (1921), which was soon destined to lead the entire nation on to a totally different road.

Meanwhile in April (1919) the Canton Gov. had split, and Sun Yat-sen with 2 other leaders from Shanghai negotiated with Tuan Chi-jui at Peking for the unification of the country. In 1921 Sun Yat-sen returned to Canton, and in April was elected president.

On 11 Nov. 1921 the Washington Conference met to discuss the limitation of armaments and incidentally the question of Shantung and the Far E. A compromise was reached over the management of the Shantung Railway, and it was agreed to restore to C. all public property in Tsingtao. By 1923 C. was in possession of all former leased ters. at Kiaochow. Other Chinese demands for tariff autonomy and the abolition of extra-territoriality were favourably received. Britain proposed to restore Weihaiwei, and the agreement was eventually signed on 18 April 1930. A commission, empowered at Washington to investigate

extra-territoriality, suggested in their report (1926) a progressive scheme for the elimination of foreign jurisdiction in C. In 1929 an exchange of notes took place between the Nationalist Gov. of C. and the interested powers concerning extra-territoriality. In April 1922 Sun Yat-sen, president of the Canton Gov., and Chang Tso-lin, dictator in Peking, made an alliance to suppress Wu Pei-fu. Wu, aided by the 'Christian' general, Feng Yu-Hsiang, defeated Chang and, forcing Hsu Shih-chang to retire, reinstated the former president, Li Yuan-hung. At this time Russia tried to restore diplomatic relations with C., but Joffe, the Soviet envoy, agreed to mutual co-operation with Sun Yat-sen. Sun was in exile at Shanghai owing to conflict between the Kuomintang and the Kwangsi military party, but on 21 Feb. 1923 he returned to Canton and formed a military gov. The constitutional Parliament, however, in force in Peking should have had Sun's co-operation. Karakhan, who was in Peking in Sept., restored relations between Russia and C., relinquishing all Russian extra-territorial rights. Sun reorganised the Kuomintang, and at the first national congress, held in Jan. 1924, issued the celebrated manifesto which became the foundation of the National Gov. Sun had based his constitution on that of Great Britain and the U.S.A., hoping for their support, but after the Hong Kong strike in 1922 none was forthcoming, and in 1924 he turned to Russia. Borodin came to Canton as Soviet representative. The Kuomintang was a revolutionary, not a Communist, party, but after the 1924 reorganisation members of the Chinese Communist party were admitted. The Chinese Communist party, beginning as a secret society in 1920, consisting of students and intellectuals, intensely idealistic, had grown rapidly. In Nov. Chang Tso-lin and Feng Yu-hsiang persuaded Tuan Chi-jui to return to Peking as chief executive. Sun was invited to a conference, but arrived in Peking a sick man. On 12 Mar. 1925 he *d.*, and his death caused a split in the Kuomintang. Meanwhile a Nationalist army had been formed by Chiang Kai-shek, head of the Whampoa Military Academy. Forty Russian instructors, ex-officers of the Red Army, had been engaged by Sun to teach in the academy. Borodin continued as adviser to the Central Executive Committee of the Kuomintang, but during his absence in Mar. 1926 Chiang succeeded in expelling the Russians and other Communists, including Wang Ching-wei, from Canton. On Borodin's return in April, however, Chiang drove his anti-Communist colleagues from office. On 11 June he became commander-in-chief of the Nationalist Army, and began his campaign against the N. By July Changsha was taken, and by Aug. the borders of Hupeh were reached. The N. warlords, Sun Chuan-fang and Wu Pei-fu, failed to unite, owing to jealousy, and Wu was defeated. Hankow was captured. On 6 Dec. the Nationalist Gov. arrived there

from Canton. The Communist party was still predominant, with Borodin as adviser, but the most outstanding man was Eugene Chen, the minister of foreign affairs, a man held in respect by all parties. Chiang Kai-shek, after the defeat of Sun Chuan-fang, estab. a rival gov. at Nanchang. The march of the Nationalist armies had been prepared by propaganda, and on 3 Jan. 1927 anti-foreign feeling culminated in the attempt to seize the Brit. concession at Hankow. The concession was defended by marines, but no shot was fired and no lives were lost. Negotiations followed between Eugene Chen and O'Malley, the Brit. representative. The Brit. Gov. had adopted a new conciliatory policy towards C., and it was proposed to put the concessions at Hankow and Kukiang under Chinese administration. Negotiations went forward favourably, but on 24 Jan. a Brit. expeditionary force of 20,000 men, with tanks, aeroplanes, and artillery, arrived in Shanghai. Shanghai was in danger from the fighting between Chiang and Sun Chuan-fang, but this precautionary measure to protect Brit. nationals so exasperated the Chinese that Eugene Chen broke off negotiations. They were resumed later, and on 19 Feb. the Chen-O'Malley agreement was signed. The S. armies took Shanghai on 22 Mar., and 2 days later entered Nanking. Although Chiang's armies had a reputation for orderly behaviour, a body of armed men began systematic looting of foreigners' houses. Seven foreigners were shot, and others, including the Brit. consul-general, were wounded. A party of 150 were eventually rescued under cover of a barrage from Brit. and Amer. warships. These Nanking outrages were the result of a Communist plot to discredit Chiang Kai-shek with the foreign powers. Chiang referred the powers to Nanking for their indemnities, and on 15 April himself ordered a clean-up of Communists in Canton with 2000 arrests and many executions. Previous to this the Hankow Gov. had tried to undermine his command in the army, and Chiang set up the rival Nanking Gov. He started the so-called purification movement and prosecuted the trade unions of Shanghai, with whose aid he had taken that city. In Peking Chang Tso-lin, who had maintained his authority since 1926, also started a Communist prosecution. The Hankow Gov. then began a military drive northward, hoping to take Peking in 3 months with the help of Feng Yu-hsiang, who had declared for the Nationalist cause. Tang Sheng-chih began the march against Peking on 22 April, hoping to join with Feng, who was in Shensi with the Kuo-min Chun or Nationalist Army, drilled with the fanaticism of a Cromwell. Hankow was itself beset by a Nationalist general of Chiang Kai-shek's faction. The gov. would have fallen had not its troops gained a victory at Chumaiien and taken Cheng-chow. Feng controlled Honan, while Tang returned to defend Hankow. The severe losses at Chumaiien, however, indefinitely delayed the attack on Peking. Meanwhile Chiang was

conducting his own campaign against Peking, and in June invaded Shantung. Fifteen hundred Jap. troops suddenly occupied Tsinanfu, and Tsingtao was similarly garrisoned. The pretext was the protection of nationals, but Japan was interested in maintaining the supremacy of Chang Tso-lin. Hankow had declared war on Nanking on 9 July. Chiang was hemmed in on 3 fronts, as Feng, who had been keeping the balance between Nanking and Hankow, joined with Hankow. However, the difference between the 2 govs. was beginning to disappear. Members of the Kuomintang at Hankow became dissatisfied, as it appeared that Borodin was pledged to betray the gov. into a more violently communistic regime, presided over by the Chinese Communist party. On 17 July Ho Chien, a Nationalist general, taking advantage of the Hankow forces being engaged with Nanking, descended on Hankow and effected a *coup d'état*. Eugene Chen was expelled, and later left C. for Moscow. There was a general exodus of Chinese and Russian Communists. Mine Sun publicly proclaimed at Moscow that Sun Yat-sen's work was betrayed into the hands of the militarists, and that the revolution was finished. The only obstacle now hindering the reunion of Hankow and Nanking was the person of Chiang Kai-shek, and he resigned on 12 Aug. 1927. Nationalist control was estab. S. of the Yangtze, and in Sept. the Nanking Gov. was organised by the reunited Kuomintang. Nanking became cap., having no foreign concessions and being near Shanghai. The gov. in renouncing the workers' and peasants' associations looked to the Shanghai bankers for support. In Jan. 1928 the Nanking Gov. again offered Chiang the command of the army and the leadership of the revolution. He tried to stabilise the gov. in order to continue the N. campaign, and on 7 Jan. 1928 the Third Nanking Gov. was organised. Its manifesto was based on Sun's Three People's Principles, but all connection with Soviet Russia was severed. T. V. Soong was appointed minister of finance. He had the confidence of the Shanghai bankers, and a loan was floated to subsidise the N. campaign. In Mar. the expedition started. Chiang was allied with Feng Yu-hsiang and Yen Hsi-shan, and the common enemy, Chang Tso-lin, was routed. The Japanese again rushed troops to Tsinanfu. Chiang's advance was checked, and skirmishes between Japanese and Chinese were inevitable, but more serious consequences were avoided by Chiang's prudence. The implication that Chang Tso-lin was being indirectly aided by Japan broke the morale of the N. resistance. Chang evacuated Peking, and, while en route for Manchuria, was blown up and killed.

Under the Kuomintang tutelage. The party dictatorship of the Kuomintang inaugurated the period of political tutelage which was to succeed militarism. At the fifth plenary session the Organic Law of the National Gov. was drawn up. This was the basis of the ensuing

Five-Power Gov. The chief problem confronting the National Gov. was now a military one, which in its financial aspect meant a burden of taxation. Chiang wished to create a strong national army out of the existing troops, and to disband and industrialise the remainder. He sought the help and personal advice of Bauer, a Ger. colonel; this man earned Chiang the jealousy of other commanders, notably Feng, who issued manifestoes criticising the gov. and ridiculing his colleagues. Chang Hsueh-liang, governor of Manchuria, acceded to the central authority, and this gave Chiang the opportunity to call a disbandment conference in Jan. 1929. He met with no support, and the failure of disbandment brought renewed civil war. In Feb. Feng left Nanking to join his army, wishing to control Shantung as soon as the Japanese evacuated. At the same time the Kwangsi party, the Fourth Army group at Hankow, became disaffected towards Chiang, and made war on Nanking. Feng failed to co-operate, and Chiang's alertness destroyed the Kwangsi forces. Chiang had made overtures to Feng, promising him Shantung, but at the conclusion of the Wuhan or Hankow campaign the Nationalist control of Shantung proceeded. Feng was now openly hostile to Chiang, who, in asserting the authority of Nanking, was virtually dictator. In Mar. the Kuomintang convened the Third Party Congress, but although it strengthened the administration of the gov., it failed to find a sound financial policy. In the N. dissatisfaction with the gov. was aggravated by famine. Meanwhile in Manchuria trouble was developing over a dispute which began in July when the Russian manager of the Chinese E. Railway was dismissed by the Chinese, following a police raid on the Soviet consulate. A state of war existed for some months, until on 22 Dec. the Chinese acceded to the Russian demand for a restoration of the *status quo ante*. While the Manchurian trouble was at its height, Chiang was forced to compound with Feng, who retired, leaving the Nationalist forces to occupy Loyang. The year closed with a mandate issued by the Nanking Gov., abolishing extra-territoriality as from 1 Jan. 1930. In the N. the hegemony of Nanking was resented, and in Mar. Yen Hsi-shan allied himself with Feng and seized control of Peiping (Peking). Wang Ching-wei, the left wing advocate of reform, was expelled from the Kuomintang. In May civil war broke out between the N. and S. and in July resulted in a stalemate.

Events in China in the decade before the Second World War. Chang, ostensibly neutral, was eventually bribed by Chiang Kai-shek and marched his troops from Manchuria to Tientsin, thereby threatening the rear of the Yen-Feng forces, but leaving Manchuria unguarded. He further seized the occasion to extend his gains southward to the Yellow R. Chiang Kai-shek, whose occupation of Hopei and Shansi had enabled him to defeat the coalition leaders, found it expedient to

acquiesce in Chang's usurpations and indeed to entrust him with the pacification of the country N. of the Yellow R. When Chiang was directing the civil war in the field, the Nanking Gov. was entrusted to Hu Han-min, the president of the Legislative Yuan, to whom Chiang was a junior member in the Kuomintang. After Chiang had won the war, the first thing he did on his return to Nanking was to imprison Hu. The Kuomintang was again split, and a SW. gov. was formed in Canton. But in 1931 came the Jap. military offensive in Manchuria, an event which prompted an overwhelming wave of nationalism, compelling the resignation of Chiang Kai-shek. His political difficulties had been aggravated by the Communists. However, Chiang Kai-shek retained his military power by means of alliances with loyal generals of sev. provs., while effective authority in the coalition gov. was vested in Sun Fo, only son of Sun Yat-sen, who became head of the Executive Yuan, a post comparable to that of Prime Minister, the foreign minister being Eugene Chen. In this way some semblance of national solidarity against foreign aggression was brought about, though, as later years showed, it was far from effective.

The Sino-Jap. War of 1931-3 apparently arose out of disputes over Jap. interests in the Manchurian Railway and, later, in the Shanghai area. Having overrun Manchuria in the autumn of 1931, the Japanese disembarked troops in the Shanghai area, alleging that there had been an organised Chinese boycott of Jap. imports. The League of Nations and the Amer. and Brit. Govs. tried to stop the conflict by reminding Japan of her obligations under the Nine Power Treaty of 1922. This treaty guaranteed Chinese sovereignty over Manchuria and the 'open door' for international trade. Japan was a signatory of this treaty, but she also had treaty rights over certain areas, which included that of maintaining garrisons in a defined railway zone. There was severe fighting early in 1932 in the Shanghai area. The Nanking forts were also fired on and a great attack launched at Chapel, while Jap. destroyers bombarded Woosung. In reply to the League of Nations, the Jap. Gov. refused to recognise C. as an organised people in the sense of the League Covenant, but averred that Japan had no territorial or political aspirations in C. Negotiations for an armistice, however, broke down. A puppet state called Manchukuo was set up under Jap. control. C. ineffectually protesting against its estab. as a breach of her sovereignty. Then the Brit. and Amer. Govs. made a joint proposal for the cessation of hostilities, which Japan accepted, while rejecting the offices of neutrals in the settlement of the Manchurian dispute. A League commission under Lord Lytton went out, however, to Manchuria to investigate the position, and issued a report suggesting the creation of a special regime there which would maintain the sovereignty of C. while safeguarding Jap. rights.

But in spite of an overwhelming vote of the League in favour of the report, Japan rejected it, holding herself to be the chief power responsible for keeping peace in the Far E. She then resumed the struggle, which ended, so far as this phase of Sino-Jap. relations was concerned, by Japan placing Pu-yi, ex-Emperor of C., on the throne of Manchukuo.

By the close of 1932 a large Chinese army under Chang Hsueh-liang, the young Manchurian warlord, was concentrated in Jehol to repel the further advance of the Japanese from Manchuria. But Jehol soon fell, and by May 1933 the Jap. armies had crossed the Great Wall and were standing outside Peking. An armistice was now signed creating a demilitarised zone, and a political council was formed at Peking with delegated authority from the Executive Yuan to negotiate with the Japanese for the restoration of the public services. In other parts of the country, however, there was much internecine strife. Disaffected elements from the Nineteenth Route Army, which fought the Japanese in Shanghai, were endeavouring to form a provisional gov. in Fukien with Eugene Chen as foreign secretary. Large Communist forces had begun a bitter struggle in Kiangsi, and, before all other factions had combined to repel them, had even menaced Amoy. But early in 1934 the gov. forces regained their initiative and the Communist forces began their long march to NW. C.

Although an armistice had been signed with Japan, later events were to show that that power was very far from staying her hand in C. The salient feature in the hist. of C. in the 25 years before the Second World War was the gradual development of Jap. influence, and each step in the consolidation of that influence only marked the culmination of a policy which was initiated as long previously as 1915, when Japan, taking advantage of favouring circumstances during the First World War, presented some 21 demands on C., acceptance of which would have reduced the country to the status of a Jap. protectorate. Their partial acceptance, however, gave Japan a strong hold in N. C., especially in Manchuria. After the First World War Jap. policy seemed to grow more conciliatory, and by the Nine Power Treaty, signed in Washington, Japan pledged herself to respect the sovereignty and territorial integrity of C., and even to seek no exclusive privileges there. The growth of Chinese nationalism, however, soon gave rise to friction with Japan. After the occupation of Peking by the Nationalist armies, the autonomous gov. of Manchuria began to look to Nanking rather than to Tokyo for advice and tried to undermine the position of the Japanese as lessees of the S. Manchurian Railway, and it was this that led directly to the Sino-Jap. War of 1931-3 (described above) and the eventual estab. of the puppet state of Manchukuo. The Jap. armies actually marched on Peking in 1933, but the city was saved by an armistice

known as the Tangku truce, by which the Nanking Gov. agreed to prevent all anti-Jap. activities in N. C. The next significant event in C. was the pseudo-secessionist movement of the N. provs.—Suiyuan, Shantung, Hopei, Honan, Chahar, and others. This movement was ostensibly a Chinese revolt against an oppressive gov. led by Chinese generals, and it might have been regarded as a natural movement of reaction against Communist or Bolshevik influences but for the cloven hoof of Jap. 'co-operation' in the movement at the time of its announcement.

The Sino-Japanese War. Utter lack of political cohesion characterised C. in 1935-6. The Nanking Gov., under the leadership of Chiang Kai-shek, claimed to be the lawful Chinese gov. to speak for all C. But, although it was unquestionably the Central Gov. *de facto*, its political influence was by no means commensurate with the geographical area of the country. In the N. Manchukuo and Jehol, as well as those provs. under the control of the Hopei-Chahar Political Council, passed virtually under Jap. control. Outer Mongolia adopted a Soviet form of gov., and seemed, politically speaking, to be regarded to all intents as a protégé of the U.S.S.R. 'Communist China', in addition, comprised many areas in the interior and in Fukien, and their presence inspired a series of military operations against them on the part of the Nanking Gov. with varying degrees of success. In the S. the SW. Political Council—the so-called Canton Gov.—was for some time practically independent of Nanking, and it was only after July 1936 that the Central Gov. estab. any considerable measure of control in the S. provs. It was from those provs., and especially from Kwangtung and Kwangsi, that the greatest opposition to Jap. penetration and other foreign penetration had come. Sino-Jap. tension grew acute at the end of 1936, when a delegation of students of the univs. of N. C. pressed the Nanking Gov. to adopt a strong anti-Jap. policy. They demanded an alliance between the Kuomintang, Chiang Kai-shek's Nationalist party, the Communists, and all other organisations in resisting Jap. aggression. Meanwhile the Communists, after their famous long march from Kiangsi to Shensi in 1934-5, had settled down in Yenan and were on friendly terms with Gen. Chang Hsueh-liang's troops whom Chiang Kai-shek had sent to Sian to suppress the Communists. Early in Dec. Chiang flew to Sian to press the unwilling young general to action against the Communists, but Chiang was kidnapped and imprisoned by Chang Hsueh-liang on 12 Dec. Anxious to form a united front against Jap. invasion, Chou Ku-lai, a Communist leader, intervened and secured the release of Chiang Kai-shek on condition that Chiang promised to stop civil war and to co-operate with all parties in face of foreign invasion. This co-operation between the Kuomintang and the Communists greatly alarmed the Japanese, and tension with Japan

became acute in July 1937 with the outbreak of fighting between Chinese and Jap. troops at Lukouchiao, SW. of Peking, on the 7th. On 13 Aug. war broke out in Shanghai, and the unabashed invasion of further areas of C. without any declaration of war, began. On 25 Aug. C. secured a Russian loan to the value of U.S. \$500,000,000, and, with the support of Communists in N. C., Gen. Chiang was prepared for a protracted war against the Jap. aggression. The Communist troops were organised into the Eighth Route Army in N. C. and the New Fourth Route Army in the Yangtse valley. At the close of 1 year (July 1938) the Jap. armies were in control of most of E. C.—300,000 sq. m., with an estimated pop. of 130,000,000—after more than 1,000,000 Chinese and Jap. lives had been lost and the greatest misery suffered by the Chinese civilian pop. Probably the Chinese casualties were over 400,000 soldiers killed and twice as many wounded, while the Japanese had 100,000 killed and as many wounded. The total number of refugees was not fewer than 10,000,000, but the final toll of the war in famine, flood, and disease is not known. In the middle of 1938 Jap. armies of 1,000,000 were mobilised against 2,000,000 Chinese on fronts 1500 m. long, spread over an area more than half the size of Europe. Neither country showed any sign of yielding. The results of the campaign in the first year of the conflict showed that Japan had obtained nominal control over all the ter. bounded by a line running from Hangchow through Wuhu along the Yangtse to Hukow, N.-eastward to the flood area, and all the country bounded by the bend of the Yellow R. northward into Inner Mongolia. They also controlled nearly the whole of N. C., the provs. of Shantung, Shansi, Hopei, Kiangsu, parts of Honan and Anhwei being also in their occupation. Peking and Tientsin were entered almost immediately after the outbreak of the conflict, and in the former city a Jap.-created provisional gov. was inaugurated. Further S. the Japanese captured Shanghai after a prolonged resistance, and, following a rapid advance inland, stormed Nanking, the Nationalist cap. (Dec. 1937). The National Chinese seat of gov. had previously moved to Chungking (Szechwan), far in the interior, but the conduct of operations continued to be directed from Hankow by Chiang Kai-shek. As at Peking, a Jap.-sponsored puppet gov. was estab. at Nanking. It was early evident that Japan's mechanised troops and modern equipment altogether outweighed the numerically superior masses of Chinese troops, whose lack of tanks, aeroplanes, and heavy mobile artillery found but little compensation in tenacity and bravery. But quantities of arms were constantly finding their way into C., particularly from the Soviet Gov., via Kansu, over the frontier from Fr. Indo-C., and via Hong Kong. Necessarily the conflict had repercussions on those countries which had commercial and business interests in the Far E. Moreover the Jap. press began to

criticise Britain on account of the arms traffic through Hong Kong; there were incidents at Shanghai, and the wounding of the Brit. ambas. in Aug. 1937 by machine-gun fire during a Jap. air reconnaissance led to a temporary deterioration of Anglo-Jap. relations. There was also some tension between Japan and the U.S.A., particularly after the sinking of the Amer. gunboat *Panay* on the Yangtse (Dec. 1937). With Germany and Italy, Japan's partners in the Anti-Comintern Pact (q.v.), however, Japan's relations continued to be cordial. At the end of June 1938 Japan stated that she proposed to occupy Hainan, the large is. near Fr. Indo-C., but the prompt action of the Fr. Gov. in occupying the Paracel Is., a series of coral reefs to the SE. of Hainan, coupled with a warning from the Brit. Gov., deterred Japan from carrying out her intention.

By the end of the second year of the conflict neither C. nor Japan was within sight of ultimate victory, and both countries recognised that the struggle would be prolonged indefinitely. Both govts. announced their determination to pursue the conflict to a victorious close. In the autumn of 1938 the Japanese pursued a vigorous drive up the Yangtse, and they soon occupied Kinkiang. In Oct. they captured Hankow and Canton. In Feb. 1939 the Japanese descended on the is. of Hainan, a move which caused uneasiness to the Fr. Gov. but led to no action by them. In the spring of 1939 there was a resumption of military activity with the launching of a Chinese offensive on all fronts; but apart from local successes in central C. and near Canton, the military situation was little altered. Later (May) the Japanese intensified their grip on the Chinese coast by landing at the international settlement of Kulangsu (off Amoy), and by occupying Swatow (June). In N. and central C. and in the Canton area the Chinese Communist Eighth Route Army, the New Fourth Army, and Pearl River columns carried on a well-organised guerrilla warfare with considerable success. The general position then was that while the Japanese nominally controlled vast areas of C., their actual control was limited to key cities, ports, waterways, and railways, while outside the main lines of communication they had little or no hold on the countryside. But, necessarily, the effective control of the coast, especially after the fall of Canton, made it practically impossible for C. to import war materials by sea, and in 1940 her main arteries of communication with the outside world were the 'back doors'—the long caravan route from Lanchow (Kansu) in the NW. to Asiatic Russia, and the new road linking Kunming (Yunnan) with Burma. This remarkable piece of road construction was completed in Dec. 1938 in spite of the greatest difficulties.

In the occupied areas the Jap. Gov. made strong efforts to exploit the economic resources of the country, and in 1938 a 'China Board' was formed in Tokyo for

this purpose, and, later, development companies were formed with Jap. capital. A Supreme Council of N. C. was formed about the same time, in which were incorporated the Jap.-controlled Nanking and Peking provisional govts.

Considerable friction developed in 1938–1939 between Japan and the W. powers, and protests were made by the Amer., Brit., and Fr. Govs. at the closing of the Yangtse to foreign shipping, a step which was contrary to the 'open door' policy which the W. powers had consistently upheld in C. The grant of an Amer. credit of \$25,000,000 to C. for the purchase of Amer. manufs. and primary produce also strained Jap.-Amer. relations, while the action of the Brit. Gov. in 1939, in deciding to assist C. by the creation of a £10,000,000 exchange stabilisation fund (see CURRENCY, etc., above), evoked bitter protest from Japan. Tension also grew with France over the occupation of Hainan and the annexation of the Spratley Is., a small group in the S. C. Sea, sovereignty over which was claimed by France. Tension grew still more acute with the Jap. landing at Kulangsu, the occupation of Swatow, and the blockade of the Brit. and Fr. concessions at Tientsin, with the consequent infliction of humiliations on Brit. subjects by Jap. soldiers.

China in the Second World War. C. was rapidly changing before the Second World War. In the decade 1928–37 the W.-trained Chinese had their opportunity to secure administrative control within C. and to modernise the country. In this same decade C.'s heavy and light industries expanded with rapidity, and in all kinds of enterprises which had formerly been possible only under foreign ownership or management the Chinese manifested ever more enterprise and competence. The National Gov. also showed skill in dealing with foreign countries, whose conservative interests were calculated to resent any attempt by the Chinese Gov. to compel them to respect the national interests of C. The primary problem was the old desire of the foreign interests for a strong man to rule C. on their behalf, and they naturally favoured the idea of making Chiang Kai-shek their strong man. But Chiang Kai-shek gradually succeeded in committing America and Great Britain, among the great powers, not only to support of the Chinese Gov. but also gradual relinquishment of their privileges; and this reacted against Japan, which stood alone in supporting territorial and political imperialism in C. and in doing so against the interests of the great W. democracies. C. in 1937 was well on the way to attaining the rank for which her pop. and resources qualified her, but which her prolonged repudiation of W. civilisation and the ensuing period of civil strife and confusion had hitherto denied her. The turning-point was the Leith-Ross mission to C. in the winter of 1935–6; this, and the Chinese currency reform then successfully carried out with the co-operation of Brit. banks, constituted in Jap.

opinion the abandonment by Britain of her traditional pro-Jap. policy. The prospect that C. would soon be receiving large credits for industrialisation on the basis of her new financial stability was one that alarmed the rulers of Japan. Brit. financial support was a factor of vital importance in enabling C. to withstand the Jap. invasion; hence the Japanese now believed that the only way to win the war against C. was to drive Britain by pressure and threats into withdrawing this support. The primary motive of Japan in the war which began in 1937 with the clash at Lukouchiao, SW. of Peking, was to prevent C. from becoming a great power. Hence arose a great struggle, involving directly 500,000,000 people in the 2 warring states, a conflict which would have been continually absorbing the attention of the world were it not for the war of even wider scope which was threatening to break out in Europe and involve all the great powers of the W. The conclusion of the Matsuoaka Pact between Japan and Russia (April 1941) dismayed the Chinese Gov. of Chungking, although Chiang Kai-shek himself never lost confidence in the W. powers. Despite the pact it soon became evident that C. had no cause for apprehension. Moscow intended to continue assistance to C., and Britain and the U.S.A. announced new currency credits. Although relations between the Chungking Gov. and the Chinese Communists could best be described as merely an armed truce, the higher leaders on both sides appeared determined to prevent the dispute from interfering with C.'s resistance to the invaders. At the beginning of 1941, however, a new conflict took place between Chiang's troops and the Communist-led New Fourth Army in S. Anhwei. The Communists had been operating behind the Jap. frontier ever since Chiang's troops retreated to the interior in 1938, and their success in guerrilla warfare had earned some fame. In an attack which was only possible via Jap. occupied areas, Chiang managed to inflict 14,000 casualties on the New Fourth Army and captured its commander, Gen. Yeh T'ing. The remainder of the New Fourth Army was ordered to retreat to N. Anhwei. This was the first breach of the Kuomintang-Communist co-operation, and it was destined to precede further conflicts between the two in the later stages of the resistance war.

After repeated raids, with large numbers of war planes, the Japanese had, by mid 1941, still failed to realise that they could bomb Chungking for years without much effect. The city had the finest passive air defences. Dug-outs were built in solid rock capable of sustaining direct hits by the heaviest bombs. The rebound from the Matsuoaka Pact came quickly in the Brit. and Amer. credits, the arrival of an Amer. air mission in Chungking, and the Brit. ambas.'s assurance that the Burma Road would be kept open. C. also gained international prestige when the 3 leaders of Great Britain, the U.S.A., and C. met in Cairo

in Nov.-Dec. 1943, and pub. the Cairo declaration on 1 Dec. that 'the territories Japan has stolen from the Chinese, such as Manchuria, Formosa (Taiwan), and the Pescadores, shall be restored to China.' The terms of this declaration were again affirmed in the 3 gov.'s Potsdam declaration on 26 July 1945.

The Communists were, however, considerably increasing their power, especially in the later years of the Second World War. They had no confidence in many of the Kuomintang leaders, who, they averred, had been at least as interested in fighting them as in fighting Japan. In the later stages of the war in C. guerrilla activity by the Communist forces rather than regular warfare by Chiang's troops contained the larger part of the Jap. forces. In early 1944 some 22 divs., or 64 per cent of the Jap. forces in C., were operating against Communist troops behind the regular front. The Japanese began an offensive in Honan just before this time, but even then the forces withdrawn from those operating against the guerrillas were small. In addition to these Jap. forces, the puppet army of 750,000 men under Wang Ching-wei was engaged against the Communists. Yet in this struggle behind the regular fronts there were few large battles. The Communist forces claimed, however, that in the 12 months between June 1943 and June 1944 they accounted for nearly 200,000 Jap. and Chinese puppet forces, besides taking 75,000 prisoners. During 1941 and 1942 the Japanese gained some ground, but from 1943 were losing. The pop. paying taxes to the Communist regime rose from 50,000,000 to 80,000,000, the Japanese lost or abandoned 13,000 forts, involving a consequent loss of motor roads and blockade ditches, and in the first half of 1944 the Chinese Communists recaptured 24 *hsien* (co.) cities and retained control of at least a third of them. With some justification the Communists claimed that only their forces, at this time, had been able to carry on effectively this war behind the enemy lines, even though they had received no supplies from outside, even from Russia; and they maintained that in 1941 there were nearly 1,000,000 Central Gov. troops fighting behind the Jap. lines, but that by 1944 their number was no more than 30,000, many having deserted to the enemy. By this time the main Communist forces behind the Jap. regular front were the Eighth Route Army, with 320,000 men serving in an area extending from the Lunghai Railway up to S. Jehol and Liaoning in Manchuria; the New Fourth Army of 150,000 operating S. of the Lunghai Railway in Kiangsu and parts of Anhwei, Hupeh, and Chekiang; and small forces operating near Hong Kong and on Hainan Is. But the limiting factor of the operations of these Communist armies was shortage of ammunition. They had nothing but what was captured from the enemy or made in small local arsenals. This shortage enforced close-range fighting and often made it impossible to liquidate a Jap. force after it had been

surrounded. Moreover the shortage prevented them from bringing about any serious dislocation of Jap. railway communications or damage to industrial installations. With reasonable ammunition supplies, the Chinese Communists might have been able to weaken the whole Jap. position in N. and central C., and it was a situation which clearly offered a great opportunity in the allied war effort against Japan. But the Kuomintang had for some years enforced a strict blockade of the Communist areas. The Communist party considered that it was impossible to overcome C.'s military and economic difficulties without the introduction of democratic reforms, and they could certainly make political capital out of the comparative success of their armies operating under logistic difficulties, but with full popular support, as against the rapid collapse of the Kuomintang armies in Honan and their severe defeats in Hunan. It was generally believed in Yenai, the Communist centre, that the widespread desertion of Kuomintang forces to the puppet armies was the result of a deliberate policy to build up a force which could preserve N. C. for the Kuomintang after the collapse of Japan. Failing an agreement between Yenai and Chungking, indications in 1944 were that the collapse of Japan would leave N. C. in the hands of the Communist forces and that it would be extremely difficult for the Kuomintang to dislodge them.

China after the Second World War. C. greeted the Jap. surrender with mixed feelings. Since April (1945) negotiations had been going on intermittently in Moscow between the Chinese Premier, T. V. Soong, brother-in-law of Chiang, and Soviet leaders. In Aug. it was announced in Chungking that a treaty had been signed with Russia by which C. agreed to let Russia jointly use Port Arthur and Dalren and the Chinese Changchun railways for 30 years. C. also agreed that Outer Mongolia, over which C. had hitherto enjoyed suzerainty but in which Russian influence had been increasingly exercised since 1921, was to decide by referendum whether she wanted to be independent from C. It was later revealed that the treaty was in fact part of the secret agreement reached in Yalta in Feb. 1945 without the participation of C.

Shortly after the conclusion of the Sino-Jap. War, Chiang's half a million best troops under Gen. Hu Tsung-nan, who had been encircling Yenai since 1940, began operating in N. Shensi and captured the Communist bases of Ts'unhua and other towns. In other parts of C., Shansi, Hopei, Chahar, and Manchuria, conflicts between Communist and the former puppet troops were also reported. The whole country was on the brink of civil war. The Communist leader, Mao Tse-tung, flew to Chungking in Sept. to negotiate with Chiang, and agreement was reached on 10 Oct. that a Political Consultative Conference to include the 5 main parties should be convened to

settle their differences. But before the conference took place Communist bases were attacked in Hopei, Shensi, Honan, Anhwei, Hopei, Chekiang, and Kwangtung. In the midst of this confused situation Central Gov. forces were landed at Chingwangtao from Amer. transports with a view to wiping out all the Communist bases in Manchuria and Hopei. Meanwhile the Russian forces in Manchuria had announced that they were withdrawing from the country (under the terms of a Sino-Soviet treaty concluded since the war) and that Central Gov. troops were due to take over Manchuria. Chiang, however, requested the Russian troops to stay on as from 6 Sept. for another 3 months in order to gain time for him to ship his troops there. To this request the Russians readily agreed. On 4 Nov. 1945 an overwhelming force of Communists captured Kweisui, cap. of the prov. of Suiyuan. Ten days later powerful gov. forces landed in Tientsin in a determined effort to clear Shantung of the Communists. After these events a military and political truce was arranged between Chungking and the Communist representative Chou En-lai; but in Feb. 1946 civil war prevailed in Manchuria. Following close upon the successful advance of the gov. troops in Manchuria in the summer of 1946, a 15-day truce was arranged during which the Amer. mediator, Gen. Marshall, made an effort to find a basis for a permanent settlement of the Chinese civil war, but with no real hope of success. The 'unofficial war' between the Communist and gov. or Nationalist forces, which had been dragging on for a year or more, flared up in July (1946) into what seemed to be a full-scale test to decide who should be master. The situation was the more confused from the fact that the Communists frequently asserted their faith in Chiang Kai-shek personally, while it was still open to them to enter the Coalition Gov. agreed upon at the Chungking conference of all parties in Feb. (1946). The gov., for its part, also protested that it still earnestly desired to end the conflict by agreement through the peace envoys of Gen. Marshall. Meanwhile Nationalist forces were launching an attack on the Communist front in Kiangsu, N. of the Yangtze, and developing an offensive in the Kirin prov. of Manchuria, employing in these general attacks quantities of lend-lease Amer. weapons, including destroyer escorts, minesweepers, and aircraft. Early in Aug. Nationalist aircraft made a strong attack on the Communist cap., Yenai. Late in Aug. (1946), in Manchuria, Communist forces struck a blow at the railway between Mukden and Changchun, and in C. proper fighting was in progress in Shansi prov., but Nationalist reinforcements were quickly sent to save the railway. The efforts of the Amer. mediators were still politely welcomed. Gen. Marshall and Dr Stuart had obtained the assent of both sides to the appointment of a committee, under Dr Stuart's chairmanship, to discuss the formation of the State Council which was

to be the mainspring of the projected Coalition Gov. According to the Chungking agreement the council was to consist of 40 members, half from the Kuomintang and half from the other parties, and its constitution was designed to mark the formal ending of the Kuomintang dictatorship and the dawn of a democratic system. But the efforts of the mediators were now being frustrated by the rapid march of military events. An advance by the better equipped Nationalist troops on the Communist centre of Kalgan

were ordered home. The announcement of these measures was made in Nanking (17 Feb.) with a frank statement by Chiang Kai-shek that C.'s survival as a nation was at stake.

Nanking Government loses Manchuria and North China to the Communists. The refusal of the gov. to carry into effect the political accord embodied in the resolutions adopted by the Political Consultative Conference in April 1946 gave the Communists legitimate ground for complaint, though the incurable suspicion in

New York Times Photos

IN THE VILLAGE OF LISON, FIVE MILES NORTH-EAST OF TSINGTAO,
SHANTUNG PROVINCE

threatened to undermine the entire position of the Yen'an administration in N. C. The Communists had now also suffered equally serious reverses in Manchuria; Harbin and Kirin were now threatened. At the end of Jan. (1947) the U.S. Gov. formally abandoned its long sustained effort to mediate in the quarrel, criticising extremist elements in both Chinese camps and suggesting that the salvation of C. lay in the assumption of leadership by the Liberals in the Kuomintang and the minor political parties. The severity of the Chinese Gov.'s remedial measures in Feb. matched the seriousness of the country's economic plight. Her currency was pegged at a realistic level, and stringent war-time controls were reintroduced. The rate of exchange was now 12,000 Chinese dollars for 1 Amer. dollar. Trade in gold and foreign currencies was prohibited and private fortunes abroad

which they held the Kuomintang was the primary cause of their failure to accept the army reorganisation upon which Chiang Kai-shek insisted. Hence the continuance of the civil war, which now dragged on into 1947. The position in the early months of 1947 was that Chiang was directing his operations to the restoration of communications on the Tientsin-Pukow and Lung-Hai railways in N. C., and to the recovery of the ter. N. of Changchun up to the N. Sungari R. In Mar. (1947) the gov. announced their occupation of Yen'an, the remote Communist cap. in Shensi. But that stronghold had been stripped and deserted so that its seizure had no great strategical effect on the anti-Communist campaign. The strength of the Communists in C. depended upon the contrast existing in public opinion between certain meritorious features of the system they practised and

the many evils which the gov. still tolerated within its own territory.

In July the Chinese State Council decreed 'total mobilisation' and the ban of the Democratic League, a party formed mostly by univ. profs. and intellectuals, an indication of the serious crisis facing the Nanking Gov., which had at this time suffered in its ill-advised attempt to suppress the Communists by force of arms instead of effecting salutary reforms while permitting the Communists to exist in a separate state N. of the Yellow R. The significance of the crisis lay in the gov.'s frank acknowledgment of its dependence upon Amer. aid to enable it to carry the civil war to a successful conclusion. Hence the popular suspicion that America by aiding Chiang was in fact encouraging him to carry on the internecine war as well as his dictatorial rule, though in fact the U.S.A. was continually urging Chiang to fight Communism by internal reform as well as military weapons. After the Second World War political reorganisation left the Kuomintang in effective control behind a democratic facade, but was not an honest attempt to carry out the proposals of the Joint Political Consultative Conference of 1946 on which many hopes were based by C.'s friends abroad. The Communists and the Democratic League had held aloof, while the Kuomintang and its offshoots, the Youth party and the Democratic Socialists, had abandoned all pretence of conciliation. Chiang Kai-shek, relying upon his Amer.-trained and equipped troops, was confident of speedy victory earlier in 1947 when he launched an all-out offensive against the Communist-held areas; but following the Pyrrhic victory of the capture of Yenan, the tide of war turned. The Communists, with the support of the rural pop., concentrated on attacking communications and, keeping their own forces intact, inflicted great losses on the gov. forces. Heavy fighting continued in the summer (1947) in Manchuria, where gov. forces were still struggling to reopen the railways. The military misfortunes of the gov. served to aggravate its economic plight, which in turn made the prosecution of the war more difficult without foreign aid.

Towards the late autumn of 1947 the situation of the Nanking Gov. had deteriorated markedly. In Shantung large Communist forces had escaped into Kiangsu; others had overrun Honan, Anhwei, and E. Hupeh, and reached the N. bank of the Yangtze; while those driven out of N. Shensi in Mar. had seized fresh areas of hitherto unoccupied ter. in the neighbouring prov. of Shansi. Another group of Communist forces had crossed the Yellow R. from S. Shansi and spread into W. Honan. In Hopei the N. section of the Tientsin-Pukow railway and the Peking-Paoing corridor along the Peking-Hankow railway had been lost by the gov., and the Peking-Paoing-Tientsin triangle, which they had cleared in Sept., had now been recaptured by the Communists. In Manchuria the

situation was even worse: the narrow corridor along the main railway, held by gov. forces, had now been reduced to a few isolated areas, and the whole forward area N. of Changchun to the Sungari R. had been abandoned.

By Mar. (1948) the whole of Shansi was in the hands of the Communists. Honan was almost completely overrun, except for a large patch with Chengchow at the centre. The Communists had strengthened their grip over Manchuria and N. C., while the S. Manchurian Railway was largely destroyed. The Peking-Mukden line had been out of commission for sev. weeks, and large portions wrecked. With the loss of Liaoyang and Panshan, 2 important ports to the SE., Mukden was further isolated. The whole NE. of Hupeh was in the hands of the Communists, who had now cut the Hankow-Ichang waterway, and were pushing westwards. In the spring of 1948, under Amer. pressure for democratisation, Chiang summoned the National Assembly, whose members were elected or appointed by himself in 1936, to elect a president and a vice-president. He was elected president, but his own candidate for the vice-presidency, Sun Fo, was defeated, and Gen. Li Tsung-jen was elected vice-president.

The strength of the Communist party, which had enabled it to hold its own against the numerically stronger and better equipped forces of the gov., was largely due to the enthusiasm and idealism of its leaders; to the discipline and able command of its military forces; to its able conduct of guerrilla warfare; to the economic benefits it promised to a poor country like C.; to the vast peasant support it enjoyed; and to the growing discontent towards the Kuomintang, coupled with chaotic economic conditions.

The interminable war was inflicting grievous misery on a third of C. Inflation was followed by a tremendous increase in the cost of living and flight of capital. There were serious rice riots in W. and central C.; the provs. were proving insubordinate towards the Central Gov.; there was general unrest among all classes. The overall picture in C. towards the end of 1948 was that the Nanking Gov. had made no attempt to check the corruption that prevailed in higher official circles. No attempt had been made to tax the wealthy to pay for the war. None of the chief Nationalist generals had been superseded or punished for inefficiency. Foreign trade was dwindling, gov. monopolies were increasing, and the gov. had formulated no definite economic plans, such as might be expected of any realist gov. which was determined to exorcise the spectre of popular discontent, and to defeat a rebellion which owed its success less to victories over ill-fed Nationalist armies than to the gov.'s administrative sins of corruption and suppression. Meanwhile there was a rapid debacle in Manchuria, which indicated the complete collapse of the morale of the Nationalist armies. Whether further Amer. aid could have

saved them is doubtful. The culminating point of the Nanking Gov.'s ineptitude came at the end of Oct. (1948) when Communist troops broke into Mukden. This irruption, which in effect marked the turning-point of the civil war, was soon followed by the fall of the city and the surrender of its once-powerful Nationalist garrison. The elimination of the garrison of Mukden meant that the Communists, now masters of Manchuria, could concentrate against the few remaining strongholds of the gov. in N. C., and the fall of Taiyuan, cap. of Shansi, was expected at any moment, for Gen. Fu Tso-yl, who was responsible for the defence of N. C., had insufficient troops and arms to hold out against Communist forces who were superior in numbers and well armed—with captured Nationalist arms and equipment—and contemplated withdrawal into Chahar and Suiyuan.

The immediate reason for the disastrous turn in the military situation—which lost the gov. in succession Chefoo, Kaifeng, Chichow, Changchun, and now Mukden—apart from faulty generalship, was the poor morale of the Nationalist forces. The news of the surrender of the Changchun garrison of 80,000 men, which refused to continue fighting, had a further depressing effect on the spirit of the other gov. forces, and in fact was followed by the surrender of 7 divs. in the corridor (a small strip including Peking and Tientsin), thus sealing the fate of Mukden and Manchuria. Gen. Fu was now in a hazardous situation. With a force of no more than 300,000 his task was to hold a front reaching in a vast arc from Paotow, in the NW., to Shanhaikwan, in the E.; while some of his divs. were strung out along the Peking-Hankow line well S. of Paoting. The Communist armies, flushed with victory, had above all been enormously reinforced with captured arms, artillery, munitions, and other equipment.

It was not long before the Communists followed up these successes by thrusting southward along the Hsuehchow defence line protecting Nanking, the gov.'s plight being aggravated by food riots in Nanking and Shanghai which only ended with the imposition of martial law (11 Nov.) and by a quickening spiral of inflation. At the end of Nov. the 250,000 troops making up the Nationalist garrison of Hsuehchow, following some weeks of confused fighting, abandoned the stronghold on orders from Nanking to hasten to the relief of the 140,000 troops of the Twelfth Army Group now encircled SW. of Suhsien. This latter group had not long previously marched eastwards through Anhwei prov. to the support of their outnumbered comrades in the Suhsien area. The Hsuehchow garrison and other troops comprising 3 Nationalist army groups had failed to relieve the Twelfth Army Group and, in their abortive efforts to do so, had sustained 30,000 casualties. In the rapidly deteriorating situation Chiang on 10 Dec. ordered the extension of martial law to the whole of C. under Nationalist control except the W. provs.

and Formosa. About the middle of Dec. the situation around Peking suddenly took a serious turn for the worse from the gov.'s standpoint, for Gen. Lin Piao's well-trained Manchurian troops, having driven back Gen. Fu Tso-yl's best gov. troops on a front 30 m. E. of the line Peking-Tientsin-Tangku, had advanced to within 10 m. N. of Peking, and the W. airfield, only 3 m. outside the city, was evacuated. The gov. forces, which had abandoned Hsuehchow and withdrawn 100 m. southwards to Pengpu, from where they estab. a new line of defence for Nanking along the Hwai R., now made a further withdrawal, this time to Chuhsien, only 30 m. NW. of the cap.

With the fall of Hsuehchow the result of the civil war was no longer really in doubt. Chiang summoned a military conference in Nanking, but very few commanders-in-chief or prov. governors came. In N. C. Tientsin was captured by the P.L.A. (People's Liberation Army) on 15 Jan. 1949, after 3 days of fierce fighting. On 21 Jan. Chiang Kai-shek was forced to resign by the Sun Fo-Li Tsung-jen faction and Li Tsung-jen, the vice-president, became acting president; Sun Fo was appointed premier. Li's first act was to disband the secret police and to free political prisoners, but his orders were largely ineffective, for the secret police was Chiang's personal force and would obey no orders from anyone else, and the amnesty only served to shorten the lives of those in concentration camps. The P.L.A., under Gens. Nien Jung-chen and Lo Jung-huan, were now besieging Peking, and, after 2 weeks' negotiations, Fu Tso-yl peacefully handed over the anet cap. to its new master on 31 Jan. In Mar. Li Tsung-jen sent a peace delegation headed by Gen. Chang Chih-chung, governor of Sinkiang, and Shao Li-tzu, once ambas. to Moscow and now secretary-general of the national assembly, to Peking to discuss terms. On their arrival they chose to stay with the Communists. In April Sun Fo moved the gov. to Canton, the cradle of the revolution of his father, Sun Yat-sen, but the vice-president stayed on in Nanking. The P.L.A. crossed the Yangtze in force on 20 April, and during the operation damaged the Brit. destroyer *Amethyst* and caused some casualties. Nanking was entered on 23 April, thus bringing formally to an end the 22 years' rule of Chiang Kai-shek's regime. Events now moved rapidly. The governor of Suiyuan, a subordinate to Fu Tso-yl, was persuaded by Fu to change his allegiance to the new authority, and other NW. provs. soon followed suit. In S. C. the rulers of Hunan and Yunnan peacefully changed sides. Kuomintang troops in Shanghai and other coastal areas fled to Taiwan and Hainan is. While the P.L.A. marched S. practically unopposed, the Nationalist Gov. moved back to Chungking, but this time the country failed to rally to them. When the People's Gov. was set up in Peking on 1 Oct. 1949 the old one had withdrawn to Taiwan, with Chiang again at its head.

When the Nationalist Gov. had come

to power in 1927, the Chinese had hoped that Chiang Kai-shek would put an end to the former warlords' civil wars and would industrialise C. according to Sun Yat-sen's *Plan for National Reconstruction*. Apart from his ruthless purges and unsuccessful military campaigns against the Communists, whom Sun Yat-sen welcomed as allies and who greatly helped him in his early revolutionary cause, Chiang constantly engaged in civil wars with troops inside his own party. It is on record that during his 10 years' rule before the Sino-Jap. war there had not been a period of 3 months in which there was no civil war between his 'Central' troops and other 'Local' forces. But Chiang's 'military tutelage' regime excluded any non-Kuomintang party members from his gov., and all other political parties, left or right, were soon forced to go underground. His alliance with the class of vested interests in Shanghai and other big cities alienated the vast majority of the people, especially the peasants who constituted 90 per cent of the pop. Until about 1937 a new liberal-minded middle class, which could have been the mainstay to check Communism as well as right-wing extremists, was gradually emerging in the cities; but it was systematically destroyed by the subsequent inflation. As a result, the white-collar workers were merged with the peasant masses, and this made the alliance of the intellectuals with the Communists iron-cast. Added to the scourge of inflation was Chiang's increasing reliance on his secret police force, which infiltrated into every corner of Chinese life, from the office of a cabinet minister to the canteen of the grammar school. The massacre of univ. students in Kunming in the spring of 1945, and the assassination of the educationist Li Kung-po and the Prof. of Classics, Wen-I-to, within 1 month of the Jap. surrender, put a last touch to the united front of the peasants and scholars against the Chiang regime. In the last stage of the civil war, the indiscriminate bombing by Chiang's Amer.-built aircraft drove the vast mass of the pop. to the Communist side, turned the civil war into a semi-foreign war, and, ironically enough, weakened the morale of Chiang's own troops who, after all, were part of the poor peasantry. The final defeat of Chiang's Kuomintang, and the estab. of a Communist regime in its place, must be considered one of the most important historical events of the 20th cent.

The People's Republic of China. The Central People's Gov. of C. was set up by the Chinese People's Political Consultative Conference which was convened from 21 to 30 Sept. 1949 in Peking by representatives of the Chinese Communist party, the Revolution Committee of the K.M.T., the Democratic League, the Democratic Construction Association, the Democratic Promotion Association, the Chinese Peasants' and Workers' Democratic party, the China Chih-kung party (oversea Chinese), the Chiu-san Society (profs., lecturers), the Taiwan Democratic Autonomous League, trade unions, and popular organisations, and non-

party leaders. At this conference a *Common Programme* was adopted and it confirmed the *Organic Law* of the Central People's Rep. and elected Mao Tse-tung as chairman of the People's Rep. of C. Among the 6 vice-chairmen elected were Mme Soong Ching-ling, widow of Sun Yat-sen, Gen. Li Chi-shen, an old comrade of Sun, and Chang Lan. On 1 Oct. 1949 Chairman Mao declared the People's Rep. of C. estab. with Peking as its cap. He declared his gov. the only legal gov. of C. and stated that it was prepared to enter into diplomatic relations with any foreign country which would agree to the principles of equality, reciprocal benefits, and mutual respect for territorial integrity and sovereignty. On 3 Oct. Moscow announced its decision of 2 Oct. to recognise the People's Rep. of C. On 5 Oct. diplomatic relations were estab. with Poland, Czechoslovakia, Rumania, N. Korea, and sev. E. European countries. Burma, India, Indonesia, Britain, Pakistan, Switzerland, and the Scandinavian countries recognised the Peking Gov. in Jan. 1950. A Chinese delegation, led by Mao, arrived in Moscow on 16 Dec. and was later joined by Chou En-lai, the premier and foreign minister. A treaty between the 2 countries 'of friendship, alliance, and mutual assistance' was signed on 14 Feb. by which Russia agreed to transfer to C. the Changchun railways, Dairen, and Port Arthur upon the conclusion of a peace treaty with Japan or not later than the end of 1952 instead of the '30 years' stipulation in the Soviet-Chiang treaty of 1945. Russia also agreed to hand over to C. the administration of Port Arthur and Dairen and all property in Manchuria leased to Russia in the 1945 treaty. At the same time C. received a large credit loan from Russia to the value of U.S. \$300,000,000.

America had still not recognised the People's Rep.; and when the Korean war broke out, in June 1950 (see KOREAN WAR), the Amer. attitude to C. hardened. The U.S. 7th fleet was ordered to protect Formosa from a possible Chinese attack, and Amer. military aid to the Fr. forces in Indo-C. was accelerated. On the other hand, the U.S.A. rejected Chiang's offer of troops to help the U.N. forces in Korea. In Sept. 1950 Chou En-lai gave notice that if Amer. troops crossed the 38th parallel C. would intervene. On 8 Oct. the U.N. passed a resolution which authorised Gen. MacArthur to cross the parallel, and in Nov. a Chinese 'volunteer' force was sent to N. Korea. This conflict helped to increase Amer. bitterness against C.; the U.S.A. continues to withhold recognition of the Peking Gov., which is still (Jan. 1958) denied representation at U.N.O. Though recognised by most other W. powers, C.'s relations with them have been strictly limited since 1949. Until recently C.'s trade with non-Communist Europe was virtually nil; but a change in the situation was brought about in May 1957 by the Brit. Gov.'s announcement that it intended to relax restrictions on trade with C. There are increasing trade, cultural, and political contacts with India

and other countries of Asia, and in 1956 Chou En-lai visited sev. non-Communist Asian caps.

The Chinese People's Rep., with Russian financial and technical aid, has greatly improved the living standard of the masses, and is carrying through a vast programme of industrialisation and agric. mechanisation. See articles on the various provs. and prin. cities mentioned above.

China Aster, *Callistephus chinensis*, variable Chinese annual, sole species of its genus, introduced in 1731, family Compositae.

China Bark, one of the names applied to the bark which yields the drug cinchona.

China Clay, Eng. name for kaolin (q.v.).

China Grass, see BOEHMERIA.

China Root, name given to the root of the tropical vine, *Pittis sicyoides*, and also to that of the lilaceous plant, *Smilax china*. The latter plant is used medicinally, and others of its genus yield sarsaparilla.

China Sea, South (Chinese Nan Hai, or South Sea), that portion of the Pacific Ocean lying to the E. of China and Siam, being bounded by China and Formosa on the N. and NW., the Philippine Is. on the E., Borneo on the S., and the Malay Peninsula and Indo-China on the W. and SW. It forms the great gulfs of Siam and Tongking. Its chief affluents are the R.s Meinan, Cambodia, Pearl, Mekong, Songkol, and Sikiang. The chief ports are Canton, Manila, Bangkok, Singapore, Hong Kong, and Saigon. Greatest depth, 14,250 ft.

China-stone, Eng. name for petuntse (q.v.).

Chi-nan, see TSINAN.

Chinandega, city in C. dept, Nicaragua, with important cotton, sugar, timber, and related industries. Connected by rail with the country's main port (Corinto) and all prin. cities. Pop. 16,171.

Chinaware, term nowadays used solely to denote Eng. 19th- and 20th-cent. bone-porcelain or bone-china. It is a hybrid paste containing china-clay and china-stone in combination with bone-ash. First introduced by Barr at Worcester and by Spode at Stoke-on-Trent about 1806, it became the standard Eng. body. Bone-china is softer than hard-paste porcelain, but less costly to produce and more durable than the Eng. soft-paste porcelain of the 18th cent. A high standard was maintained throughout the 19th and 20th cents. at the Minton, Royal Doulton, Royal Crown Derby, and Wedgwood works. See DERRY; DOULTON; MINTON; SPODE; WEDGWOOD; WORCESTER.

Chincha Islands, 3 small rocky is. in the Pacific, off Peru (Ica dept), and about 14 m. from the coast. Total area 6½ m. The is. rise to about 200 ft. and were formerly noted for guano, but have now been worked out. Lat 13° 39' S.; long. 76° 25' W.

Chincherinohes, S. African name for *Ornithogalum thyrsoides*, a bulbous plant valued for its long-lasting white flowers.

Chinchilla de Monte Aragón, Sp. tn in the prov. of Albacete, with a striking 15th-cent. church and an anct. castle. There are lead mines near by. Pop. 7450.

Chinchillidae, family of rodent mammals estab. by Bennett, consists of sev. genera of S. Amer. animals allied to the agouti

(q.v.). All the species have long limbs, bushy tails, very soft hair, and resemble squirrels to some degree. *Chinchilla laniger* is the true chinchilla, a little creature with large eyes and ears, and its fur is so much sought after that it is diminishing in numbers. In habit it is gregarious and subterranean, and in disposition it is mild. *Lagidium* is another genus which has its habitat in the higher Andes, and the third genus consists of 1 species, *Viscacia viscacia*, the vizcachas.

Chinchón, Sp. tn in the prov. of Madrid, 25 m. SE. of the cap. Pop. 11,000.

Chinebow, tn in the prov. of Liaoning, China, on the railway from Mukden to Peking, near the Gulf of Liaotung. It is a transport centre. Pop. 190,000 (1951).

Chinde: 1. Riv. of Portuguese E. Africa, mouth of the Zambesi R. which empties into the Indian Ocean.

2. Seaport of Portuguese E. Africa, at the mouth of the C. R., most of the trade of which has now gone to Beira. Sugar, cotton, and sisal are exported. From 1891 until 1922 Great Britain had the right to store foods in transit to Nyasaland duty free. Pop.: Europeans, 472; Indians, 466; natives, 138,000.

Chindwin, or **Kyendwin**: 1. Riv. of Upper Burma. It rises in the Patkoi Mts near the Assam frontier, and flows S. for about 500 m., joining the Irawadi on the r. b. between Mandalay and Pagan. During the rainy season the riv. is navigable for 150 m. from its mouth by light craft only. On 16 Mar. 1944 the Jap. Gen. Mutaguchi's Fifteenth Army crossed the riv. with the intention of reaching Imphal and Kohima before allied reinforcements could arrive and then breaking into the Brahmaputra valley. But the 5th Indian Div. was flown up from Chittagong and 2 brigades were landed at Imphal, where they formed the necessary reserve. The Japanese were heavily defeated at Kohima and Imphal, and the remnants of their 31st and 15th Divs. were driven back across the Chindwin R. by the 33rd Corps. By summer the Allies reached the junction of that riv. with the Irawadi and the advance on Mandalay was begun. See **further** BURMA, SECOND WORLD WAR CAMPAIGNS IN.

2. Name given to 2 dists. in Sagaing, Upper Burma. The upper dist. is mountainous and covered with forest. Area 16,037 sq. m. Cap. Mawlaik. Pop. 210,000. The lower dist. is partly wild and wooded and partly a fertile rice-producing plain. Area 3480 sq. m. The cap. is Monywa. Pop. 428,000.

Chinese Architecture. The early Chinese tribes were cave dwellers, but palaces built with wooden pillars have been discovered in the Great Shang City of the 14th cent. bc. The temples are chiefly of wood, on a tall stone base, and decorated in bright colours with glazed tiles, etc., and the construction is remarkable in that the roof is not supported by the walls, but by a wooden framework. It is, in fact, put on before the panels of the wall are filled in. Wood carving plays an important part in the interior of a Chinese

building. The use of brick and stone has been known to the Chinese since very early times; the latter has been used chiefly for city walls, embankments, bridges, and pagodas. The stone arch was known in unct China and some of the long bridges have 10 or more arches. See p. 410.

Chinese Art. In painting the Chinese long ago attained a degree of excellence reached only by the greatest masters of the art. Chinese art was on a lofty plane cents. before the modern W. nations had learned even the elements of painting. The landscape painting founded by the Sung artists, in which mts figure so conspicuously, is ranked as the greatest school of landscape painting the world has seen, its merit lying in the imaginative portrayal of the elemental and sublime in nature, while its 'visions of storm and peace among abrupt peaks and of plunging torrents,' though often fantastic, are never tame. It is a commonplace that great Chinese artists have no regard for outline as opposed to the spirit of the subject depicted, and Chinese art has languished in later cents. only because popular favour has veered to the productions of the studio artist as opposed to the artist of the *plein air* school. As in poetry so in pictorial art, the Chinese delight in 'suggestion' or leaving something to the imagination of the beholder, and Chinese artists found scope in 'Impressionism' cents. before that term became current in the Eng. language. Time-honoured stories, like that of the fruit painted so realistically by Zeuxis that the birds pecked at it, are paralleled in the literature of Chinese art; and exhibitions of Chinese pictures held in the present cent. show that the amazing stories of the power and originality of Chinese painting are justified. Among notable Sung artists were the Emperor Hui-tsung, famous for his pictures of white falcons, and Li Lung-mien.

Many examples of Tang art are to be seen in the Brit. Museum to-day, mostly dealing with Buddhist subjects. In this, the 'golden age' of Chinese art, 2 schools of painting were founded: the N. by Li Szu-hsun, and the S. by Wang Wei. Robust sternness is the feature of the N., and exquisite refinement of the S. Besides the above painters, the greatest painter of the Tang period was Wu Tao-tzu, the most revered figure in Chinese art, and celebrated as the father of modern Jap. painting. Apparently no paintings of his are extant, but 'The Death of Buddha,' in the Brit. Museum, founded on one of his reputed masterpieces, affords a clue to his powers. Chinese painting in these earlier periods owes much to Chinese poetry, the religion of Taoism, and the Zen form of Buddhism, to all of which influences may be attributed its predominantly symbolic or suggestive spirit.

Shang and Chow bronze vessels are of outstanding merit. Chinese sculptures from the 3rd to 4th cents. are mostly Buddhist statues with strong Indian influence. Sung and Ming lacquer work and porcelain are also known the world

over, the latter being remarkable for the device of coloured glazes and painting beneath the glaze. As regards porcelain, the Ch'ien Lung era was the most prolific in the hist. of Chinese art, and modern W. collections consist largely of specimens of that period. The celebrated imperial potteries of Chingtehchen and Kiukiang, estab. under the experts T'ang kung and

Nien, maintained their reputation until the time of the Tai-ping rebellion in the 19th cent., when they were closed, but there has since been a revival of the art. The Chinese have also excelled in the carving of jade, a light or dark green stone, into vases and other objects for ornamental purposes. See J. C. Ferguson, *Outlines of Chinese Art*, 1920, and *Chinese Painting*, 1927; U. Pope-Hennessy, *Early Chinese Jades*, 1923; A. J. Coop, *Early Chinese Bronzes*, 1924; W. G. Gulland, *Chinese Porcelain*, 1928-1929; L. Binyon, *Paintings in the Far East*, 1934; G. Rowley, *The Principles of Chinese Painting*, 1947; W. Cohn, *Chinese Painting*, 1948.

Chinese Eastern Railway, The, is a railway of about 1100 m. in length, running SE. across the N. part of Manchuria. It enters Manchuria on the W. at Manchuli, and on the E. it joins the Ussuri railway, running to Vladivostok, at Pogranichnaya, or Suifenho. It has a branch running S.

from Harbin and joining the S. Manchuria line at Changchun. The line, which is of the standard Russian gauge of 5 ft., was built in 1898-1903, mainly by Russian and Fr. capital, though the Chinese Gov. had a small holding in its stock. In 1935 the Russian Gov. sold the entire system to the Jap.-controlled gov. of Manchuria, or Manchukuo. It became part of the state system, known as the N. Manchuria Railway. The Hsinking-Harbin section was converted to 4 ft 8½ in. gauge in 1935 and the remainder in 1936. By the Sino-Russian treaty of 1945 the trunk line of the Chinese E. was combined with the S. Manchuria Railway as the Changchun Railway, to be jointly owned and operated by China and the U.S.S.R. for 30 years and then revert to China without compensation. The Sino-Soviet treaty of Feb. 1950 provided for the transfer to China of Soviet rights of co-administration of the Changchun Railway on conclusion of a peace treaty with Japan or not later than 1952.

Chinese Ink, see **INK**.

Chinese Labour Question. The hist. of the C. L. Q., which so agitated the public mind in S. Africa and Great Britain during the first decade of the present cent., may be traced back to the pre-Boer days. The gold-mine owners of the Rand (Transvaal), in giving evidence before a commission appointed by the Boer gov. (1897), had demanded cheaper coloured labour to work their mines. They pointed out that certain low-grade ores could be profitably mined if the gov. would increase the native hut tax and consent to the estab. of locations in order to compel the Kafir to work at reduced wages. They further argued that with an increased supply of native labour more white labour would be employed. On the commission reporting adversely on these suggestions, the mine owners talked of the importation of Asiatic labour and of closing down the mines if their demands were refused. President Kruger replied by passing a law which provided that if the mines were not worked by the mine owners, the gov. would confiscate them and work them itself. Then came the war (1899-1902) in which the Kruger gov. was swept away and the Milner regime estab. One of the first acts of Lord Milner was to double the hut tax. At the close of the war the mine owners reduced native wages from 47s. a month to 27s., with the result that at that time only 42,000 natives were working, as against 90,000 at the beginning of the war. On their raising wages next year to their former level, the natives flocked back until their numbers were the same as before the war. In 1903 Lord Milner appointed a commission to inquire into the adequacy or otherwise of the sources of supply of labour for the mines. This commission reported that an additional 129,000 labourers were necessary, and that Central and S. Africa were unable to meet this demand. In the following year an ordinance was carried in the Transvaal Legislative Council for the introduction of indentured labour 'from outside Africa S. of 12° N. of the equator.' This ordinance,

which received the royal assent, was strenuously opposed by the Liberal party in Great Britain and by the Boers and white labourers in the Transvaal. On the other hand, it was claimed that a petition in favour of Chinese labour was signed by a little over half of the white adult pop. The opinion of Cape Colony may be gauged by the fact that in May 1904 a Bill was passed in the legislature excluding Chinese labour from that

Apart from the C. L. Q., no large number of Chinese have entered the Brit. Empire, though some thousands, lured by the gold-fields, went to Australia and increased the total by the middle of the cent. to about 50,000. Political trouble ensued, and the numbers went down steadily, and by 1930 were less than half what they were, a result chiefly due to the Australian immigration tests. A high head tax excludes them from Canada and

colony. The first shipload of Chinese coolies arrived at Durban on 20 June 1904, and ultimately as many as 60,000 coolies were employed on the Rand. The strong feeling roused in Great Britain against the employment of Chinese labour, freely characterised by opponents as 'Chinese slavery,' was, it is generally conceded, mainly responsible for the overwhelming defeat of the Conservative party at the general election in Jan. 1906. On the granting of a constitution to the Transvaal the Het Volk (or Boer) party obtained a majority in the new chamber, and this party proceeded to redeem its pledge to repatriate the Chinese speedily. Thus 17,000 left in 1907, 28,000 in 1908, and the remainder in 1909.

a poll-tax has the same effect in New Zealand.

Chinese Literature. *Inscriptions on oracle bones and bronzes.* The earliest Chinese writing, found in 1899 in Honan, is inscribed on oracle bones and tortoise-shells from the tombs of Shang kings (14th-12th cents. BC). Excavation of the ant sites has been going on ever since, and over 200,000 fragments or whole pieces of these inscribed bones and shells have been unearthed, of which 500 are in the Brit. Museum. The bones and shells were used to divine the auspiciousness of the future, and subsequent events, including those concerned with the weather, agriculture, harvest, hunting, fishing, warfare, sacrificial ceremonies, royal

excursions, births and deaths of the royal family, and other similar matters, were carefully recorded and inscribed on them, the longest consisting of over a hundred characters or words. On bronze vessels from the early Chou (11th-8th cents. BC) period are inscribed, in verso or prose, historical events in up to 500 words or more. Inscriptions are also found on Ch'in stones from the 8th cent. BC, known as the 'Stone Drums.'

Confucius and Confucian classics. The belief that Confucius (551-479 BC, q.v.) wrote some of the so-called Confucian classics has been proved unauthentic by

W. F. Mansell

LAO-TZŪ AND HIS DISCIPLES

By Huang Shao-ming, 16th century.

modern scholarship, but, as the founder of the first private univ. in anc't China, he collected and publicised many old books and transmitted them to his disciples (who at one time numbered 3000). Hence the name of 'Confucian classics.' Of these the *I Ching* or the *Book of Changes* is a heterogeneous collection of material from different eras. Its earliest part (11th cent. BC) is the Divinatory Classic of 64 hexagrams explained in lyric folk-songs. The 'Ten Wings' or appendices, which are later additions (7th-3rd cents. BC), purported to expound the symbolism of the hexagrams, but are in fact treatises on the genesis of civilisation, cosmology, metaphysics, political philosophy, etc. The *Shih Ching* or *Book of Songs* is an anthology of over 300 folk-songs, odes, and hymns of N. China compiled before Confucius' time; the earliest odes, dealing with the origin of the Chou tribe, can be dated in the 9th cent. BC, and many others treat of love, warfare, agriculture, hunting, feasting, marital fidelity, and official tyranny. These songs are trea-

sured by the Chinese to this day for their simple, lyrical beauty, sometimes robust, at other times plaintive, and for their metaphors and similes, often subtle, yet never obscure. The present version of the 54 documents in the *Shu Ching* or *Book of History*, which was supposed to have been compiled out of 1000 documents by Confucius, is in fact a 3rd-cent. redaction with many apocryphal chapters, e.g. the *Canons of Yao and Shun*. However, some Shang and most of the early Chou documents are authentic recordings in the anc't language, which is only now beginning to be understood with the help of modern archaeology. The documents are mostly gov. proclamations, admonitions, declarations of war, etc., containing many homilies, proverbs, and aphorisms which are still current in Chinese sayings. Of the 3 Classics of Rites, the *Chou Li* or *Rites of the Chou Dynasty* is really a sort of constitution with all the ramifications of governmental depts and their functionaries listed and described in great detail; the last of the 6 books deals with industry and handicrafts. The *I Li* or *Code of Etiquette* describes at length manners and customs in anc't feudal society, including diplomatic punctilio and religious ceremonies. The *Li Chi* or *Record of Rites* is a collection of 46 essays on ceremonies written from the 5th to 1st cents. BC, with interesting stories and illustrative anecdotes. The *Ch'un Chiu* or *Spring and Autumn Annals*, reputed to have been written by Confucius, was the Court Gazette of the state of Lu, of which Confucius was a native. Recording in bare outline the events of 244 years (722-479 BC), this classic is always attached to the *Tso Chuan*, or to one of two other Commentaries, the *Kung-yang Chuan* and the *Ku-liang Chuan*, and in each case the *Annals* together with a *Chuan* is counted one classic; hence with the above mentioned they are Nine Classics. The *Tso Chuan* is not, as has been wrongly believed, a commentary on the *Spring and Autumn Annals*, but a great book in its own right. Covering the years 722-468 BC, it was the first authentic, detailed hist. of 19 Chinese states, great and small, recounting in chronological order wars and diplomacy, court intrigues and love affairs, in a quarter of a million words. Its style is terse and vigorous, often lightened with piquant dialogues that gleam with the grandeur of Gk tragedies. Of the so-called *Four Books*, the first 2, the *Great Learning* and the *Doctrine of the Mean*, are in fact 3 chapters from the *Record of Rites*; the third, the *Analects*, a compendium in 20 books of anecdotes and sayings of Confucius, and dialogues between him and his disciples on philosophy, ethics, and gov. recorded by his disciples shortly after his death, is the most reliable source of information about the sage and his school of thought which shaped the Chinese national character in the past. The last, *Mencius*, a political philosophy of Mencius (372-289 BC), a member of the Confucian school, is remarkable for the writer's Socratic irony and Horatian eloquence in refuting the theories of the

rival schools which, in the preceding cent., had gained ascendancy at the expense of the Confucians.

The 'Hundred Schools of Thought.' Eminent among the 'Hundred Schools of Thought' were the Taoist, the Mohist, the Logicians, and the Legalist. The Taoist school may be represented by 2 books: first, the *Tao Te Ching* or *The Way and Its Power*, which has often been trans. into W. languages (the best trans. is by A. Waley), is a treatise of recondite naturalistic philosophy in verse. Secondly, the *Chuang Tzu*, by Chuang Chou (369-286 BC), who could not tell whether he once dreamed of being transformed into a butterfly or whether it was a butterfly that dreamed of being transformed into a human being, i.e. himself, is perhaps the most beautiful poetry in any prose literature—indeed the language he wielded seems to be inadequate to express the profundity of his thought. The *Mo Tzu* of the Mohist school, founded by Mo Ti (c. 479-381 BC), is in 2 parts: the first part contains popular essays on universal love, pacifism, altruism, frugality, etc.; the second part, the *Mohist Canons*, lays down postulates and propositions in logic and epistemology and deals with such sciences as optics, mechanics, metallurgy, etc. A sect of the Mohists developed into the School of Logicians, whose hair-splitting arguments earned them the sobriquet 'sophists.' Shang Yang (d. 338 BC), the exponent of the Legalists, bequeathed the Chinese his masterpiece the *Book of Lord Shang*, a dissertation on political economy; he put his theories into practice in the state of Ch'in and made her the greatest power of his time. The rational philosopher and master of prose Hsün Ch'ing (339-247 BC), the Aristotle of China, was the first to synthesise and expound Confucian philosophy with insight and penetration in his carefully planned and systematically organised book, the *Hsün Tzu*. Two of Hsün Ch'ing's disciples, Han Fei (d. 233 BC) and Li Ssu (d. 208 BC), however, reverted to the Legalist school. The former's book, *Han Fei Tzu*, is the best work in this school, while the latter, who later became the Premier of the Ch'in Empire, has been remembered for his work in standardising the Chinese script in 221 BC. Lü Pu-wei (d. 235 BC), the actual, if not the legitimate, father of the ruthless First Emperor (Ch'in Shih Hwang-ti), was the editor of the *Lü-Shih Ch'un-chiu*, a symposium of many schools of philosophy in 28 books, pub. in 239 BC.

The poet Chü Yüan and his influence. The greatest poet before the Christian era was Chü Yüan (340-278 BC), b. in the Yangtze valley in the state of Ch'u, a member of the royal house, a secretary to the king and sometime an ambas. to Ch'i, in N. China. His unfettered imagination, variegated similes, passionate expressions, and elegiac style as illustrated in his best works, *The Lament*, *Queries put to Heaven*, and the *Nine Chapters*, are entirely different from the style of the *Book of Songs*; but above all he is best loved for his noble patriotic feeling that permeates every line of his work. His name has become

synonymous with the *Ch'u T'zu* or *Songs of the Ch'u People*, and his work was so loved by the emperors and writers of the Han Dynasty (206 BC-AD 195) that most of them wrote in this 'T'zu-fu' genre, which later developed into 'poetic essays' of prodigious length on such topics as *The Great Man*, *The Imperial Park*, *Mr Nobody* by the romantic poet Szu-ma Hsiang-ju (d. 118 BC); *Lament on the Death of Lady Li* by Emperor Wu (157-87 BC); *The Sweet Fountain* and *The Royal Hunting* by the mystic philosopher Yang Hsiung (53 BC-AD 18); and *The Two Capitals* by the mathematician Chang Heng (AD 78-139). On the other hand, folk-songs of every prov. of the Han Empire were officially collected and encouraged by the *Pao Fu* or the Bureau of Music which was estab. in 133 BC, and ever since lyric and narrative poems of that popular type have been known as *yao-fu* poems. It was this genre that laid the foundation of the later 5-word metres which broke the stylistic bounds of both the *Book of Songs* and the *Songs of the Ch'u People* and opened up new fields for further cultivation.

Historians of the Han Dynasty. The great pride of the four-cent. Han Dynasty, however, is the work on hist., of which Szu-ma Ch'ien's (b. 145 BC) *Shih Chi* or *Historical Record* is the crown of the 26 dynastic histories of China. This 'Herodotus of China', was the son of a Taoist historian, Szu-ma Tan, whose premature death moved the boy to undertake his father's ambitious project of writing a complete hist. of China from the earliest times to his own, a work destined to be the model of subsequent dynastic hist. of all ages. This masterpiece of over one million words is divided into 5 parts: its 12 chapters of *Dynastic Annals* are followed by 10 chapters of *Chronological Tables* synchronising events in different states in anc. China, and 8 *Dissertations* on rites, music, astronomy, irrigation, etc. These are followed by 30 hist. of *Hereditary Houses* of nobles of various states, including the family hist. of 'the uncrowned king' Confucius, and 70 *Associated Biographies* of all sorts of people, not excluding assassins, humorists, or even fortune-tellers. In his funt enchanting style there is unity in variety, and with his powers of characterisation the biographies are as interesting as any of the best modern short stories. The second great work is the *History of the Former Han Dynasty*, another collective work of a learned family, in which the father Pan Piao set out the project, the daughter Pan Chao contributed some chapters, and the son Pan Ku (AD 32-92) executed the main task of 100 chapters (one of which in Dubs' Eng. trans. runs into 500 pages). As a writer Pan is less fluent but more concise than Szu-ma; as an historian he is less imaginative but more scientific and exact. Apart from many political pamphleteers, the sceptical philosopher Wang Ch'ung (d. AD 97) by his revolutionary *Lun Heng* or *Balanced Criticism* helped to undermine the authority of Confucianism that had dominated the thinking *literati* since

136 BC, when 5 chairs of Confucian Classics were created in the Imperial Academy by Emperor Wu. The great etymological dictionary *Shuo-wen Chieh-tse* by Hsu Shen (2nd cent.) remains to this day an indispensable tool for Chinese studies.

Poetry, poetic essays, and parallel prose. The end of the Han Dynasty was marked by the introduction of Buddhism into China and the thriving of individualistic poetry, notably that of the Chien An school founded by Prince Ts'ao Chih (192-232) and his friends. In the following Wei and Chin Dynasties mysticism and metaphysics dominated C. L., including poetry, the best writers of which were the 'Seven Worthies of the Bamboo Grove,' with the great thinker Yuan Chi (210-63) as their leader. When mysticism gave way to the love of nature and freedom there emerged the peasant poet T'ao Ch'ien (365-427), who preferred farming to bowing to a high official. With profound but mellow feelings expressed in plain, simple language, T'ao's poems resemble those of Burns and Wordsworth. Folk-songs in the S. Dynasties (222-588) are mostly charming love ditties and descriptions of natural beauty. After the 3rd cent. poetic essays took a new turn and became shorter and more musical. Luh Chi's *Poetic Essay on Literature*, which was written in 281 when he was 20, is strikingly similar to Pope's *Essay on Criticism*. In prose, undue stress laid on the importance of balanced couplets gave rise to 'parallel prose' in which the 2 lines in each couplet are antithetically balanced, not only in the meaning but also in the tonal value of each word. The first systematic work of literary criticism, the *Wen-hsin Tiao-lung* or *A Literary Mind Carves the Dragon*, in 50 chapters, by Liu Hsieh, a Cantonese monk of the 6th cent., is written in this difficult but sonorous style. Meanwhile thousands of vols. of Buddhist literature were being trans. into Chinese, which, after the destruction of most of the original works in India, has become the chief repository of Buddhist writings in the world.

The Golden Age of Chinese poetry. The T'ang Dynasty (618-907), known as the Golden Age of Chinese poetry, bequeathed to the Chinese the works of 2000 poets, ranging from emperors and scholars to peasants, monks, and courtesans. The 2 most distinguished were Li Po (701-62) the Taoist and Tu Fu (712-70) the Confucian. The T'ang poets benefited by a legacy from their predecessors of many new devices and techniques in prosody as well as a great variety of styles and types of poetry. Li Po, however, was great enough to set aside all his predecessors by creating a new world with his unbridled imagination and bursting vitality. His work is characterised by a fairy-tale beauty unattained by other poets. His friend Tu Fu was versed in every type of poetry, paid meticulous attention to rules of prosody, yet wrote with ease as if there were no rules at all. His loyalty to the sovereign, love of the people, and patriotic feelings compelled him ruthlessly to expose the misrule of the gov. and the misery

of the people. His work has rightly been regarded as 'history written in poetry.' The painter and Buddhist Wang Wei (699-759) belonged to the peasant-poet school and some of his best poems were written before he was 20. The young poet Li Ho (790-816) was a Chinese Keats in his sheer ability to create sensuous beauty. The popular poet Po Chü-i (771-846) advocated a new school of didactic poetry, for the people and of the people. His outspoken criticism of gov. policy in verse was as widely circulated as modern newspapers. Yet his best achievement is to be found in his less didactic work such as the *Everlasting Sorrow* and the *Song of the Guitar* (trans. Giles). Outstanding as romantic poets were Tu Mu (803-52) and Li Shang-yin (813-58), whose pensive love poems move lovers of all ages. The leader of the literary reform movement, Han Yu (769-824), was a great master of prose whose chief concern was 'to get rid of clichés in the parallel prose of the past 8 dynasties.' His friend Liu Tsung-yuan (773-859) excelled in the description of natural scenery. Short stories or romances, often dealing with fairy-tales and with love-stories, showed considerable development in T'ang times.

The Versatile Writers of the Sung Dynasty. In the short-lived Five Dynasties (907-959) and the following Sung Dynasty (960-1279) a new type of verse, the *ts'u* or irregular metres, dominated the realm of the muse. At first these were love-songs, written or improvised to be sung by court girls at entertainments, but when later men of letters took a hand in writing such songs their scope was enlarged to include all subject-matter. As the songs were to be accompanied by music, the prosody was even more rigid than that of T'ang poetry, but this difficult task was eased by the introduction of vernacular expressions and rhymes. Best writers of this genre were Li Yu (937-78), Emperor of the S. T'ang Dynasty, whose love ditties cost him a kingdom; Yen Ch'u (991-1055) and his youngest son Yen Ch'iao, whose improvised songs often reach the height of majestic beauty; Liu Yung (990-1050), who preferred poetry writing to high office and whose poems were 'sung in every place where people drink water from the well'; Su Shih (Tung-p'o, 1036-1101), the most versatile writer of the time, who 'broke all the bounds of irregular metres'; and Chou Pang-yen (1057-1121), the president of the Royal Institute of Music, whose style and technique are considered the best. Hsin Ch'i-shi (1140-1207), a guerrilla leader who fought his way back to S. China from Shantung under the Golden Tartars, founded a new school of irregular metres by raising the lyrics to a height of epic grandeur. Classical poets of this period were Su Shih, Huang T'ing-chien (1045-1105), and their followers, whose refreshingly new styles earned for their works the celebrated designation 'Sung poetry' in contradistinction to 'T'ang poetry.' Among prose writers were the historians Ou-yang Hsiu (1007-70), compiler of

the *New History of the T'ang Dynasty* and *New History of the Five Dynasties*, and Szu-ma Kuang (1019-86) who spent 19 years in writing his *General Mirror Aid for Governing*, which chronicles and discusses events of 1362 years in about a hundred vols. There were also the economist and reformer Wang An-shih (1021-86); the essayists Su Shih, his father Su Hsün (1009-66), and his brother Su Che; and the philosopher and educationist Chu Hsi (1130-1200), whose neo-Confucianism influenced China for nearly 800 years. Vernacular short stories made their first appearance in the 11th and 12th cents., and the texts of the synopses of the story-tellers in the tea-houses later became the prototypes of Chinese historical novels, of which the *Romance of the Three Kingdoms*, rewritten by Lo Kuan-chung, was the most popular. Drama also flourished in S. China under Sung and in the N. under the Golden Tartars.

Drama in the Yuan Dynasty. In the Yuan (Mongol) Dynasty (1277-1367) scholars were looked down upon by their conquerors and men of talent devoted themselves to artistic creation. Poetic plays flourished on the Yuan stages; they were mostly in 4 or 5 acts, composed of narrative songs derived from the irregular metres, but with little dialogue. They were the direct offspring of the 'southern play' from the Sung Dynasty, with themes taken from Chinese hist., popular romances of T'ang and Sung, and occasionally from a Buddhist source but given a Chinese twist: e.g. Chi Chin-hsiang's *The Orphan of the Chao Family*, the best known of these plays in the W., was a famous story from the state of Chin (600 BC) recorded in the *Tao Chuan*; Wang Shih-fu's *The West Chamber* was based on a love-story by the T'ang poet Yuan Cheng; Li Hsing-tao's *The Chalk Circle* was a popular Sung legend. Other eminent authors among the 146 Yuan playwrights were Kuan Han-ch'ing, out of whose 60 odd plays there are 17 extant, and Ma Chih-yuan, whose 13 masterpieces were compared by his contemporary critics to the 'singing of a phoenix in the morning sunshine.' In the Ming Dynasty (1368-1662) there was a revival of the 'southern play' with elaborated plot, more refined verse, and many more acts for each play. *The Story of the Guitler* by Kao Tsé-cheng of the 14th cent., an ethical play in praise of patriotism, filial piety, and wifely forbearance, and *The Peony Pavilion* by T'ang Hsien-tsu (1550-1617), are the best and incidentally the longest of this kind of drama. The tradition of writing long plays was carried on to the early Ch'ing (Manchu) Dynasty (1644-1911), in which K'ung Shang-jen (1648-1718) dramatised the fall of the Ming Dynasty with an intriguing love-story in his *Peach Blossom Fan*, and Hung Sheng (1646-1704) immortalised the tragedy of the T'ang Emperor Ming-Huang and his sweetheart Yang Kuei-fei in his poetic play *The Palace of Eternal Youth* (trans. Yang Hsien-yi).

Novels since the fifteenth century. The 15th-cent. novel *Pilgrimage to the West*,

supposed to be the story of Hsüan Chuang's journey to India in search for Buddhist sutras, by Wu Cheng-en, is a combination of *Pilgrim's Progress* and *Gulliver's Travels* with incisive sarcasm on human frailties (there is an abbreviated trans. by Wailey called *The Monkey*). *The Water Margin* (trans. P. S. Buck), a lengthy novel about the life of 108 Chinese 'Robin Hoods' by Shi Nei-an, is in fact a rewritten text of popular legends once told in the tea-houses. The remarkable social novel *Chin P'ing Mei* is a merciless exposure of the corrupt, erotic life in the decadent 16th cent. by an anonymous author. The greatest among all Chinese novels, however, is *The Red Chamber Dream* (there is an abbreviated trans. by Wang Chi-chien) by Ts'ao Chan (Hsüeh-ch'in, 1715-64), of about 2500 pages, a tragedy of the first magnitude comprising some 400, mostly female, characters; the characterisation is such that any one of them is unmistakably distinct from the others. It gives a panoramic picture of upper class social life in a Peking family, from its zenith of prosperity to its decline, with a passionate but unsuccessful love-story as its central theme. Its perfectly natural and realistic development of plot and psychological analysis of the characters are unrivalled in any literature. A totally different novel, *The Unofficial History of the Literati* (trans. Yang Hsien-yi, *The Scholars*), by Wu Ching-tzu (1701-54), is a most powerful satire on vices of the examination system, concubinage, self-immolation, superstition, and, above all, hypocrisy and vanity. Its style is so realistic that it appears as if the author's sympathies were with the characters he ridicules. Vernacular short stories were written and collected in the 17th cent. by Feng Meng-lung, and the best extant are those in the *Wonderful Tales Ancient and Modern* (a part trans. as *The Courtesan's Jewel Box*). Fairytales in the classical Chinese language have been written ever since the 6th cent., but the best and the most voluminous writer of these was P'u Sung-ling (1640-1715), whose *Liao-chai Chih-i* contains 431 stories (164 of which were trans. by Giles in *Strange Stories from a Chinese Studio*), and in 1936 another 56 by him were discovered. His vernacular novel *Hsing-shih Yin-yuan*, or *Strange Marriages*, is less popular.

Researches in classics under foreign rule. In the early Ch'ing Dynasty the number of Chinese scholars executed on account of their hostile literary works far exceeded those killed by the First Emperor in 212 BC, and the collecting of books to furnish the 79,339 vols. of the *Szu-k'u Ch'uan-shu* or *Complete Collection of the Four Treasures* by Emperor Chien-lung, 1762, had served the double purpose of eliminating books containing Chinese nationalist elements directed against the Manchus, and encouraging researches in ancient classics so that the minds of Chinese scholars could be turned away from dangerous political thoughts. As a result the Chinese sought refuge in researches in philology, phonetics, textual criticism, historiography,

geography, etc., which laid the foundation of truly scientific scholarship in classical studies. Their original works numbered over 3000 vols. in the 2 collections of *Ching Chieh* or *Studies in Classics* up to the end of the last cent. Local hist. of every one of the more than 2000 cos. in the whole country was compiled and revised from time to time, in addition to prefectural (*fu*) and prov. hist. Since the 4th May Movement in 1919 a very considerable amount of new literature in the vernacular has been produced. The best and most beloved writer was Lu Hsün (Chou Shu-jen, 1880-1936), the Chinese Gorky, whose *True Story of Ah Q* and other stories have been trans. into most W. languages.

Acton (trans. and ed.), *Famous Chinese Plays*, 1937; Feng Yu-lan, *A History of Chinese Philosophy* (2 vols.) (trans. D. Bodde), 1937-53; P. S. Buck, *The Chinese Novel*, 1939; W. Eberhard, *Chinese Fairy Tales and Folk Tales*, 1941; E. R. Hughes, *Chinese Philosophy in Classical Times*, 1942; Lin Yu-tang, *The Wisdom of China*, 1949; Mao Tun (editor), *Chinese Literature* (quarterly), 1953 et seq.

Chinese Pottery. It is to China that we owe sev. of the distinctive features of artistic pottery. The development of ceramics seems to have followed the same lines as elsewhere in the early stages, though the Chinese appear to have been the first to discover that powdered felspathic rock mixed with lime could give a high glaze. The earliest crude porcelain has been discovered from tombs of the 1st cent. Chinese potters favoured high temp. firing, which resulted in a highly vitrified stoneware. The discovery of the properties of kaolin appears to have led to the production of the thin translucent ware known as porcelain about AD 1000. Owing to the high temp. of firing, the Chinese were restricted to such colours as cobalt blue and a blood-red copper pigment in their decorative schemes. Afterwards other colours were painted after the blue and red had been fixed and the ware fired again at a lower

temp. The influence of Chinese porcelain cannot be over-estimated. *See also* POTTERY.

Chinese White, condensed form of the pigment known as zinc white. This is an oxide of zinc (ZnO) which is manuf. by combining vaporised metallic zinc with air, when the pigment is deposited as a white powder. C. W. is not liable to chemical or physical change, and is practically inert with regard to other pigments. It forms an excellent opaque water-colour, but lacks toughness with oil.

Chinese Wood Oil, *see* TUNG OIL.

Chingcheng, or Tsinchow, tn of Shan-tung prov. in N. China, 80 m. NE. of Tsinan. The former cap. of the prov. and a centre of the silk trade.

Chingchou, tn of Hupeh prov., China, near Shashi.

Chingford, suburb of London in Essex, England, situated between the R. Lea and Epping Forest, 10 m. from London. Pop. 49,000.

Chingleput, tn in Madras state, India, 35 m. S. of Madras. It has a fine Hindu Fort, built about AD 1565, which was the scene of fighting between the British and French in the time of Clive (1751-2), and later between the British and Hyder Ali.

Chingola, tn of N. Rhodesia, on the Copperbelt, estab. 1940 around the Nchanga copper-mine. Pop.: Europeans, 4000; Africans, 30,000.

Chingsha, or Kinschakiang (riv. of golden sand), Chinese name for the upper course of the Yangtze-kiang, rising in the mts of the Kunlun system, dividing the prov. of Sikang. It is separated by mts from the R.s Hwang Ho and Mekong.

Chingtehchen, or Fuliang, tn of China in the prov. of Kiangsi, on the R. Ch'ang. Famed for its porcelain, which was made here before AD 1000, the industry declined from 1920 onwards, and has been revived only since 1951. The Kaoling hills in the dist. have given the name to kaolin (q.v.) or china clay, used in the manuf. of porcelain. Pop. 600,000.

Chingtzukuan, tn of Honan, China, on the T'ang R., of considerable commercial importance, being at the head of winter navigation on the riv. and on the Hankow to Sianfu trade route.

Chin-India, *see* IND-CHINA.

Chinkiang, *see* CHÜANCHOW.

Chinlin Mountains, branch of the Kunlun Mts in China, dividing the Wei and Han R.s in their upper courses. Its highest peaks are in the Tapishan and Kwangtangshan, both upwards of 12,000 ft high. This range has sev. important passes, of which the chief are those connecting Sian and Shangchow with Lunchow and Fengsiang with Kuang-yuan.

Chinnampo, port in Korea, 40 m. from Pyongyang, has a pop. of 30,000. Rice, beans, wheat, cow-hides, and timber are exported.

Chino-Japanese War (1894-5), *see* SINO-JAPANESE WAR.

Chinon, Fr. tn, cap. of an arron., in the dept. of Indre-et-Loire, on the Vienne. Clovis I (q.v.) took it from the Visigoths.

In the Middle Ages it belonged to the Plantagenets (q.v.), but was lost to Philip II of France (q.v.) by Henry II of England who d. here. On a hill above the tn are the ruins of an immense stronghold, which is really 3 castles in 1. One of these castles was built by Henry II, and in another Joan of Arc (q.v.) informed the Dauphin of her mission. There are 3 remarkable churches, one of which is partly 11th cent. Rabelais (q.v.) was b. here. Pop. 6100.

Chinook, name applied to a warm SW. wind which blows from the Pacific over S. Brit. Columbia. It is a local wind similar to the *Föhn* of the Alpine valleys and is due to a cyclone passing northwards. The name was first applied because this wind blew from the neighbouring C. camp over Fort George (Astoria), at the mouth of the Columbia R. Under its influence, the snow melts with astonishing rapidity, and the weather soon becomes springlike. It is felt as a cool wind in summer.

Chinooks, aboriginal tribe of Amer. Indians living in the extreme NW. of the U.S.A. The tribe is now nearly extinct. The C. were formerly great traders, bartering with the interior tribes the articles they obtained from the white skippers. The useful 'Chinook jargon' came into being as a means of communication rendered necessary by this commerce.

Chinquapin, or *Castanea pumila*, Amer. species of *Fagaceae* closely allied to the chestnut. The plant is of shrubby habit, and the nuts are edible.

Chinsura, formerly a tn in W. Bengal state, India, now forming one municipality with Hugli, 24 m. from Calcutta. It is the seat of Hugli College. From 1656 to 1824 the chief Dutch settlement in Bengal, ceded to the English with other places in exchange for possessions in Sumatra Is.

Chintz (Hindu *chint*; Bengali *ch*, from Sanskrit *chitra*, spotted, variegated), originally the name of pieces of printed calico or cotton fabric from India, each piece being a 'chint.' The name was later applied to a highly glazed, printed calico of home manuf., with a many-coloured pattern of flowers or birds on a light background. C. is used for curtains, furniture coverings, etc. Dust does not adhere to its calendered surface. See also CRETONNE.

Chinwangtao, modern treaty port of China on the Gulf of Chihli. The port, which is ice free, has a tidy and busy appearance. In recent years C. has become an important port for Manchurian products, especially soya-beans. Some 11,000 persons are employed by the port administration. Pop. 20,000.

Chiococca, genus of Rubiaceae which consists of seven evergreen shrubs of tropical America. The root of sev. of these plants has emetic properties, and *C. angustifolia* is used by the natives as a remedy for snake-bites. *C. racemosa* is the fragrant Snowberry.

Chioggia (anc. Fossa Clodia; later Clugia), It. tn, in Veneto (q.v.), built on an is. at the S. end of the Venetian lagoon,

15 m. SSW. of Venice (q.v.). Near the tn, in 1379, the Venetians decisively defeated the Genoese fleet. It is connected with the mainland by a bridge, and is intersected by 3 canals. There are many curious old buildings, including sev. fine churches. The cathedral dates from the 17th cent. C. is a busy fishing port, and has manufs. of lace, sails, candles, and bricks. Pop. 47,000.

Chionea, genus of Diptera in the family Tipulidae, has sev. peculiar features, and the species are destitute of wings. *C. araneoides* has been found in the woods of Sweden and the mts of Austria when both were covered with snow, the insect showing itself only in cold weather.

Chios, Gk is. and port in the Aegean Sea, 8 m. off the W. coast of Asia Minor at the entrance to the Gulf of Smyrna. It is 32 m. long, varies in breadth from 8 to 15 m. and has an area of 320 sq. m. Pop. 66,800. The scenery is very striking. Grapes, oranges and lemons, figs, olives, aniseed, and tobacco are grown. Mastic or gum resin is a noted product. C. was the home of the school of epic poets called Homeridae, whose task it was to hand down the Homeric text. Voliso (formerly Bolissus), the tn in which these poets lived, is still extant. C. is famed for its sculptors and the long succession of Chian sculptors in marble testifies to the fame of Chian art in the 7th to 6th cents. BC. Six m. N. of the tn of C. is a curious monument of antiquity called 'the school of Homer'; it is an anct. sanctuary and altar built to the goddess Cybele, whose statue, with 2 lions, is chiselled in the rock. At Cape Phanae, the S. extremity of the is., is a harbour and the remains of a temple of Apollo. C., the cap. of the is., is on the E. coast. It has a harbour, a cathedral, and a 13th-cent. castle. It is one of the busiest ports of the Gk is. Pop. 24,400.

This hist. of C. is most obscure and the early relations of the is. with other states conjectural. It was settled by Ionian colonists about the end of the Bronze Age. The Chians, however, were allies of Miletus and hostile to the Phocaeo-Samian alliance, to which the neighbouring Erythrae belonged. The Chians took part in the Ionian rebellion against the Persians (500-495 BC) and supplied 100 ships. After the Persian victory at the battle of Lade, C. was unmercifully treated, the tns and temples razed and many inhab. sent into slavery. After the battle of Mycale (479 BC) the is. became free with a democratic form of gov., in place of the tyranny. C. was the strongest state after Athens in the Delian confederacy and it was an ally, on an equal footing, of the Athenian empire, tribute-free but supplying ships in time of war. Later the Chians joined the Lacedaemonians but, though their fleet was defeated at Bolissus and in 2 other battles, the Athenians could not conquer the is. In the Mithridatic wars C. leaned to alliance with Rome but, following defeat, a large number of the Chians were carried to slavery in Pontus. C. had, however, many cents. of peace and prosperity under both Rom. and Byzantine

rule. A Genoese chartered company held the is. from the 14th cent. to 1568 when the Turks took it and, except for a brief occupation by the Venetians in 1694, it remained in Turkish possession until the First World War when it became a Gk is. Under the Turks C. was almost wholly self-governing but in 1822 a revolt was punished by a savage massacre. In 1881 the is. was devastated by an earthquake, in which some 5000 people perished. The Chians are traditionally republican in politics. It was in C. in 1922 that the revolt began which led to the fall of King Constantine.

Chipmunk, or *Tamias striatus*, species of ground squirrel common to N. America, and belongs to the family Sciuridae. It is a pretty creature, differing from the common squirrel chiefly in having large cheek-pouches and a shorter tail. Its diet is strictly vegetarian.

Chippendale, Thomas (c. 1718-79), famous cabinet-maker and upholsterer of the 18th cent. He came to London from Worcester with his father, a well-known cabinet-maker and wood-carver, and ultimately estab. himself with his factory in St Martin's Lane. C.'s work is characterised by solidity without heaviness; his ribbon-backed chairs are perhaps his most successful work, and next to these his settees of 2 or 3 conjoined chairs. His designs were influenced by the architect, Robert Adam, and by a varied taste for Chinese, Gothic, and Fr. patterns, but in adapting them he showed the talent of an artist. He pub. *The Gentleman and Cabinet Makers' Director*, containing his own designs and descriptions, and had a host of imitators. See R. W. Symonds, *Chippendale Furniture Designs*, 1948.

Chippenhams, tn in Wilt, England, the point of intersection of 4 'A' roads, 12½ m. from Bath and 22 m. from Bristol. The R. Avon is crossed here by a bridge having 21 arches. The tn has weekly corn and cattle markets, the latter in modern premises. There is also a general goods market held every Friday. Railway brakes and signals, also rectifiers, are manuf. here and it has bacon-curing factories, a tannery, and milk-processing plants. It used to be a centre for the making of broadcloth. It is stated that Ludovic Muggleton, the founder of the Muggletonians, was b. here. The tn is of historical interest, being formerly occupied by the Saxon kings in Wessex, and King Alfred was forced to flee from the tn when surprised by the Danes. Sev. battles were fought in the neighbourhood during the Great Rebellion. Pop. 15,000.

Chippewayans, numerous tribe of Amer. Indians of the Algonquian linguistic stock, now settled in U.S.A. and Canada in the region of the Great Lakes. They are also called Ojibwa. They number about 35,000, of whom about half are in Canada. They fish, hunt, gather wild rice and cranberries, manuf. maple sugar, weave baskets and mats, and prepare birch bark for canoes, etc. Most of the stories quoted in Longfellow's *Hiawatha* are from the C.

Chipping Campden, mrkt tn in Glos.,

England, 9 m. from Evesham, formerly a thriving centre of the woollen industry. In 1933 land was bought by the Pilgrim Trust to preserve the surroundings of the fine Perpendicular church and of Old Campden House. Pop. 1800.

Chipping Norton, mrkt tn and municipal bor. (charter of James I) of Oxon., England, 18 m. N. of Oxford. C. has a fine Gothic church, almshouses (1640), a 16th-cent. Guildhall, and other buildings of architectural and historic interest. Near by are the Rollright Stones (see ROLLRIGHT, GREAT AND LITTLE). Tweed is manuf.; there is a brewing industry and an agric. trade. Pop. 3900.

Chipping Sodbury, small mrkt tn of Glos., England, 11 m. NE. of Bristol and administrative centre of the rural dist. of Sodbury. Pop. (tn) 1800; (rural dist.) 37,850.

Chipping Wycombe, see WYCOMBE.

Chiquichiqui Palm, or *Leopoldinia piassaba*, Brazilian palm noted for the good fibre obtained from its bast. The piassaba fibre is used in brush-making and the leaves in thatching.

Chiquimula: 1. E. dept of Guatemala, largely agric., with stock-raising and sugarcane, coffee, tobacco, etc. Area 917 sq. m.; pop. 112,300.

2. Cap. of above, colonial city, 65 m. from Guatemala on the Salvador branch of International Railways. The ruins of C. Antigua, destroyed by earthquake in 1773, are near. It has an active agric. trade. Pop. 8850.

3. Isthmus of Guatemala on Caribbean Sea, between the Motagua and the Dulce on Honduras Bay.

Chiquinquira, city of Boyacá dept, Colombia, 91 m. from Bogotá on W. bank of Suárez R.; altitude 8365 ft. Noted for its miraculous picture of Our Lady of C., annually visited by thousands of pilgrims. Every seventh year there is a special public celebration. It has an airport and is a commercial centre, marketing coffee and cattle. Pop. 7000.

Chiquitos, group of Amer. Indian tribes dwelling in Bolivia. They are well built, powerful, and of middle height, with bronze complexions. They are hospitable, kindly, cheerful, and fond of music and dancing. They live in vils. founded by Jesuit missionaries, whom they willingly received in 1691, and who rapidly converted and civilised them. Since the expulsion of the Jesuits in 1767 they have degenerated considerably. They number about 20,000, and live in adobe houses thatched with grass; they are principally engaged in weaving ponchos (a kind of blanket cloak) and hammocks, manufacturing copper boilers for sugar making, and straw hats.

Chira, or **Cheera**, tn of Sinkiang, China, 50 m. E. of Khotan. The Gobi Desert skirts it about 3 m. to the N. Pop. about 40,000.

Chirata, *Suertia* (synonym *Ophelia chirata*, an annual of the Gentianaceae, grown in N. India; gathered and dried for its bitter, stimulant, and tonic properties, due to content of chiratin, the active bitter principle, and ophelic acid.

Chirchik, in NE. of Tashkent in Uzbek S.S.R. of Soviet Union. It is a centre of the chemical industry and has a large hydro-electric plant. Pop. 60,000.

Chiriqui, prov., riv., lagoon, and archipelago of Central America, in W. Panama. The riv. flows into the Gulf of C. on the Pacific; it is not navigable, and shares a delta with the David R. The lagoon is an inlet of the Caribbean Sea separated from it by the archipelago. It has 3 entrances. Boca del Drago, del Toro (on each side of Isla del Drago) in NW. Boca del Tigre on E., and is navigable for the largest ships. It extends 90 m. along the coast, and 40 m. inland. The prov. has lofty volcanic peaks (C., 11,410 ft) and a fertile soil. Tobacco, sugarcane, and bananas are grown. Cap., David. Area 3893 sq. m.; pop. about 137,400 (20 per cent Indian).

Chirk, par. and vil. in Denbighshire, 9 m. from Wrexham, on the W. Region railway. Has a famous castle, the home of the Myddelton family. The original castle was built in the 11th cent., the later, a 14th-cent. building, being restored in the 17th cent. In the vicinity are collieries. Pop. 3100.

Chiromancy, see PALMISTRY.

Chirozo, vil. and trading-port of Nyasaland Protectorate, at confluence of R. Shire and Ruo, 55 m. from Blantyre. The Shire Highlands railway here crosses the Shire.

Chiromya Madagascariensis, see AYE-AYE.

Chiron one of the centaurs (q.v.), son of Cronos by the sea-nymph Philyra. Instructed by Apollo and Artemis in hunting, medicine, music, gymnastic, and prophecy, he taught these arts to the most famous heroes of mythology. Accidentally wounded with a poisoned arrow by Heracles, he renounced his immortality in favour of Prometheus, and was placed by Zeus among the stars as Sagittarius.

Chironectes, water opossum or Yapock, genus of marsupials, is represented by one species which inhabits S. and Central America. It is about the size of a rat, has webbed hind feet, and feeds upon fish, water insects, and crustaceans.

Chironomus, chief genus of the midge and gnat family or Chironomidae, contains over 200 Brit. species. The perfect fly is 2-winged, and the blood-red larva is often called a blood-worm by anglers, who use it when fishing. It dwells in mud and forms food for birds and fishes. The swarms of little grey flies which dance actively above water on summer evenings belong to this genus.

Chiroptera, see BAT.

Chirotes Canaliculatus, worm-like lizard of the family Amphisbaenidae, forms in itself a genus, and bears the distinction, wanting in all its relations, of possessing 2 small anterior limbs each with 2 toes. The C. is to be found in Mexico, and in length it varies from about 8 in. to 1 ft.

Chirpan, or Tehirpan, mkt tn of Bulgaria, in Stara Zagora (q.v.) prov., 23 m. SW. of Stara Zagora. Pop. 13,600.

Chiru (*Pantholops hodgsoni*), Tibetan species of antelope. The animal is pale

fawn in colour with coarse hair; the male alone has horns, and these are long, straight, ringed, and gazelle-like. It is nearly 3 ft in height, and is so swift and alert that great difficulty is experienced in its capture.

Chisel (M.E. *chisel* or *chesil*, from O.F. *ciel*), cutting tool with the blade at one end, driven with a thrusting action by hand or hammer. C.s differ widely in shape and purpose. The *cold C.* is used for cutting unheated metal and stone; it is formed of highly tempered steel, and is driven by a hammer. Stonemasons' C.s are bevelled on both sides and vary considerably in shape; the *boasting C.* is used for roughly dressing the surfaces of stones. Carpenters' C.s are driven by hand or by blows from a mallet. The ordinary implement is wooden-handled, and the blade is bevelled on one side only, the bevelled face meeting the flat side at an angle of about 20 degrees. The *carving C.* is one of the most delicate of these instruments. It is bevelled on both sides, and the 2 faces meet at an extremely acute angle, that it may lightly cut the wood without crushing it out of shape. The *spoon C.* is a bent instrument, bevelled on both sides, used by sculptors. Among other varieties may be named the dental C., the turning C., the mortise C., and the ripping C. Certain C.s, with semicircular blades used for gouging, are generally known as 'gouges'.

Chishima (Thousand Isles), Jap. name of the Kurile Is. (q.v.).

Chisholm, Alexander (c. 1792-1847), Scottish painter, early apprenticed to a weaver, went to Edinburgh about 1812, becoming teacher at the Royal Scottish Academy. He moved to London, 1818, exhibiting at the Royal Academy and the Water Colour Society. His main works were anecdotal and illustrative, e.g. 'Boys with a Burning Glass' 1822, and 'Shakespeare before Sir Thomas Lucy', 1834.

Chisholm, Hugh (1866-1924), editor, b. London, grandson of Henry C., private sec. to Lord Grenville, the Prime Minister. He was educ. at Felsted and Corpus Christi, Oxford, and was called to the Bar in 1892, but was already in journalism—as assistant editor of the *St James's Gazette*, of which he became editor in 1897. In 1900 he was engaged as joint editor, with Sir Donald Mackenzie Wallace and President Hadley of Yale, of the supplementary vols. of the *Ency. Brit.*, constituting the tenth ed. In 1903 he became editor-in-chief of the eleventh ed., and he also ed. the twelfth. From 1914 till March 1920 he was financial editor of *The Times*, resigning to edit the additional post-war vols. of the *Encyclopaedia*.

Chisinau, see KISHINEV.

Chislehurst forms, with Sidcup, an

CHISELS

urban dist. of Kent, England, 13 m. SE. of London by rail. It is delightfully situated on a common. At Camden Place, in the vicinity, Napoleon III. d. in 1873, and the Empress Eugénie lived here for some years with the Prince Imperial, to whose memory a cross has been erected on the common. There is a chain of interesting subterranean caves whose origin and use have not been fixed with certainty, but they are believed to be sanctuaries and hiding-places. Pop. 85,290.

Chistopol', tn in the Tatar Autonomous Rep. (q.v.), on the Kama, 70 m. SE. of Kazan'. It is the centre of the Lower Kama agric. area. Pop. (1931) 15,500 (1901, 22,000; 1926, 17,500). It has been a town since 1781. Before 1917 there was a flourishing grain trade. Cap. of C. Oblast within Tatar Rep. 1932-3 (abolished).

Chiswick, Middx, suburb of London, on the N. bank of the Thames, 7 m. from St. Paul's. The name means 'cheese farm.' Since 1932 it has been joined with, and is the administrative centre of, the bor. of Brentford (q.v.). For long a riverside vill., its N. part, lying on the Great W. Road was rapidly developed in the later 18th cent. C. House, a remarkable Palladian villa, was designed by the 3rd Earl of Burlington for himself, c. 1725-7, the interior being decorated by Wm. Kent. Hogarth's house, in which he lived from 1749 until his death in 1764, is now a museum of the painter's relics. Walpole House is probably the original of Miss Pinkerton's Academy in Thackeray's *Vanity Fair*. Charles Whittingham's famous C. Press d. here from 1816 to 1852. At Turnham Green, N. of the old parish, Charles I.'s forces turned back after capturing Brentford (1642). In the par. churchyard are the graves of Hogarth and Whistler (qq.v.). Industries include the manuf. of polishes and cosmetics, and light engineering. Pop. (with Brentford), 59,100.

Chita, tn of Boyacá dept, Colombia, 74 m. from Tunja, 150 from Bogotá. On W. of E. Cordillera at a height of 9859 ft, it produces wheat, potatoes, and maize. It has a salt mine and springs. Pop. 1000.

Chita: 1. Oblast in SE. Siberia, E. of Lake Baykal, a mountainous region largely covered with coniferous forests, with a continental climate (little precipitation, very severe winters). It has large deposits of gold, tin, other non-ferrous metals, iron, and coal. C. has dairy cattle and sheep breeding, spring grain growing, mining, engineering, and food industries. It is an area of banishment and labour camps. Area 168,200 sq. m.; pop. (1956) 1,009,000, mostly Russian (since 17th cent.), also Buryat and Evenki.

2. Cap., economic and cultural centre of the above, on the Trans-Siberian (q.v.). It has locomotive works, sawmills, and sheepskin and leather industries. It was a small Cossack fort. tn in the 18th cent., a place of banishment of Decembrists (q.v.) in 1827, and from 1851 the cap. of Transbaikalia and the seat of Nerehinsk

(q.v.) Mining Administration. From 1918 to 1920 it was the H.Q. of a White army, supported by the Japanese, and from 1920 to 1922 the cap. of the Far E. Rep. (q.v.). Pop. (1956) 162,000 (1897, 11,500; 1917, 44,000; 1939, 102,500).

Chita (animal), see CHEETAH.

Chitambo, vil. of N. Rhodesia, situated about 10 m. to the SE. of the S. shore of Lake Bangweulu. It is noted as the place where Livingstone d. in May 1873.

Chitin, skeletal substance found in all arthropods, forming most of their hard parts, and also in some other animals, e.g. the brachiopod *Lingula anatina*. It is a white, amorphous substance containing nitrogen, yields glucosamide in acids, and is insoluble in alkalis.

Chitonidae, family of molluscs, in the class Amphineura, consists of marine animals ranging in size from half an inch to half a foot: some are littoral and others have been dredged from greater depths. All the species are bilaterally symmetrical, have 8 shell-plates embedded partially or entirely in the mantle, are covered with spicules, have an anterior mouth and a median posterior anus. They live on vegetable matter, and in habit are like limpets; they usually attach themselves to rocks, but can crawl by means of their long foot, and are capable of rolling themselves up.

Chitor, tn in Rajasthan, in the former state of Udaipur. The fortress Chitorgarh is famous for its fanatical defence against Muslim invaders. Three times in its hist. the ruling prince led the defenders of the fort to total extermination while the women immolated themselves in sacrificial fire.

Chitral, state formerly constituting an agency of the NW. Frontier of India, now administered as an agency by the Gov. of Pakistan. The state has an area of about 4500 sq. m., and a pop. of 60,000. In 1885 the Lockhart mission visited C., and in 1889, and again in 1891, the Brit. Gov. agreed to pay the reigning *mehar* a subsidy on condition that he accepted its advice as to foreign policy and defence. From 1895 to 1947 Great Britain exercised a protectorship over the state, and maintained a small force there, as it was an important Brit. outpost. The region is fertile and the climate cold.

Chittagong, tn in E. Bengal, Pakistan. It was originally in the Hindu kingdom of Tippera, but was captured by Moguls in 1688. C. has long been a useful port of call for coastal shipping and proved a valuable base for operations against the Japanese in Burma in 1943-4. It is now being rapidly developed as the chief port of E. Pakistan.

Chittagong Wood, large tropical tree, *Chickrassia tabularis*, family Meliaceae, also known as Indian red-wood, bastard cedar, and white cedar. It is largely used in cabinet making.

Chitty, Joseph (1776-1841), eminent special pleader and writer of *Treatise on Pleading*, 1809, *The Laws of Commerce and Manufactures and the Controls relating thereto*, 1820, and other books on law. His 3 sons, Thomas, Joseph the younger,

and Tompson, were also well-known lawyers and writers.

Chitty, Sir Joseph William (1829-99), son of Thomas C., was for 16 years a very popular judge. He became master of the rolls in 1881, and was promoted to the court of appeal in 1897; he wrote legal text-books.

Chiusa (Lat. *clausa*, shut in): 1. It. tn. in Trentino-Alto Adige (q.v.), 6 m. SW. of Bressanone (q.v.). It lies on a narrow strip of land (altitude 1678 ft) between a cliff and the R. Isarco, and is overlooked by an anct monastery.

2. (Chiusa Solafani) Tn in Sicily (q.v.), 32 m. SSW. of Palermo (q.v.). Pop. 7000.

Chiusi (Etruscan Clusium), It. tn. in Tuscany (q.v.), 37 m. SE. of Siena (q.v.). It stands on a hillside near the lake of C. Anciently, it was one of the cities of the Etruscan Confederation (see ETRURIA), and it was the home of Porsena (q.v.). Near the tn there still exist vestiges of Etruscan fortresses, as well as grottoes or catacombs, which served as tombs and where were found the sun-dried black earthenware vases and other ornaments now in the museums of Florence and C.; the latter museum suffered severe losses during the Second World War. In the Middle Ages the tn was plagued by malaria from surrounding swamps—Dante calls it a 'pestilential pool'—but, as a result of drainage schemes, it is now the centre of a fertile agric. dist. It has a 10th-cent. cathedral (restored, 19th cent.). Pop. (tn) 3000; (com.) 8600.

Chivalry, or the system of knighthood, is closely bound up with the feudal system of Norman times. It has its roots, however, in Germanic times, as Tacitus shows in his account of this race. C. became further developed in the 11th cent., and the order of knighthood involved many duties and responsibilities. The king himself had to train for knighthood when he had to serve first as page, then as esquire, before being presented with the golden spurs which were one of the symbols of knighthood. Before a knight was admitted into his order, a vigil or night-watch was held by him in a chapel where he gave himself up to solemn meditation before assuming his new duties and privileges. C. was eminently social in its relations to feudalism, and assumed a deep spiritual significance in its relations to the crusade movement where the knight had to perform military service for the cause of Christianity against the infidel in Palestine. The favourite sport of C. was the tournament or joust, in which the knight sought to win his lady's favour. A tournament would occupy some 2 or 3 days. There would be a trial of combat between 2 knights, often with lances, and the victor, besides winning the armour and horses of the vanquished, would be permitted to name some lady who would preside over the remaining sports, and who was called the Queen of Love and Beauty. The idea of a love both spiritual and chivalrous became associated with the word C. in the Middle Ages. Here the love of a lady

implied a deep and reverent attachment to the whole of womanhood; at the same time one woman could be the particular object of the knight's thoughts, when the relationship was purely platonic. C. under these conditions gave rise to a vast library of literature, in which all kinds of romances, adventures, and poems were written. See also KNIGHTHOOD. See C. S. Lewis, *The Allegory of Love*, 1936.

Chivalry, Court of, military court estab. under Edward III, regulated by Richard II, 1390, of which the earl marshal and lord high constable were joint judges. Its function is to determine questions relating to armorial bearings. It tried no cases from 1937 until 1955 when it upheld the Manchester Corporation's claim that a certain theatre should not display the civic coat of arms. The Lord Chief Justice who sat with the earl marshal as his surrogate (q.v.) delivered judgment in which he held that the C. of C. was not obsolete. See Sir W. Blackstone, *Commentaries on the Laws of England*, 1765-8, and H. J. Stephen, *Commentaries on the Laws of England*, ed. of 1883.

Chivasso, It. tn., in Piedmont (q.v.) on the Po (q.v.). It is an important mkt and commercial tn, and has engineering and textile manufs. There are sulphur springs near by. Pop. 12,000.

Chive, Clive, or *Allium schoenoprasum*, a liliaceous plant related to such well-known plants in culinary use as the leek, onion, and garlic. Like them, it grows in Britain, and the leaves are considered to be edible, their chief use being to flavour soups and stews. The C.s grow from bulbs, the leaves are long and narrow, and the flowers are bright purple or pinky in colour.

Chivilcoy, tn and cap. of C. dist., Buenos Aires prov., Argentine Rep., situated 95 m. WSW. of Buenos Aires. It is an agric. centre, and has dairying, flour-milling, meat-packing, and other industries. Pop. 23,000.

Chizerots, or Burins, name given in France to the debris of one of those despised races known under the general name of Cagots (q.v.). The C. are found in sev. of the coms. of Bourg, in the dept of Ain, being mostly cattle-dealers and butchers. Opinion is divided as to their origin, but they are said to be of Goth or Saracen blood, though it is possible that they really originated as a leper colony. In the Middle Ages they were the object of persecution and restrictions. Only with the Fr. Revolution were they allowed ordinary civil rights. See F. Michel, *Histoires des races maudites de la France et de l'Espagne*, 1947.

Chkalov (until 1938 Orenburg): 1. Oblast in Russia, S. of the Urals, on the border of Europe and Asia, largely fertile, level steppe; in the E. it includes the southernmost part of the Ural Mts. It has a dry continental climate. There are large iron ore, nickel, copper, and other non-ferrous metals, oil, and coal deposits. Spring wheat is grown, and cattle and sheep are bred for meat and milk. There are also engineering, metallurgical, oil refining, food, and other industries. The

prin. tns are C. and Orsk. Area 47,400 sq. m.; pop. (1956) 1,776,000, mostly Russian. Renamed Orenburg in 1957.

2. Cap., economic and cultural centre of the above, on the R. Ural. It has extensive engineering, flour, meat, leather, and clothing industries, and is an important transportation centre. C. was founded in 1735 (on the site of Orsk, transferred in 1743 to present site) as a fortress and centre of the Orenburg Fortified Line along the R. Ural, manned by Cossacks. Since 1744 it has been administrative centre of the S. Urals and the adjoining steppe areas, the main point of a large barter trade with the Kazakhs (q.v.), and the base of Russian advance into Central Asia. In 1918-19 it was a centre of anti-Bolshevism, and in 1920-4 cap. of the Kirghiz (Kazakh) Autonomous Rep. Pop. (1956) 226,000 (1897, 73,000; 1939, 173,000). Renamed Orenburg in 1957.

Chladni, Ernst Florens Friedrich (1756-1827). Ger. philosopher, founder of the science of acoustics. He was b. at Wittenberg, became doctor of laws and prof. of jurisprudence at Leipzig, but after some time abandoned law and gave himself up to the study of natural science, investigating chiefly the laws of sound. During the years 1802-12 he travelled and lectured with great success in Germany, Holland, Italy, Russia, and Denmark. Among his writings are treatises on acoustics and meteorites, of which he had a collection. See his life by Melde, 1866.

Chlaenaceae, small family of dicotyledonous trees or shrubs of no known use, native to Madagascar.

Chlaenius, genus of Carabidae, belongs to the Coleoptera. There are many species dwelling in Europe, Africa, Asia, and N. America; *C. sericeus* and *C. tomentosus*, 2 medium-sized purple or greeny-bronze beetles, are found in the U.S.A.

CHLAMYDOSAURUS KINGI: FRILLED LIZARD

Chlamydosaurus Kingi, or Frilled Lizard of Australia, represents a genus of the family Agamidae. It is noted for the

expanse of skin, in the shape of 2 large disks, which forms an ample frill to the sides of the neck and throat, and can be unfolded when the lizard is angry and folded again at will. In length it is about 3 ft. and when running it presents a curious spectacle, for it accomplishes the feat with its fore limbs in the air. The creature is allied to the iguana and in habit is arboreal. The general colour is yellowish-brown variegated with black.

Chlamyphorus, or Pichiologo, edentate quadruped of the armadillo family, or Dasypodidae. The species, of which only two are in existence, are small animals covered over with 4-sided, horny plates which are thin in the front and strong in the hinder region. The external ears are very small, and the small eyes are buried in long silky hair; under the bony plates and over the whole body the straw-coloured hair also prevails. The limbs are short and there are 5 digits on the fore limbs. *C. truncatus*, a native of Mendoza, Argentina, is the more common species; it is about 5 in. in length, has strong burrowing habits, and is insectivorous in diet.

Chloasma, patchy deposit of yellowish-brown pigment in the skin. C. occurs notably in pregnancy and is also associated with ovarian dysfunction. The cause is obscure but is probably endocrine in origin.

Chlodowesoh, or Chlodwig, see CLOVIS.
Chlopicki (pron. *Chlopitski*), Gregorz Josef (1773-1854), Polish general and patriot. He took part in the first Polish insurrection, then served under Napoleon in the Grande Armée. After the taking of Paris in 1814 he led back to Poland the remnant of the Polish troops and was made general of div. by the Emperor Alexander. After the second Polish insurrection (1830) C. became, though most unwillingly, dictator. He soon resigned in order to re-enter the army and fight as a simple soldier.

Chlora, see BLACKSTONIA.
Chloral (trichloroacetaldehyde, CCl_3CHO), formed by the action of chlorine on anhydrous alcohol. It is an oily, colourless liquid with a penetrating odour. Combined with water it forms C. hydrate (q.v.), while with alkalis it forms chloroform and a formate. It was discovered in 1831 by Liebig. It is used as a drug to produce sleep, when from 15 to 30 grains are sufficient. It is also used to alleviate pain, and to check excitement and convulsions, etc. Since it tends to reduce the heart's action and lower the temp. of the body its use is dangerous. See also HYPNOTICS.

Chloral Hydrate, commonly but erroneously called chloral, is chloral combined with water, and is a white crystalline substance with a pungent smell and a bitter taste. C. H. treated with caustic potash gives pure chloroform. It has anaesthetic properties, and is a drug. See also HYPNOTICS.

Chloramphenicol, see ANTIBIOTICS.
Chloranthaceae, family of tropical or subtropical dicotyledonous plants, consists of herbs, shrubs, and trees having an

aromatic fragrant odour. The hermaphrodite or unisexual flowers are small, sometimes with a sepaloïd perianth, 1 to 3 united stamens, an inferior ovary consisting of a single carpel, and a few seeds with oily endosperm and no perisperm. Chief genus is *Chloranthus*.

Chlorargyrite, see CERARGYRITE.

Chlorate, see CHLORIC ACID.

Cholesterol, alcohol occurring as a constituent of bile, gall-stones, egg-yolk, nervous tissues, and blood. It is a white crystalline substance, soapy to the touch, insoluble in water, but soluble in hot alcohol or chloroform. It is said to neutralise snake-poison.

Chloric Acid (HClO_3) is obtained by decomposing barium chlorate with its exact equivalent of dilute sulphuric acid. It is a clear, unstable liquid, and the strongest acid contains 60 per cent of water. It has powerful oxidising properties, and if wood or paper be dropped in it the oxidation is so rapid that they will char, and even take fire. It is a monobasic acid, and forms stable salts called chlorates. The most important of these is potassium chlorate (KClO_3). The chlorates are usually formed indirectly by passing chlorine into a hot solution of the hydroxide of the metal, and then crystallising out the chlorate. Chlorides are formed at the same time, but they are much more soluble and remain in solution. Potassium chlorate is manu. by the electrolysis of a hot concentrated solution of potassium chloride. Since chlorates contain a large amount of oxygen, they are used as oxidising agents, potassium chlorate being used in the manu. of matches, and in pyrotechny, especially where coloured effects are required; it is also used in tabloid form for the alleviation and cure of sore throat. Sodium chlorate is a very efficient and widely used weed killer.

Chloride, Ethyl, see ETHYL CHLORIDE.

Chloride of Lime, see BLEACHING and BLEACHING POWDER.

Chlorimetry, term applied to the estimation of the proportion of available chlorine in bleaching powder (q.v.). It varies from 20 to 43 per cent. The process is one of volumetric analysis. It is usual to make a definite solution of arsenious acid or some other substance which can be oxidised. The solution of bleaching powder is then carefully run into a measured quantity of the arsenious acid, and by the aid of an external indicator—a paper moistened with potassium iodide and starch—sufficient is added until oxidation is quite complete. The quantities of both liquids being known, the available chlorine can easily be found by calculation from the equation: $\text{H}_3\text{AsO}_3 + \text{CaOCl}_2 = \text{H}_3\text{AsO}_4 + \text{CaCl}_2$. Another method is to add an excess of potassium iodide to the solution of bleaching powder, acidified with acetic acid, and then titrate the liberated iodine with standard sodium thiosulphate solution.

Chlorine (symbol Cl; atomic weight 35.5; atomic number 17) was discovered by Scheele in 1774. He called it *dephlogisticated muriatic acid*, and regarded it

as a compound. In 1810 Davy proved it to be an element, and gave it its present name, because of its greenish-yellow colour. It does not occur free in nature, but it is very common in combination with metals, the commonest chloride being sodium chloride (common salt). As such it occurs in all natural waters; in beds as rock salt, in animal secretions, and in plants. In combination with hydrogen, as hydrochloric acid, it is found in volcanic gases and in the gastric juice. C. can be obtained in various ways: (1) by heating gently manganese dioxide and hydrochloric acid, water, manganese chloride, and C. being formed; (2) by heating manganese dioxide with a mixture of the substances from which hydrochloric acid is made, e.g. common salt and sulphuric acid. This results in the formation of sodium bisulphate, manganese sulphate, water, and C. A comparison of these two methods shows that whereas the second process results in the obtaining of all the C. from the common salt, the first process leaves half of it in the form of manganous chloride; (3) many highly oxidized compounds, together with hydrochloric acid, give us C., and among these substances may be named potassium dichromate and potassium chlorate.

Manufacturing processes: (1) *Weldon's process* is really a process by which the manganous chloride mentioned above can be turned again into manganese dioxide, and re-used to act upon further supplies of hydrochloric acid, giving further quantities of C. (2) *Deacon's process* depends upon catalysis (q.v.): air, or oxygen and hydrochloric acid, are passed over pumice impregnated with cuprous chloride (a salt of copper), which has been heated to a dull-red heat. Then water is formed and C. evolved. But Weldon's process is now obsolete, and Deacon's is rarely used. Most of the C. now manu. is obtained by the electrolysis of a solution of common salt.

Properties. It is a greenish-yellow gas, which has a suffocating smell. If inhaled in the pure state it would cause death. It acts very rapidly on the mucous membranes even when largely diluted in the air. Very dilute in the air, however, it imparts a pleasant odour to a room. It is two and a half times as heavy as air, but when heated its density is considerably less than it should be. So while at lower temps. its molecular formula is Cl_2 , i.e. has 2 atoms in the molecule, at higher temps. it must dissociate into single atoms. It is fairly soluble in water, although it may be collected over warm water, or over brine. It has such powerful chemical affinities that it will enter into combination with a large number of elements at the ordinary temp.: in many cases so violent is the combination that the other body takes fire, e.g. phosphorus, arsenic, antimony. It is remarkable to notice that if the C. be dry it will not unite with these substances. It has a strong affinity for hydrogen. If the two gases be mixed and heated, or even exposed to sunlight, they will unite with an explosion to form hydrochloric acid gas. C.

possesses strong bleaching powers by virtue of this great affinity for hydrogen, for it will unite with the hydrogen in water, displacing the oxygen, and this nascent oxygen acts on the natural colouring matter, bleaching it. It is this bleaching power which makes it valuable commercially, and for this purpose it is combined with moist slaked lime to form bleaching powder (q.v.). O. gas can be liquefied by lowering its temp. to -34° C., when it has a golden colour. At -104° it freezes into a yellow crystalline mass. As a liquid it is packed in lead-lined iron bottles and exported to be used in the extraction of gold by the chlorination process. Liquid C. enters into combination with the gold in the ore and forms a soluble chloride which can be separated from the insoluble residues. Then by suitable means the gold can be obtained. C. is one of the *halogen* group of elements, which are fluorine, C., bromine, and iodine, all of which possess similar properties. See BROMINE; FLUORINE; HYDROCHLORIC ACID; IODINE.

Chlorine in Warfare. The introduction of chlorine as a weapon in modern warfare dates from 22 April 1915, when the Germans discharged it from cylinders opposite a sector held by the French, while another attack was made on the Canadian front on 24 April. The gas was a complete surprise to the unprotected troops, and it removed all resistance on the front affected to a considerable depth. Crude respirators were soon supplied to the troops, and later much improved upon. The first gas attack by the British was made at Loos on 25 Sept. 1915, using cylinders of chlorine. It is noteworthy that conditions of wind were more frequently favourable to the Allies than to the Germans. The gas shell was eventually substituted for the cloud method, and found to possess many advantages. It is relatively independent of wind, and enables many more toxic substances to be used. Chlorine, phosgene, chloropierin, and others were classed as asphyxiating gases, and produced their effect by causing lesions and congestion in the pulmonary system while death frequently resulted from suffocation. Chlorine was not used in the Second World War.

Chlorite, mineral of a green colour composed of silicate of alumina, iron, magnesia, and a certain amount of water. It is soft, and when crystallised in small green hexagonal crystals is scaly in texture. It forms the prin. part of C. schist in the region of the metamorphic rocks, and is also an alteration product of hornblende and other minerals in many crystalline rocks. There are many varieties: orthochlorites, which are crystalline, and leptochlorites, which are not.

Chlorite Schist, variety of schist composed of chloritic material such as clinoclone, together with quartz, mica, talc, feldspar, and other minerals.

Chloritic Marl, name given to what is really glauconite marl. It is a chalky marl of a white or yellow colour and situated at the base of the chalk. The name 'chloritic' was given owing to the

presence of grains of glauconite scattered through it, which was wrongly supposed to be chlorite. It also contains phosphatic nodules. The C. M., together with the chalk marl, the grey chalk, and the white chalk which overlies it form the div. called the Lower Chalk of the Upper Cretaceous Period. The prin. fossils are varieties of *Ammonites* or *Schloenbachia*.

Chlorocinnose ($C_{11}H_7ClO_2$), compound produced by the action of chlorine upon oil of cinnamon. When pure it exists as brilliant crystals, which are colourless. It volatilises by heat without change.

Chlorocyanic Acid, or **Cyanuric Chloride** ($(CN)_2Cl_2$), is obtained when anhydrous hydrocyanic acid and chlorine are together exposed to the action of sunlight. It is crystalline, forming needles, and has a disagreeable smell. Heated with water it is decomposed, and gives cyanuric and hydrochloric acids.

Chlorodyne, popular patent medicine, first compounded by Dr Collis Browne. Owing to its dangerous nature and variability of composition, the latter was fixed by the Brit. pharmacopoeia of 1885 as chloroform, morphine, prussic acid, ether, and, in addition, peppermint and a syrup. It is useful for diarrhoea and coughs, but must be used carefully.

Chloroform, or **Trichloromethane** ($CHCl_3$), volatile liquid widely used as an anaesthetic. It has a pleasant odour, boils at 61° C., has a melting point of -63° C., and a sp. gr. of 1.3 at 15° . It is not inflammable at ordinary temps., but burns with a green-edged flame when heated. It is formed when methane, methyl chloride, or methylene dichloride is treated with chlorine in sunlight, but is commonly prepared by distilling alcohol or acetone with bleaching powder, or by warming chloral or chloral hydrate with a solution of sodium hydroxide. C. quickly decomposes in air, especially in the presence of sunlight, carbonyl chloride and hydrochloric acid being produced. As carbonyl chloride is a dangerous impurity when the C. is used for anaesthetic purposes, it is customary to keep the liquid in the dark, and the addition of a small percentage of alcohol serves to effect the decomposition of any carbonyl chloride which may be formed. A good test of the purity of C. is provided by the addition of silver nitrate when no precipitate should form; it also should not darken when agitated with strong sulphuric acid. C. was introduced as an anaesthetic by Sir James Simpson in 1847, and it quickly superseded ether for long operations. It has about three times the potency of ether. It is administered by means of a loose-fitting mask which allows mixture of air, and the strength of the vapour is gradually increased. The effect of the inhalation is to produce first a state of disordered consciousness, which leads to complete unconsciousness. The reflexes persist for some time, and there are energetic movements of the muscles. In the next stage the muscles relax, and many of the reflexes disappear, though the vital centres in the medulla are still sensitive, and the heart muscle is active;

this is the stage suitable for surgical operation. Later, the vital centres in the medulla may become paralysed, in which case respiration stops and life is endangered. C. under skilled management is a safe anaesthetic, but owing to the ease with which an overdose may be given, and the risk of delayed C. poisoning causing fatty degeneration of the liver, heart, and kidneys, it is seldom used now except in emergency. C. is also administered internally as a stimulant, anodyne, and as an antidote to strychnine poisoning. Externally, it is used to dilate the superficial blood-vessels, and as a local anaesthetic in cases of toothache. See also ANAESTHESIA.

Chloro-nitrous Gas, or Nitrosyl Chloride (NOCl), orange-coloured gas obtained by the direct union of chlorine and nitric oxide. It is easily liquefied at about 5° C. and atmospheric pressure, and is readily decomposed in the presence of water and hydroxides of sodium, potassium, or ammonium.

Chloropal, massive mineral resembling opal. It is green in colour, and consists of a hydrous silicate of iron.

Chlorophyll, green colouring matter of plants, in which it is accompanied by 2 other substances, carotin ($C_{40}H_{56}$) and xanthophyll ($C_{40}H_{56}O_2$). C. is not a single compound, but, as was shown by Willstätter, a mixture of the bluish-green chlorophyll-a with about one-third of its weight of the yellowish-green chlorophyll-b. Chlorophyll-a has the formula $C_{55}H_{90}ON_4Mg(COOCH_3)(COOC_2H_5)$, and chlorophyll-b a similar constitution except that it contains 1 atom of oxygen more and 2 atoms of hydrogen less. C. is insoluble in water, but dissolves in alcohol, benzene, and chloroform, and when extracted by the aid of one of these solvents, appears as a green amorphous mass. It is dichromatic, that is to say, when a thin layer is viewed by transmitted light, it appears green; but when the layer is of considerable thickness, it is dark red in colour. This is explained by the fact that whereas both red and green rays are transmitted, the green rays predominate in a thin layer, but are absorbed with greater facility than the red if the layer be thick. The development of C. in plants appears to depend on certain conditions of temp. and light, for if parts of a plant are hidden from sunlight, they quickly become blanched. The function of C. is to aid in the nourishment of the plant by absorbing carbon dioxide from the atmosphere and producing carbohydrates. The nature of the process (photosynthesis) is obscure, but sunlight is an important factor, and the C. cells appear to possess the power of absorbing radiant energy from the sun's rays, by means of which the necessary chemical changes are brought about. Viewed microscopically, the C. of plants is seen to consist of granules or corpuscles called chloroplasts, which are embedded in the protoplasmic substance of certain cells. The chloroplasts of the algae frequently exhibit a complicated appearance; in *Spirogyra*, for instance, they are spiral

in shape. It is associated with other pigments in the plant economy, and the changing colours of spring and autumn are probably due to changes in the relative amounts of C. and other pigments (anthocyanins, and also the xanthophyll constituent of the C. itself). The existence of C. is sometimes taken as the distinguishing characteristic of the plant as compared with the animal, but some plants seem to build up their tissues without the aid of C., and some animals, such as certain infusoria, hydra, etc., possess C., but this is due to symbiotic algae. Molluscs and crustacea frequently exhibit C. as the result of absorption from food.

Chlorophyllite, mineral consisting of quartz, chlorite, and muscovite, occurring in scales or laminae. It is a variety of the larger group of the phyllites, minerals intermediate in character between the clay-slates and the mica-schists.

Chlorovaleric Acid, chlorino substitution product of valeric acid. When the anhydrous valeric acid is mixed with red phosphorus and dry chlorine passed into the mixture in the presence of sunlight, an atom of chlorine is substituted for an atom of hydrogen.

Chlumez (Ger. Chlumetz), Czechoslovakia in the region of Hradec Králové (q.v.), on the Cidlina. Pop. 4100.

Chlumetz, see CHLUMEC.

Chmieleński, see CHMIELNYTSKY.

Cho-Bo, tn of Tong-king, Indo-China, situated on the Song Bo (Black R.) at the point where the riv. bends N. before it enters the Song Koi (Red R.). It is an important trading centre, and gold is worked in the neighbourhood.

Cho Oyu, Himalayan mt in E. Nepal, 20 m. to the W. of Everest; height 26,750 ft. It is the world's seventh highest mt. It was first reconnoitred in November 1951 by W. H. Murray and T. D. Bourdillon, who discovered the best route on its NW. face. This route was twice attempted; once, unsuccessfully, in 1952 by a large Brit. expedition led by E. Shipton; again in 1954 by a party of 3 Austrians and 5 Sherpas led by Dr Herbert Tichy, who wished to demonstrate that a very big mt could be climbed by a very small party. On 19 Oct. he, S. Jochler, and Pasang Dawa Lama reached the summit. They carried no oxygen.

Chobe, or Linyanti, River, trib. of the R. Zambezi, N. Rhodesia, discovered by David Livingstone, 1851.

Chocolate, see COCOA AND CHOCOLATE. **Choctaws**, tribe of N. Amer. Indians of the Muskogean family, now largely intermarried with white and Negro stock. They are now citizens of the U.S.A., numbering about 18,000, mostly in Oklahoma. They sided with the Confederates in the Civil war, and suffered the loss of all their rights. They were one of the Five Civilized Tribes. They practised head deformation of infants, and are often thereby known as 'flatheads'.

Chodkiewicz, Jan Karol (1560-1621), Polish soldier, most famous member of a famous family. He served under Alva

in the Low Countries and, later, under Zamoycki in the Turco-Moldavian campaign, where he obtained high command. Played a prominent part in resisting repeated Swedish invasions of the Baltic procs. He was made a hetman of Lithuania in 1665 and won a remarkable victory with 4000 men against a Swedish army of nearly 20,000. In 1619, however, he was forced to sue for peace, his position having been undermined by revolts. Subsequently, when the Turks and Moldavians attacked Poland and defeated Zolkiewski, C. counter-attacked and completely defeated the invaders, but d. soon afterwards.

Chodowiecki, Daniel Nicolas (1726-1801), Polish painter and engraver, b. Danzig. He produced the famous set of miniatures, 'The History of the Life of Christ,' but his large output is on the whole somewhat trivial in nature, though he was a capable portrait painter and book illustrator. He has occasionally been known as the Ger. Hogarth, possibly because of his truthful representation of middle-class life. He became the director of the Berlin Academy in 1797.

Chodzko, Alexander (1804-91), Polish poet and oriental and Slavic scholar. He was appointed Russian consul to Persia, 1829, and made a special study of the language and literature of that country and also of other oriental languages. In 1842 he went to Paris, and in 1858 succeeded Mickiewicz as prof. of Slavonic literature at the Collège de France. He was the translator of many Persian poems, among others 52 lamentations or miracle-plays concerned with the deaths of Iliass and Hoseln. He pub. *Popular Poetry of Persia*, 1842, and *Fairy Tales of the Slav Peasants and Herdsmen*, trans. into English, 1895, a Persian grammar, and many other works.

Choerilus: 1. Athenian tragic poet, competed with Aeschylus, 499 BC. Said by Suidas to have written 150 plays, but none is extant.

2. (5th cent. BC), Gk epic poet, b. Samos. Fragments of his *Persais*, written at the court of Archelaus of Macedonia, have been preserved. See G. Kinkel, *Epicorum Graecorum Fragmenta*, I, 1877.

Choeropus Castanotis, pig-footed bandicoot, an Australian marsupial of the family Peramelidae. It is an omnivorous, burrowing animal with long ears and tail, and the two well-developed digits on its fore limbs give them a pig-like appearance. It lives on grassy plains.

Choir, formerly spelt *quire*, as it is pronounced (from O.F. *cuer*, modern *choeur*; Lat. *chorus*), the name of the trained or organised body of singers who take part and lead in the musical portions of a church service, or perform portions of the service alone, where the congregation do not join, as in the singing of anthems. The term is also applied to a body of male and female singers who perform the choral portions of a musical composition; and to the part of the church used by them. In the Anglican Church, the C. usually consists of male voices only, boys taking the treble or soprano

parts, and boys or one or two rare male voices the alto or contralto parts, and men the tenor and bass. They usually are surpliced. In cathedrals they are divided into 2 portions, *cantoris*, i.e. on the precentor's or N. side of the chancel, and *decant*, on the dean's or S. side. The men form a special body attached to the cathedral and are termed vicars-choral or lay clerics.

Choir, in architecture, that portion of a church which is specially reserved and furnished for choristers. This is usually, but not invariably, in the E. part of the church, occupying the W. half of the chancel (q.v.) or sanctuary. Hence the terms 'chancel' and 'choir' have come to be almost synonymous; but this usage may be incorrect, e.g. at Westminster Abbey, where the C. is in the nave.

Choiseul, César, Duc de, Sieur du Plessis-Praslin (1598-1675), Fr. general who distinguished himself at the siege of La Rochelle, 1628, and in Piedmont, 1636-1643; at the end of which campaign he was made a marshal. Gained a decisive victory over the Spaniards at Trancheron in 1648, and, soon afterwards, having been given the command of the royal forces in the war of the Fronde, he defeated Turenne at Rethel, 1650. Created duke in 1665, also known as the Marshal du Plessis.

Choiseul-Ambolse, Etienne François, Duc de (1719-85), Fr. statesman, eldest son of François Joseph de C., Marquis de Stainville (1700-70), b. Lorraine. He entered the army and fought in the war of the Austrian Succession. He became lieutenant-general after seeing service in Italy and Bohemia. He gained the favour of Mme de Pompadour, and after various diplomatic missions became minister for foreign affairs in 1758, and he controlled the Fr. foreign policy through the Seven Years War. He became minister of war and marine, and again minister of foreign affairs in 1766. Having failed in his Austrian policy he strove to retrieve the situation by an alliance with Spain, known as the Family Compact (1761), but it was too late to save Canada or the Fr. possessions in India from Great Britain, and he turned his energies to fresh colonies in the Antilles and San Domingo. In 1768 he annexed Corsica with the hope of its future use in the colonisation of Africa. After Mme de Pompadour's death, however, Mme du Barry soon persuaded Louis XV to dismiss him, and he then retired to Chanteloup. In 1774 Louis XVI recalled him, but did not restore him to favour. See F. Calmettes (ed.), *Mémoires du duc de Choiseul*, 1904.

Choisy-le-Roi, Fr. tn in the dept of Seine, on the Seine, 7 m. S. of Paris. It has the remains of a royal château, and there is a parachute training centre. Rouget-de-Lisle (q.v.). d. here. Its manufs. include chemicals, glass, and pottery. Pop. 27,200.

Choke-cherry, name given to *Prunus virginiana*, a N. Amer. shrub, yielding small dark red fruits of harsh taste.

Choke Damp, miners' term for carbon

dioxide. Under ordinary circumstances it may be found in recesses or badly ventilated places in the mine, but is formed in huge quantities when an explosion of coal-gas mixed with air occurs, owing to the combination of the carbon of the gas and the oxygen of the air. When formed in this way it is known as *after-damp*. When the atmosphere is charged with a large amount of carbon dioxide, symptoms of suffocation occur through deficient oxidation of the blood.

Choking, suffocation by obstruction or compression of the windpipe. Any object indrawn into the windpipe when swallowing food is usually the cause of C.; such objects, fishbone, piece of bread, etc., become impacted in the glottis, at the top of the windpipe, blocking the passage. Children, also, often get buttons, small coins, etc., lodged in the same place. The natural response of nature is to cause a fit of violent coughing which removes the obstruction. Failing this, where cases threaten to prove fatal by asphyxiation, tracheotomy must be performed, i.e. an incision is made into the trachea from the front of the neck, so that a tube can be inserted; the operation was formerly often necessary in the treatment of diphtheria. In cases of external compression of the windpipe, such as in strangling, hanging, or garrotting, the heart and lungs are paralysed, breathing ceases, and death occurs in a few seconds. It should be noticed that in execution by hanging, C. does not occur, death being produced by dislocation of the neck vertebrae.

Choking-coil, inductance coil used on A.C. circuits for reducing the current without appreciable loss of power, the resistance being small. The effect can be made variable by providing the coil with a core consisting of a bundle of iron wires, which can be pulled out or pushed in, thus decreasing or increasing the inductance. A core increases the power loss by iron losses (q.v.).

Chola, name of an ant. div. and dynasty of the Tamil country, India, between the Cauvery R. and the S. Penner, Madras. The whole S. peninsula of India was once ruled by the C. dynasty. Its hist. began in AD 860 but it gradually declined, and was extinguished in the 11th cent.

Cholecystitis, see GALL BLADDER.

Cholelithiasis, see GALL-STONES.

Cholera (Gk *cholera*) synonymous with Asiatic cholera, acute infectious disease caused by the *Vibrio cholerae*. Asiatic C. has its home in India, particularly in the lowlands of Bengal, and was confined to E. countries until the 19th cent. In 1817 an epidemic of C. spread from India to Japan in one direction and in the other reached Astrakhan in 1823. Another epidemic started in India in 1826, reached Astrakhan in 1830, Moscow and Berlin in 1831, Paris and the Brit. Isles in 1832; it was carried by emigrants to Canada in the same year, and raged with varying virulence until 1838. The next great epidemic reached Europe in 1847 and lasted until 1855. In 1865 the disease again appeared in Europe, travelling

from India to Mecca, whence it was disseminated by pilgrims to Egypt and other parts. In 1884 it reached Europe again by the same pilgrim route and was carried to S. America by an It. ship. In 1892 a severe epidemic appeared in Paris and subsequently in Germany and Russia. In Hamburg there were 16,956 cases and 8605 deaths. By 1895 the disease had exhausted its energies in Europe, though it still prevailed in Arabia, Persia, China, and Japan as well as in India. The specific cause of Asiatic C. is a micro-organism which invades the intestines and develops there. R. Koch, in 1883, found in the stools of C. patients in Egypt a microbe of the genus *Spirillum*, which he called the 'comma' bacillus (actually bacterial vibrios) from its shape, and asserted it was the cause of the disease. It is a very motile organism, possessing a single long flagellum, and appears only in the intestinal tract. Cultures of this microbe show it to be a somewhat weakly organism, unable to live at a temp. above 60° C. or in the presence of any acid, being at once killed by drying, and readily overgrown by other bacteria. When these facts were estab., scientists found it difficult to believe that the comma bacillus could be responsible for such widespread and obstinate outbreaks of disease, and many attempts were made to account for its virulent nature under certain conditions. The outcome of the investigations seems to credit the microbe with two or more stages of development. Like many other parasites, when it emerges from the human body, it has to develop under certain other conditions of temp., moisture, and food, before it regains its virulence. The reservoir, or source, of infection is usually symptomless carriers of the infection who are either convalescent from an attack of the disease or are suffering from it in a mild form. The disease may be both air- and water-borne. In Hamburg the drinking of unfiltered riv. water was undoubtedly the cause of the outbreak of 1892, as in Altona, where the water was filtered, the pop. escaped except for cases imported from Hamburg. Modern methods of sanitation and, in particular, the chlorination of water supplies have greatly limited the incidence of C. The symptoms are usually classified in three stages. There is first of all a preliminary diarrhoea which may not occasion alarm; the characteristic C. attack follows, including vomiting and profuse liquid evacuations. These are very frequent, and soon become of the colour and consistency of rice-water or thin gruel. Owing to the great loss of water, other secretions are lessened, the urine becomes totally suppressed, the skin shrinks and assumes a grey tinge, the calves and other muscles are cramped, and the patient suffers from an unquenchable thirst. The third stage may be asphyxia or recovery. In the asphyxial stage the skin becomes dark grey and the circulation of the blood becomes more and more sluggish, until the cutting of a vein fails to produce any outflow of blood. If the patient survives he proceeds to the

stage of recovery, when cyanosis vanishes, the evacuations resume their yellow colour, the urinary secretion returns, and the circulation improves. There is always danger of a relapse, and the occurrence, the so-called *C. typhoid*, may lead to death. The average rate of mortality in an epidemic is about 50 per cent. Curative treatment should commence with the preliminary diarrhoea. When *C.* is threatened, all cases of diarrhoea should be suspected. The patient should take to bed and endeavour to produce a mild perspiration. Transfusions of hypertonic alkaline saline should be given; a suitable solution is 180 grains of sodium bicarbonate and 90 grains of sodium chloride in 1 pint of sterile water. No specific chemotherapeutic agent has been discovered. Opium, morphia, and alcohol are to be avoided. Potassium permanganate should be administered *per anum* in all cases of *C.*, to oxidise and so destroy the toxins produced by the germ in the intestine; Kaolin is also useful for the same purpose. Barley water can be given to combat the dehydration, even if vomiting occurs. Preventive measures are of the utmost importance when *C.* is threatened. An effective *C.* prophylactic vaccine is available, and persons proceeding to *C.* districts should be inoculated beforehand. There should be the utmost cleanliness in everything concerning the water supply and the disposal of sewage. Travellers should be kept under inspection, and public authorities should thoroughly disinfect all dustbins, water-closets, etc., whether owned privately or not. The individual should practise personal cleanliness, boil all water and milk before drinking, avoid uncooked fruit, and excess in alcoholic liquors.

Cholera nostras, gastro-enteritis resembling true Asiatic *C.* but usually caused by bacilli of the paratyphoid or colic group. *Cholera infantum*, term used to describe the more severe forms of summer diarrhoea in infants. See J. H. Chambers, *Conquest of Cholera*, 1938, and Manson's *Tropical Diseases* (14th ed.), 1954.

Cholet, tn in the dept of Maine-et-Loire, France, situated on the r. b. of the Maine, 30 m. SW. of Angers. There are large cattle markets, and textiles, footwear and preserves are manuf. There are also bleaching and dye-works. Pop. 23,200.

Choliambus (Gk *chólios*, lame), lambeo line with a spondee or trochee instead of an iambus in the last foot. Termed the limping iambus, it was used by Gk and Lat. poets to give a ludicrous or satirical effect.

Cholmondeley, Mary (1859-1925), novelist, granddaughter of Mary Heber, sister of Bishop Heber (q.v.). Her *Red Pollage*, 1899, won considerable success. She had previously written 3 other novels. *The Danvers Jewels*, 1887, *Sir Charles Danvers*, 1889, and *Diana Tempest*, 1893. Her later novels included *Moth and Rust*, 1902, and *The Lowest Rung*, 1908. *Under One Roof*, 1918, is a book of reminiscences.

Cholon, Chinese city adjoining Saigon in Cochín-China. It was founded by Chinese merchants in about 1778 and has

remained almost exclusively Chinese. *C.* is the centre of Cochín-China's network of canals and rvs. and the H.Q. of its rice trade. Most of Viet Nam's rice-mills are situated in *C.*, which also manufs. cigars, ettes, glass, textiles, sugar, and alcohol. Estimates of pop. vary widely, but it is probable that more than half a million Chinese people live in *C.*

Cholula, city, Puebla state, Mexico, a railway junction and agric. processing centre, 6 m. from Puebla, with an ancient Indian pyramid or teocalli crowned by a Sp. church. Here the Mexican god Quetzalcoatl passed 20 years in teaching the Toltecs the arts of civilisation. The pyramid was erected in his honour, and crowned with his temple and image. Six thousand human victims are said to have been sacrificed annually at this and the other sanguinary shrines in *C.* It was claimed by Cortés the Conqueror that the sacred city contained 40,000 houses. In 1519 he destroyed the city. Pop. 8400.

Choluteca: 1. Dept of S. Honduras on the Gulf of Fonseca, part of the coastal plain providing transcontinental communication. Agriculture, livestock raising, and dairying are the prin. occupations. Area 1966 sq. m.; pop. 118,000.

2. Cap. of above dept, one of the oldest cities in the country, 55 m. S. of Tegucigalpa. Products include coffee and cattle; there are light industries. Pop. 5300.

Chomolhari, or Chomo-lha-ri, peak of the Himalaya Mts. over 23,930 ft high, between Tibet and Bhutan, E. of Sikkim, 140 m. from Mt Everest, rising above the main route from India to Gyantse. First ascent by F. S. Chapman and Pasang Dawa, 1937.

Chomolungmar, see EVEREST, MOUNT. Chomutov (Ger. Komotau), Czechoslovak tn in the region of Usti and Labem (q.v.), at the foot of the Erzgebirge (q.v.). It is in a coal-mining dist., and has an important engineering industry. Pop. 28,700.

Chondracanthus, curious genus of parasitic copepod crustacean in which the large females attach themselves to the gills of living fish, and the small males attach themselves to their feminine counterparts.

Chonos Archipelago, group of over a thousand rocks, is., and reefs off the W. coast of Chile in the provs. of Chiloe and Aysen between lat. 44° and 46° S. They are inhabited only by a few nomadic Indians, and are separated from the mainland by the Moraleda Channel.

Chopi, Bantu tribe of Mozambique, who provide much labour for the Rand gold-mines. They are famous as musicians, with large orchestras of Marimbas. There is also an unrelated tribe of the same name in central Uganda. See H. Tracey, *Chopi Musicians*, 1948.

Chopin, Fryderyk Franciszek (Frédéric François) (1810-49). Polish composer and pianist, b. Zelazowa Wola, a vil. 30 m. from Warsaw, of Polish-Fr. parentage. His father was an emigrant Fr. book-keeper and subsequently a teacher. Although he spent half his life in Paris,

C. became the greatest exponent of Polish nationality in music. He showed early genius in music and, at the age of six, began his musical training under Zywny, a Bohemian and teacher of piano. In 1823 he was sent to a Warsaw college, where his genius began to assert itself, and while there he received instruction in composition from Józef Elsner, a Silesian and director of the conservatory at Warsaw. Later he became a pupil at the Warsaw Conservatory. His fellow students there introduced him into the best circles of Polish society, and these early impressions of cultured life were of

CHOPIN

After a drawing by A. Duval.

enduring influence on C.'s development, both as a man and as an artist. His début as a pianist was in Vienna in 1829, and his first appearance in public was marked by considerable success. Two years later he proposed to visit London, but, on reaching Paris, settled there. Here too he soon became a favourite of society and was the friend of Berlioz, Bellini, and Liszt. Here began his friendship with Mme Dudevant, otherwise George Sand, who exercised an important influence on his life. When in 1838 his pulmonary trouble began he accompanied George Sand, with her children to Majorca; but though she nursed him with solicitude, he made no permanent recovery. The last 10 years of his life were a continual struggle with the disease to which he succumbed. The revolution of 1848 drove him out of Paris to Britain, where he was a centre of attraction in the chief cities, but eventually he became so weak that when he was to play at some great house he

had to be carried upstairs. After a visit to Scotland, where he stayed at Lord Torphichen's country seat, he went back hysterically to Paris, but only to die on 17 Oct. 1849; he was buried in Père Lachaise cemetery beside Bellini and Cherubini.

C.'s compositions embrace the imaginative melancholy of the Slavonic peasant as well as the grace and culture of the Polish aristocrat, and his character shines out through much of his work. His compositions stand alone owing to the peculiar nature of his genius; they are extremely individualist and of a pronounced style and full of poetic imagery. He employed dance forms and rhythms—particularly the mazurka—round which to weave many of his melodies. He has been well described as the poet of the piano—a lyric poet for the most part, though sometimes a dramatic poet. The list of his compositions is so prolific in mazurkas, waltzes, polonaises, and other forms of national dance music that it is sometimes difficult to believe that they are so often the expression of a deeply melancholy nature—a seeming paradox, yet explained by the type of C.'s nationality, a nationality which has been justly described as sadness personified. What music C. composed for other media than the piano is negligible, for even when he associated other instruments with the piano they were obviously subordinated to it. Among his compositions are 27 études, 24 preludes, 20 nocturnes—the style and name of the pianoforte nocturne he owed to the Irish composer, John Field (1782–1837)—59 mazurkas, 18 polonaises, 14 waltzes, 4 ballades, 4 scherzos, 3 impromptus, 3 sonatas, and 2 concertos. Some of these are still the most popular of all recital items. Excepting a collection of Polish songs, the 2 concertos above mentioned, and a few concerted pieces of chamber music, almost all the works of C. are written for pianoforte solo; the symphony, the oratorio, and the opera he never attempted. He was among the finest executants as a pianist, and in this art Liszt alone approached him. He was among the first to use the thumb freely on black keys. Many of his pieces, with eerie effects or echo effects or fairy-like accompaniments, depend for their adequate rendering on the use of a particularly subtle kind of finger technique and pedalling, and are indeed a good test of the varied resources of the skilled pianist.

The house in which C. was born was taken over by the Polish nation in 1834 and extensive gardens were laid out. In the Second World War the Germans stripped it of all its furniture and things of value; but after the war the Poles gradually collected various pieces of furniture, pictures, etc., which had been saved by the composer's admirers, with a view to furnishing the house at Żelazowa Wola as a worthy place of pilgrimage. The Poles see C.'s music as the noblest expression of the romanticism in their soul; his whole life, his patriotism, his death, and his request that his heart be brought back to Poland all made the strongest appeal

to Poland's imagination. The return of O.'s heart to its former resting-place in the Church of the Holy Cross in Warsaw, from where it was removed and hidden from the Germans during the war, was the occasion of a great national demonstration in which the Polish president and the leading members of the regime took part. Efforts were made to have the remains brought back from France not later than 1949, in time for the centenary celebrations, to be marked also by the pub. of a revised ed. of his works, collected and ed. by Paderewski, and the holding of an international C. congress in Warsaw. Sev. years before the war the C. Institute arranged for Paderewski to edit the revised ed. and to add his own interpretations. Paderewski collected all the various eds., including 19 nocturnes, 14 waltzes, and 7 items which had first been pub. by the Oxford Univ. Press. He found that in the course of a cent. many errors called for correction, and he devoted the last years of his life to completing the task (1939). The new ed. was actually started in 1939 and all the proofs and annotations had to be hidden in a cellar in Warsaw. Because of a lack of printing facilities the proofs were, after the war, sent to America for pub. there in time for the centenary. See A. Hedley, *Chopin*, 1947; W. Murdoch, *Chopin: his Life*, 1938; G. Abraham, *Chopin's Musical Style*, 1939.

Chopine (Sp. *chapin*), very high clog or patten, sometimes half a yard high, of oriental origin, introduced into England from Venice in the reign of Elizabeth I.

Chopsticks, implements used by the Chinese and Japanese to pick up their food, the equivalent of the knife and fork. They are made of either ivory or wood, and held between the fingers and thumb of the right hand in much the same way as sugar-tongs.

Choragus, or **Choregus**, in anct Greece, the name given to the citizens who bore the expense of the chorus furnished by each tribe for public festivals, and also to the musician who directed the tribal chorus. The most successful C. in competitions was rewarded with an engraved tripod, which he consecrated and set upon a monument. The choragic monuments of Thrasylus and Lysicrates still exist at Athens.

Choral Service, services in the Eng. and Rom. churches where the psalms, responses, etc., are sung, not said.

Chorale (Ger. *Choral*), named applied to a particular form of musical composition for voices which was introduced by Luther into the services of the Ger. Reformed Church. The words were always in the vernacular and in the form of hymns. The music was not always original, being sometimes secular and sometimes adapted from hymn tunes of the Rom. Church. Luther and his friends, Walther and Senfl, pub. the first important set of chorales at Wittenberg in 1524.

Chorale Prelude (Ger. *Choralvorspiel*). The singing of the chorale (see above) in the Ger. Reformed Church being done by the congregation, accompanied by the

organ, the practice arose in the 18th cent. of playing an introduction, first of all simply to establish the key of the hymn for the singers and to remind them of the hymn tune that was already familiar to them. Organists skilled in improvisation then naturally yielded to the temptation of weaving these tunes into some kind of a free instrumental fantasy, and so organ pieces based on them became estab. and were often written down to be preserved for posterity. The great exponent of the organ chorale prelude is J. S. Bach, who developed it with the utmost skill and variety; but it was not his invention, for he had learnt to cultivate it from such predecessors of his as Böhm, Buxtehude, Pachelbel, and Reinken.

Chord: 1. Music, the simultaneous sounding of notes of different pitch. The common C. consists of a note with its major or minor third and fifth.

2. In geometry a C. is a straight line joining two points on the circumference or curve of a circle, ellipse, parabola, etc. In a circle the greatest C. is a diameter, and the length diminishes as it recedes from the centre. The perpendicular drawn from the centre bisects the C.

Chordata, term used in speaking of all animals which have at some period of their life the organ which functions as a supporting rod, the *notochord*. In some of the lowest members of the group this elastic rod is present only in the earliest stages of their life, while in the highest members it is eventually replaced in the adult by the spinal column. Other universal features are the presence of gill-slits and a central nervous system. Zoologists are by no means agreed upon the creatures which may be included in the C., and though the Amphioxus and all vertebrates have an assured position, opinions vary as to the claims of such lower forms as the Tunicata and Entero-pneusta.

Chorea, or **St Vitus's Dance**, disease of the nervous system related to, and perhaps a form of, rheumatic fever (q.v.). C. occurs most frequently in childhood, but is apt to recur under conditions of stress (such as pregnancy) in adult life. It is commoner in girls than boys—it is characterised by involuntary, jerky, purposeless movements and inco-ordinated voluntary movements. The contents of cups, glasses, etc., are spilt and feeding is sometimes difficult. The child becomes easily excited and depressed, and is generally emotionally unstable. Recovery is slow and some inco-ordination of movement may remain. As with rheumatic fever there is a tendency for the heart to be affected. C., at one time commonly seen, is now like rheumatic fever, a comparatively rare disease. There is no doubt whatever that improved standards of living is responsible for this. *Huntington's C.*, or *hereditary C.*, is a hereditary form of C. coming on gradually in the third or fourth decade. Apart from the typical inco-ordinated movements, which become increasingly more severe, there is degeneration of the cortical brain cells and mental deterioration.

Choreography, art of arranging the steps, movement, and pattern in the creation of a dance or a ballet. Originally the term denoted the art of recording dances by a system of symbols, but the term 'dance notation' is now applied to this. There have been many such systems invented, the most widely used at the present time being Labanotation.

Choriambus, in classical prosody, a foot consisting of 4 syllables, of which the first and last are long, the second and third short (— — — —). It is so called because it consists of a trochee (chore) and an iambus.

Chorley, municipal bor. and tn of Lancs, England, situated on the R. Chor. 20 m. NW. of Manchester. The manuf. of cotton yarn and goods is largely carried on, and there are calico printing, bleaching, heavy motor engineering works, and a Royal Ordnance factory. Coal, iron, lead, and slate are found in the neighbourhood. Pop. 33,000.

Chorlton-cum-Hardy, residential dist. of Manchester (q.v.).

Chorlu, or **Tchorlu**, tn and riv. in Turkey, 60 m. W. by N. of Istanbul. Scene of much sanguinary fighting between the Turks and Bulgarians in 1912.

Chorotegans, one of the larger tribes of Central America. Their land extended from Fonseca Bay to the E. side of Lake Nicaragua. At present they have nearly all become swallowed up in the Sp.-Amer. communities of Honduras and Nicaragua, where they form the main constituent element. They were for long under Aztec and Maya influence, but the early Sp. missionaries had their temples destroyed, their idols broken, and their graves despoiled. On the is. of Lake Nicaragua are some colossal basaltic monoliths which are supposed to be of Chorotegan origin. They are for the most part in the form of human figures, very rudely carved. The C. were notorious cannibals.

Chorus, word which originally in Greek meant a dance (*choros*) accompanied by singing, employed at festivals in honour of the gods, especially of Dionysus, and thus developed into the songs accompanied by rhythmic movement forming the lyric parts of the Gk tragic and older comic drama. It is thus applied to the body of singers in opera, oratorio, cantatas, etc., who sing the music written for large groups of voices in parts for each type of voice, soprano or treble, contralto or alto, tenor, and bass. A C. may be distinguished from a glee which is properly written for single voices to each part. Hence when a portion of a song is to be sung, not by a single singer but by a number of singers, it is styled a C. In the Elizabethan drama, the word is applied to a single character who spoke the epilogue and prologue.

Chorzów (Ger. *Königschütte*), tn of Poland, in Katowice prov., 4 m. NW. of Katowice (q.v.). It was formed in 1934 by the fusion of the coms. of Królewska Huta (1934 pop. 81,000), Hajduki Nowe, and C. It is an important coal, iron, steel, chemicals (nitrates), and engineering centre. Pop. 142,000.

Chose in Action, in its general significance, means all rights over property which, in contradistinction to those which can be asserted by taking physical possession of the property, can only be enforced by action. It is, however, a term of many shades of meaning, all of which have been the subject of much legal controversy. In its other but related senses it may mean the property itself which is the subject of personal rights or the instrument which evidences those rights. In the sense of the property itself the term has been held to comprise, *inter alia*, shares and stock in companies, insurance policies, patents, debentures, tithes, negotiable instruments, debts of all kinds, annuities, trusts, legacies, reversionary interests, and advowsons. In contradistinction to choses in possession (a thing of which a person has physical possession), C.s in A. were not transferable at common law, but by the custom of merchants the rules of equity and statute law, certain C.s in A. became assignable, and hence it was that prior to the Judicature Act, 1873, C.s in A. were commonly classified according to the mode of assigning them. C.s in A. not being assignable at common law, the result was that a person who purported to assign could not maintain an action in his own name against the debtor. But by the Judicature Act, 1873, all C.s in A. are made assignable by agreement in writing signed by the assignor, provided written notice is given to the debtor or trustee, and the assignment is absolute and not by way of charge. See L. A. Goodeve, *The Modern Law of Personal Property*.

Chosen, see KOREA.

Choshi, city of Chibaken, Japan, on the E. coast of Honshu, 72 m. from Tokyo. The chief industry is fishing, and fish oil is manufactured. Pop. 85,000.

Chos-Malal, former cap. of the Neuquén ter., Argentina, on the Neuquén R., 465 m. inland from Bahía Blanca. It is a mining centre. Pop. 1000.

Chosroes I, II, see KHUSRAW I, II.

Choszezo (Ger. *Arnswalde*), tn of Poland, in Szczecin prov., on a lake 44 m. SE. of Szczecin (q.v.). Until 1945 it was in Pomerania (q.v.). The tn was very severely damaged in the Second World War. There is a textile industry. Pop. 7000.

Chotusitz, see ČASLAV.

Chou Carabe, see BRAZIL CARRAGE.

Chou En-lai (1898-), premier and foreign minister of the People's Rep. of China. A native of Huai-an, Kiangsu, his father was a gov. official. C. E. went to the Nankai High School, Tientsin, in 1913, and from there proceeded to Nankai Univ. After graduation in 1920 he studied in France, England, and Germany. In 1921 he took part in the meeting which formally estab. the Paris branch of the Chinese Communist party (hereafter abbreviated C.C.P.). Returning to China in 1924, he was appointed secretary of the Kwantung prov. branch of the C.C.P. in Canton. The Nationalists were then co-operating with the C.C.P. and C. E. was appointed the chairman of the political

dept of the Whampoa Military Academy, of which Chiang Kai-shek was principal. In 1926 C. E. was the political commissar of Chiang's First Army, which launched the N. expedition. C. E. soon left the army and went to Shanghai to organise the urb. workers for an uprising against the war lord regime. In April 1927, however, Chiang's Kwangsi army entered Shanghai and C. E. was taken prisoner. He escaped, and on 1 Aug. was one of the organisers in the Nanchang uprising of the Fourth Army which became the first Communist army in China. From 1929 to 1935 he was successively chairman of the Organisation Bureau, chief of the Military

CHOU EN-LAI

Bureau, and vice-chairman of the Military Commission of the C.C.P. After the successful long march of the Red Army from Kiangsi to Yenan in 1935 he was elected a member of the Politburo and a secretary of the Central Committee of the C.C.P. When Chiang Kai-shek, on 12 Dec. 1936, was held captive by his subordinates in Sian it was C. E. who counselled moderation and rescued Chiang from being executed and thereby formed the united front between the C.C.P. and the Nationalist party to counter Jap. aggression in China; he became the representative of the C.C.P. in Chungking, and it was owing partly to his diplomatic skill that a precarious *entente* between the two rival parties was maintained throughout. He became premier and foreign minister of the Communist gov. after the overthrow of Chiang's regime in China. C. E. emerged as an important international figure in 1954 in the Geneva Conference at which the war in Indo-China was brought to an end. In the following

year in the Bandung Conference of Asian and African politicians he gained reputation by proposing direct negotiations with the U.S. Gov. on Far E. problems. As premier of the People's Gov. he has especially cultivated friendly relations between China and the 'new' Asian countries, including India, Pakistan, and Ceylon. (See CHINA, History.)

Chou Shu-jen, see LU HSÜN.

Chouans, Breton word, meaning 'screech-owls.' This name was given to a band of smugglers, who rebelled during the Fr. Revolution and joined the Royalists in La Vendée. They were led by Jean Cottereau (1767-94), a dealer in contraband salt, whose trade was ruined by the destruction of the inland customs. Under his leadership the C. carried on a guerrilla warfare against the Republicans; his company soon grew into an army which was known as *La Petite Vendée*. Cottereau was killed in an ambush, and his place was taken by Georges Cadoudal (1771-1804). The insurrection then spread through Brittany and the W. of France. The devotion of the Bretons and the energetic skill of Cadoudal made this revolt a menace to the rep. The little army had grown to 10,000 men, who regarded the revolt almost as a holy war; they were finally beaten by Lazare Hoche at Quiberon (20 July 1795). Cadoudal was imprisoned but escaped, and though open warfare was now impossible, he continued plotting; he was arrested and executed in Paris, June 1804, with sev. others, but the movement was not finally suppressed until 1815.

Choudard, Pierre Jean Baptiste, see DESFORGES.

Choughs (*Pyrrhocorax*), group of the crow family or Corvidae. It includes sev. species, of which the Cornish Chough (*Pyrrhocorax pyrrhocorax*) is an example. They are allied to the magpies and jays; the name is given to them in imitation of their cry. The species are usually black, with red feet, and a long, powerful yellow or red beak; the claws are long and hooked. In diet the C. are frugivorous and insectivorous. The Alpine C. (*P. graculus*) differ from the true C. in their shorter bill, and in having the cheeks bare, not feathered as in the genus *Graculus*. Only one species of this genus is known.

Chouquet, Adolphe Gustave (1819-1886), Fr. musical writer, b. Le Havre. In 1871 he became keeper of the collection of musical instruments at the Paris Conservatoire of Music, and he issued an illustrated catalogue of that collection in 1875. His chief work is *L'Histoire de la Musique dramatique en France*, 1873.

Chow-chow, or Chow, Chinese dog, popular in Great Britain as a pet dog. In China it is killed and hung up for sale in the meat-shops. It has a piquant expression, is an intelligent companion, and a good house dog. Its chief peculiarity is that it has a black tongue. Occasionally the roof of the mouth is also black. Its coat should be all of one colour—black, red, yellow, blue, or white—but not in patches. White spots on the coat are a disqualifying point. The

hair under the tail and under the thighs is frequently of a lighter shade in the same colour. Other points to notice are: Head broad and flat; nose moderate in length, but short tipped; nose and mouth black; eyes small and dark; ears alert and carried erect and well over the eyes; neck broad and firmly set; legs strong, bony, and perfectly straight; feet round and cat-like; chest broad and deep. The C. has a deep ruff round the neck, and a hairy, full tail, curled over the back. It weighs from 46 to 55 lb.

T. Fall

CHOW-CHOW

Chree, Charles (1860-1928), physicist, b. Northshire and educ. at Aberdeen and Cambridge. Achieved distinction in the study of terrestrial magnetism (q.v.) and atmospheric electricity. From 1893 to 1925 he was superintendent at Kew Observatory, during which period it was developed into one of the best in the world. In 1897 he was elected fellow of the Royal Society. Pub. *Terrestrial Magnetism*, 1912.

Chrestien, Florent (1541-96), Fr. scholar and satirical poet, b. Orleans. He was one of the co-authors of the *Satyre Ménippée*, 1594, directed against the League. A composer of Lat. verse and a good Hellenist, he was chosen as tutor to the prince de Béarn, afterwards Henry IV.

Chrestomathy (Gk, 'good learning'), collection of the best extracts from any author or authors. The term is especially applied to such a compilation in a foreign language. An example from modern times is G. Paris's *Chrestomathie du moyen âge*, 1908.

Chrétien de Troyes (fl. c. 1170), Fr. medieval poet, b. Champagne. Little is known of his life, except that he wrote his *Lancelot* at the command of Marie, Countess of Champagne (after 1164), and his *Perceval* or *Le Conte del Graal* for Philip, Count of Flanders, who d. 1191. His other romances are *Erec*, c. 1165, *Cligès*, c. 1170, and *Yvain*, c. 1175, often considered his masterpiece. Whether Chrétien is the author of the poem *Guillaume d'Angleterre* is still a matter of controversy. The subject of his romances is always a love-story, set in a background

of King Arthur's court. Although it is not certain whether Chrétien had a didactic purpose, his poems all deal with a psychological problem, such as the compatibility of love and marriage, the extent of independence permissible in marriage, etc. Chrétien possesses a brilliant narrative technique and an equally brilliant style; he handles the traditional octosyllabic couplet with consummate skill. The incomplete *Conte del Graal* is probably the first work on the story of the Holy Graal, and leaves us with the possible hypothesis that in his old age Chrétien turned to religion. See W. Foerster and H. Breuer, *Kristian von Troyes' Wörterbuch*, 1914; A. Micha, *La tradition manuscrite des romans de Chrétien de Troyes*, 1939; G. Cohen, *Un grand romancier d'amour* (2nd ed., 1948); R. S. Loomis, *Arthurian tradition and Chrétien de Troyes*, 1949.

Chrism (Gk *chrisma*, a substance used in anointing, from *chriein*, to anoint), consecrated olive oil mixed with balm, used by the Rom. Catholic Church for anointing in certain sacraments; in the Orthodox Church it is mixed with spices. Children are anointed before being baptised.

Chrisome, robe presented to infants when baptised in the Rom. Catholic faith, to symbolise innocence. It represents the original C. cloth which used to be placed on the head to prevent the chrism oil being rubbed off. A C. child is one who dies within a month after baptism, in which case the C. is used as a shroud (cf. Shakespeare's *Henry V.* II. 3).

Christ, from Gk for 'anointed,' usually with the definite article, 'the anointed one, the Christ,' and used in the Septuagint version of the O.T. to translate the Heb. *Mashiach*, *Messiah*, the anointed one, i.e. the great earthly king whom the Jews expected to restore their kingdom and free them from the subjection in which they were held, according to prophecy (see *MESSIAH*). In the N.T. it always refers to the claim of Jesus (q.v.) to fulfil the Messianic prophecies, but in a spiritual sense as the establisher of a spiritual kingdom and of freedom from subjection not to earthly rulers, but to sin. When He asks His disciple, 'Whom think ye that I am?' Peter answers, 'The Christ.' The high priest asks Him if He is 'the Christ,' and He says 'I am.' In the first epistle of St Paul to the Thessalonians, not later than AD 52, the Church is addressed as in 'the Lord Jesus Christ.' It may be noted that 'Christ,' alone with 'Jesus' or 'Lord Jesus,' is far more frequent in the Epistles and Acts than in the Gospels. From the earliest time it is the spiritual side of Jesus' mission as Messiah that is stressed, and it is plain how His followers came to be called 'Christians.' The first letters of the name in Greek, X.P. formed the monogram of Constantine's *labarum*, replacing the Eagle, and have always remained a favourite symbol of Christian art.

Christ, Disciples of, or **Campbellites**, religious sect founded by Alexander Campbell (1788-1866). They do not

have any creeds or confessions; they take their religious ideas direct from the N.T., and baptise by total immersion. In the U.S.A. they had 7900 churches and 1,820,000 members in 1955.

Christ, United Church of, name under which the Congregational Christian churches in the U.S.A. and the Evangelical and Reformed Church (q.v.) were merged in 1957.

Christ Church (Lat. *Aedes Christi*, popularly called 'The House'), Oxford, commenced by Cardinal Wolsey in 1525. The Church of St Frideswide became both the cathedral of the diocese and the college chapel. The foundation was first called

CHRIST CHURCH, OXFORD: FRONT QUAD
KNOWN AS TOM QUAD

Cardinal College, was suppressed by Henry VIII on the fall of Wolsey, and re-named 'King Henry VIII's College,' and in 1546 was estab. as it now exists with the legal title of 'The Dean and Chapter of the Cathedral Church of Christ in Oxford, commonly called Christ Church.' The foundation consists of the dean, 6 canons (of whom 5 are univ. profs. and the sixth archdeacon of Oxford), the students (equivalent to fellows in other colleges), the cathedral staff, and the scholars and commoners. The disciplinary officer (called deans in other colleges) are 2 of the students known as censors; 2 other students are known as the treasurer and the steward and perform the duties carried out in other colleges by the estates and domestic bursars respectively. The great gateway was carried up by Wolsey to the level of the parapet, and completed by Dr John Fell and Sir Christopher Wren in the 17th cent.; the cloisters in the Great Quadrangle ('Tom Quad.') were never completed. The tower of the gateway contains the great bell known as 'Tom' (St Thomas of Canterbury), which was formerly the clock bell of Osney Abbey.

The cathedral is small and cruciform; it was originally the priory church of St Frideswide and contains traces of Saxon work, but was restored and made Norman in 1180. The building contains specimens of every Eng. style. The nave roof is

woodwork; the choir is roofed with fan tracery in stone; there are some windows by Burne-Jones (q.v.) some 14th-cent. glass, and a curious Dutch window by Abraham van Ling, 1630. The cathedral contains many interesting tombs, including the shrine of St Frideswide.

Christ of the Andes, see USPALLATA.
Christadelphians (Gk. 'brethren of Christ'), sect founded by Dr John Thomas (b. London, 1804). They believe in the unity (but deny the Trinity) of God; in Jesus Christ b. of the Spirit of God and so the son of God, who d. as a sacrifice that men might have life; in immortality as a conditional gift at the resurrection of the dead on the return of Christ to establish a universal kingdom upon earth, when the centre of gov. will be in Palestine with Jerusalem as cap. See J. Thomas, *Elpis Israel*, 1850; R. Roberts, *Christendom Astray*, 1884; J. Carter, *God's Way*, 1947.

Christchurch, tn in Hants, England, situated at the junction of the Avon and Stour, on the edge of the New Forest, close to Bournemouth. It possesses a beautiful church, the priory church of the Holy Trinity, a cruciform edifice, without the central tower, and having a Perpendicular tower at the W. end. The nave and transepts are mainly Norman. The priory of C. is mentioned in Saxon documents as Twineham, and in 901 it was seized by Ethelwold (A.-S. Chronicle). About 1095 it was partially rebuilt and endowed by Ranulph Flambard, Bishop of Durham. It contains the poet Shelley's monument and many others of interest. The ruins, of a Norman castle, built by Richard de Redvers in Henry I's reign, are close to the church. The bor. was first summoned to send representatives to Parliament in 1307. Pop. 21,290.

Christchurch, largest city of the S. Is. of New Zealand, was intended from the outset by the Anglican founders of the Canterbury settlement, some of whom were Christ Church, Oxford, men, to be the cap. of the prov. dist. of Canterbury. It is situated on the Avon and Heathcote R.s and extends from the hills of Banks Peninsula to the sea. While the industrial and business areas and most of the residential dists. are on level land, there are many hillside suburbs and seaside resorts. The Avon and Heathcote R.s are small slow-flowing streams, ideal for rowing in the upper reaches and for small pleasure craft by the sea. C. is known as the 'Garden City' of New Zealand, being celebrated for the many fine parks and open spaces, boulevards and riverside reserves. Canterbury Univ. College includes an engineering school with a world famous reputation. The Anglican cathedral in the centre of the city (Cathedral Square) is one of the finest buildings of the kind in the S. hemisphere. The museum contains many exhibits of interest, including the bones of the moa (q.v.) and the finest collection of New Zealand stamps, bequeathed by Sir Heaton Rhodes in 1958. The largest of the many parks, known as Hagley Park, comprises just under 500 ac. The city, as the commercial centre of the rich

Canterbury Plains, is highly industrialised and contains many industries connected with both primary and secondary production. It is rapidly becoming the chief manufacturing centre of New Zealand because of the unlimited facilities for expansion, the wide streets and highways radiating in all directions, and its fine international aerodrome. Lyttelton, the port of C., is approached by road and rail, the latter being a direct route through the tunnel in the hills to the port only 7 m. from the heart of the city. A tunnel road is planned to give the city additional access to the port. Pop. of the city (urb. area) 193,182.

Christening, see BAPTISM.

Christian, name of sev. kings of Denmark and Norway:

Christian I (1448-81), b. 1426. He was also King of Sweden (1457-64), and was elected Duke of Schleswig-Holstein (1460). He was the first Oldenburg king of Denmark.

Christian II (1513-23), b. 1481, King of Denmark, Norway, and Sweden, son of King John of Norway and Denmark and Christina of Saxony, married Isabella of Burgundy. On his accession the Swedes refused him as king, and, headed by Sten Sture, held out against him for some time, but were finally defeated at Upsala, 1520. After the heads of the nation had sworn fealty, he gave a banquet and had most of his guests seized and imprisoned. About 82 persons were executed or drowned by his order the following day (the Stockholm massacre). Sweden revolted successfully, while his system of taxation made him hated by the nobility in Norway and Denmark. Jutland revolted and gave the Dan. crown to Frederick of Holstein in 1523. After a long struggle C. was compelled to surrender to King Frederick in 1532, and was kept in solitary confinement for 27 years. He d. in 1559.

Christian III (1535-59), b. 1503, son of Frederick I. The year after his accession Lutheranism was estab. as the state religion in Denmark. C. made successful alliances with various Ger. states to protect himself from imperialist threats, and during his reign Denmark enjoyed great material prosperity.

Christian IV (1588-1648), b. Fredriksborg, Zealand, in 1577. In 1611-13 he waged war with Gustavus Adolphus of Sweden, which terminated in the peace of Knärod. During the Thirty Years War he was crushingly defeated by Tilly (1626) at Lutter-am-Barenberge and Jutland was raided by the enemy's troops. He again fought with Sweden from 1643 to 1645, and by the peace of Brömsebro was obliged to yield a great part of his ter. around the Sound. C. IV was, however, a popular king. He was energetic in promoting commercial enterprise and encouraged science and industry, and his foreign policy, though a failure, had the support of his people. He founded Christiania, the present cap. of Norway, in 1624 (now named Oslo).

Christian V (1670-99), b. 1646, was a generally incompetent ruler. The war

with Sweden, 1675-9, greatly weakened Denmark. During his reign Denmark acquired the is. of St Thomas and St John in the W. Indies.

Christian VII (1730-46), b. about 1699.

Christian VII (1766-1808), b. 1749, son of Frederick V and Louise, daughter of George II of Great Britain. He was feeble-minded, and was dominated by his ministers, Bernstorff and Struensee. He married Caroline Matilda, sister of George III, who was subsequently accused of committing adultery with Struensee, and sent back to England after the latter's execution. After 1784 his son Frederick (later Frederick VI) ruled as regent.

Christian VIII (1839-48), b. 1786.

Christian IX (1863-1906), b. 1818. He was closely connected by marriage with many of the thrones of Europe. His daughter, Alexandra, married Edward VII of England; another, Dagmar, married Tsar Alexander III; while his second son, George, became King of Greece (1863). His grandson became King of Norway as Haakon VII, 1905. In 1864 C. lost Schleswig-Holstein in war with Austria and Prussia, and his reign was notable for the growth of Socialism in Denmark. He was succeeded by Frederick VIII.

Christian X (1912-47), baptised with the additional names Carl Frederik Albert Alexander Vilhelm, King of Denmark and Iceland, was b. at Charlottenlund, 26 Sept. 1870; son of Prince Frederik, later Frederick VIII, and of Princess Louise of Sweden and Norway. He joined the army, and rose to be major-general. He married Alexandrine, Duchess of Mecklenburg-Schwerin, in 1898; in 1906 he became crown prince; and he succeeded to the throne of Denmark and its dependencies on the death of his father, 14 May 1912. The chief features of his reign were: the co-operation (beginning with the meeting at Malmö in Sweden, 18 Dec. 1914) of Sweden, Norway, and Denmark, as neutrals during the First World War; the enfranchisement of women as part of a new constitution granted in 1915; the erection of Iceland into a separate kingdom under the same head on 1 Dec. 1919; and the re-acquisition of N. Slesvig from Germany at the end of the war. During his reign he made a number of visits to Iceland, and he also went to Greenland, being the first Dan. monarch to do so. When an Icelandic rep. was declared in 1944, he sent the Icelandic Gov. a generous message of goodwill. C. will be remembered by the Dan. people for the courage with which he upheld his people's rights during the Ger. occupation of Denmark, 1940-5. So far as he was able he maintained a show of independence in his relations with the Germans, but he continued on the throne on sufferance. Nevertheless he provided in his person a rallying point for Dan. patriotism and sentiment, and the fervour with which he was acclaimed when he appeared in public bore witness to his popularity with his subjects, which never waned.

Christian, Prince, Frederik Christian Charles Augustus (1831-1917), prince of Schleswig-Holstein-Sonderburg, son of

Duke Christian August. In 1866 he married Princess Helena Augusta Victoria, third daughter of Queen Victoria, and helped her a great deal in her philanthropic work.

Christian, follower of Christ. According to Acts xi. 26, 'the disciples were called Christians first in Antioch,' about the year 43. The word only occurs in 2 other places in the Bible (Acts xxvi. 28 and 1 Peter iv. 16). It was at first a contemptuous nickname given by the Pagans (cf. Tacitus, *Annal.* xv. 44). The name could not have originated among the Jews, who called the disciples Nazarenes and Galileans and would not have given them a name which meant 'followers of the Anointed.' See CHRISTIANITY.

Christian Brothers. Rom. Catholic educational institute, founded at Waterford, Rep. of Ireland, in 1802 by Edmund Ignatius Rice. Rice had resided in that city as a merchant since 1780, and his pity had been excited by the deplorable state of ignorance and vice in which the poor lived. In 1803 a monastery was built for his school by the citizens of Waterford. Rice received the support of the Bishop of Waterford, and was before long asked to open houses of the institute in many parts of Ireland. There are now 200 schools of the C. B. in Ireland, England, Australia, India, and N. America. In 1820 they were granted a constitution by the Holy See, and confirmed as a religious institute of the Rom. Catholic Church. When the Irish national system of education was estab. (1831), the C. B. for a time accepted the grant by placing their schools under the Board, but they later withdrew from the connection as they could not separate secular from religious teaching. The title has erroneously been given to the Brothers of the Christian Schools, a brotherhood of laymen bound by 3 religious vows, founded by St J. B. de la Salle for the education of the poor, in France (1684). The training college estab. at Rheims in 1685 was the first of its kind in the world. There are now, in all parts of the world, about 300,000 pupils of the brotherhood. The system of elementary education given by these Fr. schools was adopted by Rice in drawing up the rules for his Irish institute.

Christian Connection, sect for banding together Christians who have no definite creed. They take the Bible as the foundation of their belief and conduct. They were founded in America in the early part of the 19th cent. Their views are much the same as those set out by Chillingworth in *The Religion of Protestants a Safe Way to Salvation*, 1637.

Christian Endeavour. The Christian Endeavour (C. E.) movement originated in Williston Congregational Church, Portland, Maine, U.S.A., in 1881. It was formed by Dr Francis E. Clark, who later became the first world president. The movement was formed to hold and train young Christians in and for the Church. Its motto 'For Christ and the Church' indicates its supreme purpose. The success of the first society led to the extension of the movement in other

churches, not only in America but throughout the world. While its emphasis is upon the devotional life, it seeks to train young people to apply their faith to every aspect of life; thus, through its weekly topics, it focuses attention upon the missionary spheres and Christian citizenship. Its work is interdenominational, not undenominational, and is found in all the evangelical denominations of the Church, where it enjoys full recognition. It is international, having been estab. in Canada (1883), India (1883), China (1885), Great Britain (1887), S. Africa (1887), Australia (1888), France, Spain, Burma (1888), Turkey (1889), Sweden (1890), Jamaica, New Zealand (1891), Japan (1893), Germany, Switzerland (1894), etc. In each country the work is controlled by a national C. E. union, which has local unions to cover its constituency. The whole is co-ordinated in the world's C. E. Union. While the local society is pledged in its first loyalty to the church with which it is attached, its fellowship extends to all similar societies. Societies are graded according to age groups, thus its membership reaches from childhood to riper years. As a pioneer of Christian youth work it is still virile and active throughout the world.

Christian Knowledge, Society for Promoting, founded in 1698 by 4 laymen, Lord Guilford, Sir Humphrey Mackworth, Mr Justice Hook, and Col. Colchester, and 1 parson, Dr Thomas Bray (q.v.), who met, probably in Hook's chambers in Lincoln's Inn, to discuss the provision of church schools in London parishes, the catechising of the children of the poor, the conversion of Quakers, and Dr Bray's scheme for promoting religion in the plantations (colonies). The directing mind was that of Bray (1658-1740), rector of Sheldon, near Birmingham. Appointed commissary to Maryland by Compton, Bishop of London, he estab. lending libraries in that settlement and, later, at home. As a result of his preoccupation with the eccles. affairs of Maryland, he drafted *A General Plan of the Constitution of a Protestant Congregation of Society for Propagating Christian Knowledge*. This document is preserved in the library of St. John's College. Bray's original scheme contemplated a 'congregation *pro Propaganda Fide*,' a society incorporated by royal charter, consisting of clergy and laymen who 'should meet and consult upon the best means and methods of promoting religion and learning in any part of His Majesty's plantations abroad'; to supply and support a missionary clergy; and to establish parochial libraries throughout the plantations; and further, in order to arrest 'the terrible decay of religion in this kingdom,' they were to provide clerical lending libraries in market towns and 'set up catechetical schools for the education of poor children in reading and writing and especially in the principles of the Christian religion.' This was an ambitious project and, after Bray's return from Maryland, it was evident that the work was more than a single society could cope with; and the result was that, while

the S.P.C.K. continued to work with no restrictive charter, a separate society for the propagation of the gospel in foreign parts was founded in 1701, with a royal charter. To both societies, founded by Bray, the Angloan Communion owes a great debt. As a church publishing society the S.P.C.K. exercised great influence in moulding clerical opinion in the period when convocation was suppressed. Among the earliest works circulated by the S.P.C.K. were Bray's *A Discourse upon the Baptismal Covenant* and the controversial pamphlets of George Keith, a convert from Quakerism. The society also pub. tracts addressed to particular classes of the pop.: *The Husbandman's Spiritual Companion*, *The Christian Soldier*, *Serious Advice and Warning to Servants*, more especially those of the *Nobility and Gentry*. But its prin. pub. were cheap reprints of standard works by Anglican divines—Burnet, Hopkins, Lowth, and others—particularly those bearing upon the prayer-book and catechism. To this day the S.P.C.K. is regarded primarily in terms of its publishing, for it publishes books of first-rate theological and historical scholarship both under its own imprint and also that of the Church Historical Society. It also supplies vernacular prayer books for the Church overseas, maintains a large overseas publishing programme, and operates 50 bookshops in different parts of the world. But this limited viewpoint ignores much of the society's hist. It was the originator of the charity school movement in the 18th, and of the National Society for Promoting Religious Education in the early 19th cent. It was a pioneer in the foundation of church training colleges at home and overseas. It endows scholarships, studentships, and bursaries in many lands. Under the aegis of the society are the Religious Drama Society and the Church of England Films Commission. It sponsored missionary work in S. India, has financed the training of medical missionaries for all the missionary societies of the Church of England and has helped to endow overseas bishoprics. Address: S.P.C.K., Holy Trinity Church, Marylebone Road, N.W.1.

Christian Science, name given by Mrs Mary Baker Eddy (q.v., 1821-1910) to a system of metaphysical healing based on the Scriptures, the divine Principle of which Mrs Eddy declares she discovered in 1866, and later elucidated and gave to the world in the textbook of the C. S. movement, *Science and Health with Key to the Scriptures*. This remarkable vol., which is Mrs Eddy's prin. work, was first pub. in 1875. *Science and Health* is said so to illuminate the Scriptures as to enable those who understand it to repeat in a degree at least the healing and regenerating works of the prophets and of Jesus and the apostles. C. S. accepts the first chapter and the first 5 verses of the second chapter of Genesis as representing the true account of creation, the account beginning at the sixth verse of the second chapter being regarded as untrue. C. S. accepts Christ Jesus as the Saviour of

the world from sin, sickness, and death, and the Way-shower to eternal life. It distinguishes between Jesus of Nazareth, the son of Mary, and the Christ, the spiritual Son of God. In her *Message to The Mother Church* for 1901, Mrs Eddy wrote: 'The Christ was Jesus' spiritual selfhood; therefore Christ existed prior to Jesus who said: "Before Abraham was, I am." Jesus, the only Immaculate, was b. of a virgin mother, and C. S. explains that mystic saying of the Master as to His dual personality, or the spiritual and material Christ Jesus, called in Scripture the Son of God and the Son of man—explains it as referring to His eternal spiritual selfhood and His temporal manhood. In the first chapter of Genesis it is declared that man is made in the image and likeness of God. Christ Jesus' statement, 'that which is born of the Spirit is spirit' (John iii. 6) conforms to this. The world in general, however, has accepted the second or false account of the creation of man from the dust of the ground. C. S. claims to teach men how to overcome the false sense and replace it with the truth which Christ Jesus said would make men free. C. S. declares that God is Spirit, that He is good, and that He is the only creator. 'This being the case, only the spiritual and the good are real and eternal. The spiritual and good being all, there is in reality no place for evil, sin, disease, and death. Therefore the latter have only a supposititious existence. C. S. does not deny that evil seems real, but maintains that this seeming disappears in the proportion that the truth, which destroys error, is apprehended. The application and effect of this exact, spiritual thinking C. S. declares to be that which Jesus meant when He said: "Ye shall know the truth, and the truth shall make you free." C. S. healing, according to its adherents, is brought about by the operation of Truth in human consciousness and not, as some believe, by mental suggestion, psychotherapy, or other form of human will-power.

The first C. S. church was organised in Boston, Massachusetts, in 1879. From this beginning C. S. has circled the globe with a chain of churches numbering over 3000 branch churches and societies as well as 99 univ. organisations. C. S. organisations may now be found in every country of the civilised world. At the head of these is the Mother Church in Boston, of which Mrs Eddy was the first pastor, and in later years the pastor emeritus. All C. S. churches are branches of this Mother Church, officially known as the First Church of Christ, Scientist. The affairs of the Mother Church are administered by a board of directors of 5 members. The duty of the directors is to administer the affairs of the denomination under the by-laws framed by Mrs Eddy. This authority is vested in them by section 6 of Article 1 of the Church Manual as follows: 'The business of the Mother Church shall be transacted by its Christian Science Board of Directors.' No adequate estimate of the number of Christian Scientists in the world to-day is obtainable,

but in 1936 there were 2113 churches and 269,000 communicants in the U.S.A. and to-day the First Church of Christ, Scientist, in Boston, claims to have 333 branch churches and societies in Great Britain and Ireland. There are over 8000 practitioners throughout the world who give their entire time to C. S. healing. Many remarkable cures have been attributed by its adherents to C. S. who claim that these cures have included diseases and deformities considered by the medical profession to be incurable.

The pubs. of the movement issued by the C. S. Publishing Society, Boston, Massachusetts, include periodicals in various languages besides *The Christian Science Monitor* (daily). See Sybil Wilbur, *The Life of Mary Baker Eddy*, 1907; E. M. Ramsay, *Christian Science and its Discoverer*, 1923; L. Powell, *Mary Baker Eddy: a Life-size Portrait*, 1930; C. Smith, *Historical Sketches from the Life of Mary Baker Eddy and the History of Christian Science*, 1941, and *The Story of Christian Science Wartime Activities, 1939-1946*, 1947; I. Tomlinson, *Twelve Years with Mary Baker Eddy*, 1945; Julia Johnson, *Mary Baker Eddy: her Mission and Triumph*, 1946; W. D. Orcutt, *Mary Baker Eddy and her Books*, 1950; Norman Hensley, *The Cross and the Crown: the History of Christian Science*, 1953; also *We Knew Mary Baker Eddy* (1st series, 1943; 2nd series, 1950; 3rd series, 1953) and books by Mary Baker Eddy (q.v.).

Christiania, see OSLO.

Christianity, the teaching of Jesus Christ as found in the N.T., together with the whole body of doctrine and institutions based thereon. See ACTS OF THE APOSTLES; APOSTLES; APOSTOLIC FATHERS; ATONEMENT; BAPTISM; BIBLE; CANON LAW; CHRIST; CHURCH; CHURCH HISTORY; CHURCHES IN THE U.S.A.; CLERGY; CREED; EASTERN ORTHODOX CHURCH; ENGLAND, CHURCH OF; EUCHARIST; FAITH; FALL, THE; FATHERHOOD, THE DIVINE; FATHERS OF THE CHURCH; GOSPELS; GRACE; HEAVEN; HELL; HERESY; HOLY GHOST; INCARNATION; JESUS; JUDGMENT, THE FINAL; MARY, THE BLESSED VIRGIN; MESSIAH; NONCONFORMITY; ORDERS, HOLY; ORIGINAL SIN; PAPACY; RELIGION; RESURRECTION; REVELATION; ROMAN CATHOLIC CHURCH; SACRAMENTS; SACRIFICE; THEOLOGY; TRINITY; and the numerous articles there referred to. Christiansborg, former Dan. fort and settlement in Ghana near Accra (q.v.). It was ceded to Great Britain by the Danes in 1840. The fort is the official residence of the Governor-General of Ghana.

Christiansfeld, small tn in S. Jutland, Denmark. It was founded by Moravians (q.v.) in 1773. Pop. 800.

Christianshavn, see COPENHAGEN.

Christiansted, cap. of the formerly Dan. W. Indian Is. of St Croix which was sold to the U.S.A. in 1917. Pop. 4126.

Christie, Agatha (1891-), novelist, b. Torquay, her maiden name being Agatha

Mary Clarissa Miller and her father an American. Educ. privately and in Paris, in 1914 she married Archibald Christie, who became a colonel in the First World War, during which she worked as a V.A.D. in a Torquay hospital. In 1920 she wrote her first detective story, *The Mysterious Affair at Styles*, introducing her famous Belgian detective, Hercule Poirot, who scorns the traditional clue-hunting and pins his faith to psychology and the 'little grey cells' of his brain. Further Poirot mysteries followed, and in 1926 *The Murder of Roger Ackroyd* caused a sensation by making the narrator of the story the criminal. In the same year the authoress gained publicity through being reported missing and finally discovered at a Yorks health resort suffering from loss of memory. In 1928 she divorced her husband and in 1930 married Max Edgar Lucien Mallowan, an archaeologist, whom she later accompanied on many of his expeditions. She is perhaps the most successful writer of detective fiction after Conan Doyle, and her books are extremely popular. Among the best known are *The Mystery of the Blue Train*, 1928, *The Seven Dials Mystery*, 1929, *Murder at the Vicarage*, 1930, *Lord Edgware Dies*, 1933, *The ABC Murders*, 1936, *Ten Little Niggers*, 1940, *The Body in the Library*, 1942, and *A Murder is Announced*, 1950. A number of these were dramatised, and in 1954 she enjoyed the unique distinction of having 3 mystery plays running simultaneously in W. End theatres. See also DETECTIVE STORY.

Christie, Alexander (1807-60), painter, b. Edinburgh. He studied art there and was teacher in the Edinburgh School of Art, 1845, and an associate of the Royal Academy in 1848. His best-known picture is 'An Incident in the History of the Great Plague,' and he also illustrated the Abbotsford ed. of Scott's *Bride of Lammermoor*.

Christie, James, the Elder (1730-1803), auctioneer of London. He held his first sale on 5 Dec. 1766, and the exhibitions of the Royal Academy used to be held on his premises in Pall Mall until 1779. He subsequently moved next door to Gainsborough at Schomberg House.

Christie, James, the Younger (1773-1831), auctioneer and antiquary. He carried on the business of his father, and moved to 8 King Street, St James's Square, London, in 1824. The full title of the firm is now Christie, Manson, & Woods Ltd (see CHRISTIE'S). C. wrote sev. works, among which are *An Inquiry into the Ancient Greek Game (i.e. chess)*, 1801, *Etruscan Vases*, 1806, and *Greek Vases*, 1825.

Christie, Samuel Hunter (1784-1865), mathematician and physicist, b. Twickenham, son of James C. the Elder. He took his B.A. degree at Cambridge in 1805, and was second wrangler. From 1806 to 1854 he taught maths at Woolwich Military Academy, becoming prof. there in 1838. He wrote many articles for the Royal Society on the effects of temp. and the solar rays on the magnetic needle, and also on the conductivity of metals.

Christie's, world-famed art auction room in London. The full title of the firm, founded by James Christie (1730-1803), is Christie, Manson, & Woods, of King Street, St James's, London, W.1. The most celebrated sale that ever took place there was that of the Hamilton Palace collection in 1882. It lasted for 17 days, and the amount of money realised was £239,562. All along the hist. of this house there has been a succession of interesting sales. There was the Bernal collection in 1855, with a result of £70,954; the Bicknell pictures in 1863, with

was paid for a reputed It. 16th-cent. *biberon* in rock crystal. The value of Turner pictures much increased in later years, as in 1906 his 'Rape of Europa' realised 6400 guineas, while in 1909 his 'Mortlake Terrace' realised 12,000 guineas. The jewels of Mrs Lewis Hill were sold in 1907, and fetched nearly £95,000, while 1650 guineas was paid for Sir Luke Fildes's 'Venetian Flower Girl' in her collection. This was for some years the highest price paid in modern times for a picture by a living artist—though this figure was considerably less than the £4567 10s. paid

Christie, Manson, & Woods

A SALE AT CHRISTIE'S

The painting which is being auctioned is Constable's 'Stratford Mill on the Stour.'

£58,639; the Manley Hall collection, 1875-8, with £150,000; the Fountaine collection of 1884 with £96,200. In 1892 the Dudley collection of 91 pictures realised £99,564; also in 1892 there was the Magniac collection of works of art which brought in £103,040. Sir Julian Goldsmid's pictures, furniture, and china in 1896 resulted in £101,727. Sir John Pender's pictures, sold in 1897, brought in £81,913; Sir T. G. Carmichael's works of art in 1902 realised £49,273; and the Huth collection of pictures in 1905 realised £50,452. At the Blyth sale of mezzotint engravings in 1901, a 'first state' of the 'Duchess of Rutland,' by Valentine Green after Sir Joshua Reynolds, realised 1000 guineas. The Duke of Cambridge's pictures, jewels, etc., realised £89,734 in 1904; the Orrock collection of pictures the same year fetched £65,946; and Lord Tweedmouth's collection in June 1905 brought in £49,548. In May 1905, 15,000 guineas

for W. P. Frith's 'Dinner Party at Boswell's Lodgings,' sold during the life of that artist many years ago. In 1926, however, Orpen's portrait of President Wilson was sold for 2730 guineas. In considering the records of prices realised at C. sales after the First World War, the depreciated purchasing power of the pound must be borne in mind. During the war art sales were naturally restricted, but a 12-day sale by this firm in 1915 of *objets d'art* realised over £37,000 for the Red Cross Society. The year following the war, 1919, was a boom year in art sales, and C. sales exceeded £3,000,000. This was in part due to the postponing of sales during the war, and in part to the 'new poor' selling to the *nouveaux riches*. This high figure has not since been exceeded, but in 1929 the money realised by the sale of pictures and drawings alone was the highest in C. annals. The largest amount received for 1 day's sale

was on 8 Nov. 1919, when a second collection from Hamilton Palace was sold (see above). This fetched nearly £189,000, thus exceeding the record sale of £150,000 for 2 days made earlier in the same year, the Drummond collection being disposed of on that occasion. One of the highest bids made for a single picture at C. was that made in Nov. 1919 for Romney's portrait of the Beekford children, which formed part of the Hamilton Palace collection: this realised £54,800, and it was then the highest price for a picture sold in the public market; 52,000 guineas was the sum bid earlier in the same year for Sir Joshua Reynolds's 'Mrs Siddons as the Tragic Muse.' At this figure the picture was bought in, and it was disposed of privately in 1921, going with Gainsborough's 'Blue Boy' to an Amer. purchaser for £200,000. In 1926 a portrait of the family of Sir Wm Bromley-Davenport realised £80,900 at C. One of the most interesting sales at C. in recent years of an *objet d'art* other than a picture was the offering for sale in 1929 of the Portland Vase, which for 100 years had been lent by the dukes of Portland to the Brit. Museum. The £34,450 bid was the highest bid of that season, but the vase was bought in at that figure and returned to the museum. The auction rooms of C. in St James's were totally destroyed through enemy action in April 1941, and the firm moved to Spencer House, Stratford Place, but returned to 8 King Street in 1953. Good sales went on throughout the Second World War, though no sensational prices were realised. A pair of capricci by Canaletto fetched 480 guineas (1942). Lawrence's portrait of 'Miss Juliana Copley' was sold for £4200 in 1943. J. Pierpont Morgan's collection from his Herta residence was sold in 1944, and L. W. Neeld's collection about the same time. Constable's 'Vale of Dedham' was bought for £20,000 before the sale by the trustees of the National Gallery of Scotland. In 1945 a large water-colour of 'Vauxhall Gardens' by Rowlandson was sold for £2730; it had been lost eight of since its exhibition at the Royal Academy in 1784, having been bought in the meantime at an antique dealer's in the suburbs for 20s. Constable's 'Stratford Mill on the Stour,' owned by Lord Swaythling, was sold at C. in 1946 for £43,050. At the Walter Hutchinson sale of 1951 it was again sold for £44,100. Notable in recent years was the Ashburnham sale of 1953 (£220,000), including the record price for a Claude of £13,000. The story of the house is told at great length in W. Roberts's *Memorials of Christin's*, 1897. See also ART SALES.

Christina (1626-89). Queen of Sweden, only daughter of Gustavus Adolphus and Marie Eleonora of Brandenburg. She became queen in 1632. During her minority the chancellor, Axel Oxenstierna, directed the regency and instructed her in politics, and she grew into a woman of great intelligence and latent ability. Her effective rule began in 1644, but unfortunately she allowed her pride to rule her judgment and soon showed herself

capricious and reckless. Her treatment of her chancellor was unpardonable, and in her efforts to thwart him and his policy she caused considerable harm, and diminished materially the gains that Sweden should have obtained from the Thirty Years War. She was, however, a lavish patron of the arts, founded a national school of literature, and encouraged science and learning. She collected men of learning about her, but allowed her admiration of them to become unconventionally extravagant; thus at the death of Descartes, the Fr. philosopher, in 1650, she wanted him to be buried at the feet of the Swedish kings and to build a magnificent mausoleum to his memory, but this was not allowed. C. refused to marry, and eventually appointed Charles Gustavus, her cousin, as her successor. In 1654 she was persuaded to abdicate in favour of her cousin. The idea appealed to her imagination, that a queen in the prime of her life should voluntarily give up her throne, so a great ceremony took place at the castle of Uppsala. She left Sweden, dressed as a man, and at Innsbruck she adopted the Catholic faith, having always held the Protestant religion in contempt. The rest of her life was a series of adventures and scandals. She twice returned to Sweden in the vain hope of being received as queen again. She d. in Rome in 1689, quite poor and neglected. Her valuable library of MSS. was presented to the Vatican by Pope Alexander VIII. See lives by F. W. Bain, 1890; F. C. Mackenzie, 1931; A. Neumann, 1936.

Christine de Pisan (c. 1363-1430), Fr. poet of lt. parentage. She married the secretary of Charles V. of France, her father being his astrologer. On the death of her husband in 1389 she had recourse to writing as a means of support for herself and 3 children. She refused invitations from Henry IV of England and Visconti of Milan, who offered her a home at their courts; for she already enjoyed the patronage of Charles VI and the dukes of Berry and Burgundy. Her *Le Livre des faits et bonnes mœurs du sage roi Charles*, 1405, gives an interesting contemporary picture of Charles V and his court, whilst in her *Livres des trois vertus*, 1407, will be found a unique description of the domestic life of the time. In *La Vision*, 1405, she tells her own story, and her *La Cité des dames*, 1407, contains a valuable series of contemporary portraits. She was versed in the Lat. poets, and assumed the championship of her sex in *Épître au dieu d'amour*, 1399, as also in *Dit de la rose*, 1402. See E. Nyas, *Christine de Pisan et ses principales œuvres*, 1914.

Christinehamn, or Kristinehamn, commercial tn on the NE. shore of Lake Vener, 25 m. E. of Karlstad in Värmland, Sweden. Pop. 19,794.

Christison, Sir Robert (1797-1882), physician and toxicologist, b. Edinburgh, where he graduated M.D., 1819. He studied toxicology in Paris under Orfila. From 1822 to 1832 he held the chair of medical jurisprudence at Edinburgh and

was then appointed prof. of materia medica (q.v.), retiring in 1877. In 1829 he pub. his classical *Treatise on Poisons* and was appointed a medical officer to the Crown. He gave professional evidence in many notable cases, including that of Burke and Hare (see RESURRECTIONISTS). In 1848 he became physician to the queen. He was chairman of the General Medical Council committee responsible for the preparation of the first pharmacopoeia of Great Britain and Ireland, 1864. He was for sev. years editor of the *Edinburgh Medical Journal*. C. was created baronet in 1871. He made outstanding contributions to toxicology and pharmacology; he wrote a monograph on the pathology of the kidneys, 1839. See life, ed. by his sons, 1885.

Christlieb, Theodor (1833-89), Ger. theologian, b. Birkenfeld, Württemberg; gave up his ministry at the Ger. Protestant Church in Islington, London, to take charge of a par. in Friedrichshafen. In 1868 he became prof. at Bonn. He wrote *Modern Doubt and Christian Belief*, 1868.

Christmas (*Cristes masse*, the mass of Christ), the conventional anniversary of the nativity of Christ, celebrated in Europe on 25 Dec. On this day, in the Rom. Catholic Church, every priest is entitled to say 3 masses: at midnight, at dawn, and later in the morning. The beginning of the celebration of C. cannot be exactly dated. References to it as flourishing in the time of Telesphorus (AD 138-61), are probably spurious, and the first certain mention of the festival is under the Emperor Commodus (AD 180-92); it is mentioned in the 3rd cent. by Clement of Alexandria. Dioctetian, learning that Christians were celebrating the anniversary of the founder of their religion, fired the church, and all the worshippers perished in the flames. The early Church had no fixed date for C.; by some it was observed in May, by some in Jan., and by others concurrently with Epiphany. It is, however, unlikely that 25 Dec. was the actual date of Jesus' birth. The choice of this season may be due to the general recognition that the winter solstice was the turning-point of the year; all things seem to prepare then for a fresh period of life and activity after the winter sleep of death. The Rom. festival of the winter solstice was celebrated on 25 Dec. (*dies natalis solis invicti*). The Celtic and Germanic tribes held this season in veneration from the earliest times, and the Norsemen believed that their deities were present and active on earth from 25 Dec. to 6 Jan. Many other ant. beliefs and customs about this period have been handed down to our times, and have crept into Christian usage. The lighting of the Yule log, a custom once widely prevalent, was derived from Lithuanian folklore. The practice of decorating houses and churches is pagan in its origin, and the mistletoe so widely used for that purpose was the sacred plant of the Druids. The custom of presenting friends with gifts at C. dates back to the time of the ant. Romans. In Italy, however, it is attached rather to Epiphany, in commemoration of

the gifts of the Wise Men. In Scotland, in the 15th cent., the Yule celebrations lasted from 13 Dec. to 7 Jan. The latter date was termed *Uh-halie Day*, and within the period of the celebrations 'Yule Girth' was proclaimed over all the country, and the worst of miscreants enjoyed sanctuary, as no court had the right to punish them. The 'Up-Holly-Aa' of the Shetland Is. is a relic of this ant. custom. It was, however, the aim of the Christian Church to ennoble and lift above their heathen associations all the customs that survived from bygone ages, and with this end the liturgy was framed, and many dramatic representations of the birth and early life of Christ were instituted. Hence the so-called manger-songs, C. carols, special dishes for C., etc. During the Middle Ages and later, the customs practised at C. time, and the legends associated therewith, were exceedingly numerous; most of them have now become obsolete. The C. tree, a young spruce-tree, still survives; some trace its origin to the Rom. saturnalia as indicated by Virgil's supposed allusion in the line 'Oscilla ex alta suspendent mollia pinu' (*Georgics*, II. 389); but it probably dates from the time of St Boniface, the apostle of Germany (AD 680), who is said to have substituted for the sacrifices to Odin's sacred oak a fir-tree adorned in honour of the Christ child. It is said that Luther introduced the C. tree lighted with candles. It was introduced into England from Germany in the reign of Queen Victoria. Father C., who is supposed to come down the chimney and place gifts in the children's stockings that are suspended by the fire-place or the bed, has a parallel in every European country. He is variously identified with St Nicholas (Santa Claus), Robin Goodfellow, Knecht Ruprecht, and the Father Bonhomme Noël. St Nicholas's Day is on 6 Dec. The social festivities of the season were formerly kept up uninterruptedly for over a week; now C. Day and Boxing Day only are general holidays. The custom of giving gratuities to servants, etc., at C. is also Roman in its origin. The Romans named such gifts *strenae*, and they are called boxes from the fact that boxes used to be hung up in church at C. time for offerings to be dropped therein for the poor and needy of the par. These boxes were opened on the day after C. Day and their contents distributed; hence the day was known as Boxing Day, and the gifts themselves came to be known as C. boxes. Public servants formerly received C. boxes, but this was discontinued about 1840. C. cards, now so universally used, were instituted in 1846. In Scotland, C. is not kept as a universal special holiday, New Year's Day taking its place; the Presbyterian Church, therefore, has no special services for C. Day. Hansel Monday, the first Monday of the New Year, is the equivalent of Boxing Day in Scotland, and in the more northerly parts of England. See Brand, *Popular Antiquities*, 1870; A. Tille, *Yule and Christmas*, 1899; W. F. Dawson, *Christmas and its Associations*, 1901; C. C. Polhill, *Christmas in Ritual and Tradition*, 1925; D. B.

Wyndham Lewis and G. C. Heseltine, *A Christmas Book*, 1928.

Christmas Island: 1. Is., never more than 12 m. long and 9 m. broad, in the E. part of the Indian Ocean, 190 m. S. of Java. Area 62 sq. m. C. I. is a Brit. possession under the gov. of Singapore. Deposits of phosphate of lime, the result of the continuous action of the dung of sea-fowl on the chalk below, give the is. its one commercial value. C. I. is really the top of a submerged mt., some 15,000 ft. high, of which only 1200 ft. rise above the surface of the sea. It was visited by Dampier in 1688 and was annexed in 1889, being then uninhabited. Pop. about 1300, employees of the Phosphate Co. Most of the houses on the is. have electric light and running water. There are 11 m. of railway and 8 m. of road. A wireless station was installed in 1923. The is. was occupied by the Japanese during the Second World War.

2. Is. (with a 90-m. circuit) in Polynesia, Pacific Ocean, lies a little above the equator, S. of Honolulu. It is attached to the Gilbert and Ellice Is. (q.v.) colony, and lies in 1° 59' N. lat. and 157° 30' W. long., and about 160 m. ESE. of Fanning Is. Discovered by Cook in 1777, it was annexed by Great Britain in 1898 with a view to laying the Pacific cable, of which Fanning Is. is a station. Since 1952 the dist. officer in charge of Line Is. dist. of the Gilbert and Ellice Is. colony (Washington, Fanning, and C. Is.) has had his H.Q. at C. I. and managed the copra plantation there. The is. was chosen as the site of the 1957 Brit. H-bomb tests. Area 60,000 ac. (12,000 ac. under coco-nuts). Pop. 50.

Christmas Rose, also known as the **Black Hellebore**, is *Helleborus niger* (family Ranunculaceae), a herbaceous perennial, winter-green and flowering late Dec. to Feb.; native to Central and S. Europe and W. Asia, introduced to Britain early in the 17th cent. Leaves are leathery, dark green, pedate with 7-9 lobes; the flowers, resembling a single rose, are saucer-shaped with 5 white or tinged rose sepals, yellow nectaries, and many stamens. The blackish rhizome and roots were once considered of medical value in mental derangement, hysteria, and melancholia, but are little used to-day; they contain a principle that is bitter, acrid, and slightly toxic. See also HELLEBORE.

Christophe, Henri (1767-1820), Negro King of Haiti. Originally a slave of Grenada, he became a chief under Desalines, Emperor of Haiti. After the latter's murder he estab. himself as King of the N. Civil war followed, but he was declared king in 1819. His cruelty caused a revolt, and to escape imprisonment he shot himself. A bronze plaque on his tomb is inscribed 'Ci-git le Roi Henri Christophe, né le 6 Octobre, 1767, mort le 20 Octobre, 1820, dont la devise fut: Je renais de mes cendres.'

Christopher, St., early martyr of whom nothing else is known, but whose feast is on 25 July. His renown is due to legend rather than to fact. The representation of him in art with the infant Christ upon

his shoulder is founded on the story that a little child once asked C., who was of imposing stature, to carry him over a bridgeless stream. Staggering across, the bearer cried out against the strange heaviness of his load, but the boy replied: 'Marvel not, for with Me hast thou borne the sins of the whole world.'

Christopher I, King of Denmark (1252-1259), succeeded his brother, Abel. He was obliged to make over the rich duchy of Schleswig to his nephew, Valdemar, thereby beginning the series of dissensions over the Crown lands. When C. imprisoned his prime, Jakob Erlandsen, like a common felon, because of his devotion to the Pope and contempt for his own authority, he was excommunicated, but C.'s sudden death (probably by poison) put an abrupt end to the dispute.

Christopher II, King of Denmark (1319-1332), made repeated and eventually successful attempts to secure the duchy of S. Jutland (Schleswig), which had fallen to a minor. During his reign the royal prerogative was considerably curtailed, and the privileges of the aristocratic party strengthened. His reign was disturbed by internal rebellions, and the virtual dissolution of the kingdom at his death into the Scanian prov., Schleswig, E. Denmark, and Jutland and Fünen, demonstrates the weakness of his rule.

Christopher III (1418-48), King of Norway and Sweden, besides Denmark. C. owed his accession (1440) to the Riksgaard. In his reign the condition of the peasantry further deteriorated, and in Jutland, after their rising of 1441, the peasants were reduced almost to the condition of serfdom.

Christopoulos, Athanasios (1772-1847), Gk poet, b. Castoria, Macedonia; studied at Buda and Padua, and from 1811 assisted Prince Caradja, hospodar of Moldavia and Wallachia, in making a code of laws for his country. When Caradja fell he lived in retirement and composed his lyrics and drinking songs which earned him a wide popularity. Besides translating Homer and Herodotus into modern Greek, he wrote *Politika Parallela*, on different forms of gov., a tragedy, and some philological works.

Christ's College, Cambridge, founded in 1505 by Lady Margaret Beaufort, mother of Henry VII. On the site of C. C. had stood 'God's House', founded in 1436 by Wm Byngham. Henry VI gave the new foundation his royal charter on 16 April 1448. It was revived as C. C. by Lady Margaret Beaufort, who declared herself to be heir to all King Henry's godly intentions, and in the letters patent of Henry VII, dated 1 May 1505, Henry VI is recognised as founder of this new but continuing college. Part of the building was refaced in the 17th cent. It is not known for certain who was the architect of the fellows' building in the second court, a fine example of the Palladian style. One side of a third court was erected in 1883 by J. J. Stevenson, and 2 further sides added 1949-53 by Prof. A. E. Richardson. Among C. C.'s famous alumni are Bishop John Fisher, John

Milton, Charles Darwin, and Jan Christian Smuts.

Christ's Hospital (the Blue-coat School), public school for boys founded in 1553 by Edward VI. The original buildings were those of the monastery of the Grey Friars in Newgate Street, London. The dress of the boys has scarcely differed in style since 1553; they wear a long blue coat and knee-breeches with yellow stockings and white neckbands, the only difference being that the yellow petticoat and flat blue cap have been discarded. In 1902 the school was removed to new buildings at Horsham in Sussex, which were designed by Sir Aston Webb; the building is on an entirely new plan for public schools, accommodating over 800 boarders (there are now no day scholars). Among pupils at C. H. were Camden, Stillingfleet, Charles Lamb, S. T. Coleridge, and Leigh Hunt. The girls' school, also originally in Newgate Street, was removed in 1798 to Hertford (q.v.), and now takes 280 boarders (no day scholars). Lamb's essay on C. H. gives a picture of the school in its old days.

Christ's Thorn, or *Paliurus spina-Christi*, species of Rhamnaceae which flourishes in S. Europe and in W. Asia. The shrub is common in Palestine, and is said to have provided the crown of Christ; the thorns are formed from the stipules. The name is applied for a similar reason to other plants, especially to *Zizyphus spina-Christi*, another species of the same family with stipular thorns, related to plants which produce the fruit known as the jujube.

Chromatic Aberration, see **ABERRATION**.

Chromatic Scale, in music, a succession of all the semitones within an octave: C, C# (or Db), D, D# (or Eb), E, F, F# (or Gb), G, G# (or Ab), A, A# (or Bb), B, C. Such a scale obliterates any sense of key, but chords belonging to any major or minor tonality may be chosen from it.

Chromatic Thermometer, apparatus for measuring temp. by observing the colour of the light radiated from a heated body. A heated body changes in colour from red to white as its temp. rises, and a comparison of the colour with a standard colour chart gives an indication of the temp. The standard colour chart is calibrated by comparison with the colours of a body at known temps. See **PYROMETER**.

Chromatography, or **Adsorption Analysis**, method of analysing mixtures of chemical compounds by their differential adsorption on a solid adsorbing medium through which they are passed in solution. The process was originally invented by the Polish botanist Tswett in 1906, but it is only within the last few years that its possibilities have been realised. The solution to be analysed is allowed to seep down through the finely divided adsorbing solid, such as magnesia, alumina, gypsum, or calcium carbonate, contained in a vertical glass tube. The ingredients in the mixture are thus withdrawn from the solution, but at different levels, and if they are coloured a series of zones or bands is seen. The column with its adsorbed coloured compounds is called a chromatogram. It is pushed out of the glass tube

and cut up into its various coloured zones. The compound in each zone is then washed out with a suitable solvent, which is afterwards evaporated, so leaving the coloured compound itself. In this way, separation of the mixture into its ingredients is effected. Though originally applicable to the analysis of coloured substances only, the method has recently been extended by the use of ultra-violet light, in which many compounds colourless in ordinary light appear brightly coloured. C. is extremely useful in biochemistry, e.g. the study of vitamins and plant pigments, and also has industrial applications. See T. I. Williams, *An Introduction to Chromatography*, 1946.

A modification of adsorption chromatography is the 'Schlieren' method, in which a solution of the substances under investigation is forced continuously through a column and their concentrations on leaving the column are determined by registering changes in refractive index by optical measurement of the concentration gradients.

In 1941, Martin and Synge introduced a new principle known as 'partition chromatography' in which the separations that occur are due to the differences in partition coefficients shown by the various substances in the original mixture between non-mixing solvents. The column, which is usually powdered paper or precipitated silica, soaks up water but does not become obviously damp, and when a mixture of substances in a solvent which is immiscible with water is run through the column some of the dissolved substances are extracted from the solvent by the water and some are not. Partition C. has achieved success in analysis of mixtures of amino acids derived from proteins and in the synthesis of penicillin.

A modification of partition C. is 'paper chromatography' in which a drop of solution of substances under test is put near one end of a strip of filter paper and allowed to dry. Chromatographing is effected with an organic solvent either by putting this end of the strip into the solvent so that the latter is drawn up by capillary attraction or by bending over the top of the strip and dipping this in the solvent so that the latter travels downwards past the spot of the original solution.

There is also two-dimensional paper C. in which a square sheet of filter paper is used. The drop of solution is placed at one corner, chromatographed as before, dried, turned at right angles, and chromatographed again but using a different solvent. This method has been applied successfully to separating mixtures of amino acids by chromatographing in phenol and collidine and developing by spraying the sheet with ninhydrine. This results in dark spots scattered all over the paper, each spot representing a developed amino acid.

Instead of a strip or square of filter paper, circular filter papers have been used in which a 'tongue,' cut from the edge to the centre, dips in a suitable solvent, the drop of solution under examination being

at the centre of the filter paper. This method is known as 'radial chromatography.'

Chromatophores, pigmented cells in the surface of plants and animals, whose function appears to be restricted to the production of colour for appearance's sake. They are developed out of young cells which may become *leucoplasts* or starch-formers, *chloroplasts*, or chlorophyll cells with nutritive functions, or may be specialised to the production of pigment only.

Chromatype, photograph on paper sensitised by salts of chromium.

Chrome Colours, see DYE.

Chrome Yellow (Lead Chromate, $PbCrO_4$), colouring material used in dyeing and as a pigment. It is found as a mineral in Siberia, in the Urals, Brazil, and the Philippines, under the name of crocoisite. It may be prepared by precipitating a solution of a lead salt with potassium dichromate. Different shades may be obtained by mixing with lead sulphate, which gives a lighter shade, or with chrome red, which gives numerous shades of chrome orange.

Chromic Acid (H_2CrO_4) is important because of its salts, the chromates. It is liberated on adding to a concentrated solution of potassium dichromate a sufficient excess of sulphuric acid. The acid, when the solution is concentrated, loses water and deposits deep red crystals of chromic anhydride or chromium trioxide. The excess of sulphuric acid and potassium sulphate is washed out with nitric acid, which is then driven off by gentle heat. C. A. has never been isolated in the pure state. With sulphuric acid, C. A. acts as a powerful oxidising agent, and as such is much used in organic chem., while in botany it is used for dissolving intercellular tissue. The acid is used for dyeing in red and brown colours. C. A., however, is not so important as the chromates. In their production the native chrome iron ore, $Fe(CrO_4)_3$, is used. This is heated in powder form with lime and potassium carbonate in a reverberatory furnace, where oxidation takes place and potassium and calcium chromates are formed together with ferric oxide. These are treated with water, and the chromates are extracted. For the production of the bichromate of potash, or, more properly, potassium dichromate ($K_2Cr_2O_7$), which is used as a pigment, the solution of chromates is treated with sulphuric acid, and the potassium sulphate formed produces, by means of double decomposition, the potassium chromate and precipitates calcium sulphate. To convert the chromate into dichromate, a quantity of sulphuric acid is added to the solution. The dichromate forms large red prisms, and in solution gives a very poisonous acid solution.

Chromite, mineral which forms the chief source of chromium and its compounds. It consists of chromium, iron, and oxygen, $FeO \cdot Cr_2O_3$, and is known as chrome iron ore, chromic iron, and chrome iron stone. It forms octahedral

crystals, but is usually found in granular masses; its hardness is 5½, sp. gr. 4.5, and it is black or dark brown in colour. It is found in ultra-basic igneous rocks, and is chiefly mined in Turkey, S. Rhodesia, Union of S. Africa, U.S.S.R.

Chromium (symbol Cr; atomic weight 52.01), hard steel-grey metal belonging to the same chemical group as molybdenum, tungsten, and uranium. It is not found free in nature, but in chrome iron ore ($Cr_2O_3 \cdot FeO$), crocoisite, and chrome ochre it is found very frequently. Many green stones, such as emerald and serpentine, owe their colour to its presence. The general methods of production are the reduction of the oxide by carbon in the electric furnace or its replacement by aluminium. Its chief industrial uses are in C. plating and in the addition of very small quantities to steel, which it renders hard and tenacious. The important salts are the chromates and dichromates.

Chromosome, body—one of sev. similar bodies—formed from the chromatin network of a cell nucleus during the process of normal cell div. (karyo-kinesis or mitosis). Cs occur in every species in a constant number and transmit the genes of hereditary characters. See CELL; GENETICS; HEREDITY.

Chromosphere, name given to the shell of luminous gas which surrounds the photosphere of the sun. When observed in its usual condition by the eye or the telescope, the sun is seen as a highly luminous disk with a sharp edge: this is called the photosphere. When, however, the eye cannot see the bright photosphere, as in an eclipse of the sun, its great luminosity does not mask the lesser luminosity of the C., which can then be clearly seen or photographed. The edge of the C. is, however, not regular, for there shoot out from it gigantic flame-like masses of luminous material called prominences (q.v.).

Chromo-xigraphy, see COLOUR PRINTING.

Chronicle (Gk *chronos*, time), a record of events in order of time. In literary development it antedates true hist., which involves the scientific study of facts and their interrelation. By far the most important of early Eng. Cs is the A.-S. C. (q.v.), which is written in the vernacular and continues to the end of the 13th cent. Most early Cs are in Latin. Gildas (d. 570) wrote *De Excidio Britanniae* (On the Destruction of Britain), beginning with the Romans and ending at 516. His work was used by Bede (873-735), who wrote a notable ecclcs. hist. which told of events as late as 731. Much later Florence of Worcester (d. 1118) produced a *Chronicon* or *Chronica*, which as its name indicates is compiled from the work of earlier annalists. Eadmer (d. 1124) wrote *Historia Novorum in Anglia*, an account of his own times, and Ordericus Vitalis (1075-1143) compiled *Historia Ecclesiastica*, a church hist. in 13 books from the beginning of the Christian era to 1141. Wm of Malmesbury (d. 1143) filled the gap between Bede and Eadmer with his *De Gestis Regum Anglorum* (On the

Deeds of Eng. Kings), telling of events from 449 to 1127; later he continued his account to 1142. Geoffrey of Monmouth (1100-1154) filled in the blanks in pre-Christian and early Christian times with a wealth of stories that are more picturesque than reliable, and gave us the legends of Brutus the Trojan, Lear and Cymbeline, Merlin and Arthur. He is severely criticised by Wm. of Newburgh (1138-98), who tells of the period of Stephen and Henry II. Greatest of 13th-cent. chroniclers were Roger of Wendover (d. 1236) and Matthew Paris (d. 1259). The *Floris Historiarum* of the former was continued in the *Chronica Majora* of the latter, bringing the account down to 1259. In the next cent. Ranulf Higden (d. 1364) compiled *Polychronicon*, a universal C. from the earliest times to his own day. Later Andrew of Wyntoun (c. 1350-c. 1420) produced *The Original Chronicle*, a metrical hist. of Scotland to the accession of James I. The *Anglica Historia* of Polydore Vergil (1470-1555) is of special value for the reign of Henry VIII.

Cs now were written in the native tongue instead of in Latin. Edward Hall (d. 1547) wrote on *The Union of the two noble and illustrious families of Lancaster and York*, and also a laudatory account of the reign of Henry VIII. Raphael Holinshed (d. c. 1580) has gained vicarious fame because Shakespeare made use of his *Chronicles of England, Scotland, and Ireland*. John Stowe (1525-1605) and John Speed (1552-1629) were industrious antiquarians, the former best known for his *Survey of London*, the latter for his maps of Eng. cos. With Wm. Camden (1551-1623) the C. reached its highest excellence; and though he chose to write his *Rerum Anglicarum et Hibernicarum Annales* in Latin, it was soon made available in an Eng. trans.

Chronicles, the First and Second Books of the. The Heb. name, *Divrei hay-yamim*, signifies events of the days, whereas the Septuagint-Vulgate title, *Paralipomenon*, means things passed over. They form 1 book in the Heb. canon, and constitute a hist. of the Heb. people from Adam to the return from captivity. Some of the events recorded in the Second Book of Samuel and the Books of Kings are here repeated, and the narrative is continued in the books of Ezra and Nehemiah. Nothing is known of the authorship of C., except what can be deduced from internal evidence. It was written by someone who had Levitical leanings, chiefly interested in Jerusalem, the hist. of the Temple, and all things that pertained to the theocracy of Zion. Albright declares that Ezra himself was the chronicler (c. 440). 'It is a fact that virtually all concrete objections to [this] view have been disproved or are in process of being refuted by recent archaeological discoveries' (*Archaeology of Palestine*, 1949). The early part of the hist. is contracted into the form of genealogies (1 Chron. i-ix). There are numerous omissions in the records of the reigns of David and Solomon (1 Chron. x-2 Chron. ix), only those things being mentioned which serve

to prove God's goodness to those who obey the divine law. Accordingly the sin of David, the revolt of Absalom, the idolatry of Solomon, etc., are omitted, as they do not serve the purpose of the author. Many details are given as to divine feasts, and offerings and services in the Temple, which are not mentioned elsewhere. The author refers sev. times to the 'Book of the Kings of Israel and Judah' to a *midrash* or commentary of the Book of Kings, and to the words of the prophet Jehu, and the vision of Isaiah. The most useful commentaries are those by Bertheau and Benzinger. See S. R. Driver, *An Introduction to the Literature of the Old Testament*, 1891; Dr Curtis in the *International Critical Commentary*, 1910; A. C. Welch, *The Work of the Chronicler*, 1939.

Chrono-chrome, one of the earliest systems of colour cinematography, introduced by M. Gaumont in 1912. When first shown to the public at the Gaumont Theatre, Paris, the system was received with enthusiasm owing to the naturalness and delicacy of the colours obtained, but it did not develop commercially, and is now entirely superseded. C. was produced by taking 3 pictures simultaneously through red, green, and blue-violet screens, and then projecting the 3 pictures through similarly coloured screens. All shades of red, violet, and blue, and even a perfect white, were portrayed—colours which had proved almost impossible to reproduce hitherto. They were poetically described as 'pictures from the palette of the sun.'

Chronograms (from Gk *chronos*, time; *gramma*, a letter) were extravagant devices in fashion during the late Rom. Empire and afterwards in the Renaissance period, whereby the date was indicated by certain letters in the inscription, written large to stand out. The reader had to rearrange the outstanding letters so as to form the date. Thus ChristVs DVX; ergo triVMphVs was stamped on a coin struck by Gustavus Adolphus in 1632 (MDCXVVVVII).

Chronograph, in horology (q.v.) a time-measuring instrument which possesses, in addition to the customary movement for indicating the time of day, a mechanism which permits one or more hands to be set moving at any moment, to be stopped in fraction of seconds, and to proceed or fly back without interfering with the running of the other mechanism. The name (Gk *chronos*, time; *graphein*, to write) suggests a written record of time, and the first C., which dates from about 1822, did actually write, or mark, intervals of time by dotting marks on the dial. Modern instruments that actually provide a permanent mark or record are called recording C.s, and such bear no resemblance to the clock or watch (q.v.), but rather take the form of a large mechanically or electrically driven cylinder around which a paper chart is wrapped, upon which a stylus marks the time record. The object of a C. is to make it possible to measure and read intervals of time—long or short—with some accuracy.

C.s are now made in the form of pocket or wrist-watches, operated by either 1 or 2 push pieces. In the normal pocket type, the first pressure of the push piece, which is usually incorporated in the winding button, causes the C. wheel to be brought into mesh with a wheel which is constantly rotating with the movement, once in a minute. This causes the centre seconds hand to start moving round the dial, which is marked in one-fifth or one-tenth sec. The second pressure causes the gears to be thrown out of mesh, and a brake to be applied to the C. wheel, which thus ensures that the centre seconds hand is held in the position where stopped. A third pressure brings a spring into play in connection with a heart-shaped cam, and this has the effect of causing the centre seconds hand to fly back to zero.

A split seconds C. is provided with 2 independent centre seconds hands, one of which—the split seconds hand—is superimposed over the other. When the C. mechanism is brought into action, both these hands move together. The operation of a supplementary push piece stops the split seconds hand, while the other proceeds. A second pressure of this push piece causes the split seconds hand to fly on and resume its original position over the other hand. The term 'split seconds' does not refer to some particular accuracy of timekeeping; it originated because of the fact that the seconds hand could be split or divided so as to give 2 separate readings.

A timer is substantially a C. that does not show the time of day, but only short intervals of time. C.s and timers are used for many purposes, not least in the timing of sporting events. A split seconds C. or timer enables the time of the first and second competitors past the winning post to be read off on the same dial. C.s are used for many time and motion studies and other purposes in industry. See CHRONOMETER.

Chronology relates to the dating of events. The present generally used system of reckoning in years after or before the birth of Christ was first practised by the chronologist Dionysius Exiguus c. AD 533. In this scale AD 1 follows immediately after 1 BC.

A.U.C. (ab urbe condita). This suffix relates to numbers measuring time in years from the traditional founding of the city of Rome in 753 BC.

Julian era began 1 Jan. 45 BC (709 AUC) with Julius Caesar's reforms. See CALENDAR.

Julian period = 7980 years beginning in 4713 BC. Proposed in 1592 by Joseph Scaliger as a potentially convenient common basis of reference for comparative C. The period of 7980 years is the product of $10 \times 28 \times 15$, which numbers represent respectively the Metonic and Solar cycles and the Rom. Indiction.

Metonic cycle = 6940 days = 19 years based on the hypothesis of 235 lunations in this period. Proposed c. 430 BC by Meton as the basis of a calendar in which the average year is $(6940/19) = 365.2631$

days, but this is just over half an hour too long.

Solar cycle = 28 years. The days of the week recur on the same dates in cycles of 28 years, this number being the product of 7 (days in the week) and 4, the periodicity of leap years.

Roman Indiction = 15 years. The fiscal period beginning 1 Jan. AD 313. This is the Rom. (Pontifical) Indiction; the Indiction of Constantine and the Imperial Indiction began respectively on 1 and 24 Sept AD 312.

Olympiad. Four-year periodicity of the Olympic Games. Year 1 of the first Olympiad was 776 BC. The first to use this reckoning was Ptolemy Philadelphus (285–246 BC).

A.H. (anno Hegirae). Suffix attached to the date reckoned in years of the Mohammedan era, which began with the Hegira (Flight) in AD 622. See CALENDAR.

Hebrew dates are reckoned from 3760 BC.

Other eras and their starting dates are: BC 5508 Constantinople, 5502 Alexandria, 747 Nabonassar, 323 Alexander, 312 Macedonian, AD 284 Diocletian, 632 Persian.

An attempt by the revolution to establish 22 Sept 1792 as the beginning of a new official era in France was cancelled by Napoleon in 1806. See CALENDAR.

Babylonian and Egyptian dates. Association of the Venus Tablets with the reign of the tenth king in the First Dynasty of Babylon led (through their astronomical content) to 2169 BC as a suggested date for the beginning of that dynasty, but 1894 BC is an alternative within the astronomical and more in accord with later archaeological evidence; its acceptance would alter dates that have been pub. for other dynasties. The most extensive extant record of dynastic sequence is that inscribed in cuneiform on the Oxford Prism (Ashmolean Museum); it states that the kingship was in Kish, after a flood; a date proposed for Kish I was 5500 BC until the hypothesis of overlapping periods of conflict between successive centres of dynastic power led to a suggestion that 3100 BC might be more in accord with other archaeological evidence, but this date also would need revision if the reduced date for Babylon I is taken as a basis. It is thought that the Egyptians watched regularly for the heliacal rising of Sirius and that their continuous calendar of 365-day years was instituted when this rising coincided with the summer solstice. A computed date for this is 2782 BC, and a rising recorded in association with a certain regnal year has led to 1990 BC being suggested for the beginning of the Twelfth Dynasty. The co-ordination of Egyptian and Babylonian C. also involves recognition of certain points of recorded synchronism such as those in the Bible and in the Tell-el-Amarna letters. See O. Neugebauer, *The Exact Sciences in Antiquity*, 1951, and A. E. Berriman, *Historical Metrology*, 1953. See also CALENDAR; HOROLOGY; TIME.

Chronometer, a portable timekeeper (see HOROLOGY) provided with the spring detent escapement. Shipping losses, due to the inability of mariners to determine their long, with any degree of accuracy when out of sight of land, caused such anxiety that from 1714 the Brit. Gov. offered a series of rewards ranging from £10,000 to £20,000 for any generally practicable and useful method of finding the long. at sea. In order to obtain the highest award the method had to be accurate to within half a degree—i.e. to about 30 m. An official body known as the Board of Long, was set up to deal with the many and sometimes fantastic schemes that were submitted. Fifty years later the prize was won by an accurate marine timekeeper, the invention of John Harrison (q.v.).

Harrison succeeded with his fourth timekeeper. His first 3 were large, cumbersome, and complicated pieces of mechanism. Each was different from the others in many respects. By 1757 his 'Number 3' was so nearly finished that Harrison notified the Board of Long, that he proposed to compete with it for the £20,000 reward, and he suggested that at the same time he should put in hand a much smaller timekeeper to serve as an auxiliary to it. With the help of his son Wm he constructed his celebrated 'Number 4' which, according to Commander R. T. Gould, is the most famous timekeeper which has ever been, or ever will be, made. This is really a large centre seconds watch, 5 ft 2 in. in diameter, fitted with a greatly improved version of the verge escapement (see CLOCK) and a remontoir, wound every 7½ sec. by the mainspring, through the lever. When tried it proved to be at least as good a timekeeper as Number 3, with the additional advantage of being much more portable, and Harrison decided to use it instead of Number 3. Its first official trial took place in 1761 on a voyage to Jamaica, when after 6 weeks at sea it was found to be 5 sec. slow, an error representing 1¼' of long.—i.e. less than 1 geographical mile in that lat. Shortly after Harrison's success great strides were made in the development of marine timekeepers, notably by 2 world-famous Eng. watch-makers, John Arnold and Thomas Earnshaw (q.v.). Arnold concentrated more on improving the compensation balance and balance spring. He introduced the helical spring. Earnshaw went much further and not only devised the spring detent escapement, substantially as it stands to-day, but created the type which all succeeding C. makers have followed.

The spring detent escapement is the most highly detached form of escapement used in a portable timekeeper. This means that the interference caused to the 'free' vibrations of the balance by the escapement itself is less in this form than in any other; it is a great advantage. Further there is no need for oil on any part of the spring detent escapement, other than the pivots, and consequently changes of temperature have less effect;

moreover there is less change of rate due to the oil drying or dispersing with time. It is a single beat escapement; the escape wheel is unlocked and impulse imparted at each alternate swing of the balance. It is not self-starting, like the lever, for example; should the movement stop, say through being run down, the balance must be turned to start the C. in motion again. Wear is usually negligible, and many of these escapements have seen more than 100 years of continuous use. The balance is similar to that employed in good watches, but heavier. It may be bimetallic, and provided with a steel, palladium alloy, or other spring; or it may be monometallic with an appropriate spring of low thermo-elastic co-efficient, e.g. Elinvar. Many variations of balance have been used in C.s, most of them fitted with 'auxillaries' for compensation of what is known as the 'middle temperature error.' The balance spring is of helical type.

Although pocket C.s have been made, they have not been used extensively because the fact that it is a single beat escapement makes it prone to 'set' and stop if it receives a jar.

A modern C. is set out rather like a large full-plate watch. The balance carries 2 rollers, 1 with an impulse jewel and 1 of smaller diameter with a discharging jewel. The detent carries a locking jewel and also a gold spring. As the balance rotates in one direction the discharge jewel first strikes the tip of the gold spring, thereby displacing the detent to unlock a tooth of the escape wheel. Another, following tooth of the escape wheel then overtakes and strikes the impulse pallet, thereby imparting impulse to the balance. As the balance makes its return swing, the discharge pallet merely displaces the gold spring and the detent holds the escape wheel locked.

The movement is fitted into a heavy brass box (or bowl) to which the bezel is screwed. A pipe is secured to the top place of the movement around the winding square in order to exclude dust; the pipe extends to a hole in the brass box and the hole is covered by a brass shutter. The brass box is generally accommodated in a specially designed wood box made in 2 sections; the lower part containing the C. can be kept locked while observations can be made by lifting the lid and looking down through a glass window. Gimbals are provided in order to maintain it in a horizontal plane.

Chronometer, in music, see METRONOME. Chrudim, Czechoslovak tn in the region of Pardubice (q.v.), on the Chrudimka. It has a noted horse market, and manufs. sugar, alcohol, and fertilisers. Pop. 13,300.

Chrypsis, see CURA, NIKOLAS OF.

Chrysalis, or **Chrysalid**, term applied to the pupa of an insect, but especially to that of a butterfly or moth. It is essentially the resting stage of the creature's life, when, the larva having stored up much food, the perfect insect is built up from the disintegrated tissues.

The pupa may be exposed or within a cocoon.

STAGES IN THE LIFE OF THE BUTTERFLY

A, egg cluster on leaf (top left: single egg magnified); B, caterpillar; C, chrysalis; D, butterfly, in flight and at rest

Chrysanthemum (Gk *chrysos*, gold; *anthemon*, flower), genus of Compositae, contains about 150 species of varied and beautiful plants which are natives of all countries but Australia, and are generally hardy in Britain. The plants are either herbaceous or shrubby in habit, and the flower-heads consist exclusively of ligulate florets of almost every colour except blue. Pure white, bright yellow, deep and pale red, rich purple, and dark brown occur in different varieties, and contribute to the beauty for which the species are admired. The parents of the autumn-flowering C.s are *C. morifolium* and *C. indicum*, and natives of China and Japan. In cultivation the different varieties require a good, rich, well-manured soil, and they should be carefully protected from frost. In Britain we have sev. common species. *C. segetum*, the corn marigold, is an annual with yellow flowers, and occurs as a weed in fields; *C. leucanthemum*, the ox-eye or dog-daisy, is a well-known meadow plant with white ray florets and yellow disk-florets; *C. frutescens*, the Paris daisy or marguerite of France, is grown as a garden plant and somewhat resembles *C. leucanthemum*; *C. parthenium*, the feverfew, has small flower-heads, and is used as a remedy for slight fevers; *C. carinatum*, the tricolor daisy, comes from Barbary, and is an annual cultivated in Britain; *C. arcticum* is a small species with pink and white florets. In this country hardy perennial C.s include the hardy border as well as the early and late flowering Jap. (greenhouse) kinds, both single and double flowered in white, and practically every colour and shade excepting blue. They flower from Aug. to Christmas (indoors), from Aug. to mid Dec. (hardy border) outdoors. Hardy

annual types (*C. carinatum*) or summer-flowering marguerite, will flower from seed sown in a very sheltered border, or in a cold frame the previous autumn, or in a greenhouse. They have both single and double (*C. coronarium*) flowers in many colours, and white. There is a growing tendency to sustain the stock of perennial C.s from seeds sown in heat in Feb. to flower the following autumn, so as to obviate the trouble of growing on from cuttings year by year in greenhouses.

Chrysanthemum, Order of the Kikkwa Daijasho, was instituted in 1877 by the Emperor Musto Hiti of Japan, and is conferred on members of the royal house and on foreign princes. The badge is conventional in design, with a red sun in the centre, sending forth white and gold rays, separated into 4 groups by a yellow C. with green leaves, the whole hanging from a larger yellow C.

Chrysis, daughter of the priest of Apollo at Chryse in the Troad. Taken prisoner by Achilles, she was given as part of the spoils to Agamemnon, who thereby called down the wrath of Apollo upon the whole Gk army in the form of a pestilence. When the seer Chaleas revealed the cause of the god's anger, Agamemnon was obliged to restore her; but he took Achilles' slave, Briseis (q.v.), in compensation. Homer's *Iliad* tells the disastrous consequences of the ensuing quarrel.

Chryselephantine (Gk *chrysos*, gold; *elephas*, ivory), adjective used to describe the gold and ivory statues of the Greeks, by far the most famous of which were the colossal Zeus at Olympia and Athena in the Parthenon of Phidias. A development from wooden images where flesh was painted white and drapery gilded, these C. statues were built up on wooden or clay cores, by attaching thin plates of ivory (to represent flesh tints) and gold. The preciousness of the materials amply accounts for the non-survival of any illustration of this art.

Chrysididae, family of insects, in the series Hymenoptera Tubulifera, consists of near allies of the true wasp which are called popularly ruby-wasp or golden-tailed flies. They are brightly coloured creatures with wings moving so swiftly as to make them invisible, and in habit they are parasitic in the nests of bees and wasps. *Chrysis ignita* is a common Brit. species. The adult wasp lays her eggs in the nest of other species, and the larva feeds upon the young insect which it has supplanted. The *Chrysis* is a brilliantly coloured and very active creature.

Chrysippus (c. 280-207 bc), Gk philosopher, and one of the leaders of the Stoic school, b. at Soli in Cilicia. He came to Athens and studied under Cleanthes. His skill in argument and his impartiality and reasonableness earned him the name of the Column of the Portico (Stoa). C. became head of the Stoic school at Athens in 232 bc, and saved the doctrines of the Stoics from extinction. He is said to have written 750 treatises, of which only fragments survive; some of them are preserved in the MSS. found at Herculaneum. See

N. L. Davidson, *The Stoic Creed*, 1907, and E. Bréhaut, *Chrysippe*, 1910; M. Pohlenz, *Zenon und Chrysippe*, 1938.

Chrysobalanus, family Rosaceae, a genus of tropical shrubs or trees, of which *C. icaco*, the Coco Plum, grows to 6 ft high, with sweet, edible fruits, esteemed in the W. Indies; and *C. oblongifolius*, a small shrub, are both natives of Florida, sometimes grown in warm greenhouses.

Chrysoberyl, crystallised mineral generally of a green colour, translucent, and having a vitreous lustre and conchoidal fracture. Sp. gr., 3.8; hardness, 8.5. It consists of alumina, 77.0 per cent; glucina, 17.5 per cent; protoxide of iron, 5.0 per cent; other matters, 0.5 per cent. A few specimens are met with uncrystallised. It is found mostly in Ceylon and Brazil. When the green is very pale it is often called oriental chrysollite. It crystallises into 6-sided crystals.

Chrysochloridae, family of insectivorous mammals containing a single genus with about half a dozen species known as Cape golden moles and found in central and S. Africa. The *Chrysochlore* has mole-like habits, and its eyes are covered with skin, but it has only 4 digits on its fore-paws, while the mole has 5. It has no tail, and the ears lack pinnae. *C. capensis*, the Cape *Chrysochlore*, has a velvety fur of metallic lustre, burrows underground, and feeds on worms and insects.

Chrysocola, ore of copper, being the hydrated silicate of that metal. It is of a bluish colour, and found in large quantities in the Mississippi valley and in smaller quantities in Cornwall and Cumberland.

Chrysocoma, genus of composite plants, is indigenous to S. Africa. *C. comataurea*, evergreen shrub with yellow flower-heads, is grown in garden greenhouses.

Chrysollite (golden stone), mineral of pale greenish colour, crystallising in rectangular prisms. It is a silicate of magnesia and protoxide of iron, the formula being $2(\text{MgFe})\text{O} \cdot \text{SiO}_2$. It is mostly used in jewellery, and is occasionally found in rounded masses, but usually as a constituent of basalts and lavas. The common form of the mineral is olivine, which is of an olive green or brownish colour. The crystals are positively doubly refractive.

Chrysoloras, Manuele (c. 1350-1415), Byzantine diplomat and scholar. He taught Greek at Florence (1397-1400) and is generally considered as the originator of Gk studies in Italy. His prin. work is a Gk grammar, *Græcae Grammaticae institutiones*, 1534.

Chrysomelidae, large family of coleopterous insects, consists of smallish and brilliantly coloured species. The fat little grubs and the perfect beetle are both vegetarian in diet, and many are destructive to crops. The well-known Colorado beetle (q.v.) is a species which feeds on potatoes.

Chrysophyllum Cainito, or Star-apple, is a species of Sapotaceae which grows in the W. Indies; an evergreen tree, growing to 50 ft, with small white flowers in

clusters, followed by apple-like green and yellow fruits, of soft, sweet, and pleasant taste; the black seeds presenting a stellate figure, to suggest the common name.

Chrysoprase, mineral variety of chalcedony (q.v.) used as a precious stone, more particularly on the Continent. Its prin. constituents are crystalline and amorphous silica which are combined to give differential effects; the fine apple-green colour is due to nickel oxide. It is obtained from Silesia, Oregon, and California.

Chrysorrhoea, see JOANNES DAMASCENUS, St.

Chrysosplenium, genus of Saxifragaceae, occurs in mild countries, its species being herbaceous plants with pale green flowers. *C. alternifolium* and *C. oppositifolium* are natives of Britain, and are called golden saxifrages.

Chrysostom (Gk, 'the golden-mouthed'), St John (c. 345-407), one of the great fathers of the Church, also known as John of Antioch, where he was b. At the school of the sophist Libanius he showed such intellectual gifts that he would have succeeded his teacher as head of the school had not his mother and his many Christian friends persuaded him to be baptised, c. 370. For 10 years he lived in the desert, studying theology, but his austerities damaged his health, and he returned to Antioch, and was ordained. After 10 more years' strenuous work there he became Archbishop of Constantinople, and one of the greatest preachers of the age. His eloquence, however, made him as many enemies as adherents. His sermons in St Sophia were directed against the Arians, but even more against the licentiousness of the imperial court and the idleness and vice of the innumerable monks in the city. The Arians, having no place of worship, met at night outside public buildings, and sang hymns expounding their doctrines. To counteract this C. arranged nightly processional hymn singing, the first example of hymns combined with an act of worship. Riots ensued and much bloodshed, the Empress Eudoxia's chief eunuch being slain. Theophilus, Bishop of Alexandria, summoned C. to a synod which met at Chalcedon through fear of the fury of the people of Constantinople, ardent supporters of their archbishop. He refused to appear, was condemned for Origenism and contumacy, and removed to Nicaea in Bithynia. The populace was so furious that he was hastily brought back to Constantinople, but 2 months later exiled again, this time to Ocutus in Cilicia. There he wrote many of his greatest sermons and letters, and planned missions to the Persians and Goths. His enemies then had him moved to the far desert of Pityrus, and on his way there he d. Fresh riots broke out in Constantinople at the news, and peace was not restored until his bones were brought back 30 years later. His festival in the E. Calendar is 13 Nov., in the W., 27 Jan. The prayer of St C., in the Eng. Book of Common Prayer, is from the liturgy (q.v.) named after him. For his works

see *Oxford Library of the Fathers*, and lives by W. R. W. Stephens, 1872, R. W. Bush, 1886, and A. Puech (collection, *Les Saints*), 1891; also E. Leigh-Bennett, *Handbook of the Early Christian Fathers*, 1920, Palladius, *Dialogus de vita S. Chrysostomi* (ed. by P. R. Coleman-Norton), 1928, and *Divine Liturgy* (trans. by E. E. Brightman), 1931.

Chrysostomus, see **DION CHRYSOSTOMUS**.

Chrysotrux, genus of squirrel monkeys, belongs to the family Cebidae (q.v.). It consists of 4 species, all of which are arboreal, insectivorous, and gregarious; the long tail is non-prehensile and the face is small.

Chrzanów, tn of Poland, in Cracow prov., 25 m. W. by N. of Cracow (q.v.). It is in a coal and lead-mining dist., and has manufs. of rolling-stock and cardboard. Pop. 20,000.

Chu: 1. Riv. some 570 m. in length, in the Kirgis S.S.R. of Soviet Central Asia. Rising in the Tianshan Mts. in the WSW. of Lake Issyk Kul, it is first known as the Koshkar. Passing within 3 m. of Issyk Kul, it swerves into the gorge of Buam, and leaving Tokmak behind flows on towards Lake Saumukul, disappearing in the desert 125 m. before reaching it. Its valley supports one-third of the total pop. of the rep., and its water has in recent years been used for irrigation works, bringing 200,000 ac. of formerly arid land under cultivation. The valley produces grain and cotton, and is noted for horse-breeding.

2. Tn in Karaganda Oblast of Kazakh S.S.R. Pop. 20,000.

Chu Teh (1886-), Chinese military leader and vice-chairman of the People's Rep. of China, b. Yilung, Szechwan. In 1909 he entered the Yunnan Military Academy in Kunming, and upon graduation in 1911 was appointed a company commander by Gen. Ts'ai Ao, who was a member of Sun Yat-sen's (q.v.) revolutionary party. After defeating the Manchu Army, and as a result of his success in other engagements, C. T. was rapidly promoted to the rank of brigadier-general. He commanded a regiment in 1915. Having defeated the traitor Yuan Shih-kai's troops in 1916, C. T. was in command of a brigade in 1919. He went to Germany in 1922 for further studies in military science. He joined a branch of the Chinese Communist party there and studied sociology at Göttingen. When he returned to China in 1925 he was given the command of the 20th Army in Szechwan. In 1927 he was director of the Bureau of Public Safety in Nanchang and also commandant of the Nanchang branch of the Whampoa Military Academy. When the Nanchang uprising broke out on 1 Aug. 1927 he joined the mutiny forces and organised the first Chinese Red Army on the borders of Kiangsi and Fukien. In 1928 he joined forces with Mao Tse-tung (see *CHINA, History*). From 1930 to 1934 Chiang Kai-shek assembled forces sev. times greater than those of the Red Army. As Communist commander-in-chief C. T. showed considerable military genius in

repeatedly beating off and out-manceuvring Chiang's forces, and finally, together with Mao Tse-tung, led the Red Army in its long march (8000 m.) to Yen-an, 1934-5. During the Sino-Jap. War the Red Army was reorganised into the 8th Route Army and C. T. was appointed its commander-in-chief. It operated behind the Jap. lines in N. China. By the end of the war the Communists had equipped 60 divs. with captured Jap. and puppet arms. In the ensuing civil war C. T. was commander-in-chief of the People's Liberation Army. In the first session of the National People's Congress in 1954 he was elected vice-chairman of the People's Rep. of China. In 1955 he was honoured as the first marshal of the rep.

Ch'u T'sai, see **CHINESE LITERATURE**.

Chü Yuan, see **CHINESE LITERATURE**.

Chüanchow (Chinkiang), anct. port and walled city in the prov. of Fukien, China. There being now a great sand-bar across the harbour mouth, C. has been outstripped in trade by the port Amoy. The most famous bridge in the whole of China connects C. with its suburb, Loyang. Marco Polo and other travellers mention C. as carrying on a large traffic with Europe in the Middle Ages.

Chub, name of sev. carp-like fishes, in the large family Cyprinidae, is applied in Britain to *Leuciscus cephalus*. In N. America, however, it is given to the nearly *Leucosomus corporalis*, and to fishes of the genus *Ceraticthys*.

Chubb, Charles (1773-1846), locksmith, improved the detector lock, which his brother Jeremiah had originally patented in 1818. Originally Jeremiah and Charles C. had an ironmonger's and ship's outfitter's shop in Portsmouth. After the invention of the C. lock they opened a lock factory in Wolverhampton. C. then went to London, where he set up a factory for burglar- and fire-proof safes of his own patent in 1835.

Chubb, Thomas (1679-1746), deist, b. E. Harnham, near Salisbury, the son of a maltster. Apprenticed to a tallow chandler, he educ. himself after his father's d. in 1688, theology being his favourite subject. In 1715 he wrote *The Supremacy of the Father Asserted*, followed by other theological works.

C. represents a popular form of deism, and shows the hold that rationalism had then taken on the popular mind. His works also include *A Discourse concerning Reason*, 1731, and *The True Gospel of Jesus Christ*, 1739.

Chubut, ter. in S. Argentina, bounded on the N. by Rio Negro, on the E. by the Atlantic, on the S. by Santa Cruz, and on the W. by Chile. Connected by rail with Puerto Madryn on the Bahía Nueva. Rising in the Andes, the R. C. flows straight across to the Atlantic. The Chico discharges into Lake Colhuapi (or Colhué Huapi), other lakes of size being La Plata and Fontana in the Andean highlands, and Musters and Grande Salada in the interior. Agriculture is carried on by irrigation along the banks of the R. C. Sheep are raised and some cattle. The ter. is colonised mostly by

descendants of Welsh immigrants. Rawson is the cap. and Madryn (44 m. distant) the chief port. Total area 65,669 sq. m.; pop. 58,900.

Chüching, or **Kiutsing**, well-fortified city, 78½ m. ENE. of Kunming, in the prov. of Yunnan, S. China.

Chucuito, prov. of Peru, former cap. of this prov., 12 m. from Puno, on W. of Lake Titicaca; altitude about 11,820 ft. There are silver- and gold-mines, woollen manufs., and dyeing of vicuna wool. Prehistoric remains have been found in the dist. Pop. 3200.

Chudleigh, or **Chidley**, promontory on the N. coast at the entrance of Hudson Straits in Labrador, Canada.

Chudleigh, tn in Devon, England, 10 m. SW. of Exeter. In 1807 it was almost destroyed by fire, but was rebuilt. It is noted for cider. Pop. 2000.

Chudakoye Lake, see **PRIPYA**.

Chufut-Kale ('Jewish Town'), deserted tn 24 m. E. of Bakhchisaray in the Crimea. Perched on almost inaccessible cliffs, it was, in the 15th cent., the refuge of the Karaites Jews from the Crimea.

Chuhung, tn on the Burma Road, 77 m. W. of Kunming, in Yunnan, China.

Chukchi (own name *Lu-oravellan*—'people'), people dwelling in scattered groups in the N. of the Russian Far E. between the Bering Straits and the Kolyma R., numbering (1936) 11,000, and speaking a Paleo-Asiatic language. They combine the physical features of Mongols and Amer. Indians and are divided into the semi-nomadic Reindeer C. in the interior and the sedentary coastal C. engaged in sea-animal hunting and fishing. They have been known since 1644, when Russian Cossacks first reached them. They stubbornly fought for independence from Russia and were not finally subdued until the 1930's.

C. National Dist., formed in 1930, belongs to Magadan Oblast. Area 274,500 sq. m., pop. (1956) 43,000, mainly Russians, also C. and Eskimos. It has some coal, lead, and zinc mining, mostly by forced labour. See V. Bogoraz, *The Chukchee*, New York, 1904-10, and W. Kolarz, *The Peoples of the Soviet Far East*, 1954.

Chukiang, see **CANTON RIVER**.

Chul'man, settlement in S. Yakutia (SE. Siberia) on the Amur-Yakutsk highway. It is the prospective centre of the metallurgical industry, based on large iron-ore and coking coal deposits found in the area.

Chulmleigh, mkt tn 2 m. from Eggesford station and 14 m. SE. of Barnstaple in Devon, England. Pop. 1143.

Chumbi Valley, natural approach to Tibet from India, up which the Brit. expedition to Lhasa in 1904 advanced. Flanked by Bhutan and Sikkim, it lies on the S. slopes of the Himalaya at an elevation of 9500 ft.

Chunam, Indian name for quicklime, made from very pure limestone or from calcined shells. It is used as an ingredient for plaster, when it is well mixed into a paste, together with fine riv. sand and *jaggery* (coarse sugar).

Chungking, commercial cap. of the prov. of Szechwan and of the whole of W. China. As a result of the Jap. invasion of China during the Second World War C. became the Chinese cap. of Chiang Kai-shek's gov. and the centre of Chinese resistance to both the Jap. invasion troops and the Chinese Communists. It occupies the end of a high rocky bluff at the confluence of the R. Kialing with the Yangtze, and is surrounded by a stone wall in good repair. Before the war with Japan it had many fine shops and streets. Its pre-war exports were yellow silk, wax, hides, wool, hemp, feathers, etc., and Chinese medicines, but even before the Jap. invasion trade had been crippled by brigandage in the interior. In the Second World War C. was repeatedly bombed by Jap. aeroplanes, but its natural defences and shelters guaranteed its immunity from destruction. The tide was turned largely by allied air power despite the smallness of the available forces. Heavy bombers struck at the Jap. base of Ichang, disrupting communications (29 May 1943), and next day a Chinese counter-offensive was launched which threw the Jap. force back in disorder; and by June the threat to C. had been removed. With the walled city of Kiangpeh, now incorporated in C., and the large vils. near by, C.'s pop. has grown to 1,360,000. A railway from C. to Chengtu was built in 1951.

Chupanga, or **Shupanga**, vil. of Portuguese E. Africa, on the r. b. of the Lower Zambezi R. The wife of David Livingstone was buried here (1862).

Chuprov, **Aleksandr Ivanovich** (1842-1908), Russian economist and liberal publicist. His research in agric. economics exercised considerable influence on contemporary thought in Russia and provided the basis for the future Neopopulism (q.v.).

Chuquiamata, tn in the prov. of Antofagasta in the N. highlands of Chile. It is one of the world's most important copper-mining and processing centres. Pop. 10,000.

Chuquisaca, or **Characo**, dept in S. Bolivia lying between the Andes in the W. and bordering on the Chaco, Paraguay, in the E. It has fertile valleys and tropical lowlands. The cap. is Sucre (q.v.). It covers an area of 19,140 sq. m. Pop. 392,800.

Chur (Fr. *Coire*; Romansh *Cuera*), the cap. of the canton of the Grisons, Switzerland, lying in the valley of the Upper Rhine. It still contains many 15th- to 17th-cent. buildings. The cathedral of St Lucius was begun in 1178. The episcopal court occupies the site of the Rom. *castrum*, which commanded the road leading over the passes. The tn is mentioned as a bishopric in 452, and was freed from the bishop's rule in 1464. The townsmen embraced the Reformation in 1524. The painter Angelica Kauffmann (1741-1807) was born here. Although C. is 1950 ft above the sea, the climate is very mild. Pop. (1955) 21,100.

Church, **Alfred John** (1829-1912), classical scholar, educator, and author, master at the Merchant Taylors' School,

1857-70. With Brodrick he trans. Tacitus (3 vols.), 1862-77. He is best known for his attempts to popularise the classics. His *Stories from Homer and Stories from Virgil* appeared in 1878. He also wrote *Stories from the Greek Tragedians*, 1879, *Stories from Livy*, 1882, and *Stories from Herodotus*. Other works are *Roman Life in the Days of Cicero*, 1883, *Carthage*, 1886, and *The Crusaders*, 1905. C. ed. *Horae Tennysonianae* (trans. into Lat. verse), 1868.

Church, Sir Arthur Herbert (1834-1915), chemist and scientific writer, prof. of chem. in the Agric. College of Cirencester, 1863; at Royal Academy of Arts, 1879-1911; lecturer at Cooper's Hill, 1888-1900. Among new minerals discovered by C. are churchite (called after him), and the animal pigment turacin. He was president of the Mineralogical Society, 1898-1901. He carried out researches in various branches of chem., and besides scientific memoirs his works include *Precious Stones*, 1883, *English Earthenware*, 1884, *English Porcelain*, 1885, *Food Grains of India*, 1886, *The Chemistry of Paint and Painting*, 1890, *Josiah Wedgwood*, 1894, and *The Conservation of Historic Buildings and Frescoes*, 1907. He was made K.C.V.O. in 1900.

Church, Sir Richard (1784-1873), soldier, one of the liberators of Greece, son of a Quaker, b. Cork. He accompanied the expedition to the Ionian Is. in 1809, raising 2 regiments of Gk light infantry in 1809 and 1812. C. was Eng. representative with the Austrian troops at the time of Napoleon's fall (1813-14), and served King Ferdinand of Naples from 1817 to 1820. On the outbreak of the Gk revolution and war of independence he became general of land forces there (1827), but an attempt to relieve the Acropolis failed, owing to lack of co-operation. He was more successful in W. Greece, forcing the garrisons of Missolonghi and Lepanto to surrender (1828), but resigned his command in 1829. He helped in the revolution of 1843, which gave Greece a constitutional gov. See E. M. Church. *Sir R. Church in Italy and Greece*, 1895.

Church, Richard (1893-), poet and novelist, b. London. Educ. at Dulwich Hamlet School, he entered the Civil Service and remained in it till he was 40. His first book of poems, *Flood of Life*, 1917, was followed by some 10 others, and his *Collected Poems* appeared in 1948. His best-known novel is *The Porch*, which won the Femina Vie-Heureuse prize for 1938; it forms a sequence with *The Stronghold*, 1939, and *The Room Within*, 1940; later novels are *The Sampler*, 1942, *Green Tide*, 1944, and *The Dangerous Years*, 1956. Among his critical works are *Mary Shelley*, 1928, *British Authors*, 1943, and *The Growth of the English Novel*, 1950. In 1955 he pub. his prize-winning autobiography *Over the Bridge* followed by a sequel, *The Golden Sovereign*, 1957, and in 1957 he was made a C.B.E.

Church, Richard William (1815-90), divine, nephew of Sir R. C. (d. 1873), became fellow of Oriel, 1838. C. was an intimate friend of J. H. Newman at this time, and allied to the Tractarian party.

In 1844, as junior proctor, he vetoed a proposal to censure *Tracts for the Times*, No. 90, publicly. He founded the *Guardian*, 1846, and contributed also to the *Saturday Review*. C. became rector of Whitley, 1852, and was nominated by Gladstone to the deanery of St Paul's, 1871. On Archbishop Tait's death, Gladstone wished C. to succeed. As an ardent high churchman he deprecated anti-ritualism, and urged toleration. Among his many works are *Civilisation and Religion*, 1860, univ. sermons in *Human Life and its Conditions*, 1876-8; a series of St Paul's and Oxford sermons in *The Gifts of Civilisation*, 1880, and *Discipline of the Christian Character*, 1885; *Village Sermons preached at Whitley*, 1892-7. C. wrote *Spenser*, 1879, and *Bacon*, 1884, for the Eng. Men of Letters series, both admirable works. Other works are *The Beginning of the Middle Ages*, 1877, and *The Oxford Movement*, 1891. C. ed. Hooker's *Ecclesiastical Policy*, i. 1868, and with Paget revised Keble's ed. of Hooker, 1888. See M. C. Church. *Life and Letters of Dean Church*, 1895, and D. C. Lathbury, *Dean Church*, 1907.

Church (from Gk *kuriakon*, 'belonging to the lord'; hence 'the Lord's House'). The term originally was confined chiefly to buildings used for Christian worship; but its use was extended later to: (a) the whole body of Christian believers, e.g. 'The Church Universal'; (b) a large organised national, regional, or theological group of Christians, e.g. 'The Church of England', 'The Methodist Church', 'The Greek Orthodox Church'; (c) a single local community or congregation, e.g. 'The church at Corinth' (1 Cor. 1.2).

Following is a brief description of the development of types of building erected by Christians for various forms of worship and in successive periods of hist. (For the architectural style of their buildings, see ARCHITECTURE, 4-9; also articles on the architecture of separate countries, e.g. FRENCH ARCHITECTURE.)

In the first years of Christianity, when persecution prevailed in the Rom. Empire, the small congregations met secretly in private houses or in the catacombs (q.v.) outside Rome. The earliest surviving C.s were erected in Rome just before or soon after Constantine's Edict of 313, permitting freedom of worship throughout the Empire. (For a list of them, see ITALIAN ARCHITECTURE.) They are now all known as 'basilican churches' or 'Christian basilicas'; because their general form resembles that of the secular basilicas used in Rome, Pompeii, and elsewhere, as covered places of assembly for the transaction of legal and commercial business (see BASILICA).

The early basilican C.s usually had an aisled nave, separated from its flanking aisles by a range of columns; round-headed windows in the wall above them (later called the 'clerestory' (q.v.)) to light the nave; a. apse at the E. end; and a narthex or vestibule at the W. end. While this type of plan, often with added

transepts forming a 'Latin cross' or cruciform plan, was adopted throughout most of W. Europe during the Romanesque period, the Byzantine or Orthodox Gk C. in E. Europe favoured a 'Greek cross' plan, with a central dome and 4 short arms of equal length, in contrast to the long nave and choir and the short transepts of the Rom. Catholic W. (see ARCHITECTURE, 4).

The cruciform plan was not adopted to symbolise Our Lord's crucifixion, but in order to provide increased space by adding transepts; and the curious deflection sometimes apparent in the axis of the choir, once alleged to symbolise the inclination of Christ's head on the cross, is now believed to have been entirely unintentional, and due to inaccurate setting-out of the foundations.

chancel only, without porches, aisles, or transepts. As local pop. increased, most C.s were enlarged gradually. The usual procedure was to add 1 or 2 aisles, 1 or 2 porches, a W. tower, occasionally 1 or 2 transepts; also to lengthen the chancel—possibly substituting a square E. end for a Norman apse. Chantry-chapels were frequently added at the cost of pious or repentant parishioners; and such chapels often filled up the angle between chancel and transept, so that the whole plan of the C. was changed between Norman and Tudor times.

Fixed fonts of stone or lead were usually installed in medieval C.s; but organs were almost unknown, and were rare even in London in 1700. (On various internal details of medieval C.s, see AISLE; AMBULATORY; APSE; CHANCEL; CHANTRY;

PLAN OF THE BASILICAN CHURCH OF SAN CLEMENTE, ROME

A, Entrance; B, Narthex; CC, Chapels; D, Ambones (= pulpits); E, Bishop's seat; F, Marble screens (*cancelli*); G, Apse; XX, Altars.

The chancel derives its name from Lat. *cancelli*, the barriers provided in secular basilicas to protect the judge in the apse from the public in the nave. In the early Christian basilicas there was a range of seats around the apse for the bishop (in the middle) and officiating clergy, who thus had their backs to the E., and faced the congregation. As the elaboration of services increased, space was needed for a choir as well as for the clergy; and the 'chancel' or 'presbytery' was therefore lengthened, and divided from the congregation by a screen, at first low and often of marble; later, of Gothic tracery woodwork, allowing a view of the altar but maintaining a sharp distinction between the nave and the chancel.

The chancel is often called the 'choir,' although in some C.s (e.g. Westminster Abbey) the choir is seated in the nave; and in some other C.s of later date, in a W. gallery. Eventually, England discarded the Romanesque apse, and most Eng. C.s after c. 1200 have a square E. end. Pulpits and benches were seldom provided before the 17th cent., while closed pews are an innovation of the 17th-18th cents.

Although the largest Eng. C.s were cruciform, few of the smaller ones were. They often consisted of a nave and

Besides the normal types of C. just described, a few circular C.s were erected in W. European countries, including England, mainly by the Knights Templars, and based on the C. of the Holy Sepulchre at Jerusalem. A few 'hall-churches' were also erected by the Friars for preaching purposes: such C.s had no chancel or transepts.

The evolution of C. architecture in England was completely interrupted by the Reformation, which occurred in 1531 when Henry VIII proclaimed himself head of the C. of England, which thenceforth was divorced from Rome. For the next cent. and a quarter, very little C. building took place, and much damage was done to the interior of C.s. Thomas Cromwell, on behalf of the newly reformed C. of England, led the official 'Protestant' campaign to remove from all C.s and destroy objects which in the opinion of the eccles. authorities were 'idolatrious.' The list included representations of God, Christ, the Virgin Mary, the saints, and the cross—even

religious texts and inscriptions; whether painted on glass or plaster, carved in stone, or wood, or engraved on metal. This 'iconoclasm' continued through the reigns of Edward VI and Elizabeth; but under Mary there was a brief Catholic reaction during which carvers worked overtime to reinstate the destroyed 'images,' many of which were very beautiful. Archbishop Laud (q.v.), in the next cent., took various steps to restore order and seemliness in the C.s; but his bigotry in other directions led

was imitated by other architects throughout the 18th and early 19th cents., though from c. 1720 to c. 1820 comparatively few C.s were built.

Before the Toleration Act of 1689, hardly any Nonconformist 'meeting-houses' had been erected, but during the next 11 years over 2400 buildings were registered for worship by Congregationalists, Baptists, and Presbyterians, who had become very numerous since their beginnings under Elizabeth I. Most of these buildings, of which a few

PLAN SHOWING THE GROWTH OF A TYPICAL ENGLISH PARISH CHURCH

to the final wave of iconoclasm (q.v.) in the Commonwealth. Oliver Cromwell's personal share in this is uncertain, and has been exaggerated.

When C. building on a large scale was resumed by Wren (q.v.) after the Great Fire of London in 1666, he introduced entirely fresh ideas into religious architecture, abandoning the 'Roman' type of ritual arrangement together with the Gothic style which had been used up to the Reformation. He accepted the Protestant outlook, and frankly planned his new London C.s as preaching-houses, though enriching them with brilliant design and excellent craftsmanship. In many of those on cramped sites, he was constrained to install galleries (much as he disliked them) in order to bring the congregation within range of the preacher's voice. The type of C. designed by Wren between 1686 and c. 1710

remain, were in Wren's style, but simpler owing to lack of funds (see NONCONFORMIST CHURCH ARCHITECTURE). No new Rom. Catholic C.s were permitted until the Catholic Emancipation Act of 1829.

There was a great boom in C. building in 1818, when Parliament voted a million pounds for new Anglican C.s, most of which were in the newly revived Gothic style (see ARCHITECTURE, 8). For another cent., Gothic held the field for C.s of all denominations, but since 1920 or so more original ideas of design have appeared, in England as elsewhere.

For C. in the abstract, see the articles listed under CHRISTIANITY.

Church, States of the, or the Papal States (In It., *Stati Pontifici*, *Stati della Chiesa*, etc.), were those portions of Italy formerly under the dominion of the Pope. The temporal rule of the papacy, which dated from the bestowal of the exarchate of Ravenna upon Pope Stephen II by King Pépin, and reached its height under Innocent III (1198-1216), was finally suppressed in 1870. The total area of the states in 1859, the last year of their entirety, was 16,000 sq. m., the pop. 6 years earlier being over 3,000,000. Legations were ruled by cardinals, delegations by prelates. With 2 small exceptions, the papal states may be said to have formed a compact prov. bounded on the NE. by the Adriatic, on the SE. by the kingdom of Naples, on the SW. by the Mediterranean, on the W. by Tuscany and Modena, and on the NW. by the Lombardo-Venetian kingdom. In 1929 a Concordat between the It. Gov. and the papacy granted the Pope independence and the control of a small area known as the Vatican State.

Church-ale, kind of ann. church festival in medieval England at which quantities of ale were drunk. (For the compound, cf. bridal, scot-ale.) It was held in the churchyard or near the church, usually at Whitsuntide or Easter. The profits were often used for church funds or charitable purposes. Music, bull-baiting, dice, and dancing formed the amusements. The practice died out after the Reformation, and was always strongly denounced by the Puritans. The nearest modern equivalents are village fairs or wakes. See Philip Stubbs, *Anatomie of Abuses*, 1583.

Church Army, mission of the Church of England estab. in 1882 by the late Prebendary Wilson Carille, C.H., D.D., as a working people's mission to working people. It has maintained this characteristic throughout many changes and developments. The evangelistic work includes a training college for evangelists and mission sisters, and for representatives of various pars. during special Evangelistic Week-ends; parochial evangelists and mission sisters working as lay helpers of the clergy; mission vans visiting remote country pars.; missions at the seaside, in prisons, public assistance institutions, and slums. The social work includes lodging and residential hostels throughout London and the provs. for the reception of tramps and working men; lodging hostels, moral welfare work, homes, etc., for women, girls, and children. In various parts of the country there are also homes for elderly men and women. There are also youth centres and clubs.

In addition to carrying on and developing its normal work the C. A., working on behalf of men and women on foreign military service, has provided rest and recreation centres, hostels, etc. C. A. Housing Ltd has built upwards of 1000 houses and flats which are let to poor, large families. 'Churchill' houses are being purchased and adapted to let at low rentals to elderly people who need security with independence. Everything is done under episcopal authority and in co-operation with the parochial clergy and responsible chaplains. The C. A. work is also carried on in many other parts of the world and new fields have been opened up in Kenya and the West Indies. H.Q.: 55 Bryanston St, London, W.1.

Church Assembly, The, short title of the National Assembly of the Church of England, set up in 1920. During the 19th cent. when Parl. business greatly increased, a need was felt for machinery by which legislation affecting the Church could be dealt with so as to make less demand on time in Parliament. At the same time it was thought that the laity ought to have a voice in the councils of the Church. Proposals to this end by an Archbishops' Commission on Church and State, 1916, led to the passing of the Enabling Act, 1919, conferring powers on a National Assembly. The Assembly consists of a House of Bishops (the 43 diocesan bishops), a House of Clergy (identical with the Lower Houses of the Convocations (q.v.) of Canterbury and York sitting together), and a House of Laity, numbering about 350, elected by the lay members of the Diocesan Conferences. It meets 3 times a year for periods of 5 days at Church House, Westminster. Its meetings are public.

The C. A. is 'free to discuss any proposal concerning the Church of England and to make provision in respect thereof.' In any matter which requires legislation the Assembly proceeds by 'measures.' When approved by the 3 Houses, measures are submitted to the Eccles. Committee of Parliament which then reports to Parliament on the legal aspects of the proposals. A measure then, unless withdrawn at this stage, is laid before Parliament, and a vote is taken in both Houses as to whether it shall be presented to the Crown. A measure has the force of law on receiving the royal assent. The C. A. may also make resolutions on any matter of religious or public interest, but it may not make any statement purporting to define the doctrine of the Church of England. The long-standing powers of the Convocation are safeguarded, and it is laid down that the Assembly may not 'exercise any power or perform any function distinctively belonging to the bishops.'

The Church of England has thus been enabled to secure many long desired measures of reform. New bishoprics have been created, a clergy pensions scheme inaugurated, statutes of cathedrals revised, the laws of patronage reformed, disciplinary measures passed, and the parochial system reorganised.

The abortive attempt to revise the Prayer Book is described under PRAYER, BOOK OF COMMON (q.v.). The C. A. has set up a number of councils to administer various branches of the work of the Church. These councils co-ordinate the work of many voluntary bodies in their respective spheres. Among them are councils for Women's Church Work, the Care of Churches (i.e. fabric), Education, Moral Welfare, the Overseas Council, and the Social and Industrial Council. The Central Board of Finance is the Assembly's Treasury dept, and the Church Information Board its organ for press relations and publicity. The chairman of the Assembly is the Archbishop of Canterbury, the Archbishop of York being vice-chairman. The treasurer is the Rt Hon. Earl Grey, and the secretary Mr John A. Guilleum Scott. The offices are at Church House, Dean's Yard, Westminster, S.W.1.

Church Association, see CHURCH SOCIETY.

Church Brief, see BRIEF.

Church Commissioners, set up by the C. C. Measure, 1947, to unite Queen Anne's Bounty (q.v.) and the Eccles. Commissioners, and to exercise the functions of both bodies. Eccles. Commissioners were founded by Act of Parliament in 1838 following reports of 2 Royal Commissions recommending reforms for radical improvements in the Church's temporal affairs. By an Act of 1840 they were given power to suppress redundant offices and to create from the endowments a common fund for the benefit of parochial clergy. To-day the C. C. include the archbishops and diocesan bishops, 3 Church Estates Commissioners, representatives of deans, other clergy and laity appointed by the Church Assembly, nominees of the Sovereign and the Archbishop of Canterbury, certain officers of State, and representatives of the cities of London and York and the univs. of Oxford and Cambridge. The commissioners deal with payment of permanent income and pensions to bishops and clergy of the Church of England, and central administration for pastoral reorganisation and for provision, maintenance, or sale of parsonage houses and sales and leases of glebe land. They make grants to augment the incomes of the clergy, also for parsonage houses, endowment of new parishes, and church buildings in new housing areas. Their revenues are derived from agric. and urb. estates, largely the auct. estates of bishoprics, chapters, etc., and from securities. The gross income of the general fund in 1954-1955 was £10,529,490, of which 80 per cent was applied towards the stipends of the bishops and some 12,000 of the clergy. The C. C. have done much, assisted by diocesan boards of finance and certain voluntary societies to provide the worst paid clergy with better incomes. Very few benefices are now worth less than £550 per annum, whereas early in the cent. there were hundreds worth less than £250. The offices of the C. C. are at 1

Millbank, Westminster, SW1. A report is pub. annually.

Church Congress. A gathering of both ministers and laymen of the Church of England was annually convened for free discussion of questions concerning Church and State from 1861 onwards. Since 1919 the meetings of the Church Assembly (q.v.) have performed the same function, and C. C.s are no longer held.

Church Councils, see COUNCILS, CHURCH.
Church Enabling Act, short title of an Act passed in 1919 setting up the Church Assembly (q.v.).

Church History falls into 3 periods: auct., medieval, and modern: (1) The first period begins with the descent of the Holy Ghost upon the Apostles (Acts ii. 1-11), who then went forth to preach the gospel. They immediately began to baptise converts in large numbers, at first only Jews or proselytes, then Samaritans; but Gentiles also were included after St Peter (q.v.) had received Cornelius and his household into the Church (Acts x). St Paul (q.v.) was the prin. evangelist of the pagan world in the course of his missionary journeys (c. AD 48-58). The question at once arose whether Christians had first to become Jews by circumcision before baptism (q.v.), and observe the law of Moses as well as that of Christ. St Paul strenuously opposed this, maintaining (cf. Galatians) that we are saved by faith in Christ, not by the works of the Mosaic law; and so it was decided by the Apostolic Council at Jerusalem in 50 (Acts xv). Jewish hatred and intrigue helped to turn the Rom. gov. against the new faith as a *religio illicita* (an unlawful superstition). Persecution was severe under Nero (64), Domitian (85-96), and Trajan (98-117), whose correspondence with Pliny on the subject is famous. Before Decius (249-51), however, it was only spasmodic and ineffectual, while under Hadrian (117-38) and Antoninus Pius (138-161) the church was regarded as negligible and enjoyed a measure of toleration, being allowed to form funerary associations and poor men's guilds. But from 250 the Church with its hierarchical constitution and systematised worship, was considered a grave menace to the military and religious policy of the empire. Widespread massacres began, and continued until the abdication of Diocletian (305) after desperate but futile efforts to exterminate the whole Christian society. The accession of Constantine (q.v.) in 313 brought peace, for he extended to Christianity all the rights and privileges hitherto enjoyed by paganism alone. But it was not until the reign of Theodosius the Great (379-395) that Christianity was finally made the one and only religion of the state.

During these cents. the Church was growing not only externally by conversions, but also internally by a clearer definition of its faith, and by the development of its liturgy, discipline, and constitution. The first of these chapters, the growth of the Creeds (q.v.), is largely the story of the struggle with heresy, and of the oecumenical councils.

Meanwhile, since the early years of the 3rd cent., the conversion of the heathens in the E.—Arabia, Persia, Armenia—and on the N. and W. confines of Rom. territory had been making continual headway; so that before the great migrations of the 4th cent. the Goths and other Teutonic peoples were already Christians. In Persia and elsewhere, political persecution, and later the force of Islam, wiped out all traces of Christian proselytes. But in the W. the effect of the barbarian invasions was to endow the bishops with much of that social and moral power formerly wielded by Rom. officials; so that the Church came to be regarded as heir to the majesty and influence of anct Rome.

To Britain Rom. soldiers brought the Christian faith perhaps as early as the 1st cent. There is no historical value in the legends of Glastonbury (q.v.). St Alban (q.v.) is traditionally Britain's first martyr; and 3 bishops (London, York, and probably Lincoln) attended the Council of Arles in 314. But the Romano-Celtic Church was overwhelmed in England by the A.-S. invasions, though it survived in the W., and especially in Wales (see CENYDD; DAVID; DYFRIG; ILLTYD; SAMSON; TEILO). St Patrick (q.v.), himself of Celtic origin, estab. the Church in Ireland about the mid 5th cent. In 596 St Gregory the Great (q.v.) estab. Christianity in S. England through a mission led by the Benedictine St Augustine, who became first Archbishop of Canterbury. But before this, St Columba (q.v.) and other missionaries from the Celtic Church in Ireland had settled in Iona, off the W. coast of Scotland (563) and begun the evangelisation of the N. (see ADAN, ST). The 2 missions, from Ireland and Rome, had different characteristics. The Romans estab. a highly developed diocesan organisation under the bishop; the Celtic had no such organisation, the abbot being the centre of authority; it grew by the estab. of branch houses, as Lindisfarne sprang from Iona, bishops merely performing the functions of confirmation and ordination.

But the Church in Britain was now delivered from isolation and brought within the influence of the papacy which was to be the main civilising power in Europe for cents. to come. The next 250 years saw vigorous growth. The nation was still divided into separate kingdoms, but the Church was one and played a major part in its unification. She produced scholars of European reputation in Bede (673–735), Alcuin (c. 735–96), and Alfred the Great (848–99). Her vitality expressed itself also in missionary activity in N. Europe, pre-eminently by St Boniface (q.v.) of Crediton (c. 675–754), the apostle of Germany.

(2) There were in the 8th cent. 2 great forces which seemed likely to swamp Christendom, Mohammedanism and the idolatry of the Saxons and other barbaric hordes. But the Gallic conqueror, Charles Martel, by his victory at Tours in 732, effectually checked the Saracens in the W., whilst a 32 years' war (772–804)

at last enabled Charlemagne to subdue the Saxons, their conversion to Christianity being achieved by the building of tns and castles and the foundation of missions and monasteries. With Christianity once firmly estab., the medieval hist. of the Catholic Church becomes the story of the rapid consolidation of the papal power and its lengthy struggle with the Holy Rom. Empire, and into an account of the movements of reform which arose in the church itself, and also of various strivings after other forms of religion and worship which later began to stir in the W. world.

From 730 eccles. lawyers believed and spread the fable of the Donation of Constantine (q.v.), but what contributed far more to the confirmation of the Pope's authority was the severance in 1054 of the W. from the E. church. The Monophysite (484–519) and other schisms had much to do with this rupture, but its real cause was the refusal of the bishops of Constantinople to submit in any way to the Rom. See (see CERULARIUS; EASTERN ORTHODOX CHURCH; FILIOQUE; PHOTIUS). The great monastic orders, Benedictines, Dominicans, and Franciscans, kept burning during the Middle Ages the lamp of anct science and culture. From the 4th cent. onward, monasticism had continually gained new ground. The conventual life, indeed, was in part a revolt against contemporary society, with its wars and lusts and manifold corruptions, and it was ever a bulwark of the church. Thus from the monastery of Cluny (q.v.), founded in 910, there came what were known as the Cluniac reforms, the reorganisation and cleansing of eccles. offices, and above all the emancipation of the church from state control. Yet, in spite of new orders, reformed clergy, and the work of men like Gerbert, Lanfranc, and Anselm, the marriage of clergy, and evils like simony, and the selling of benefices continued. But for a time the papacy triumphed. From 1048 to 1268 Europe was divided in the famous struggle between Pope and emperor. In 1073 St Gregory VII (Hildebrand) secured at Canossa the complete humiliation of Henry IV, but lay investiture, which formed the substance of the quarrel between St Thomas Becket and Henry II, was not finally settled by compromise until 1122. In England, the Norman conquest had greatly increased the church's influence; but William I had carefully limited the Pope's authority to issue bulls, promulgate canons, and censure his barons, without royal permission. The next cents. saw the tension increased by the quarrels between Henry I and St Anselm, and Henry II and Becket, the long dispute about the appointment of papal legates who tended to undermine the Eng. archbishop's authority, the quarrel between King John and Innocent III, and the anti-papal legislation of Edward I.

Meanwhile in Europe generally, during the pontificate of Innocent III (1198–1216) the papal power attained the summit of its glory, and up to the death

of Boniface VIII (1303) its supremacy was almost unquestioned, for the 4 crusades (1095-1202) (q.v.) had greatly enhanced its reputation.

In the light of modern hist., the struggle between Pope and emperor seems a fatal disaster; for the former, by stirring up the It. cities against the latter, postponed for cents. the consolidation of the Ger. states into a united kingdom. The prevalence of pious frauds; the growth of corruption within the Church; the so-called Babylonian captivity, when the popes resided at Avignon (1305-77); and above all, the schism (1378-1409), when there were rival popes at Rome and Avignon, disabused men's minds of the conception of a World Church and a world empire mutually dependent and working in harmony. In England the papal residence at Avignon during the Hundred Years War, and the intrusion of foreigners, especially Frenchmen, into Eng. benefices, caused resentment. Thinkers everywhere revolted against the conclusions of scholasticism, as also against the persecution of the Waldenses and Albigenses (1207 and 1229), and later, of the Hussites and Lollards. The lowered esteem for the schools of philosophy, the laxity among the clergy, and the growth of nationalism, combined with the changed attitude towards the papacy to prepare the way for a new age. With the Renaissance came also the Reformation to open up a new era in C. H.

(3) With the coming of the Reformation, W. Christendom lost its unity. As the direct outcome of the preaching of Luther, Zwingli, Melancthon, and Calvin (q.v.), Protestantism was estab. in opposition to the older Christian Church. For a detailed account of this struggle, see REFORMATION. Lutheranism, which flourished in Scandinavia and Germany, was too conservative of monarchical principles and Rom. ceremonies to retain a lasting hold in other European countries. Here, and especially in S. Germany, Switzerland, Scotland, and the Netherlands, the Calvinistic or Reformed Churches sprang up; their congregations were organised on a thoroughly democratic footing which commended itself to men of radical leanings, while the rigidity of its intellectual doctrine appealed to men of sterner mould and in general to the colder character of the N. In Germany it was only after the peace of Westphalia (1648) that Protestants other than Lutherans won freedom of worship.

The reaction against Protestantism, or the Counter-Reformation (q.v.), as it is called, was led everywhere by the Society of Jesus. Beginning in Bavaria (1563), it swept through S. Germany, and appeared in France during the 16th cent., and did not finally lose its impetus till after 1650. The study of C. H. up to this point developed in the following way. Our earliest documents consist of the N.T., and scraps of information in the writings of the early fathers. In the 2nd cent., Hegesippus, a Jewish Christian who wrote of the early church, was the author of a treatise in 5 books, but only a few

fragments remain. Eusebius of Caesarea, who wrote early in the 4th cent., is known as the father of C. H. He gave an account of the church of the first 4 cents., and his work was continued in the next cent. by Socrates, Sozomen, and Theodoret. All these wrote in the E., whence no important church historian by Nicephorus Callistus (14th cent.) has arisen since. Rufinus trans. Eusebius into Latin, and fresh sequels were added by Theodorus Lector, Evagrius, Theophanes, etc. A trans. of Socrates, Sozomen, and Theodoret was made by Cassiodorus in the 6th cent., and this *Historia Ecclesiastica Tripartita*, formed the medieval text-book on the subject. Other church historians, in early times, were Sulpicius Severus, Jerome, Idatius, Prosper, Victor Tununensis, Isidore of Seville, Gregory of Tours, Bede, and Paulus the Deacon, and in the later Middle Ages, Haymo of Halberstadt, Anastasius, Ordericus Vitalis, and Otto of Freising. The greatest, however, was the Dominican, Antoninus of Florence (archbishop, 1446-59), whose work is often modern in outlook. After the Reformation C. H. was at first largely polemical. The *Magdeburg Centuries*, a Lutheran attempt to show the primitive nature of Protestantism, called forth the *Annales Ecclesiastici* of the Rom. Catholic Baronius, followed by Alexander Natalis (Noel), Bossuet, Tillemont, etc. The scientific and critical era of C. H. began with the German Mosheim, who was followed by a host of others, Catholic and Protestant. From the Reformation onwards the hist. of the church cannot be set forth in a connected narrative. Thenceforward we must speak of the various Christian bodies by the names that distinguish them. See ADVENTISTS; ANGLICANISM; ARMENIAN CHURCH; BAPTISTS; CALVINISM; CATHOLICS, OLD; CHURCHES IN THE UNITED STATES OF AMERICA; COPTS; COUNTER REFORMATION; EASTERN ORTHODOX CHURCH; ECUMENICAL MOVEMENT; ENGLAND, CHURCH OF; FRIENDS, SOCIETY OF (Quakers); HUGUENOTS; JACOBITES; LUTHER (Lutheranism); MARONITES; MELCHITES; MENNONITES; METHODISM; MISSIONS; MORAVIANS; NESTORIANS; NON-CONFORMITY; NON-JUDS; PRESBYTERIANS; REFORMATION; ROMAN CATHOLIC CHURCH; SALVATION ARMY; SCOTLAND, CHURCH OF; UNION OF THE CHURCHES; WALDENSES; WORLD COUNCIL OF CHURCHES. Church Lads' Brigade, founded in 1891 to make lads faithful members of the Church of England or other Episcopal Church in communion with it. The C. L. B. works in many parishes under the incumbent and lay leaders, using uniform and drill to instil discipline. The movement has spread through the Commonwealth and has provided many clergy from its ranks, two of whom hold the V.O. Camps are held, badges are awarded for many worth-while activities, and training is given in good citizenship. The H.Q. are at 58 Gloucester Place, London, W.1.

Church Missionary Society. This society, founded in 1799, was a direct result of the Evangelical Revival of the 18th cent. The Church of England as a whole was suspicious of the evangelicals and 'their busy zeal about salvation, the slave trade, and a thousand other matters best left alone' (Trevelyan). The 20 or so founders of the C. M. S. had therefore no support from eccles. authority, in spite of the close association with the affairs of the new society of such men as Wm. Wilberforce and Charles Grant. Africa and the E. was the C. M. S. objective at a time when Africa was nothing but a few names on the edge of the map and Asia was almost entirely closed to any missionary enterprise. W. Africa was the first sphere of work overseas. There are now over 1000 C. M. S. missionaries, including some 70 former missionaries of the Church of England Zenana Missionary Society (amalgamated with the C. M. S. in 1957). They work in E. and W. Africa, in the Middle E., India, Pakistan, Hong Kong, Japan, and Malaya. They include clergy, doctors, nurses, physiotherapists, and other specialised medical workers, men and women in various branches of education, agriculturists, and a number engaged primarily in evangelistic and social service. With them are associated over 900 clergy and more than 30,000 lay workers who are nationals of Africa and Asia. To-day, in most parts, the leadership of the Church is largely in the hands of the nationals of the country. These have been appointed principals as well as members of staff of many Christian institutions. The training of teachers is, however, still a key task for missionaries of the society, as are new experiments in methods of Christian education. C. M. S. missionaries also continue to pioneer in medical and social services. A further commitment is in the care of students from overseas who, having been educ. in its schools, come to England for further study. The society's vice-patron is the Archbishop of Canterbury. Its president is a layman and it is governed by a democratic, representative committee system. It has given whole-hearted support to the Church of S. India and plays a full part in the movement towards the reunion

of the churches (see UNION OF THE CHURCHES). Many C. M. S. missionaries are now at work in union institutions in which sev. denominations or societies co-operate, notably in the training of ministers, teachers, and doctors. At home the society seeks through a variety of means in meetings, through literature, films, exhibits, and other visual aids to make known the needs and opportunities overseas. Its monthly magazine is *Outlook*. H.Q.: 6 Salisbury Square, London, E.C.4. See also MISSIONS, Protestant.

Church of England, see ENGLAND, CHURCH OF; see also ANGLICANISM.

Church Rates, tax formerly levied in England and Ireland on all occupiers of land within the par. to pay for celebration of divine service and the preservation and repair of the church fabric. The tax was assessed by the par. vestry on the property of each tenant. Since the Compulsory Church Rates Abolition Act of 1868, maintenance of the churches has depended entirely on voluntary contributions.

Church Society, originally known as the Church Association, founded 1865, with the object of 'maintaining the principles and doctrines estab. at the Eng. Reformation and of preserving the purity of Protestant worship in the Church of England. . . . A strong Low Church body, it has formed a Protestant electoral association in many of the parl. bors. and divs. of England. It publishes through the Church Book Room Press Ltd. Address: Dean Wace House, 7 Wine Office Court, London, E.C.4. See *Official Year Book of the Church of England*.

Church Stretton, mkt tn and health resort of Shropshire, England, 13 m. from Shrewsbury and 182 m. from London. It is picturesquely situated on the slopes of Longmynd, at an altitude of 700 ft. Pop. 3600 (1953).

'**Church Times**,' founded in 1863 by G. J. Palmer and still remaining in the Palmer family. Miss Rosamund Essex is editor. It is a general and eccles. newspaper, following the High Church tradition of the Church of England. It carries home and overseas Church news, reviews, political comments, and special articles.

Church Union, originally known as the English Church Union, formed in 1859 as a consequence of the Protestant riots at St George's-in-the-E., its purpose being to maintain unimpaired the doctrine and discipline of the Church of England against Erastianism, Rationalism, and Puritanism, and, further, to rope any attempts to seize the Church endowments for secular purposes and resist all attacks on the Church's marriage laws. The organ of the C. U. is the *Church Observer*. Its offices are at Lord Halifax House, 6 Hyde Park Gate, London, S.W.7.

Churches in the United States of America. The early hist. of the C. in the U.S.A. is bound up with the struggle between the Puritans and the clergy sent out from England. But see also ROMAN CATHOLIC CHURCH, *In the New World*.

The greatest achievement of the Puritans was the settlement of New England.

After the arrival of the *Mayflower* there was a bitter conflict between the Separatists and those who still regarded the Church in England as their authority in matters of religion. The non-Separatists included men like John Harvard, founder of Harvard College, but the majority of Puritans in America wished to separate on principle not only from corruptions in the Church but from a Church which tolerated corruptions. Independent or Congregational principles prevailed among them, each congregation being an independent brotherhood bound together by a mutual covenant. The Church or congregation was the source of whatever authority there was, and the community was theocratic. Discipline was rigorous, no distinction being made between sin and crime, and maypole revels and keeping Christmas were penal offences. Throughout the 17th cent. the Puritans were in the ascendancy, gave no toleration towards those who disagreed with them, and were jealous of their hard-won privileges. Early there were conflicts of opinion with the Anabaptists, who, however, differed little from the Congregationalists except over infant baptism. The first Baptist Church in America was founded at Providence by Roger Williams, an extreme Separatist who, as an advocate of toleration, wrote a tract, *The Bloody Tenent of Persecution*, which was answered by Prynne. In his enthusiasm for toleration Williams founded the colony of Rhode Is. (1644) to further it. At least twice Charles II. intervened in favour of toleration for Separatists in America, once for the Anabaptists and again for the Quakers, who were accused of defying all civil authority. A royal letter of 1661 requesting that corporal punishment of Quakers should cease gave them relief, but their zeal was so provocative that the respite proved temporary. This was not true of Pennsylvania, where, through the initiative of Wm Penn, there was freedom of conscience. Apart from the Jesuits, the Moravians were the only influential missionary agency up to 1800, though the Society for the Propagation of the Gospel (S.P.G.) had over 50 missionaries distributed over New England, New York, New Jersey, Pennsylvania, Carolina, and Georgia, who ministered not only to the colonists but also to the Negroes and Indians.

The most important religious event in the 18th cent. was the Great Awakening (1735-60). This was a Pietistic movement which preceded the arrival of the Wesleys, led by the famous preacher Jonathan Edwards, whose book, *A Faithful Narrative of the Surprising Work of God*, so strangely influenced John Wesley himself. Methodism proper did not begin in America until 30 years later, the first Methodist bishop being Francis Asbury, whom Wesley sent out in 1771. It spread quickly and is said to be to-day the most powerful religious body in the U.S.A. The most remarkable influence in the Great Awakening was the emotional preaching of George Whitefield, and it is frequently said that no one ever preached

to such vast crowds or received such popular adulation as Whitefield did in America. Wesley's first visit to Georgia, in 1735-7, had been a failure because of his insistence on baptism by immersion, his refusal of sponsors who were not communicants, his rejection of dissenters except on re-baptism, and the personal nature of his sermons, all of which things alienated the settlers and eventually brought him into conflict with the Moravian brethren. However, during the War of Independence Rationalism spread from Europe to America. Tom Paine's *Age of Reason* had great influence in the U.S.A. Its Voltairian cynicism in expounding the common Deist objections to the Bible was calculated to appeal to the more uneducated type of colonist grown discontented under the anarchy of *laissez-faire*, and sympathetic towards Fr. opinions because of the interest shown by France; Paine was popular too as having fought for the colonists in the War of Independence. The way had also been prepared to some extent by the Universalists, whose movement had begun a decade before, but was first organised on a definite basis some 30 years later, when the parent body was estab. in Massachusetts. Universalism as expounded by Hosea Ballou, an excommunicated Baptist, assumed the final salvation of men and denied the Trinity.

There is no estab. Church in the U.S.A. The constitution expressly provides 'that Congress shall make no law respecting an estab. of religion or prohibiting the free exercise thereof.' Nevertheless there is a considerable province of the Anglican Church (see ANGLICANISM) in America, called the Protestant Episcopal Church. Anglicanism, however, had a hard struggle in New England, where in the 17th cent. the colonists were intolerant of it; and it was many years before the episcopal clergy from England obtained a permanent footing there. The Episcopal Church was, however, early endowed in Virginia, and also in Maryland. Early in the 18th cent. the S.P.G. kept episcopacy alive in America through their missions to the Indians in New York, and for most of the cent. supported over 300 missionary priests in the country, of whom, as we have seen above, Wesley was one. During the War of Independence episcopacy, which except in Connecticut had close ties with England, was openly attacked for that reason; and in the S. the existence of the Episcopal Church ceased. L. W. Bacon considers that the real revival of Anglicanism in America dates from the consecration of Bishops Griswold and Hobart in 1811. Bacon remarks that 'no fact in the external hist. of the Amer. Church at this period is more imposing than the growth of the Episcopal Church from nothing to a really commanding station.' See also CLERGY and CLERGY DISCIPLINE ACT. See J. Edwards, *Works* (8 vols.), 1806-11; A. Andrews, *Genealogy and Ecclesiastical History* (of First Church, New Britain, Connecticut), 1867; L. W. Bacon, *The History of American Christianity*, 1897; Platner and others,

Churchill, Charles (1731-64), clergyman and satirical poet, b. Westminster, the son of the rector of Rainham, Essex. His marriage at the age of 17 prevented his going to a univ., but he was prepared for the Church, and took orders in 1753. He became curate to his father in 1756, and when his father d., 2 years later, he succeeded him as curate and lecturer at St John's, Westminster. The Church, however, was not his vocation, and in 1763 he resigned his offices, probably under compulsion, for his disorderly conduct made it impossible to allow him to continue in them. Somewhat earlier he had looked to literature to supplement his meagre stipend, and in 1761 he pub. at his own expense, having failed to obtain a fair price for it from the booksellers, his theatrical satire, *The Rosciad*. This was at once successful, owing not only to its undoubted merits, but also to its numerous personalities. This was followed by other works, the best known of which is the *Apology*, all of them being distinguished by their robust satire and vigorous versification. C. now became acquainted with Wilkes, and wrote many papers for the *North Briton*, 1762-3. When Wilkes was arrested, after the issue of the notorious 'No. 45,' C. only escaped by his friend's ready wit. As a reply to Hogarth's caricature of Wilkes, he wrote the stinging *Epistle to Hogarth*, 1763; and when Martin forced a duel on Wilkes, he lampooned the aggressor in *The Duellist*, 1764. In Oct. 1764 he went to Boulogne to meet Wilkes, but was there taken ill and d. The best accounts of C. are by John Forster (*Historical and Biographical Essays*, 1858) and J. L. Hannay (prefixed to the Aldine ed. of the poet's works, 1866).

Churchill, John, see MARLBOROUGH, DUKE OF.

Churchill, John Spriggs Morse (1801-75), medical publisher who founded, 1825, the firm which still flourishes under his name. It was carried on by the next 2 generations of C.'s until A. W. C. d. in 1948. In 1934 it was made into a public company.

Churchill, Odette, see HALLOWES.

Churchill, Randolph Henry Spencer, more commonly known as Lord Randolph Churchill (1849-95), politician, the third son of the 6th Duke of Marlborough, and educ. at Eton and Merton College, Oxford, where he showed great intellectual powers. In April 1874 he married the daughter of Leonard Jerome of New York, and in the same year he was returned for Woodstock as the Tory member. In 1878 he attacked bitterly what he described as the 'old gang' of the Tory party, though he generally supported the policy of the Conservative Gov. The crushing blow which the Tories received at the general election of 1880, however, led to the formation of the Fourth party (q.v.). This party, founded and led by Lord Randolph, had for its object the vindication of

Conservative principles and the harassing of the 'old gang,' especially Sir Stafford Northcote. By this time C.'s speeches throughout the country had obtained for himself prominence as a politician and leadership in his own party. He began to advocate openly his principles of 'Tory democracy.' In Salisbury's first administration he was secretary of state for India. After the defeat of the Home Rule Bill and the disintegration of the Liberal party, he became chancellor of the Exchequer and leader of the House of Commons. His resignation in 6 months was due to his inability as chancellor to acquiesce in the vote for supplies for the army and navy, and he probably thought that the mere threat of resignation would bring the gov. to their knees. He was mistaken; his resignation was accepted, and the ministry continued and flourished. After this period he played no very active part in politics. His son, Winston Spencer C. (q.v.), wrote his life, 1906.

Churchill, Winston (1871-1947), Amer. author, b. St. Louis, Missouri. He graduated from the U.S. Naval Academy in 1894, but did not pursue a naval career, turning instead to editing the *Army and Navy Journal* and the writing of novels dealing with Amer. hist. and politics, in which he was very successful. He was a member of the New Hampshire State Legislature from 1903 to 1905. He formed an association called the Lincoln Republican Club to reform local politics, but the club was dissolved after C. had vainly sought to become governor. As he and the well-known Eng. statesman had the same name, were of about the same age, and both had written books, many people often confused them. Apropos of this, the Englishman once wrote an amusing and charming letter to his Amer. namesake. The Amer. novelist's best-known books are *The Celebrity*, 1898, *Richard Carrel*, 1899, *The Crisis*, 1901, *The Crossing*, 1904, *Coniston*, 1906, *A Modern Chronicle* (a study of the conflicts between ideals and realities), 1910, *The Inside of the Cup*, 1913, *A Far Country* (on corrupt local politics), 1915, and *The Drelling Place of Light*, 1917. After 1917 he went into retirement amid the New England mts, and wrote only one more book, *The Uncharted Way*, 1941.

Churchill, Sir Winston Leonard Spencer (1874-), statesman, soldier, and historian, eldest son of Lord Randolph C. (q.v.), b. 30 Nov. at Blenheim Palace. He was educ. at Harrow and Sandhurst, and entered the army in 1895. During the Sp.-Amer. war he served with the Sp. forces in Cuba. Between this date and the ending of the S. African war in 1902 he saw much active service: fighting in India, Egypt, and finally S. Africa. During the latter war he acted as the war correspondent of the *Morning Post*. On 15 Nov. 1900 he was taken prisoner by the Boers, but within a month succeeded in making his escape. In 1899 he contested Oldham in the Conservative interest. He won it the following year, at the 'khaki election,' and held it for

nearly 6 years. When Chamberlain's Tariff Reform was launched in 1903, C. was one of the active opponents of any change in the fiscal system. At the election of 1906 he won NW. Manchester in the Liberal interest. He had in the meantime been appointed under-secretary of state for the colonies in the Campbell-Bannerman administration, and proved one of the bitterest of opponents to the Conservative party. In 1908 he became president of the Board of Trade. He was, however, defeated at the by-election at that time necessitated by his appointment. He soon obtained another seat at Dundee. In 1910 C. was appointed home secretary. It was during his tenure of this office that C. had to deal with a serious strike in the S. Wales coalfield; and became a famous national figure as a result of his part in the Sydney Street affair (1911). He was home secretary for nearly 2 years, and was then appointed first lord of the Admiralty. In his pre-war work in that office he conferred frequently with Lord Fisher, then in retirement. The fleet's excellent state of preparedness on the outbreak of the First World War was due in great measure to C. On the recall of Lord Fisher to duty in Oct., he and C. projected a diversion in the E. The Dardanelles scheme was the outcome—later disapproved by Fisher. On Balfour taking the Admiralty, May 1915, C. became chancellor of the Duchy of Lancaster, but not being included in the War Cabinet, he resigned in Nov., and spent the early part of 1916 as lieutenant-colonel commanding the 6th Royal Scots Fusiliers in Belgium. It was during this period, when C. was out of office, that he first took up painting seriously, selling his pictures under the name of 'Charles Morin.' In July 1917 he succeeded Addison as minister of munitions. He was an outstanding success. He accelerated the supply in larger quantities of the requisite shells and other munitions for the final allied advance of 1918. His greatest triumph in this office was the organisation of tank construction on a large scale. At the armistice he became secretary for war and for air, and in that capacity he lent troops and other aid to the White or anti-Bolshevist armies in Russia. Here he has since incurred much criticism, but it must be remembered that the anti-Bolshevists had been allies of the Entente before the close of hostilities in the First World War and that there were still various isolated allied units in the Russian theatres which had to be evacuated. C. was secretary for the colonies from early in 1921 until the coalition fell in Oct. 1922, and again there fell to him tasks of great urgency by way of aftermath of the First World War. In Ireland he pursued a vigorous policy during the Sinn Féin outrages of those years and advocated reprisals. Subsequently, however, the Cabinet reversed its policy and made terms with Ireland. C. taking a prominent part in the settlement made with the newly created Irish Free State. At the Colonial Office, too, C. had much to do with the setting up

of the mandatory rule of the Brit. Gov. in Iraq—a name substituted by C. himself for Mesopotamia as more in consonance with hist. and present boundaries—and in Palestine. In the general election of Nov. he lost his seat at Dundee to the Labour party, whom he had antagonised by a circular on military action in case of a general strike, which was characterised by his Socialist opponents as a strike-breaking device.

Subsequently C. stood for W. Leicester, and was again defeated by Labour. He

Karsh, Ottawa

SIR WINSTON CHURCHILL

dissented from the Liberal-Labour agreement to throw out the Baldwin gov., and stood as an independent candidate in a by-election in the Abbey div. of Westminster, but was defeated by the official Conservative. Back again at the parting of the ways, he stood as a Conservative in the general election of Oct. 1924, and was elected for Epping. Baldwin made him chancellor of the Exchequer, and he so remained while Baldwin's ministry lasted. During the general strike of May 1926, C. ed. the gov. newspaper, the *British Gazette*. His budgets showed a gradual drift away from Free Trade, preserving and extending 'safeguards'; his last, 1928, was coupled with derating. Out of office once again, he was the chief critic of the National Gov.'s policy on the question of Indian autonomy; but in these ensuing years he is best remembered now for his repeated warnings on the rate of Ger. rearmament, to which he never ceased to direct the attention of the gov. and the nation, but with little effect until it was

too late. He was out of office from 1929 until the outbreak of the Second World War in 1939, when Chamberlain, bowing to popular demand, appointed him first lord of the Admiralty. In this office his influence was immediately felt in the steps taken to combat the submarine and mine menace—a task he had shouldered in the previous war under equally difficult circumstances. This was his old place in the Imperial War Cabinet during the First World War, but in the Second World War he became also head of a committee composed of the heads of the fighting services. The collapse of the Norwegian campaign early in May 1940 brought about the fall of Chamberlain after a dramatic debate (8 May), in which C. chivalrously supported his chief; but, while the gov. was nominally sustained by a majority of 81, it was obvious that when only 252 of 365 Conservatives in the House voted for the gov. the vote was in effect a heavy moral defeat for Chamberlain (q.v.). Chamberlain first tried to restore the gov.'s position by broadening the basis of his ministry, but Labour refused his offers. When he resigned on 10 May C., who in his career had held nearly every great office of state, at length achieved that of Prime Minister, combining the post with that of minister of defence.

Never was popular trust more justifiably reposed in a national leader; for C., then in his sixty-sixth year, was setting out on a brilliant tenure of 5 years during which his incomparable gifts as a statesman and strategist were seldom at fault, and when the greater the disasters which befell the allied arms the more surely did he rise to every occasion—always the buoyant spirit inspiring a whole people with his own resolution and unswerving confidence in the ultimate issue. It was a tenure which, beginning in the bitter prospect of 'blood, toll, tears, and sweat,' ended in the blaze of victory only to be followed by the defeat of the gov. a few weeks later by the resumption of party strife and the defeat of the Conservative followers of C.—a reversal of fortune which was in no way a reflection on C.'s leadership, but the normal reaction consequent on the break-up of a coalition, the dominant party of which had been the Conservatives. Disasters soon came after C.'s assumption of office, for the country was almost entirely unprepared for a major war; but, in the midst of disaster, came the epic of the Dunkirk evacuation when C., tempering triumph with realism, warned the nation that 'victories were not won by evacuations.' In his new Cabinet of five (himself, Halifax, and Chamberlain representing the Conservative majority, with Attlee and Greenwood as representatives of Labour) C. continued to act as co-ordinator of the service departments in the capacity of minister of defence. More than the change in personnel, however, was the change in spirit, the new spirit which C. himself infused into the gov. and the nation. 'Victory at all costs; victory in spite of all terrors; victory, however long and hard the road may be, for without victory there is no

survival.' In Oct. 1940 C. accepted the leadership of the Conservative party, relinquished by Chamberlain.

The realism and effectiveness of C.'s policy in times of deepest stress and anxiety manifested itself after the collapse of France, in the face of the armistice concluded by Pétain (q.v.), which C. heard of with emotions of 'grief and amazement,' the 'terms of which might well strike a fatal blow at France's former ally.' For the Brit. Gov.'s acquiescence, albeit reluctant, in France's negotiation of a separate peace had been accompanied by one vital condition—that the Fr. fleet should be sent to Brit. ports and remain there during the negotiations; but in the result the Fr. fleet was preparing to go over to the Germans and to resist Brit. action to turn it from that course. At the battle of Oran, C.'s gov., having formally severed relations with the Pétain gov., succeeded in thwarting German hopes of acquiring this fresh accession of naval power (see NAVAL OPERATIONS IN THE SECOND WORLD WAR). Britain now had to fight on alone as 'the sole champions now in arms to defend the world cause.... We shall do our best to be worthy of that high honour' (C. on 17 June). And always, throughout the darkening hours, C. would make some characteristic utterance which will survive in the language—as, for example, in the Battle of Britain (q.v.), 'Never in the field of human conflict was so much owed by so many to so few,' in reference to the bravery of the Brit. pilots. C.'s most striking contribution, strategically, to the victory of the Allies probably lies in his Mediterranean strategy. He appreciated that the line through the Middle E. was the vital artery of the Brit. Empire; whence his anxiety to render harmless the Fr. fleet at Alexandria; whence, too, the 100 per cent reinforcements which the Brit. Mediterranean fleet received at the beginning of Sept. 1940 and his bold decision to send to the Middle E. Britain's one armoured div. The loss of Cyrenaica early in 1941 was a sore disappointment to C., the Brit. generals on the spot having underestimated the weight of the coming Axis blow, and when ultimately Rommel (q.v.) reached Egypt, C. acted with dramatic firmness. Always bold, he decided that Crete should be defended, it being his belief, erroneous as it transpired, that 'we had a good chance of winning the battle.'

Then C., faced with the seriousness of Britain's situation owing to the decline of shipping through heavy losses in the so-called battle of the Atlantic, called, in June 1941, on America for 'a gigantic building programme as the only true remedy,' and he did not appeal in vain; for, as C. had always said, 'if America would give them the tools, they would do the job.' C.'s relations with Roosevelt were, in the early years of the war, those of perfect mutual understanding and confidence. Towards the period when German relations with America were growing more difficult owing to Roosevelt's policy of resistance far beyond America's territorial

waters, he and C. met on a warship in the Atlantic when, as the result of the famous if somewhat impracticable Atlantic Charter (q.v.), Amer. policy took a vital step forward. If the principles of the charter hardly came up to allied hopes, which indeed in the circumstances looked for a programme of immediate action, the charter's long-range policy of appealing to the conquered nations with the presentation of a programme to which they could rally as active allies of the democracies was well conceived. And at least C. could announce that Roosevelt had made it the joint purpose of America by decisive military victory to prevent another war, and that together they had 'jointly pledged their countries to the final destruction of Nazi tyranny,' a statement which was borne out by the President's subsequent course in speech and action. In a memorable invocation to the conquered after the Atlantic conference, C. said: 'Help is coming. Mighty forces are arming in your behalf. Have faith. Have hope. Deliverance is sure.' Memorable will always be C.'s prompt pledge of all aid to Russia made immediately on receiving intelligence that the Wehrmacht had invaded Russia, an offer more striking in view of C.'s unchanged views concerning Communism.

Again, when there were indications in Oct. 1941 that Japan was making preparations for further expansion in China, and before America had issued orders to withdraw the few Amer. marines then still in China, C. had promised immediate support if the U.S.A. should become involved in war with Japan. A month later C., accompanied by a staff of military and technical advisers, had arrived in Washington to confer with Roosevelt on their common defence so as to secure unified direction in the different theatres of operations and co-ordination between the various sectors of the far-flung battle fronts. The 'Pacific war' began disastrously for the Allies. In June 1942 C., with the Brit. chief of the general staff and other military authorities, made his second visit to America, for the express purpose of discussing the strategic situation with Roosevelt direct. Under C.'s lead the Brit. aerial effort against Germany was now growing apace, as was shown, for example, on the night of 30 May 1942, when over 1100 planes were concentrated in a mass attack on Cologne. This was followed by great daylight sweeps which further demonstrated the growing power of the R.A.F., a development which lent force to C.'s grim forecast that 'as the year advances Ger. cities, harbours, and centres of war production will be subjected to an ordeal the like of which has never been experienced by any country in continuity, severity, or magnitude.'

Difficult as was the path of the gov. in these fateful early years of the war it is possible to see the beginnings of the turn of the tide in C.'s decision to appoint Alexander as supreme commander in the Middle E. and Montgomery as commander of the Eighth Army (q.v.).

He had taken advantage of his visit to Moscow to investigate the situation in the Middle E. At the conference in Moscow, held early in Aug., C. with Stalin, together with various military leaders, had a 4-day discussion on strategic plans. C.'s changes in the Middle E. commands were soon followed by the remarkable Brit. victory at El Alamein (23 Oct.-4 Nov.), truly, with the concurrent battle of Stalingrad, the turning point of the war, though C. was quick to point out that the struggle was as yet far from over. In the matter of the 'second front,' it had been agreed between Britain and America to postpone an attack on Europe and to undertake an expedition to N. Africa, but it was left to C. to explain this delay to Stalin and to gain his acquiescence. One reason for the postponement was no doubt the increasing success of the Ger. submarine campaign. But, as C., in his report on the Casablanca Conference (Jan. 1943), had said, 'our duty to aid to the utmost in our power the magnificent, tremendous effort of Russia and to try to draw the enemy and the enemy air force from the Russian front was accepted as the first of our objectives once the problems of the U-boat war had been met in such a way as to enable us to act aggressively'—an assurance that was the key to all the plans and efforts of the Allies in the months that followed Casablanca.

C. fully supported the strategic task of night bombing imposed on the R.A.F., a policy that was certainly justified by its results. While at Washington in May 1943 C. took the opportunity of reassuring the U.S.A. that Britain's interests in the struggle with Japan were at least equal to those of the U.S.A. and that the British would wage war side by side with the Americans in accordance with the best strategic employment of their force—as full answer to those Amer. critics who were casting ill-founded doubts on Britain's readiness to aid America against Japan once Hitler had been beaten. C.'s strategical gifts were once again evident in the conduct of the campaign in Italy in 1943, though there were critics who (then, and subsequently) thought that valuable time had been lost between the fall of Mussolini and the delivery of the major assault on the mainland of Italy, a charge which C. vigorously refuted by the valid defence that the 'condition and the preparation of the landing craft were the sole and decisive limiting factors.' What is important to recognise is that C. never regarded the N. African operation and its sequel in Italy as a substitute for a direct attack across the Channel upon the Germans in France or the Low Countries, but only as an essential preliminary to the main attack on Germany and her ring of subjugated and satellite states. With C. and his advisers the second front existed and was a main preoccupation already with the enemy, and 'on the day,' he said, 'when we and our Amer. allies judge to be the right time this front also will be thrown open and thrown into play, and a mass invasion of the Continent from the W. and S. will begin—a promise

which was fulfilled in ample measure on D day in June the following year. Of all the conferences between C. and Roosevelt the Quebec Conference (which began on 11 Aug. 1943) was the most comprehensive; for then fundamental agreement on immediate ends was arrived at, including action in China, though once again, as at Casablanca, no Russian representative was present, the main cause of Stalin's impatience with his allies being the continued absence of a second front in W. Europe. In Nov.-Dec. 1943, however, Stalin, Roosevelt, and C. met at Teheran to discuss their common war policies. Shortly after this C. was taken gravely ill, but by Christmas was well enough to attend a conference of military commanders at Tunis.

In the flying bomb period, in 1944, C. scorned the idea that Parliament should transfer its location to some safer city and called upon all who had duties in London to remain at their posts. The internecine strife in Greece in 1944, coming on top of the political incidents in Italy of 1943, engendered in some political circles in Britain an idea that as victory was approaching C.'s policy was inclining to the support of politically bankrupt regimes in Europe as against the popular forces which had emerged; but the main preoccupation of C.'s gov. was to maintain order in Greece and safeguard the distribution of food supplies. But fighting still continued in Athens, and to restore confidence in the gov. C., with Eden, foreign minister, flew on Christmas Eve to Athens. The results of his visit, however, were less spectacular than the visit itself, though C.'s presence there restored the confidence of the GK people in Britain's good intentions. In this year (1944) C. also visited the battle front in France, and indeed it was a feature of his premiership that he was often overseas, whether at vital conferences or in theatres of war. On 10 Sept. C. went once again to Quebec to confer with Roosevelt, and there he and the President reached decisions on all points respecting the completion of the war in Europe and the destruction of Jap. power in the Pacific. Less than 3 weeks after his return from Quebec C. left England again for Moscow, accompanied by Eden and members of the general staff. This conference (Oct.) was the sequel to Quebec, the discussions concerning, chiefly, their common problems in E. Europe. In Feb. 1945 C. went to the important conference at Yalta, in the Crimea, where, with Roosevelt and Stalin, the Allies drew up a plan for the final defeat of Germany, and the occupation and control of that country after her unconditional surrender. The conference also reaffirmed the Allies' common determination to maintain in the peace the unity of purpose and action which had made victory certain; but in the sequel at Paris in 1946, many months after C. had resigned, it soon became evident that the policies of the W. democracies and Russia were entirely divergent. It was later clear, too, that the W. had been unintentionally weakened

by the fact that, towards the end of his life, Roosevelt had failed to give C. his whole-hearted support on a number of strategical matters, placing what would in retrospect appear to have been an undue faith in Stalin's disinterestedness in the internal affairs of the countries Russia was to 'liberate.' The ultimate delimitation of Germany's boundaries was considered by a 3-power conference at Potsdam on 16 July 1945 between C., President Truman, and Stalin, but certain changes had then already taken place, and in the Commons in Aug. 1945, after the change of gov., C., in the debate on the King's Speech, said, as to the results of that conference, that it would be impossible to conceal the divergence or view which existed about the state of affairs in E. and Middle Europe. Early in April (1945), as victory was approaching, the exchange of recriminations between Conservative and Labour ministers heralded the break-up of the coalition.

The end of war with Germany brought C. face to face with the question whether the time had come for a dissolution of Parliament or a general election. C. sounded the Labour leaders on the possibility of continuing the Coalition Gov. until the end of the war with Japan, but their response was unfavourable, though they were willing to remain in the gov. until the end of the session in Oct. On 25 May C. formed a new gov. (the 'Caretaker Gov.') almost exclusively of Conservatives. Parliament was prorogued on 15 June and immediately afterwards formally dissolved. In the ensuing election campaign C. toured the provs. and was everywhere greeted with unbounded enthusiasm; but his audiences in many cases made it evident that they intended to draw a sharp line between his personality and the policies advocated by his party. In London he toured certain critical constituencies, but while his reception was again most enthusiastic, the dissent from his political views was even more marked. It cannot be said that in this campaign C. really rose above the partisan, his broadcast address on 30 June on the relations between the Labour party executive and Labour ministers, and in particular on the influence of the Labour caucus, being all too reminiscent of the 'Zinoviev Letter' tactics of 1924. The results of the election disclosed a great victory for Labour. On 26 July C. resigned. In the debate on the Address from the Throne (Aug. 1945) the new Labour Prime Minister (Attlee) paid a warm tribute to C. for his services as a war leader. 'His had been,' said Mr Attlee, 'a true leadership which meant the expression by one man of the soul of the nation and its translation of the common will into action.'

The next 6 years of C.'s life were spent in opposition. He made sev. telling speeches, both in and outside Parliament, in criticism of the Labour Gov.'s internal policy; but he gave it his wholehearted support in matters of foreign affairs, and foreign policy during the period 1945-51 was, therefore, completely bipartisan.

In 1950 the Conservatives gained seven seats in the general election, but Labour still held a majority, although only a slender one; 18 months later, at the next general election, the Conservatives returned to power. C. was Prime Minister once again.

His peace ministry was a great personal triumph. It saw the end of the Korean war, and an apparent lessening of the 'cold war'; at home the country's economy made a pronounced revival. In 1953 he was created K.G. In April 1955 C. resigned from the premiership, being succeeded by Anthony Eden (q.v.). C. was now over 80; the previous year his eightieth birthday had been celebrated by numerous presentations, and he now retired to give place to a younger man. At the general election in May 1955 the Conservative majority actually increased—a very rare achievement for a party already in power and one which fittingly set the seal on C.'s political career, for the result was at least as much an approval of C.'s policy as a mandate for his successor. He has since remained in Parliament as M.P. for Woodford.

C. married in 1908 Clementine Hozier; they had 1 son (Randolph C. b. 1911, a former Conservative M.P., and subsequently a political journalist) and 3 daughters.

Pub. works: *Lord Randolph Churchill*, 1900; *The World Crisis* (4 vols.), 1923–1929) abridged and revised ed. in 1 vol., 1931; *Marlborough* (4 vols.), 1933–1938; *Great Contemporaries*, 1937; *Into Battle* (speeches), 1941; *The Unrelenting Struggle* (speeches), 1942; *The End of the Beginning* (speeches), 1943; *Onwards to Victory* (speeches), 1944; *The Dawn of Liberation* (speeches), 1945; *Victory* (speeches), 1946; *Secret Session Speeches*, 1946; *Sinews of Peace* (speeches), 1948; *Painting as a Pastime*, 1948; *The Second World War* (8 vols.), 1948–54; *A History of the English-Speaking Peoples*, 1956–8. For biographies of C. see C. Bechhofer Roberts ('Ephesian'), *Life of Winston Churchill*, 1927; H. Martin, *Battle* (a detailed study), 1940; Sir G. Arthur, *Concerning Winston Spencer Churchill* (character and opinions rather than achievements), 1940; R. Sencourt, *Winston Churchill*, 1940; W. S. C., *A Cartoon Biography* (compiled by F. Urquhart), 1955.

Churchill River rises in Lake La Loche (or Methy), Canada, between R.s Athabasca and Saskatchewan, flowing through various lakes into Hudson Bay, near Churchill, Manitoba. It forms the only harbour on the W. of Hudson Bay for large vessels at all states of the tide (6–8 fathoms deep), but has rapids only navigable by canoes 5 m. from the mouth. Lake Reindeer or Caribou connects it with Wollaston or Great Hatchet Lake and Mackenzie R.; La Loche portage with the Athabasca's trib. Clearwater. Known as C. R. as early as 1688 (probably after Lord Churchill—Marlborough). It is also called Missinippi, English, or Bayer R. It is about 900 m. long.

Churching of Women, public thanksgiving in church for motherhood and

recovery from the perils of childbirth. This religious usage (probably borrowed from the Jewish law, Lev. xii. 6) has prevailed in the Christian Church from early times. Among Protestants it is falling into disuse, though still obligatory in the Gk. and Rom. Catholic Churches, and ordered in the Anglican prayer book. Presbyterian and Independent Churches of Britain and America reject the service. The Gk rite also celebrates the presentation of the infant in the Church; the Lat. is exclusively a blessing on the woman (if her child is born in wedlock). The first definite mention is in the pseudo-Nicene Arabic canons. The formularies now used date only from medieval times.

Churchite, see CHURCH, SIR ARTHUR HERBERT.

Churchwardens are lay eccles. officers, who represent the body of the par., and are, as their name implies, guardians of the church. Under the New Parishes Measure, 1943, which consolidates the Church Buildings Acts and New Parishes Acts of the 19th cent., 2 C. are chosen annually at a joint meeting of the Parochial Church Meeting and the Vestry (i.e. persons rated in respect of property in the par.), either by joint consent of the incumbent and the meeting or one is chosen by the incumbent, and known as the rector's or vicar's warden, while the other, known as the people's warden, is elected by the meeting. The election should take place in Easter week (Canon 90 of 1603). They are admitted to office by the ordinary, usually the bishop of the diocese, after making a declaration that they will perform their duties in good faith. In early times the *seniores ecclesiastici* merely had charge of the fabric and furniture of the church. This is still their main function, and the property in the goods of the church is vested in them. But the Parochial Church Council, of which they are usually *ex officio* members, has the care, maintenance, and insurance of such goods. C. must also maintain order in the church and churchyard, and may remove persons who disturb divine service or arrest persons guilty of bad behaviour in the churchyard. They have the duty of assigning seats in church to the parishioners. During the vacancy of the benefice they frequently act as sequestrators. In general every household in the par. and persons on the church electoral roll, even, though living outside the par., are eligible. A person who is not a communicant may be elected, but is debarred from membership of the Parochial Church Council. Minors, aliens, Jews, and persons convicted of felony, perjury, or fraud are disqualified.

Churchyard, Thomas (1520?–1604), poet, began his career as a page to the Earl of Surrey, served as a soldier in various wars, and was given a pension by Elizabeth I. He produced a number of broadsheets, his best poems being *Shore's Wife*, 1563, *Churchyard's Chips*, 1575, and *The Worthiness of Wales*, 1587.

Churchyard, name of a piece of consecrated ground attached to a parochial

church (thus differing from a cemetery), used as a burial-place. C.s are often of earlier date than the church itself, since Rom. law protected any area containing monuments of the dead with the utmost reverence. Burial in C.s in England is ascribed to Cuthbert, Archbishop of Canterbury (741-58). All Christian services may now be used at C. burials (Vict. 43, 44, chap. 41). The C. is the freehold of the parson. It may never be used for secular purposes, and misbehaviour of any kind within its precincts can be severely punished by law. See also under BURIAL ACTS.

Churl, see CEORL.

Churn, vessel or utensil for the purpose of making butter, by shaking the cream and so separating the serous from the fatty parts. The form of C. which for long held its position was an upright wooden vessel, shaped like a travelling metal milk can, in which the cream was worked by a wooden plunger by hand. To this succeeded a wooden box, in which moved a splashers, or dasher, a small wooden wheel like a water wheel, turned by a crank by hand. Large C.s are now turned by machinery, and revert in a way to the primitive form by being revolved or swinging on themselves by mechanical means. Good C.s should be of seasoned oak-wood, and so constructed with removable splashers or dashers that they can be easily and thoroughly cleansed after use. In modern large C.s glass lights are fitted through which the butter can be watched as it begins to form, and the exact moment for withdrawing the buttermilk be ascertained. C. is also commonly used as a term describing the metal containers in which milk is collected and transported. See BUTTER and DAIRY.

Churubusco, residential suburb SE. of Mexico City, on the site of the pre-conquest Aztec city dedicated to Huitzilopochtli. C. was a stronghold of Mexican defence against the Amer. troops under Gen. Scott at the important battle of C. on 18 Aug. 1847, during the Mexican war.

Chusan Islands form an archipelago off the E. coast of China. The largest, C., is 20 m. long and from 6 to 12 m. wide; it is regarded as the key to China. There are sev. tns, of which the cap. is Tinghai. Pop. 250,000.

Chute, Marchette Gaylord (1909-), Amer. biographer, b. Minnehaha Creek, Minneapolis. She was educ. at the Univ. of Minnesota. Her earliest pub. were books of verses for children, but she became famous for her vivid biographies of old writers: *Geoffrey Chaucer of England*, 1951, *Shakespeare of England*, 1951, and *Ben Jonson of Westminster*, 1953.

Chutney, Chutnee, or Chutny (Hindu *chāni*), E. Indian condiment made of mangoes, chillies, or capsicum, and lime-juice, with other native fruits, such as tamarinds or ginger-root. The flavour is often heightened by garlic. It is now manuf. for sale in the W., like pickles. Home-made C.s are often made with

various fruits, acids, and spices, tomato flavouring being very common. The chief ingredients generally used are chillies, green ginger, crushed tamarinds, apples, sultana raisins, distilled vinegar, shallots, cayenne pepper, fine salt, garlic, and cucumber. See J. Forbes, *Oriental Memoirs*, II, 1813; and for detailed recipes any modern cookery book.

Chuvash Autonomous Republic lies in the N. of the Volga upland, between Gor'kiy and Kazan', and consists of ravined wooded steppe with mixed forests in the SW. and N. There are phosphorite deposits, grain and potato growing, livestock breeding, sawmilling, woodworking, and chemical and food industries. A large hydro-electric station (800,000 kW.) is under construction. The prin. tns are Cheboksary (cap.) and Alats'y. The area was annexed to Russia with the conquest of Kazan' (1552); C. Autonomous Oblast was formed in 1920, and transformed into an autonomous rep. in 1925. Area 7,100 sq. m.; pop. (1956) 1,095,000, mostly Chuvashes and Russians.

Chuvashes, Turkic-speaking people living in the Chuvash Autonomous Rep. (where they form three-quarters of the pop.) and the surrounding areas of European Russia, numbering (1939) 1,400,000. They probably descend from the medieval Volga Bulgarians (q.v.), are Christian and to a considerable extent Russianised. A Chuvash alphabet dates from 1872. The majority of C. are peasants working on collective farms. See W. Kolarz, *Russia and her Colonies*, London, 1952.

Chüyungkuan, customs station in the Nankow Pass of the Great Wall, 30 m. N. of Peking, China. It possesses a polyglot inscription.

Chyle, milky-looking fluid passing through the lacteals, which are the vessels which absorb fat from food passing from the smaller intestine. The fluid, which consists of a mixture of these fat globules with the natural juice, passes from the lacteals into the thoracic duct. Chyluria is the passage of C. with the urine. It is commonly caused by the presence of the parasitic *Filaria sanguinis-hominis* in the blood and lymph channels. Chyme is the pulpy mass into which food is converted in the stomach prior to its separation in the small intestines. See under DIGESTION and FILARIASIS.

Chynar, old fortress and tn in Bihar state, India, 20 m. from Mirzapur, on the r. b. of the R. Ganges. It was the scene of much fighting in Mogul times. It was stormed by Brit. forces in 1764 after the battle of Buxar (q.v.).

Cialdini, Enrico (1811-92), It. general and politician, who in 1860 won the battle of Castelfidardo. In 1861 he forced Gaeta and Messina to yield, for which services he was created Duke of Gaeta.

Ciamician, Giacomo Luigi (1857-1922), It. chemist, b. Trieste, educ. at univ. of Vienna. Assistant at Chemical Institute of Rome, 1880; prof. of general chem., Padua, 1887. From 1889 ordinary prof. of general chem. at Bologna. Senator, 1910. Works include *Organico*

e fisiologico chimica, 1908, and *Fotochimica nell' avventre*, 1912.

Ciampoli, Domenico (1855-1929), It. writer, b. Aversa, in the Abruzzi. He was a prof. of literature at Ancona, and has written some stirring novels which represent the life of the natives in the Abruzzi, such as *Conti Abruzzesi*, 1880, *Trece Nere*, 1882, and *Cicula*, 1884. Other novels are *L'ignoto*, 1883, and *Roccamarina*, 1890, besides various works on Slav literature, as the *Melodie Russe*, 1881, and *Literature Slave*, 1889-90.

Cianciana, tn in Sicily (q.v.), 12 m. NW. of Agrigento (q.v.). There are sulphur mines in the vicinity. Pop. 8000.

Ciano, Galeazzo, Count (1903-44), It. Fascist leader, son of a naval officer and ex-president of the Chamber of Deputies, educ. in Rome. C. supported the Fascist movement from the beginning; he married Edda, daughter of Mussolini, through whom he acquired much of his influence. He was under-secretary of state for propaganda, 1934. In the Italo-Ethiopian war he served as an air pilot, commanding a squadron. In 1936 he was made foreign minister, and in 1937 he signed the Anti-Comintern Pact (q.v.) on behalf of Italy and also, in 1939, the Italo-Ger. military alliance. In 1943 he was dismissed from the foreign ministry, and later that year voted against Mussolini. His later activities are obscure, but in Jan. 1944 he was brought to trial at Verona. Mussolini, though by that time devoid of any real power, wanted to avenge himself on the men who, he supposed, had brought about his downfall, and on 11 Jan. 1944 C. was shot. See M. Muggeridge (ed.), *The Ciano Diaries* (1939-43), 1947, and *Ciano's Diplomatic Papers* (1936-42), 1948 (a record of the Nazi-Soviet alliance as well as of contemporary It. foreign policy).

Cibber, Caius Gabriel (1630-1700), Dan. sculptor, who came to England and worked at Chatsworth for the 4th Earl of Devonshire, under whom he fought for William of Orange, who made him royal carver. His son, Colley C. (q.v.), was the well-known actor and dramatist. His most famous works are the statues of 'Melancholy' and 'Raving Madness,' the bas-reliefs on the Monument, and the phoenix over the S. door of St Paul's. The Dan. church in Stepney (demolished in 1860), where he was buried, is supposed to have been built by him.

Cibber, Colley (1671-1757), actor, dramatist, poet, b. London, son of the above. Educ. at Grantham, he served in the Earl of Devonshire's levy for the Prince of Orange in 1688. In 1690 he joined the Theatre Royal, Drury Lane, where he had his first success, playing the part of the chaplain in Otway's *The Orphan*. In 1695 his first play, *Love's Last Shift*, or *The Fool in Fashion*, was produced, and it was so successful that Vanbrugh wrote a sequel to it, called *The Relapse*, in which C. made a big hit as Lord Foppington. He wrote numerous plays, and took many parts, in pieces by himself and others. *The Careless Husband*, 1794, was, in the opinion of Horace

Walpole and others, C.'s best play. C. initiated the reaction from Restoration drama by introducing a moral tone into his comedies, but his heart was with the actors. He was at his best in eccentric comedy, his voice being too thin for declamatory roles. In 1709 he became a joint proprietor of Drury Lane, and he was the first manager to run a theatre on strictly business lines. After the death of Euaden in 1730 he was appointed poet laureate, less, as he himself freely admitted, for his literary merits than for his political activities on behalf of the Whigs. In 1740 he pub. *An Apology for the Life of Mr Colley Cibber, Comedian*. This entertaining work is the prin. authority for his life. See F. D. Senior, *The Life and Times of Colley Cibber*, 1928, and R. Barker, *Mr Cibber of Drury Lane*, 1939.

Cibber, Susannah Maria (1714-66), wife of Theophilus C. actor, and sister of Dr Arne, the composer. She started as a singer, was the original Galatea in Handel's *Acis and Galatea*, and sang in the original production of Handel's *Messiah*. Afterwards she became famous as a tragic actress, and played with David Garrick at Drury Lane.

Ciborium: 1. Covered cup to contain the eucharistic bread. 2. Canopy over an altar (see BALDACHIN).

PERFECT INSECT

PUPA

CICADA

Cicada, family of hemipterous insects of the sub-order Homoptera; the species usually inhabits tropical countries, America being especially favoured by its presence. These insects vary in size from 1 to 7 in. across, and are remarkable for their longevity and for their song. The male utters a curious sound, by some thought agreeable and by others intensely unpleasant, by means of a peculiar apparatus on the abdominal and meta-thoracic segments; it was heard by Darwin when he was on the *Beagle* a quarter of a mile from shore, and inspired the saying of the Gk poet Xenarchus: 'Happy the cicadas' lives, for they have

voiceless wives.' *C. tibicen*, the dog-day harvest-fly, is a black and green species which infests N. America in summer, and utters a shrill cry in the noontide hours; *C. septendecim*, the periodical C., is noted as the longest-lived insect, for the perfect creature requires 13 to 17 years for its development. The eggs are placed in the slits of twigs by the ovipositor of the female, and the larvae are always subterranean. They are said to damage roots, and are in process of extinction.

Cicatrization, process of healing over of a wound or broken surface in the skin or the mucous membrane, in which process the original surface is replaced by a material of a fibrous texture and resistant nature. This effectually covers and protects the portion of flesh which was exposed, but contains no glands or blood vessels which were present in the original tissue. The end result of C. is a scar.

Cicelo, l'Abate, see SOLIMENA, FRANCESCO.

Cleodra, genus of plants in the family Gentianaceae, containing 2 species, one S. Amer., the other *C. fliformis*, the gentianella, a yellow-flowered plant found in damp sandy places of S. England and Ireland, and W. and S. Europe to N. Africa and Asia Minor.

Cicer, genus of leguminous plants, allied to the vetch. The best-known species is *C. aridinum*, popularly called the gram or chick-pea (q.v.).

Cicero, Marcus Tullius (106-43 BC), Rom. orator and statesman, great in the former capacity as he was ineffectual in the latter. C. was b. Arpinum, the elder son of a knight. Together with his brother Quintus, he received his early education in Rome, where the poet Archias of Antioch and Phaedrus the Epicurean were among his teachers. After assuming the *togæ virilis* in 91 he did a period of military service during the social war, and continued his studies—dialectic under Diodotus the Stoic, law under the two Scaevolae, and rhetoric under Molo of Rhodes. In 88 he also attended the lectures of Philo, head of the New Academy, by which school he was profoundly influenced in later life. C.'s forensic career opened in 81 BC with the speech *Pro Quinctio*, which was followed in the next year by his defence of Sextus Roscius. C. spent the years 79-77 in the E., partly for reasons of health, but partly too for the sake of further study, which included a final and decisive course of rhetoric under Molo, who had returned to his native Rhodes. At Athens he met and won the lasting friendship of T. Poinponius Atticus (q.v.). Back in Rome, he married his first wife Terentia, a domineering woman of uncertain moods, and became actively engaged in political life. C. was quaestor in Sicily in 75, and 5 years later he prosecuted Gaius Verres. As praetor in 68 he delivered his celebrated speech *pro lege Manilia* (see POMPEIUS). Two years earlier saw the beginning of his famous letters, which give us an extraordinary insight into the hist. and the manners of the time. C. was not yet certain of political support, especially

of the senatorial party, and for some time he thought seriously of throwing in his lot with the democrats; but finally the senatorial party decided to support him, and he remained true to their cause for the rest of his life. In 63 he was consul. He was not, however, well supported by the nobility, who always remembered that he was not the descendant of one of the noble families. His year of office was crowded with events, his chief speeches being those made against Publius Sullus and Catiline (q.v.). The case of Rabirius Postumus found him deserted by the senatorial party, and since he had rejected the overtures made by Caesar (q.v.), he was forced into exile (58). Recalled in the following year, he found that his property in Rome had been destroyed at the instigation of Clodius (q.v.); and although he was enthusiastically welcomed by the people, he could obtain no redress for his losses. The next 5 years were devoted largely to literature; and when he did intervene in public life, it was only to flounder pathetically from one error of judgment to the next. In a letter written at this unhappy time, C. frankly confesses: 'I have behaved like a perfect ass.' In 52 he defended Annus Milo (q.v.), who was charged with the murder of Clodius, and in the same year he was sent to govern the prov. of Cilicia. He put down several risings in that prov. and did his best to alleviate the distress which existed there. In 50 he returned to Rome, but did not enter the city. He found that war was inevitable, and threw in his lot with Pompey, taking, however, no very active part in the war, and finally returning to Rome in 47, on the invitation of Caesar. During the latter's dictatorship he refrained from politics, again devoting himself to literature. At this time he also suffered much from domestic troubles; he divorced his wife, Terentia, and married his ward, whom also he shortly afterwards divorced; his greatest sorrow, however, was the death of his daughter, Tullia.

For some time after Caesar's murder C. took no part in politics, but was gradually to resume his role. He became the acknowledged leader of the republican party, and relied for safety on the influence which he felt he had over Octavian. In 43, however, he was amongst the proscribed, and on 7 Dec. of that year he was slain. His head was exposed in Rome, and there Fulvia, the wife of Antony and widow of Clodius, thrust a bodkin through his tongue. His chief philosophical works are *De Oratore*, *De Republica*, *Brutus*, *Orator*, *Academica*, *De Finibus*, *Trusculanae Disputationes*, *De Natura Deorum*, *De Senectute*, *De Amicitia*, and *De Officiis*. Among his most notable speeches are the Verrine orations, the defence of Cluentius, the 14 orations against Mark Antony (the *Philippics*), and the defence of Milo. His political works include 56 speeches, all professing to have been delivered in the forum or the curia, though some of them, as, for example, that for Milo and the greater number of the *Philippics*, were

written for pub. but not actually delivered. C.'s letters remain without doubt the most valuable of all his writings. They fall into 3 groups: *Ad Atticum*, *Ad Familiares*, and *Ad Quintum Fratrem*. The best complete ed. of C.'s complete works is that of C. F. W. Muller and others (1869-96). Eds. and trans. of separate works are numerous. See especially the complete *Letters* ed. by R. Y. Tyrrell and L. C. Purser (1904-18). See also F. R. Cowell, *Cicero and the Roman Republic*, 1948.

CICERO

Anderson

A bust in the Capitoline Museum, Rome.

Cicero. Marcus Tullius (b. 65 BC), only son of Marcus Tullius C., the great orator, and his wife Terentia. In 44 BC he joined the republican party and served as military tribune under Brutus in Macedonia. After the battle of Philippi, 42 BC, he fled to Sicily, where he joined Sextus Pompeius, but on the conclusion of peace between the latter and the triumvirs in 39 BC he returned to Rome. Octavian received him as his colleague in his consulship of 30 BC. Nothing more is known of him.

Cicero, Quintus Tullius (c. 102-43 BC), younger brother of Marcus Tullius C. He was aedile in 67, praetor in 62, and for 3 years governor in Asia, where his vile habits earned him an evil reputation. He distinguished himself as one of Caesar's officers in Gaul. In the civil war between Pompey and Caesar he joined the former, but later deserted him and reinstated himself with Caesar. He was put to death in the proscriptions of 43 BC.

Cicero, industrial tn in NE. Illinois, U.S.A., with large telephone, radio, and electrical equipment plant. Steel, iron, copper, and brass products; home appliances, building materials, tools, hardware; clay rubber, asbestos, and wood products; paints, varnishes, clothing, and musical instruments are manuf. Pop. 67,500.

Cicerone, guide, especially for galleries

of art or museums or other places of historical interest. The term was first applied in Italy to antiquarians and men of learning, and is supposed to be derived from Cicero as typical of such.

Cleaster, see CRENCESTER.

Cleindelidae, family of coleopterous insects in the section Adephaga, consists of active, voracious, and terrestrial species commonly known as tiger-beetles. Their colouring is generally rich and metallic, and the insects are to be found on sandy plains or heaths, sometimes on the seashore or the shore of rivers.

Cleisbeo, It. word applied to a gallant who waits upon a married woman. Among the higher ranks of It. society it was formerly the fashion for a C. to be in daily attendance upon the married lady of his choice, who could never be seen in public with her husband. The word is synonymous with *cavaliere servente* and *palilo*. It originally meant a knot of ribbons, hanging on to the hilt of a sword or to the handle of a fan.

Cicuta, genus of highly poisonous umbelliferous perennial herbs, of which *C. virosa*, Cowbane, is found locally in shallow water, ditches, and marshes in Britain, N. and C. Europe, and Asia.

Cid, The, historical and legendary hero of Spain. The legends which have accumulated round his name for a time gave rise to the theory that he was a purely mythical character, but it has since been proved that he existed, although his deeds, great as they were, are not actually identical with those with which he is credited. New research, much of it into Moorish sources, often lends surprising confirmation to the historical accuracy of the *Poema de Mio Cid* (q.v.). Thus a recently discovered passage by Ben Aliatib not merely confirms the C.'s victory at Cuarte, in Valencia, but describes in detail the strategy ascribed to him in the poem. He was b. during the fourth decade of the 11th cent., of a noble Castilian family. He reached manhood just at the time when Ferdinand died and left his dominions divided amongst his 5 children. He became a prominent supporter of Sancho of Castile; Spain at this time was equally divided amongst the Moors and the Spaniards. The Moors also, freed from allegiance to the caliphate, were divided up into small and independent states, continually quarrelling amongst themselves as well as with the Spaniards. The Spaniards, moreover, were not in a very united state. The C. plunged into the wars of the period; he won the title of Campeador by his valour in fighting against Navarre, and he supported Sancho of Castile against his brother Alfonso. Whilst journeying to Seville to collect tribute from one of the subject Moorish rulers, he took part in the fight against the King of Granada, whose forces he was responsible for routing. Returning to Burgos, he found himself the victim of a plot and was forced into exile (c. 1075). After this date the C. became the captain of a free company. He sold his services, now fighting for the Moors, now for the Christians. His

valour as a warrior and his capability as a general cannot be doubted, but although he made many attempts to reconcile Alfonso of Castile, his career at this time must be regarded in the light of a mercenary and not a national patriot. He led a successful expedition against Valencia, and for some time ruled over Valencia and Murcia. The Almoravides, whom he had defeated on more than one occasion, at length rose once more against him, and although he was not personally defeated, his army and chief lieutenant were. In 1099, worn out with war and grief, he died. The city of Valencia held out for yet another 3 years, and at the end of that time his body was taken to Burgos and there buried. He has been regarded always as the national hero, and within a cent. of his death legend after legend had sprung up concerning him. Over 200 ballads still exist which have him for their hero, and which ascribe to him all sorts of wonderful and heroic adventures. See Southey's *Chronicles of the Cid*, 1808; R. Menendez Pidal, *La España del Cid*, 1948; Wm Merwin (translator), *The Cid*, 1958.

Cider, alcoholic beverage made from the juice of apples. The proportion of alcohol depends on the composition of the fruit employed, the method by which fermentation is carried out, and any subsequent treatment, such as blending and sweetening. In England C. contains from 2 to 8 per cent of alcohol, but special C.s made from juice with added sugar may contain 10 per cent or more. C.s containing a large proportion of unfermented sugar are known as sweet C., those containing little sugar are known as dry C.s and the term rough is applied to those dry C.s that contain some acetic acid. The chief C. dists. of England are the cos. of Hereford, Devon, Somerset, and Glos, and to a less extent, Worcs, Kent, and Norfolk, with a C. acreage of (1954) 40,000; some C. is made in Ireland; large quantities are made in the N. districts of France and in Switzerland; some is made in Germany and in Spain. In the U.S.A. the term C. is applied to unfermented apple juice; limited amounts of C., termed hard cider, are made. The premier C. apple is Kingston Black; others well known are Yarlington Mill, Dabinett, Bulmer's Norman, and Slack-ma-Girdle. The apples used are grown for that purpose, mainly in farm orchards, and they are usually unsuitable for eating on account of their high acidity, bitterness, or astringency. The apples are crushed in a mill and the juice is pressed out from the pulp or pomace. The juice is allowed to ferment spontaneously in casks or tanks at ordinary temp. The casks are kept full, and, after the froth has subsided, an air lock is inserted to keep air away from the C., as this would lead to acetification, and the C. would become vinegary. The period of fermentation may last from a few weeks to sev. months according to the fruit used; after this the C. is syphoned from the lees or yeast deposit and stored in a cool place; it may be racked again in a few months. The good quality of C.

depends upon the choice of fruit used, a satisfactory fermentation, with freedom from acetification or other disorders, and cool storage. Its flavour should be balanced in sweetness, acidity, and astringency; the preferred flavour varies from one dist. to another. C. has long been the favourite beverage of the inhab. of the fruit-growing dists. and it is still made by the farmers: it is also produced in the U.K. In C. factories to the extent of many millions of gallons annually. C. research is carried out at the Long Ashton National Fruit and C. Institute. Of recent years in England sev. manufs. have bottled apple juice products of a teetotal nature under brand names derived from C.; these are extremely palatable, and often so closely resemble sweet C. that only an expert could detect the difference.

Ciechanów, tn of Poland, in Warsaw prov., 50 m. NNW. of Warsaw (q.v.). It is a railway junction and agric. centre, and has pottery and foodstuff manufs. Pop. 12,000.

Ciego de Avila, tn in the prov. of Camagüey, Cuba, a commercial centre, with sugar factories. Its port is Júcaro (15 m. SSW.) on the Caribbean. Pop. 23,800.

Cielo Dalcamo, or Ciullo D'Alcamo (beginning of 13th cent.). It. poet, b. Alcamo near Palermo. He was one of the first to write poetry in Italian. Of his works only one poem remains, written between 1231 and 1250. This is a spirited dialogue of 32 stanzas between lover and lady, and was trans. by Rossetti in *Dante and his Circle*. It is one of the liveliest poems of this period. See F. Torraca, *Studi sulla lirica ital. del Duecento*, 1902, and A. Monteverdini, *Studi medievali*, 16, 1943.

Cléneaga, or San Juan de Cléneaga, port in Magdalena dept., Colombia, near the mouth of C. Grande, or lagoon of Santa Marta. It exports bananas. Pop. 22,800.

Cienfuegos, tn in Las Villas prov., Cuba, on S. coast and 140 m. ESE. of La Habana. It is situated on a fine, sheltered bay, and is an important seaport of Cuba. It has an active trade in sugar and tobacco products. Pop. 52,900.

Cieszyn, tn of Poland, in Katowice prov., on the Olza, 40 m. SSW. of Katowice (q.v.). It is divided by the riv. from the Czechoslovak tn of Těšín (q.v.), with which it once formed one tn (see TESCHEN). There are coal mines in the dist., and there are engineering and paper industries. Pop. 15,000.

Cieza, Sp. tn in the prov. of Murcia, on the Segura. It lies on a plateau surrounded by mts, has a ruined Rom. fort, and a trade in grain, wine, olives, and fruit. Pop. 24,400.

Cigala, Lanfranco (c. 1218-78). It. poet, b. Genoa. He wrote some religious verse, and poems dealing with political subjects, such as Louis IX and his crusade. In his love lyrics, which are of a delicate beauty, he writes about 2 Provençal ladies, Adalais de Vidalhana and Salvaja. Only 30 of the poems have been preserved, and these have never been critically ed.

Cigar, roll of tobacco leaf for smoking purposes. The prototype of the C. was one of the earliest known forms of smoking, and its use was widespread among the natives of the Americas at the time of Columbus's voyages. The C. was adopted by the Sp. and Portuguese sailors, but although Eng. and other mariners were occasionally seen with crude rolls of tobacco leaf this method of smoking was, to all intents and purposes, confined in the W. world to the Iberian peninsula for almost 3 cents, probably owing to the almost universal acceptance of the pipe. The C. was

of the C., is rolled in a leaf known as the binder or bunch wrapper, which has to be made to the shape, size, and weight of the particular C. Finally this is covered with an outer leaf called the wrapper. The wrapper is the most expensive leaf used in C. manuf. and has to be sound and of good texture and colour. The binder need not have these qualities, and inferior grades and colours can be used, but it is preferable for it to be sound and of good size. Both wrapper and binder must have good steady burning qualities. For filler the small and broken leaves can be used. The shape, size, and colour of C.s

CIGARETTE-MAKING MACHINE

Imperial Tobacco Co.

brought to England as a result of the Peninsular war, and in spite of much criticism gradually ousted the snuff habit which was fashionable at that time. By 1840 the production of C.s in England was increasing rapidly. Leaf for the Brit. C. industry is obtained from the U.S.A. (particularly Wisconsin, Connecticut, and Pennsylvania), Brazil, Cuba, W. Canada, Jamaica, Brit. N. Borneo, Dominican Rep. (San Domingo), and the Dutch E. Indies.

C.s are produced by 3 methods: (a) entirely hand-made, which requires the greatest skill and is the most expensive; (b) the mould principle, where the bunches are shaped either by hand or machine, and pressed in wooden moulds, after which the outer wrapper is put on by hand; (c) entirely machine-made. These machines are composed of a bunch-making unit and a wrapping unit, and are manned by 2 operators. To make a C. the filler, which is the inside or the core

are indicated on the outside of the C. box. There are many shapes and sizes, and there is no hard and fast rule governing the choice of name to describe them, although certain names have become accepted by common usage. For instance Corona indicates a straight-shaped C. with a rounded top approximately $5\frac{1}{2}$ in. long, while a torpedo shape (i.e. a pointed C. drawn in at both ends) might be called Imperiale or Elegante. Panatella denotes a thin straight C. 5 in. to 6 in. long—the imported varieties being pointed while the Brit. product is usually open at both ends. Cheroots vary considerably in size, but are usually straight or very slightly tapered with both ends left open.

The colours or shades of C.s are denoted by the following markings: Claro, light; Colorado claro, medium light; Colorado, medium; Colorado maduro, medium dark; Maduro, dark.

Cigarette (dimin. of the word cigar),

small roll of fine-cut tobacco, usually wrapped in thin paper. C.s were popularised in England by soldiers returning from the Crimean War, and the first Eng. factory was set up at Walworth in 1856. C. smoking has increased steadily, particularly since the two world wars, and it now provides considerable revenue through heavy tobacco import duties. The most popular C.s in Great Britain are made from fine-cured Virginia type tobacco. This tobacco originated in the U.S.A., which still produces the finest types, and remains the main source of supply. In recent years Virginia type tobacco has been produced successfully in other countries, notably Canada, Rhodesia, and India. Turkish C.s are also manuf. in Great Britain, but their highly distinctive flavour is not generally popular in that country. The term Turkish is loosely applied to cover all oriental tobacco, i.e. tobaccos grown in the Near E., including Turkey, Greece, Cyprus, Syria, and the Balkans. Americans prefer blended C.s, which are often sweetened with glycerine. Customs regulations in Great Britain forbid the treatment of C.s in this way. Contrary to widespread belief, saltpetre is never used during manuf. Considerable quantities of C.s are exported from Great Britain. C.s were originally made by hand, but hand-making is gradually dying out, having been superseded by modern high-speed machinery. There are two methods of hand-making—rolling by hand and push work, in which the tobacco is filled into a ready-made paper tube. Modern C.-making machines, having been fed with cut tobacco, bobbins, containing up to 3 m. of C. paper, printing ink, and paste, can produce perfect C.s at the rate of 1000 per min. The cut tobacco is fed into a narrow trough housing the C. paper, which runs in an endless stream from the bobbin. A printing device, incorporated in the machine, has meanwhile printed the maker's name and brand name, at C.-length intervals, on the paper. One edge having been gummed, the paper is curled round the tobacco and sealed to form one long C., which is cut into lengths by a rotating knife. Machines are also used for packing cartons and boxes, and electrical devices effect any packet containing an incorrect number of C.s. Many novelty types of C. have been produced—scented C.s, self-lighting C.s, and C.s in coloured papers—but none has attained popularity. The recent implication of C. smoking in the development of lung cancer is serious and has stimulated considerable research.

Cigliano, It. tn. in Piedmont (q.v.), 19 m. W. of Vercelli (q.v.). Pop. 6000.

Cignani, Carlo (1628–1719), It. painter, b. Bologna; a pupil of Battista Cauro and Francesco Albani, he derived his inspiration from Correggio. His best-known work is the 'Assumption of the Virgin,' at Forlì. Others are 'Entry of Paul III into Bologna'; 'Francis I. touching for King's Evil'; 'Power of Love,' painted on the wall of the palace at Parma; and 'Adam and Eve,' at The Hague. His

son Felice (1660–1724) and nephew Paolo (1709–1764) were also painters.

Cignaroli, Giovanni Bettino (1706–70), It. painter, who in 1769 became director of the academy at Verona. He belonged to the late Venetian school.

Cigoli, Lodovico Cardì da (1559–1613), It. painter, architect, and poet, b. Cigoli, Tuscany. He was a pupil of Alessandro Allori (q.v.) and Santi di Tito, but he followed the great Florentine painters and especially Correggio, being known as the Florentine Correggio. His 'Ecce Homo,' which gained a prize against Passignani and Caravaggio, was taken to France by Napoleon, but restored to Florence in 1815. His paintings include 'St Peter healing the Lame Man,' in St Peter's at Rome; 'Conversion of St Paul,' in the church of San Paolo fuori le Mura; 'Story of Psyche,' in fresco at the Villa Borghese; and a 'Martyrdom of Stephen.'

Cilia are minute, fine-hair-like protoplasmic processes attached to one or both ends or the sides of some bacilli, by means of which they propel themselves. Bacilli possessing them are termed motile. Cells with C. attached also line some parts of many-celled animals. In man the epithelial cells lining some of the organs of the upper respiratory tract are ciliated.

Ciliata, div. of the Protozoa, which move and feed by means of cilia, and may possess undulating membranes near the mouth, membranellae and cirri. The body is nearly always surrounded by a thin layer of cuticle, contains many nuclei and sev. contractile vacuoles. Reproduction is by means of div. and by a sexual process of conjugation.

Cilicia, classical and now obsolete name for region of Asiatic Turkey (q.v.), along the S. coast between Syria (q.v.) and Pamphylia (q.v.), which before the First World War was included in the Turkish vilayet of Adana (q.v.). In ant. geography it included the valley of Adana and Tarsus, bounded by the Mediterranean on the S., Mt Taurus on the N., and Amanus on the E. It was part of the Persian Empire until Alexander's conquest, 331 bc. At his death it fell to Ptolemaic rule and later to the Seleucidae. The inhab. of the mountainous dists. became famous pirates. In 64 bc it was subdued by Pompey and made Rom. ter. It formed part of the Osmanli Empire in 1515. In 1833 it was ruled from Cairo, but was evacuated by Mehemet in 1840, and given back to the Turks. It is now included in the vilayet of Adana (Seyhan) in Turkish Asia Minor. Only ruins remain of its 2 great tns, Tarsus and Soli, once centres of Gk civilisation. By the treaty of Sévres (q.v.) part of C. was granted to France, but in 1921, after serious conflict with the Nationalist forces, France abandoned all claim to the dist. The products of the dist. include corn, wool, and sesame.

Cilician Gates, or Kilek Bogaz, narrow pass over the Taurus range in Asia Minor. The great highway led from the W., on a long rough descent from the central plateau, to the valley of Adana and Tarsus.

At the gates themselves the width of the road is 25 ft.

Cilli, see CELJE.

Cima, Giovanni Battista, called **Cima da Conegliano** (c. 1460-1518), Venetian painter, a pupil of Montagna (q.v.). His work resembles that of Giovanni Bellini (q.v.), whose studio foreman he is believed to have been. In various churches at Venice are to be found his 'Saint John the Baptist'; 'Saint James and Saint Nicholas'; and 'Saint Thomas touching the Wounds of Christ.' Other of his works are at Milan, Munich, and Dresden. In the Louvre is his 'Virgin and the Child Jesus,' and in the National Gallery, London, are a number of panels.

Cimabue, Giovanni (1240-c. 1302), It. painter, otherwise known as Cenni di Pepo, b. Florence. Little is known of his life but he worked in Rome, where he may have received his training, also at Pisa and Florence. Tradition credits him with being the greatest artist of his time, but much of the work attributed to him is not authenticated. According to Vasari he was the real founder of It. painting. This may be taken to imply that he was the first to break notably away from the rigid conventions of Byzantine art and to introduce a tendency towards naturalism. In the latter respect he was outshone by his pupil Giotto, whom he is supposed to have found as a child drawing on a slate with a piece of coal, and brought to Florence to teach. A famous painting attributed to him is a 'Madonna and Child with Angels,' which forms the altarpiece of the chapel of the Crucifix in Santa Maria Novella, Florence, but according to some this work has been proved to be by Duccio. Other Madonnas are to be found in the Academy of Arts at Florence and at the Louvre. He is also credited with some frescoes in the church of San Francesco, Pisa; his most famous work is a mosaic in the cathedral at Pisa, 'Christ in Glory between the Virgin and John the Evangelist.' He is buried in the cathedral at Florence. See T. Cole and W. J. Stillman, *Old Italian Masters*, 1892; Julia Cartwright (Mrs Ady), *Painters of Florence*, 1901; also G. Vasari, *Lives of the Painters* (Everyman's Library), 1927; Crowe and Cavalcaselle, *History of Painting in Italy*, 1923.

Cimarosa, Domenico (1749-1801), It. musical composer, b. Aversa, Naples. His first comic opera, *Le stravaganze del conte*, composed when he was 23, was a great success. He became the rival of Paisiello and wrote over 60 comic and serious operas. The most famous before his call to St Petersburg by Catherine II in 1787 were *L'Italiana in Londra*, 1778, and the settings of Metastasio's *Alessandro nell'Indie*, 1781, and *L'Olimpiade*, 1784, the latter the most frequently set libretto. Only 2 works appeared during the stay in Russia, which ended when he was called to Vienna to succeed Salieri. It was there in 1792 that he produced his most famous work, *Il matrimonio segreto*, based on *The Clandestine Marriage* by Colman and Garrick. This is still performed, and *Le astuzie femminili*, 1794, was revived by

Diaghilev in 1920. C.'s last years were troubled by the revolution at Naples and he d. at Venice on the way to Russia for a second visit.

Cimbex, genus of hymenopterous insects in the sawfly family, Tenthredinidae. The species are often larger than bees, although most of the other members of the family are small and inconspicuous. The larvae are often very destructive to vegetable life, e.g. *C. americana*, which is known to destroy large elm-trees.

Cimbri, or **Kimbri**, Ger. tribe; Pliny writes of the peninsula of Jutland as the Cimbric Chersonese; Pomponius Mela that the C. and Teutones lived on the Sinus Codanus, i.e. the SW. corner of the Baltic. In Ptolemy's map Jutland is also marked as the Cimbric Chersonese. It was formerly thought that the C. were Celts (*Cymry*, the Welsh), but this view is not now held. At the end of the 2nd cent. bc they invaded Gaul, Illyria, and Italy. In 113 bc the Rom. consul Cn. Papirius Carbo was defeated by them at Noria (Carinthia). They then moved W., and in 109 bc defeated the consul M. Junius Silanus in the S. of Gaul. In 105, led by their king Boiorix, they annihilated the Rom. Army under Cn. Mallius Maximus and (aeio at Arausio (Orange). Turning off towards Spain, they were driven back, and in 103 overran Gaul as far as the Seine, where the resistance of the Belgae forced them S. once more. With the Teutones they moved S. with the intention of invading Italy and conquering Rome. They divided their forces, the Teutones to take the W., the C. the E., passage of the Alps. At Aquae Sextiae (Aix), 18 m. N. of Marseilles, Caius Marius, the Rom. consul, inflicted a total and crushing defeat on the Teutones, 102 bc. The C. had passed the Alps to the E., and had forced the other Rom. army under Lutatius Catulus beyond the Adige and the Po. Marius followed up his victory over the Teutones by a still more crushing blow upon the C. on the Raudine plain, near Vercellae, annihilating their forces and killing Boiorix.

Cimbric Peninsula, see JUTLAND.

Cimicidae, small family of hemipterous insects, in the section Heteroptera, is represented in most lands where civilisation is predominant. The insects are parasitic on various vertebrates, such as men and birds, but are in turn preyed on by larger insects. The chief genus is *Cimex*, which contains few species, and none with which mankind would not gladly dispense. *Cimex lectularius* is the bed-bug. See BUG.

Cimicifuga, genus of ranunculaceous plants, consists of perennial herbs with divided leaves and racemes of whitish flowers; the roots act as drastic purgatives, and are poisonous.

Cimiez (anc. Civitas Cemenellensis), residential dist. of Nice (q.v.), France, in the N. of the tn. It has a Rom. arena, a notable church (partly Gothic), and fine hotels and villas. It was a favourite resort of Queen Victoria.

Ciminnna, tn in Sicily (q.v.), 18 m. SE. of Palermo (q.v.). Pop. 6500.

Cimmerii, anct people mentioned by Homer as living on the banks of a stream in darkness and mist (*Odyssey*, xi. 14). An historical race of this name dwelt on the Palus Maeotis (Sea of Azov) and in Asiatic Sarmatia. Driven out by the Scythians, they passed into Asia Minor. About 657 bc they invaded Lydia, but were finally expelled by Alyattes (610-560 bc). Their identification with the Cimbrri of Jutland rests upon no evidence other than similarity of name.

Cimolite, variety of clay (hydrous aluminium silicate), which is used as fuller's earth (q.v.), to absorb grease and oil from cloth. It is found in the is. of Argentiara, Greece, and has been mined from anct times.

Cimon (c. 507-449 bc), celebrated Athenian general, son of the great Miltiades and Hegesipyle. He distinguished himself by his valour in the Persian wars, and was, with Aristides, put in command of the Gk fleet sent to Asia against the Persians. He was later in sole command of the Gk naval forces, and conquered the isle of Scyros in 470 bc. He achieved a dual triumph in 468 or 467, defeating the Persian fleet off the R. Eurymedon in Pamphylia, and later in the same day winning a battle on the land. He was for some time one of the most prominent members of the aristocratic party in Athens; in pursuance of his policy of friendliness to Sparta, he led an Athenian force to aid them when the helots revolted in 462 bc. The Spartans, however, dismissed with scorn his proffered aid, and the Athenians in anger ostracised him in the following year on a pretext of corruption. He was recalled in 457 (or 451), and he defeated the Persians off the coast of Cyprus; the victory was due to him, but he d, before the engagement.

Cimpulung, tn of Rumania, 80 m. NW. of Bucharest, in the 13th cent. the first seat of the voivodes of Wallachia, and now an important spa. Pop. (1930) 13,900.

Cimpulung Moldovenesc, or **Kimpolung**, tn of Bukovina, Rumania, on the Moldava, situated about 55 m. SSW. of Chernovtsy. Pop. (1930) 10,000.

Cinchona, or **Peruvian Bark**, genus of Rubiaceae, consists of about 40 species of S. Amer. evergreen trees. They vary very much in size, have evergreen leaves, and flowers in panicles, white or pink in colour. The useful part of these trees is their bark, from which quinine is manuf., this medicine first being used by the Countess of Chinchon, wife of the ruler of Peru, to cure a fever, about the year 1638. After this it was taken to various places in Europe by the Jesuits, and obtained the name of Jesuits' bark. The work of obtaining the bark of these trees is carried on by Indians, who have to make their way through thick forests to the trees. The latter are detached from any vegetation growing round the stem, and after having been felled as near the root as possible, have their bark cut off from both the main stem and the branches. It is then dried and packed, the thinner bark of the branches curling up to form quills.

This method, however, was seen to be very expensive, and was leading to the extermination of the trees. Accordingly, plantations were tried in other parts, especially Algeria, Java, the Himalaya, and Ceylon. Cinchonidine, cinchonine, and other alkaloids are obtained from the bark in addition to quinine.

Cinchona Bark Alkaloids. The term alkaloid (q.v.) is applied to certain basic substances derived from plants and chemically related to pyridine, quinone, etc. They are generally of considerable physiological potency and many are valuable drugs. Sev. distinct members of the group have been obtained from C. B., the most important being *quinine*, $C_{20}H_{24}O_2N_2$, and *cinchonine*, $C_{19}H_{22}ON_2$, together with *quinidine*, an isomeride (see ISOMERISM) of quinine, and *cinchonidine*, an isomeride of cinchonine. Quinine, which is a specific for malaria and an excellent febrifuge, is a white crystalline solid melting at 177° C. It readily forms salts, e.g. quinine sulphate, and these salts are usually preferred in medicine to the alkaloid itself. Ammoniated tincture of quinine is a solution of quinine sulphate in a mixture of water and alcohol to which a little ammonia has been added. Cinchonine is very similar in constitution to quinine, but a solution of its sulphate does not show the characteristic fluorescence of quinine sulphate solutions. The structure of the C. B. A. has been solved only recently, and so far it has not been possible to make them synthetically. Similar compounds, however, such as mepacrin (Ger. Atebrin) have been artificially prepared in the laboratory.

Cinchonine ($C_{19}H_{22}ON_2$), alkaloid prepared from cinchona, the bark of certain trees grown in S. America and the E. and W. Indies. Cinchona contains 5 alkaloids, quinine, quinidine, C., cinchonidine, and conquinamine, of which C. and cinchonidine are isomeric. C. is similar to quinine in its effect upon the malaria parasite, but is not so active. It also has a tendency to produce convulsive movements in certain patients, which renders it advisable that quinine preparations should be free from C. C. is a colourless crystalline body, insoluble in water. The sulphate is dissolved with difficulty in pure water, but is soluble in acidulated water.

Cincinnati, second largest city of Ohio, U.S.A., on the N. bank of the Ohio R., 220 m. SW. of Cleveland. Five bridges connect it with Covington and Newport, Kentucky. It is an important riv. barge port. The low-lying, level land near the riv. is occupied by the commercial buildings. The residential part is on the hills. There are a number of fine buildings, of which perhaps the best is the Rom. Catholic cathedral of St. Peter's, which contains the 'St Peter Delivered' by Murillo. Among other noteworthy examples of architecture are the U.S. gov. buildings, the Music Hall and Exposition Building, the Hamilton Co. Memorial Building, the Ohio Mechanics Institute, the city hall, the co. court-house, and the 40-storey skyscraper in Fountain Square.

The educational institutions include the Univ. of C., the Heb. Union College, Xavier Union, the College of Music, Ohio Mechanics Institute, and the Art Academy. Its cultural institutions also include the Conservatory of Music, the Art Museum, and the Taft Museum. Recreation is well provided for by 95 parks, of which the finest are Eden Park, to the E., and Burnet Woods to the N. There is a zoological garden. The public library contains 1,700,000 vols. C. is a commercial centre of the first rank, and its industries are varied and important. Among them may be mentioned the manuf. of machinery and machine tools, meat packing, soap, malt, liquors, clothing, clay products, and a large printing and publishing industry. It is a centre of the Amer. radio industry. It has airlines to Chicago, Detroit, etc. Eighteen railway lines meet here. Harriet Beecher Stowe lived here from 1832 to 1850, and many fugitive slaves were aided in C. homes in their flight to liberty. C. was founded in 1788. Fifty years later refugees from Prussia discovered that grapes grew abundantly in its vicinity, and it became a wine-producing centre, and later still it was nicknamed for a time 'Porkopolis'. Since 1934 it has been governed by a city manager with a council of 9 elected by proportional representation. It is the only city in the world which, out of its own resources, built a railway system, the C. Southern, which has for long been leased by the municipality to one of the big trunk lines. The pop. in 1950 was 504,000 of whom nearly one-half are said to be of Ger. descent.

Cincinnati, **Lucius Quinctius**, one of the earliest and most typical of the Rom. heroes, was b. about 519 BC. The legend runs that in 458 BC, when the Rom. Army had been cut off by the Aequi, he was called from his plough to become dictator. He overcame the enemy, and after serving the rep., returned to his farm. He was again made dictator in 439 BC.

Cinder-bed, name of a stratum of the Middle Permian series of the Jurassic system, so called by the quarrymen of the dist., and composed chiefly of the aggregated shells of an oyster.

Cinderford, tn of Glos., England, 134 m. WSW. of Gloucester, in the Forest of Dean (q.v.), a mining, light industrial, and agric. centre. Pop. 7028.

Cineas, Thessalian, chief adviser and minister of Pyrrhus, King of Epirus. He studied oratory in Athens, and was known as the ablest and most eloquent man of his time. In 280 BC, after the defeat of the Romans at Heraclea, he was sent on a mission of peace to Rome. The terms were rejected through the agency of Appius Claudius Caecus, the censor, but on being sent again two years later, with easier terms, C. induced the Senate to accept his proposals of peace.

Cinematograph, apparatus for projecting on to a screen in rapid succession a series of images or pictures representing successive stages of appearances involving motion, thus producing the effect of a

continuously moving picture which accurately re-creates the normal movement of the people or objects photographed. The C. was the outcome of a cent. and more of experiment and invention. The principle on which it is based—the persistence of vision—had been described as early as the 2nd cent., and was demonstrated by Dr Peter Mark Roget in 1824. The first device to make use of the principle was the Thaumatrope, 1826, a disk of card with a design drawn on each face; when the disk was rapidly rotated the 2 designs seemed to be superimposed. In 1833 J. A. Plateau's Phenakistiscope first used the phenomenon to produce a moving image. Horner's Zoetrope, or Wheel of Life, 1834, was a variation of the Phenakistiscope. It consisted of a hollow cylinder with vertical slots at regular intervals around the sides. It revolved on a vertical axis, and pictures, arranged on strips, were placed round the inside. Viewed through the slots of the revolving cylinder, the pictures appeared to move. These devices, and Reynaud's Praxinoscope, 1877, the peak of their development, used drawn images; from 1851 onwards various attempts were made to produce photographic images for use in moving-picture machines. Means of taking photographs in rapid series—chronophotography—were developed in the 1870's and 1880's by a number of scientists, notably Muybridge (an Englishman) in America, Marey in France, and Anschütz in Germany. The most significant step in the development of motion pictures, however, was in 1889 when George Eastman put on the market strips of celluloid film for use in his 'Kodak' cameras. This at last gave both chronophotographers and motion-picture experimenters the material they had been lacking; and in the following year, while Marey achieved his first photographic series on flexible film, T. A. Edison and his assistant, W. K. L. Dickson, perfected their Kinetoscope. Basically this machine differed from the modern C. in only one respect—the moving picture was not projected on to a screen, but was viewed, by one person at a time, in a peep-show apparatus. The succeeding years saw a race to produce an efficient projected moving picture; the prin. competitors were Le Prince, Friese Greene, and his collaborators Mortimer Evans and F. H. Varley, Birt Acres, and R. W. Paul in England, Armat and Jenkins in America, Skladanovsky in Germany, and Georges Demy and the Lumière Brothers in France. To the Lumières must be conceded priority in giving the first performances to a paying public of projected, moving photographs; they first exhibited their Cinématographe at the Grand Café, Boulevard des Capucines, Paris, 28 Dec. 1895. The Lumières also gave the first public performances in this country, showing their Cinématographe at the Empire Theatre, Leicester Square, on 20 Feb. 1896. H. W. Paul followed with his Animatographe at the Alhambra a few days later.

C. negative film consists of sensitised emulsion mounted on a strip of celluloid

35 mm. wide. It is usually obtained in rolls of 1000 ft for use in cameras employed in studios, and in rolls of 2000 ft for use in portable cameras used on locations unrelated to studios. Studio cameras are electrically driven, whilst portable cameras are usually driven by clockwork or by electric batteries. All modern cameras, however, irrespective of size or type, are geared to run film at the rate of 24 pictures per sec. The film is driven from one spool through a gate behind the lens and on to a second spool. A positive

the corresponding sound track remain entirely separate, otherwise pictorial and sound adjustments could not be made. When an entire film has been finished, consisting of hundreds of separate strips of film, each presenting a different scene or a different angle of the same scene, and the corresponding sound track, the original negative, up till now untouched (for only the positive print is edited), is cut to match the finally edited film, and only when negative cutting has been completed is a combined print made, when, for

Paramount

CECIL B. DE MILLE DIRECTING 'SAMSON AND DELILAH'

print is then made. Such first prints from negatives are termed 'rushes,' and are viewed by the producer as soon as possible to check results. Professional productions are made on standard size film (35 mm.), whilst educational and amateur films are usually made on substandard size film—16 mm. and 9.5 mm. All C. films are now made on non-inflammable stock. Until the late twenties films were silent, their action and stories being generally explained by captions, and the cinema programme accompanied by an orchestra. With the birth of the talking film both the technique of production and the character of the cinema programme were revolutionised, for each film supplies its own dialogue or music (or both), thus making orchestral accompaniment unnecessary. Throughout the editing stage the picture film and

the first time, the sound track and the picture are printed on the same film. It is in this form that the film is projected in the cinema.

THE SCREEN. The once world-standard rectangular-shaped screen has now largely been superseded by wider screens, among which the best-known processes are the following:

Cinerama. Developed by Fred Waller, Cinerama was first shown publicly in New York on 30 Sept. 1952 (*This is Cinerama*). The film is 35 mm. wide and sprocketed, but all else about the system is special. Three cameras are used side by side, spanning a wide area. Projection is from 3 separate boxes and the 3 different images are accurately aligned on the screen to produce for viewers seated in the auditorium centre a picture of almost natural

human vision, that is presenting panoramic views. Seven sound tracks are on a separate 35-mm. film: 5 feed loudspeakers behind the deeply curved screen and the other 2 are connected to additional speakers to the left and right of the auditorium. Control of sound is by an engineer who also adjusts picture brightness and focus.

Cinemascope. This system of photography and projection was first used in New York on 16 Sept. 1953 (*The Robe*). The special lenses for camera and projector, based on earlier work by the Fr. physicist Dr Henri Chrétien, permit a picture almost twice as wide as that obtained with the conventional lens. The original Cinemascope had 4 sound tracks; 3 were fed into loudspeakers behind the screen to produce the stereophonic (or sound with depth) effect; the fourth fed a group of speakers about the auditorium for the surround effect. Normally on 35-mm. film; other processes have been produced on 55-mm. widths.

Flatvision. This name is given to sev. technical developments in the wider screen field. The main invention is a new type of camera and projector in which the film bears double images and moves horizontally from right to left through the machine when viewed by the operator from behind. The first public showing was in New York on 14 Oct. 1954 (*White Christmas*).

Superscope. Though photographed normally, Superscope is exposed approximately sprocket hole to sprocket hole instead of in the usual frame area. In colour horizontal compression is introduced into the matrix by Technicolor. In other printing methods compression can be done optically on to a dupe negative and printing carried out in the normal manner. Anamorphic lenses expand the image into normal shape during projection. A single photographic sound track is used in the usual place, and is accommodated by shifting the centre-line of the picture frame. A different sized aperture plate from the standard one is used.

Todd-AO. The newest wider screen process, Todd-AO, was first used publicly in New York on 12 Oct. 1955 (*Oklahoma!*). Projected on to a deeply curved wide screen, the process requires only 1 camera and 1 projector. Four camera lenses were developed (the widest being 120°) and are classified according to the angle of coverage. Film 65 mm. wide is used in the camera; with the 6 sound tracks (1 each side of the sprocket holes) the projection is 70 mm. wide.

In addition to wider screen processes, other developments in the technical field include:

Three-D. Third dimension or 'Three-D' is based upon the only system of truly stereoscopic motion pictures. It was widely publicised through the Brit. Film Institute's showing at the Festival of Britain Telecinema of the first polarised light system in which 3 or 4 documentaries made by Raymond Spottiswood were screened. These showings were eventually followed in the commercial cinema by

Arch Oboler's production *Brwana Devil*, which, because of its technical imperfections, did a great deal to retard progress of the third dimensional technique. Three-D is based on the fact that the 2 eyes look at objects from slightly different angles. The images projected upon the 2 retinas are therefore slightly different, but the visual mechanism in the brain combines them into a single three-dimensional impression. The 35-mm. stereo cameras used in Three-D pictures are essentially similar, as they take 2 pictures simultaneously which are identical in size and shape, and spaced apart horizontally. Natural Vision stereo cameras and some others have a fixed inter-axial distance between the 2 lenses of 2½ in.—the distance separating the human eyes. Other systems such as the Norling and the Stereo techniques employ devices to permit variable lens spacing and variable convergence. These 2 films are then projected from 2 projectors which are interlocked by either electrical or mechanical equipment to obtain exact synchronisation. However, it is essential that the right and left films reach only the right and left eyes respectively of the spectator in order that the brain may combine the 2 images into a stereoscopic impression. This is accomplished by the use of polarised light.

Dynamic Frame. During shooting, 2 sets of movable masks, which govern height and width of picture, are brought into play, and projection provides a constantly changing shape of picture, contracting or expanding whilst the film is on the screen. The first Dynamic Frame film (*The Door in the Wall*) was screened in 1956 in London and was produced by Glen Alvey under the auspices of the Brit. Film Institute Experimental Production Fund.

PRODUCTION AND DISTRIBUTION. The production of a feature film is carried out by a team of highly skilled technicians, grouped into different depts and co-ordinated by the director, who is responsible for the results. The chief technicians are the lighting cameraman, the recorder, the art director, and the editor, each aided by technical assistants. In control of a studio which may be making 3, 4, or more films simultaneously, each with its own director, is the producer, who is finally responsible to the company for all productions. Whereas each film is being made by a director, all the directors are responsible to the producer.

Films may be broadly divided into 2 main categories—features and shorts, most of the former being fictional and most of the latter being factual, covering documentary production and newsreels. There are 2 main channels through which films are exhibited: the *theatrical* or ordinary cinema exhibition for providing entertainment, and the *non-theatrical*, which covers the distribution and exhibition of films of an informative and instructional character to audiences unrelated to cinemas, as in clubs, institutes, factories, colleges. Non-theatrical shows are usually given on substandard size

film. The non-theatrical film show developed enormously during the Second World War in all countries, and the govts. of the belligerent nations organised regular propaganda film shows to keep their respective pops. informed on all vital matters. Brit. documentalists excel in the production of such short films, and the non-theatrical system of distribution has given them the opportunity, denied them by the double-feature cinema programme, of obtaining large audiences. Since 1945 non-theatrical showings have

HISTORY OF THE FILM AND FILM ACTING. Actuality films and topical events, filmed often from studio reconstructions, were the mainstay of the C. for public exhibition in its early days. Pioneer work in this direction is associated with the names of Léon Gaumont, Charles Pathé, and Georges Méliès in France, Edison, Edwin Porter, and Carl Laemmle in the U.S.A., and in Great Britain Cecil Hepworth, J. Williamson, R. W. Paul, and Bennett Stanford, who made films of the S. African war. Louis and Auguste

London Films

CHARLES LAUGHTON AS HENRY VIII IN A SCENE FROM
"THE PRIVATE LIFE OF HENRY VIII"

continued, and plans are laid for such films to play a permanent part in the gov.'s informational services. By this means special films are made for farmers, scientists, doctors, and students training for most professions and trades. Similarly the 16-mm. film is being employed increasingly for educational purposes in schools, and this visual method of teaching will, in due course, supersede many existing methods, for film is without equal for demonstrating and explaining processes, and bringing distant parts of the world to the classroom. The Brit. Film Institute serves as a link between the commercial film industry and the educational or non-theatrical film world, and records the hist. of the industry, possessing a library of all films which are important enough to preserve for future reference.

Lumière, inventors of the first projection machine, 1895, made films of scenes from home life, and in these members of their own families took part. Professional actors and actresses of the stage at first looked askance at the new medium. Dramas soon found a place on the screen; an early example was *The Life of Charles Peace*, made by the showman, Walter Haggart, in 1905. Historical dramas came into fashion. *Quo Vadis?*, 1913, an 11. film, was a spectacular achievement which influenced the development of the feature film in America. Great stage celebrities began to make their appearance on the screen, Mlle Réjane in a film version of *Madame Sans-Gêne*, 1911, and Sarah Bernhardt in *Queen Elizabeth*, 1912, a film which the Amer. promoter Adolphe Zukor imported into America, and which helped

to estab. the feature film there. The film 'vamp' was created at this time by Madeleine Roch of the Comédie Française in *Femme Fatale*, 1912.

In the U.S.A. the 'star' system came into being as a result of the struggle for the control of the C. industry between a number of independent producers and a combined trust which was attempting to secure a monopoly of production and distribution. The independents, one of the chief among them being Carl Laemmle, sought to gain publicity by using the names and personalities of their actors and actresses. Thus Florence Lawrence became one of the first of the 'stars.' Until launched by Laemmle she had been known only anonymously as the 'Biograph girl' when working for the Biograph studio within the trust. Similarly 'little Mary,' who had been discovered by D. W. Griffith in 1909 in *The Violin Maker of Cremona*, subsequently became famous as Mary Pickford. George Anderson, King Baggott, John Bunny, and Marguerite Snow were other actors who achieved early stardom at the hands of the independents. George Anderson in particular, known as 'Bronco Bill,' W. S. Hart, and Tom Mix, who had been a cowboy in Oklahoma before taking to films, became world famous for their cowboy films; and this type of film was thereafter to be an outstanding characteristic of the Amer. cinema.

It was in comedy that the film before the First World War had its most promising developments. Franco led the way, with the trick comedies of Méliès, and then with the comedians Dranem and Prince, the latter in the successful *Rigadin* the Clown series. A better-known figure was Max Linder, who began a tradition of screen comedy in which Charlie Chaplin also made his name. Chaplin's first film, *Making a Living*, was made for Keystone in 1914. He owed a good deal to the example of Mack Sennett, the hero of the celebrated Keystone comedies, as did other Keystone artists, Mabel Normand, 'Fatty' Arbuckle, Muck Swain, as well as later comedians such as Buster Keaton, Harold Lloyd, and W. C. Fields. It was while working for Keystone that Chaplin developed the character of the little man with the moustache and the baggy trousers who became world famous.

After the First World War the Amer. film industry enjoyed great prosperity. Hollywood attracted outstanding directors, actors, and actresses from Europe. Among them, besides Greta Garbo and Pola Negri, were Emil Jannings, Lars Hansen, and Conrad Veidt, who had made his name in the famous Ger. expressionist film *The Cabinet of Dr. Caligari*, directed by Robert Wiene in 1919, on the subject of insanity. Stardom in the U.S.A. was at its height. To the names already mentioned may be added those of Douglas Fairbanks, John Gilbert, Richard Dix, John Barrymore, Rudolph Valentino, and Adolphe Menjou. Menjou had been a success with Edna Purviance in *A Woman of Paris*, 1923, a film directed by Chaplin but in which he himself only made a brief

appearance. Edna Purviance also appeared with Chaplin in many of his early films. Rudolph Valentino became the idol of the 'fans' in *The Four Horsemen of the Apocalypse*, 1921, and *Monsieur Beaucaire*, 1924, the latter made by Sydney Olcott, a celebrated director since the nineties. Olcott was responsible for the spectacular *Ben Hur* in 1909. A film of the same title in 1928 became perhaps the most popular achievement of the silent film after the First World War. It made Ramon Novarro a star, the equal of

National Film Archives

A SCENE FROM 'THE FOUR HORSEMEN OF THE APOCALYPSE'

Valentino. Another eminent recruit to Hollywood from Europe was Ernst Lubitsch, who made his name in Germany in 1920 with the production of *Madame Du Barry*, entitled *Passion* in the U.S.A., and starring Pola Negri. His Amer. films begin with Mary Pickford in *Rosita*, 1923, Pola Negri in *Forbidden Paradise*, 1924, Emil Jannings in *The Patriot*, 1926, and continue well into the talkie era with the musical play *Monte Carlo*, 1930. Later films of his include *Bluebeard's Eighth Wife*, 1938, with Gary Cooper and Claudette Colbert, and *Ninotchka*, 1939, with Greta Garbo.

Outside the U.S.A. film production in the twenties was being developed, particularly in Germany, on ambitious, decorative, and highly dramatic lines, exemplified by *Siegfried* made by Fritz Lang in 1923. Russia was employing

film for propaganda purposes—to tell to her millions the story of the revolution. The early Russian silent films, *The Battleship Potemkin*, made by S. M. Eisenstein (q.v.) in 1925, and *The End of St. Petersburg*, made in 1927 by V. I. Pudovkin, were unsurpassed, and made the fullest use of film to create powerful drama by the use of impressive camera angles and the skilful editing. In 1928 appeared Carl Dreyer's great work, *La Passion de Jeanne d'Arc*, regarded as one of the finest of the silent Fr. films, and in the same year the genius of René Clair (q.v.) was revealed in the whimsical comedy, *The Italian Straw Hat*. Excellent pioneer work in the documentary field had been done by the Amer. producer and explorer Robert Flaherty, who took the camera to the Eskimos for *Nanook of the North*, 1922, and to the S. Sea islanders for *Moana*, 1926. He later contributed to the Brit. documentary movement with *Man of Aran*, 1934. Meanwhile, under Grierson's leadership, a number of Brit. directors as well as the Fr. director, Alberto Cavalcanti, were producing notable work with the G.P.O. Film Unit and other organisations.

The Russian cinema, controlled by the State, has continued to make excellent progress. One of its outstanding achievements has been the Gorki trilogy (*The Childhood of Maxim Gorki*, *My Universities*, *Out in the World*). Fr. films have won a special place by their naturalness, charm, and originality. René Clair's genius again revealed itself in *Sous les Toits de Paris*, 1930, followed by *A Nous la Liberté*, *Le Million*, and others. Other outstanding directors of Fr. films are Julien Duvivier (*Un Carnet de Bal*, *Pépé le Moko*), Jean Renoir (*La Grande Illusion*, *La Bête Humaine*), Marcel Pagnol (*La Femme du Boulanger* and the Marias trilogy), Marcel Carné (*Le Quai des Brumes*, *Le Jour se Lève*, *Les Enfants du Paradis*), Jean Cocteau (*La Belle et la Bête*, *Les Enfants Terribles*, *Orphée*), H.-G. Clouzot (*The Wages of Fear*, *The Fiends*), and, in the comedy field, Jacques Tati (*Jour de Fête*, *Monsieur Hulot's Holiday*). It. films have shown a marked resurgence since the war, and the work of such directors as Roberto Rossellini (*Open City*, *Paisa*), Vittorio de Sica (*Shoe Shine*, *Bicycle Thieves*), and Luigi Zampa (*To Live in Peace*) has become known internationally. Ger. production suffered a setback during the Nazi regime, but there are signs that it will rediscover its original artistic approach to filmmaking. In both quantity and technical excellence, however, the U.S.A. continues to hold the field. For further details on the Amer. cinema see UNITED STATES OF AMERICA (FILM).

Brit. producers and directors who contributed to the improvement in production during and since the Second World War are, to mention only a few, Anthony Asquith (*The Way to the Stars*), Michael Powell (*The Life and Death of Colonel Blimp*, *A Matter of Life and Death*, and *The Edge of the World*), Sir Carol Reed (*Odd Man Out* and *The Third Man*), Sir

Laurence Olivier (*Henry V*, *Hamlet*, and *Richard III*), Gabriel Pascal (*Major Barbara* and *Caesar and Cleopatra*), and David Lean (*This Happy Breed*, *In Which We Serve*, *Great Expectations*, *Oliver Twist*, *Brief Encounter*, and *The Bridge on the River Kwai*). Mention must also be made of the comedies produced by Ealing Studios (*Passport to Pimlico*, *Kind Hearts and Coronets*, *Whisky Galore*, *The Lavender Hill Mob*, *The Man in the White Suit*, etc.). Latterly Jap. films have created a strong impression. The most important of those seen in Britain have been Akira Kurosawa's *Rashomon*, Kinugasa's *Gate of Hell*, and Kurosawa's *The Seven Samurai*. Important films have come from China and India, which produced Satyajit Ray's *Father Panchali*.

Perhaps the greatest individual success in film-making after Charles Chaplin's (q.v.) is that of Walt Disney (q.v.), whose feature-length cartoon films, beginning with *Snow White and the Seven Dwarfs* in 1938, and followed by *Pinocchio*, *Bambi*, and many others, pointed the way to a form of film-making which exerts a universal appeal.

A survey of films, however brief, would not be complete without mention of the opportunity for descriptive music given by the introduction of sound. Scores for films were contributed by such celebrated composers as Vaughan Williams (*Scott of the Antarctic*), Arnold Bax, Benjamin Britten, Wm. Walton (*Henry V*, *Hamlet*, and *Richard III*), and Arthur Bliss, while others such as Richard Addinsell, Wm. Alwyn, and Clifton Parker became known chiefly for their work for films. Among film music directors mention must be made of Bretton Byrd, who was associated with the outstanding Brit. comedy films of the thirties, also John Hollingsworth, Charles Williams, and in particular Muir Mathieson, who has appeared in films with the London Symphony Orchestra.

Films as an aid to scientific research. The cine-camera is of great use in research work. It can act as a time-expander, recording with an 'unblinking eye' intimate details of a process which lasts for a thousandth of a second or even less, and it can spread out its record to show for minutes or hours events that lasted only a few seconds. Conversely it can be used equally well as a time compressor when pictures taken once every hour are projected as a continuous film, compressing the events of days into a few minutes. The cine-camera can—as in X-ray cinematography—do the same kind of things for the otherwise invisible, giving us, for example, a motion record of events within the animal body which cannot be seen in any other way. Through the cine-film astronomers have known for many years that large masses of incandescent matter are shot out of the sun and can be seen as solar prominences at the time of a total eclipse. Again, the technique of photographing a phenomenon at spaced-out intervals and projecting the film at the usual speed has been applied by the chemist and the metallurgist to the study of the growth of crystals. Hundreds of

motions in industry and in the laboratory have been studied with the same technique as that used in the slow-motion films of athletes and race-horses. The value of such films lies in the exactness with which it is possible to take measurements of events too fast to see with the human eye.

In 1956 the estimated amount of money invested in the Amer. motion-picture industry was \$2,738,700,000. In the same year there were 35,000 cinemas in U.S.S.R., 19,003 in the U.S.A., 7000 in W. Germany, 6611 in S. America, 5690 (about 5100 of which were efficient) in France, 4500 in Spain, 4325 in Great Britain, 3500 in Czechoslovakia, 2583 (in 1955) in Sweden, 1600 in E. Germany, 1582 in Belgium, 540 in Switzerland, 528 in the Netherlands, and 500 in Denmark.

Cineraria: 1 Genus of African shrubs or herbs, family Compositae, about 25 species; grown under glass in Britain.

2. Flower of the garden or florist which is used for greenhouse or indoor decoration in winter and spring, derived from *Senecio cruentus*, and now existing in sev. forms and strains.

Cinerary Urns, hand-made vessels of clay, glass, or sculptured marble, in which the ashes of those who had been cremated were preserved. They are relics of the Stone and Bronze ages of N. Europe, while others of a widely different type are found in Rom. tombs. The urn proper used for containing the ashes is a large flower-pot-shaped vessel, and decorated only on the top; but other urns used were the food-vessel variety, rather broad in shape, and standing low; the drinking-cup variety, tall and slim, with beautiful decorative designs covering the whole surface; and a vessel shaped like a cone, decorated, and having 2 or 3 perforations through the periphery, and known as incense cups. These latter were probably used to contain the fire with which the funeral pyre was lighted.

Cingoli (anct *Cingulum*), It. tn in the Marches (q.v.), 13 m. NW. of Macerata (q.v.). Pop. 3000.

Cinna, Gaius Helvius, Rom. poet; tribune in 44 bc. He was author of an epic poem entitled *Smyrna*, the composition of which, according to Plutarch, took him 8 years. After the funeral of Caesar he was mistaken by the mob for L. Cornelius C., one of the assassins, and lynched.

Cinna, Lucius Cornelius, Rom. statesman and member of the popular party. In 87 bc his election to the consulship was allowed by Sulla on condition of his taking an oath not to alter the existing constitution. On Sulla's departure for the E. soon afterwards C. violated his oath; riots ensued, and he was expelled from the city. Together with Marius he returned at the head of an army, captured Rome, and was consul for 3 successive years (86-84 bc). Proscriptions followed, and the death of Marius in Jan. 86 left C. leader of the popular party. Receiving news of Sulla's imminent return in 84, C. prepared to resist him, but was murdered by his own troops.

Cinnabar, prin. ore of mercury, is the sulphide HgS. It crystallises in small rhombohedral crystals with an adamantine lustre. The usual method of obtaining mercury from the ore is by roasting the ore when the sulphur is oxidised off into sulphur dioxide, and the mercury distils off and is condensed in a series of flues or chambers. It is found in Almaden in Spain, California, the Bavarian Palatinate, and Idria in Calabria.

Cinnamic Acid ($C_6H_5 \cdot CH:CH \cdot COOH$), or **Phenylacrylic Acid**, constituent of storax (*Silyraz officinalis*), from which it may be extracted by warming the resin with caustic soda. C. A. is a crystalline solid melting at 133°C.

Cinnamomum, important genus of Lauraceae, confined to the E. Indies. There are over 100 species, many of which yield either cinnamon or cassia, 2 aromatic barks. *C. zeylanicum* produces the finest cinnamon, and is cultivated in Ceylon; *C. Cassia* produces cassia, and is often used to adulterate cinnamon; *C. Camphora* is the plant from which camphor is distilled. See separate articles for various products.

Cinnamon, bark of the twigs of a small tree, *Cinnamomum zeylanicum*, family Lauraceae. The bark is taken off, and when dry curls up. It is the oil of C. which produces its flavour, and this is prepared from pieces of bark which are first soaked in sea water and then distilled. The oil itself is of a yellowish-brown colour. C. is useful both as a medicine and as a flavouring in cooking. Cassia, which is produced from another variety of the genus, is sometimes used instead of C., but is much coarser. (See illustration, p. 482.)

Cinnamon Stone, or **Hessonite**, variety of garnet so called on account of its resembling cinnamon in its yellowish-brown colour. It is found in Scotland, Ireland, Ceylon, and the U.S.A., sometimes occurring in shapeless masses and sometimes in the form of crystals. The variety found in Ceylon is used in jewellery work.

Cino da Pistoia (c. 1268-1337), It. poet,

by profession a jurist. He wrote a commentary on the first 9 books of Justinian's *Codex*, which, after 1483, was many times reprinted. He was a friend of Dante, who called him 'the Italian poet of love.' Though at times obscure, his poetry is full of a sad tenderness and grace, especially in his poems of absence.

CINNAMON

Cinque Ports, group of 5 (*cinque*) ports on the SE. coast of England, which once had special privileges and duties. The original 5 ports were Dover, Sandwich, Hastings, Romney, and Hythe; subsequently the tns of Winchelsea and Rye were added by Richard I as 'limbs' of the C. P., and other places were added later. Their origin is anct; they were of considerable importance in the A.-S. period, and in a charter of the reign of Edward I a reference occurs to a previous charter given by Edward the Confessor. After the Norman Conquest William I made this line of coast into an entirely separate ter. under the jurisdiction of a warden, corresponding to the count of the Saxon Shore (*comes littoris Saronici*). This official had his residence in Dover Castle, and exercised civil, military, and naval authority, combining the functions of sheriff, *custos rotulorum*, lord-lieutenant, and admiral. The chief duty of the C. P. in early times was to furnish shipping for the state. In the reign of Edward I they were bound to provide not fewer than 57 ships for a period of 15 days without recompense, but in return for this they had many privileges, such as exemption from taxes, the power to make their own by-laws, etc. The C. P. played an important part in the hist. of the 13th and 14th cents. Until 1688 one or two of the members of Parliament for each of the ports were nominated by the lord warden, but after that year they were elected. The franchise reforms of 1832 and 1835 reduced the members for the C. P. from 16 to 3, and since then they have been merged with the co. constituencies. The Municipal Reform Act has broken up the anct organisation, and though the anct courts of Shepway, Brotherhood, and

Guestling still meet, the meetings are purely formal. The civil jurisdiction of the lord warden has been abolished, but he still exercises maritime jurisdiction, presides at the court of Shepway (held in the aisle of St James's Church, Dover), and appoints justices of the peace within the jurisdiction of the ports; he has an official residence at Walmer, near Deal, and is entitled to £3000 a year for his office. See A. E. Bradley, *England's Outpost: the Country of the Kentish Cinque Ports*, 1921.

Cinquecento, It. word, meaning literally 500, but used as a contraction for 1500. It is used to describe the new style in all depths of culture which began to flourish in Italy about the year 1500. The whole civilised world was in reality about to revert to the anct style of art; everywhere about this period men were seeing the decadence of the Gothic. In France, in Germany, and in England the change was not definitely to come about till later, and when it did come was to be preceded by a period of transition. Thus the new movement was characterised by a revival of classical taste and design in all the arts. C., when used as an adjective, may be said to correspond to the Fr. style *Renaissance* or style *François premier*, and to the Eng. Elizabethan. The change in It. methods commenced in the 15th cent.; Ghiberti and Donatello were the pioneers in sculpture, Alberti and Brunelleschi in architecture. By the end of the cent. the standard of Brunelleschi, in particular, had been recognised throughout the country. The best examples of C. work in architecture are St Peter's and the Vatican, in Rome; the Louvre, in Paris. Among the famous cinquecentists may be mentioned Michelangelo and Benvenuto Cellini, in sculpture; Titian, Leonardo da Vinci, Bramante, and Correggio, in painting; and Berni, Ariosto, and Tasso, in literature.

Cinquefoil, in architecture an ornament consisting of 5 lobes meeting in points, called cusps, and tangential to the inner side of a larger arc. Arches may be formed with a C. See also Cusp.

Cinthio, name assumed by Giovanni Battista Giralaldi (q.v.).

Cintra, see SINTRA.

Clone, *Andrea di*, see ORCAGNA.

Cionus, genus of Curculionidae, or weevils, contains sev. Brit. species. These are small beetles, living both in their larval and imaginal states upon plants.

Clotat, La, Fr. seaport in the dept of Bouches-du-Rhône, on the Mediterranean coast, 20 m. SE. of Marseilles (q.v.). It is a holiday resort, and has a coasting trade, a coral fishery, and a boat-building industry. Pop. 13,500.

Cipher, see CRYPTOGRAPHY.

Cipolin, crystalline limestone usually containing mica. It is a granular limestone which, through metamorphism, has become a white marble with green veins, the latter being caused by the presence of bands of finely divided mica.

Cipriani, Giovanni Battista, or *Giam-battista* (1727-85), Florentine artist who studied at Rome and, in 1755, came to

London (where he settled) with the architect, Sir Wm Chambers. His graceful drawings soon won popularity and he was one of the founder members of the Royal Academy in 1768. His pictures are not of so high a quality as his designs, which were engraved by Bartolozzi. He designed the diploma of the Royal Academy and many of the exterior and interior decorations of Somerset House.

Circaea, family Onagraceae, genus of perennial herbs of which *C. lutetiana*, Enchanter's Nightshade; *C. intermedia*, Intermediate Enchanter's Nightshade; and *C. alpina*, Alpine Enchanter's Nightshade, are found in woods or shady rocky places in Britain.

Circars, **The Northern**, name formerly given to an area on the E. coast of India, stretching along the shores of the Bay of Bengal. It covers broadly the 4 main coastal dists. of the Andhra state, together with a portion of Orissa state.

Circassia, obsolete name of the area in N. Caucasus (Russia) which in the early 19th cent. was inhabited by Circassians. Sometimes it was incorrectly used to denote almost the whole of N. Caucasus.

Circassian (Russian *Cherkesskaya*) **Autonomous Oblast** lies in the SW. of the Stavropol' Kray of N. Caucasus, along the upper Kuban'. It consists of lowland steppe in the N., and embraces the Caucasian foothills in the S. It has grain growing and live-stock raising. The cap. is Cherkessk. The area was included in the Mt Peoples' Rep. in 1921, in the Karachay-Circassian Autonomous Oblast in 1922, and was made into Circassian National Dist. in 1926 and C. A. O. in 1928. Area 1540 sq. m.; pop. about 100,000—Russians (since 19th cent.), Circassians, Abaza (q.v.), and Nogay (q.v.).

Circassians (Circassian *Adyge*, Russian *Cherkesy*), Caucasian-speaking people (see CAUCASIAN LANGUAGES) living in the W. part of N. Caucasus (Russia) and in small groups in Syria and Jordan. Known since antiquity, they inhabited until the middle of the 19th cent. almost the whole area between the main Caucasus range, the R. Kuban', and the Black Sea shore. They accepted Christianity in the 6th cent., but became Muslim in the 17th. Divided into sev. tribes, they were politically independent but stood under Turkish influence and resisted the Russian advance (from the late 18th cent.) into their area. The final annexation by Russia in 1864 was followed by an exodus of 500,000 C. to Turkey, half of them perishing on the way. Now C. are officially treated as 2 peoples: Kabarda (164,000 in 1939) in the Kabarda Autonomous Rep. and Circassian Autonomous Oblast, and Adyge (88,000 in 1939) in the Adyge Autonomous Oblast. See W. Kolarz, *Russia and Her Colonies*, London, 1952. The term C. was sometimes incorrectly used to denote all the mt peoples of N. Caucasus.

Circe, daughter of Helios by Perse, and sister of Aëtes, lived on the is. Aënea. When Odysseus and his followers were cast up there she offered them a magic cup which turned all who drank from it

into swine. All suffered this fate, excepting Eurylochus (who did not drink) and Odysseus himself (who had received from Hermes a protective root). Odysseus compelled C. to restore his companions to their natural shape, and spent a year with her on the is.

Circinus, the Compasses, a S. constellation noticed by Lacaille, who placed it S. of Centaurus and not very far from the S. pole. It contains a white star, a Circini, of 3.4 magnitude, with a brick-red attendant.

Circle, plane figure enclosed by a curved line called the circumference which is at all points the same distance from a fixed point called the centre. A C. is, therefore, strictly speaking, the space included by the circumference. The distance from centre to circumference is called the radius, and a straight line drawn through the centre and terminated in both directions by the circumference is called a diameter, which is therefore twice the radius in length. A part of the circumference is called an arc, and the straight line joining the ends of an arc is called a chord. The figure enclosed by an arc and its chord is a segment, and that enclosed by 2 radii and the arc intercepted by them is a sector. An ancient problem is the determination of the ratio of the length of the circumference of a C. to its diameter. This ratio is the same for all C.s, and is an incommensurable quantity, i.e. it cannot be stated exactly in figures, and it is represented by the Gk letter π (see π). In the same C., or in equal C.s, equal angles are subtended by equal arcs and by equal chords, therefore divs. of the circumference is a convenient method of measuring angles. The angle at the centre subtended by one-quarter of the circumference is a right angle; this is divisible into 90 degrees, each degree into 60 minutes, and each minute into 60 seconds. In the circular measure of angles as employed in trigonometry, the unit is that angle subtended by a part of the circumference equal in length to a radius. The unit is called a radian, and it follows that there are 2π radians in 4 right angles. The properties of the C. are discussed in Euclid's *Geometry*, book iii. See also CIRCULAR MEASURE and METROLOGY.

Circle, **Magic**, area of ground used by sorcerers and magicians as a place of refuge against evil spirits. The whole area of ground varied, sometimes being 9 ft square, and on this area were marked out 2 concentric circles. Within the smaller sat the wizard, for it was a common belief that it was only by remaining on this particular piece of ground that he could prevent the evil spirits, with whom he was dealing, from carrying him away with them.

Circle, **Quadrature of the**, see QUADRATURE.

Circle Diagram, in electrical engineering, diagram showing the variation in magnitude and phase of the alternating current in a circuit with resistance R and reactance X on constant voltage E , when R is varied from infinity (open circuit) to zero (short circuit). When

$R = 0$, the current I represented by AB is maximum, $= E/X$, lagging the voltage E by 90° . As R increases, the impedance $Z = \sqrt{R^2 + X^2}$ increases, the current and phase angle (ϕ) decrease. If x, y are the

co-ordinates to the endpoint of the current vector AC of length I at any intermediate position, $x = I \sin \phi = \frac{E}{Z} \cdot \frac{X}{Z}$, $y = I \cos \phi = \frac{E}{Z} \cdot \frac{R}{Z}$ and $x^2 + y^2 = I^2 = \frac{E^2}{Z^2} = \frac{E^2}{R^2 + X^2}$. This is the equation to a circle on

E/X as diameter, described by the current vector as the resistance goes from 0 to ∞ . The power $EI \cos \phi$ is measured by the ordinate y . It is maximum for $\phi = 45^\circ$, $R = X$. In a more developed form the C. D. represents the working of the alternating current induction and commutator motors. See CIRCUIT, ELECTRIC.

Circle of Confusion, in photography (q.v.), the degree to which a geometrical point of light is diffused in the image projected by a lens. For reasonable sharpness the disk diameter may be $\frac{1}{16}$ in. when viewing a print or enlargement at about 10 in. from the eye; from this it will be seen that the disk must be much smaller in negatives which are to be greatly enlarged.

Circle of Curvature, see RADIUS OF CURVATURE.

Circles of Stone, see STONE CIRCLES.

Circuit, Electric, any combination of resistances and reactances carrying direct or alternating current. In direct current C.s the reactance is zero and voltage/current relations are determined by the simple form of Ohm's Law (q.v.); the volt drop across a resistance R is $R \times$ current. When resistances $R_1, R_2, R_3 \dots$ are joined in series the current I is constant through the circuit and the total voltage is $E = R_1 I + R_2 I + R_3 I \dots$ the total resistance being $R_1 + R_2 + R_3 + \dots$. If the resistances are joined in parallel across a voltage E , the currents in the branches are $I_1 = E/R_1, I_2 = E/R_2, I_3 = E/R_3 \dots$ the total current is $I_1 + I_2 + I_3 + \dots = E \left\{ \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \dots \right\}$ and the resistance of the branches taken together is given by $\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \dots$. In alternating current C.s the addition of current and

voltage values, being varying quantities assumed to follow sine curves, is a geometric ('vector') addition (see ALTERNATING CURRENT). The sum of the sine curves (q.v.) represented by OA and OB is the sine curve represented by OC . The

Fig. 1

voltage across a pure ('ohmic') resistance R carrying a current $I \sin \omega t$ is $RI \sin \omega t$, in phase with the current. The voltage across an inductance L is $L \times$ (rate of change of current). The rate of change of $\sin \omega t$ is $\omega \cos \omega t$, thus the voltage across L is $\omega L \cos \omega t$, leading the current

Fig. 2

by 90° . The quantity $\omega L = X$ is the reactance. The magnitude of the resultant voltage is $I \sqrt{R^2 + X^2}$, the quantity $\sqrt{R^2 + X^2} = Z$ is the impedance \approx the ratio of the magnitudes (peak values or r.m.s. values) of voltage to current. The voltage leads the current by a phase angle ϕ , $\tan \phi = X/R$ (the Q-factor), $\cos \phi = R/Z$ (the power factor). Adopting the prefix j to indicate a vector turned anticlockwise by 90° , $E = RI + jXI$ or $Z = R + jX$. The common induction coil has both resistance and inductance and is equivalent to a C. with resistance in series with inductance. A C. consisting of a number of induction coils in series, with resistances $R_1, R_2, R_3 \dots$ and reactances $X_1, X_2, X_3 \dots$ has impedance $Z = (R_1 + R_2 + R_3 \dots) + j(X_1 + X_2 + X_3 \dots)$ and the voltage across the C. is the geometric sum of the voltages across each coil, also obtained by adding all in-phase components and all leading components. The admittance, Y , the ratio of current to voltage, is the inverse of impedance, $Y = \frac{1}{R + jX}$. As the meaning of the prefix j in the denominator is not clear, we write $Y = \frac{1}{R - jX} \cdot \frac{R + jX}{R + jX} = \frac{R + jX}{R^2 + X^2}$. $(+j)(-j)$ indicates turning a vector up 90° and then turning it back -90° ; the result is unity. Thus $Y = \frac{R}{R^2 + X^2} - j \frac{X}{R^2 + X^2} = G - jB$. G is called the conductance, B the susceptance. It is easy to verify that $(R +$

$jX)(G-jB) = 1$. If sev. induction coils are connected in parallel across a voltage E , the branch currents are $Y_1E, Y_2E \dots$ and the resultant current is the sum $(G_1 + G_2 + G_3 \dots)E - j(B_1 + B_2 + B_3 \dots)E$. In a capacitor of capacitance C with a voltage $E \sin \omega t$ across the plates, the charge at any instant is $q = CE \sin \omega t$, the current is the rate of change of q , $\omega CE \cos \omega t$, leading the voltage by 90° . In C with a resistance R in series with a capacitance C , carrying a current $I \sin \omega t$, the voltage has a component $RI \sin \omega t$ in phase and a component $I/\omega C$ lagging by 90° , the impedance $Z = R - j\frac{1}{\omega C}$. If an inductance L is inserted, the total reactance becomes $\omega L - \frac{1}{\omega C}$. The voltages

across the inductance and the capacitance are opposite in phase. If now L or C is adjusted so that $\omega L = 1/\omega C$, the reactance vanishes and the current is limited by the resistance only. The C gives 'maximum response' to any applied voltage—this is the condition of resonance. If the frequency $f = \frac{\omega}{2\pi}$ is varied, the value

$f = \frac{1}{2\pi\sqrt{LC}}$ will give resonance. This is the 'proper' or resonance frequency of the C . Adjusting either L or C to resonance is 'tuning' the C . It should be noted that it is assumed throughout that L is independent of the value of the current, which only holds for air-cored inductance. An iron core introduces complications due to the fact that the magnetic induction B is not proportional to magnetising force H , and leads to the complex phenomenon of 'ferro-resonance.' It is also important to note that inductive reactance is directly proportional to frequency, capacitive reactance is inversely so. On low frequencies the inductance is of little effect on the current, but a capacitance is more like an open C ; on very high frequencies the inductance has an open-circuit effect, the capacitance nearly a short-circuit effect. The inductance bars or 'chokes' high frequency currents, the capacitance chokes low frequency currents and definitely bars direct current. See E. W. Golding, *Electrical Measurements and Measuring Instruments*, 1940; A. E. Clayton, *Alternating Currents*, 1934; A. T. Dover, *Theory and Practice of Alternating Currents*, 1944; J. R. Barr and D. J. Bolton, *Principles of Direct-Current Electrical Engineering*, 1943.

Circuit-breaker, powerful switch which opens a circuit automatically in conditions which endanger the plant or network, such as excessive current (short circuit) or voltage or failure of generating plant. The C s are usually operated by relays. In some cases the fault is of short duration and is cleared as soon as the C is opened. To avoid interruption of supply to consumers, C s are often made 'rapid-reclosing,' closing the circuit after a fraction of a sec. Should the fault persist, the C opens again. Sometimes this process is repeated. Arcing between

contacts may be minimised by immersion in oil or by air blast. The size of C s is indicated by their rupturing capacity in kVA, i.e. the volt-amperes they can open successfully. C s on the high voltage network of the Grid have a rupturing capacity of $1\frac{1}{2}$ million kVA.

Circuit, periodical progresses of the judges of the queen's bench div. of the high court of justice through the sev. cos. of England and Wales, for the purpose of administering justice in civil and criminal matters. The circuit system dates almost from the reign of Henry I, who organised C . of the judges of the *curia regis* and barons of the exchequer partly for judicial, but principally for financial, purposes. The great function of these old itinerant justices was that they linked up the local with the central administration. In 1173 the country was divided into 6 C . for exchequer purposes. The judicial functions were further developed by commissions of justices to try criminals presented by the hundred and the shire. Edward I replaced the irregular C . of the itinerants by regular C . of the judges of assize; the country being divided into 4 C . in 1293, with 2 judges to each div. The present assizes may be said to date from the close of the 13th cent., when the judges of assize were empowered to act under commissions of *nisi prius* (q.v.), oyer and terminer (q.v.), and jail delivery (q.v.). Regulation of the present C . was originally provided for by the Judicature Act, 1875, but this is now replaced by the Supreme Court of Judicature (Consolidation) Act, 1925. At the present day the C . comprise 8 divs.: the SE., Midland, N., NE., Oxford, W., N. Wales and Chester, and S. Wales. The winter assizes commence about the middle of Jan.; the summer, the middle of May; and the autumn, the middle of Oct. No civil (*nisi prius*) business is taken at the autumn assizes except in Bristol, Devon, Glamorgan, Lanarkshire, and Suffolk. There are additional assizes in May for Lancs and Yorks. In the U.S.A. there are 9 federal circuit courts of appeal, each circuit having appellate jurisdiction over sev. federal dist. courts. The President appoints the judges to these circuit courts, but judges of the dist. courts are eligible to sit. These courts have appellate jurisdiction over most of the issues cognisable by the dist. courts, though some issues go direct to the supreme court. See also ASSIZE.

Circular Measure, in geometry, a method of measuring angles. The angle between 2 straight intersecting lines, AX and AY , is expressed as the ratio of the length of the circular arc XY to the length of the radius AY of the circle; in general, angle = $\frac{\text{length of arc}}{\text{radius}}$. This expression is inde-

pendent of the length of the given radius, since, for a given angle, the length of the arc is proportional to the radius. The unit of $C. M.$ is the *radian*, the angle subtended at the centre of the circle by an arc of length equal to the radius. Since the length of the circumference of a

circle = $2\pi \times$ radius, the number of radians in a full circle is 2π , i.e. approximately 6.284. In order to convert the measure of an angle from degrees to radians, multiply by $\frac{2\pi}{360}$ or divide by 57.296. See also METROLOGY.

Circular Note, see CREDIT, LETTER OF.
Circular Numbers, any number with 1, 5, or 6 in the units place.

Circulating Libraries, as opposed to public libraries (q.v.), are those for the use of which a subscription is charged. They were first introduced into England in the 1740's by a bookseller who charged a fee for the loan of books from his shop. By 1776 4 C. L. existed in London, and in 1842 Mudie (q.v.) founded his famous library, which to a great extent determined the reading taste of the day. The library of W. H. Smith (q.v.) was estab. in the late 19th cent. and the Times Book Club in the early 20th cent., and there are large C. L. at Foyles, Harrods, Army and Navy Stores, and Boots (at most branches). A number of 'twopenny libraries' sprang up at the beginning of the cent., but they are largely superseded by the public libraries.

Circulation of the Blood. Harvey in 1628 was the first to demonstrate that the blood circulates. The ancients had conceived that the arteries held air, and it was generally held prior to Harvey that the blood was pumped from the heart to the veins, and that the blood moved in a to-and-fro movement. He, however, showed that the veins have valves which prevent the blood flowing back, and at the same time he proved that the arteries contained blood, not air. The circulatory system consists of arteries, veins, capillaries, and the heart. The arteries are tubes, with stout elastic walls well provided with muscular tissue. They branch in their course, becoming thinner-walled and smaller as they subdivide, and finally they pass into the capillaries, which are very minute and walled only with a single layer of cells. These capillaries run through the tissues and unite to form small veins, or venules, and these in their turn unite to form the large veins. As has been pointed out, these veins often possess valves which prevent a reflux of

blood into the arteries. The heart (q.v.) is a 4-chambered muscular bag, which by its alternate contraction and dilation acts as the pump which maintains the circulation through the body. These 4 chambers are divided into pairs, the right and left ventricles, and the right and left auricles. The auricles are in communication with the ventricles, but the right chambers of the heart are only connected to the left in the indirect manner shown in the description of the circulation. The vessels which lead from the ventricles are respectively termed the pulmonary artery on the right and the aorta on the left. There are valves between the auricles and the ventricles, that on the right side consisting of 3 flaps and being termed the tricuspid, that on the left being termed mitral, or bicuspid, and consisting only of 2 flaps. In order that the blood may circulate through the body it has to describe 2 circles. It has to pass through the body generally in a large circle, and this is called the systemic circulation, while it further has to pass through the lungs, forming the pulmonary circulation. The 2 auricles of the heart contract and drive the blood into the still expanded ventricles. Thereupon the auricles relax and the ventricles contract, driving the blood through the aorta and the pulmonary arteries. This alternate contracting and expanding causes a continual flow of blood in a series of spurts (the pulse beats). The blood driven into the pulmonary artery passes through it into its 2 branches, one branch passing through each lung. Here the blood is oxygenated and purified, since it is passed through smaller and smaller branches, ultimately directed into the pulmonary capillaries covering the air cells of the lungs (q.v.). Here the carbon dioxide is given up and oxygen taken. These capillaries then reunite into 4 pulmonary veins which carry the blood to the left auricle. Oxygenated as it now is, it is in a similar manner passed again into the left ventricle, and from thence into the aorta, which carries it in a great curve down alongside the vertebral column. Branches are given off from this for the head, the neck, and the arms at the curve, while on its downward course it throws branches to the thorax, abdomen, and legs. From the various branches of the aorta the blood passes into the capillaries, and is again gathered up into the veins after it has parted with its oxygen to the tissues and gathered up the carbon dioxide gas which represents the waste. These veins unite into 2 large trunks, the superior and inferior venae cavae. The superior vena cava receives the blood from the head, neck, and arms, while the inferior vena cava receives the blood from the rest of the body. Through these the blood is poured back again into the right auricle, whence it repeats the above process, being reoxygenated each time on circulating through the pulmonary system before it begins its course through the general system. The blood of the abdominal viscera, however, takes a different course. It comes from the aorta, but from the capillaries of the stomach,

intestines, and spleen, it is gathered into the portal vein. From here it passes into the liver, where again it is distributed into capillaries. At the same time blood travels direct from the aorta to the liver by means of the hepatic artery. It is through the portal vein that many of the products of digestion are carried to the liver, mingling with the blood from the hepatic artery, and the capillaries reuniting to form small veins; these again join together to form the hepatic vein, which carries the blood back into the

DIAGRAM OF THE CIRCULATION OF THE BLOOD

inferior vena cava. This course taken by the blood from the abdominal viscera, through the liver to the hepatic vein, involving a passage through the 2 sets of capillaries, is referred to as the portal circulation (see LYMPH). The heart itself receives its supply of blood from what are termed coronary arteries which spring from the root of the aorta. This blood, after passing through the heart capillaries, is passed directly into the right auricle. The disease angina pectoris is caused by a partial blocking of these coronary arteries.

Comparative. It is not until we come to the higher worms that we arrive at anything approaching a vascular system, the various types giving rise to manifold stages until the highest stage for them is reached in the possession of a dorsal heart. In crustaceans, arteries are fairly well developed through which the blood

is driven from this dorsal heart. The venous system is lacunar, the venous blood passing along body cavity spaces to the gills and thence back to the heart. In insects the vascular system is not very distinctly developed. In molluscs the arterial system is fairly well developed. Passing to the vertebrates, the heart is a ventral and not a dorsal vessel. The typical fish circulation involves the fact that the heart always contains deoxygenated blood, which is taken by the afferent branchials to the gills, where it absorbs oxygen. The dorsal aorta, formed from efferent branchials which drain the gills, carries the blood to the body; thus showing the great difference between them and the higher vertebrates, in whom the dorsal aorta arises from the heart. Moreover in fish the blood travels along a single circuit, in contrast to the double circulation of higher vertebrates. In amphibians the heart has developed into a 3-chambered organ. They have a right and left auricle and 1 ventricle; the ventricle drives the blood to the head, body, and lungs, while the right auricle takes deoxygenated blood from the body, and the left oxygenated blood from the lungs or gills. In all these stages oxygenated and deoxygenated blood is more or less mixed, and it is only in birds and mammals that there is a complete separation of the 2 sides of the heart, resulting in the separation of the arterial and venous systems, so that they can only communicate through capillaries. In birds the aorta goes to the right, while in mammals it goes to the left, but except for the fact that their hearts are different in structure, and for the above fact, the circulatory systems are similar in birds and mammals. In this matter the metamorphosis of the frog affords a striking example of the evolution of the circulatory system from the fish-like arrangement of the tadpole to the circulation of the adult frog as described above. See W. Harvey, *De Motu Cordis et Sanguinis*, 1628 (Eng. trans., *The Circulation of the Blood*, No. 262 in Everyman's Library); C. Singer, *The Discovery of the Circulation of the Blood*, 1922; H. Gray, *Anatomy* (31st ed.), 1954.

Circumcision (Lat. cutting round), cutting off of the foreskin (prepuce), is a rite of auct origin and widespread use. It was practised among the early Egyptians, as is proved by extant monuments; and it is a primitive Arab custom. It was practised by the Aztecs, and at the present time by all Muslims, the Kaffirs, the Australian aborigines, the Papuans, and the Jews. The last-named people regard it, as they have always done, as a custom of great religious importance; and one of the earliest controversies of the Christian Church was on the subject of its retention. The reason for the rite is not known, but it originated probably either as a sacrifice or as a distinctive tribal mark, like tattooing. C. is also practised on purely medical grounds in cases where the foreskin cannot be drawn back to allow cleansing of the underlying parts, or when the opening of the prepuce is so small as

to obstruct the flow of urine. It is a trivial operation in infancy.

Circumcision, Feast of the, commemorates on 1 Jan. the Circumcision of Jesus Christ 8 days after his birth, according to the Law of Moses.

Circumference (Lat. *circum*, round; *ferre*, to carry), or periphery, is the name given to the curved line which encloses a plane geometrical figure, such as a circle, an ellipse, etc. See **CIRCLE**.

Circumferentor, instrument used in surveying of mines. It consists of a compass, with diametrical sights, the dial of which is divided into degrees. This is attached to a stand, and can be adjusted so that the angle which the line of sight makes with the magnetic N. can be observed on the dial.

Circumlocution, see **PERIPHRASES**.

Circumnavigation means literally sailing around, but is usually applied to voyages round the world. Among famous circumnavigators may be mentioned Francis Drake, Bougainville (1766-9), and Capt. Cook (1776-9).

Circumpolar Stars, see **STARS**.

Circumstantial Evidence, see **EVIDENCE**.

Circumvallation. In fortification, an entrenchment or chain of defensive works, erected by a besieging army, but facing outwards towards the country, so as to guard against attempts at relief by a field army, is called a line of C. The field-works are sometimes connected by a parapet or a rampart.

Circus (Lat. *circus*, (cf. *Kirkos* or *Krikos*), very anc. form of entertainment, originally an exhibition of athletic prowess in the form of races and contests of various kinds. The Rom. C. was held in the open air in vast buildings which have their modern equivalent in the sports stadiums, which are almost always of the same elliptical shape. The seating, then as now, was in tiers, and in Rom. days the lower tiers were of wood and the upper of stone, the lower seats being reserved for the aristocracy. There were boxes for great personages. Chariot racing was one of the most popular contests in the Rom. C., the horses being driven by expert charioteers, nearly always slaves, who drove 2, 3, 4, and sometimes more horses. Contestants wore distinctive colours. Immense excitement was aroused and accidents were many.

The modern C. dates from the middle of the 18th cent. Except that it was performed in an arena, it had little in common with the Rom. C., except in the use of horses. It was entirely a professional affair. It was a travelling entertainment, touring the country and given in a tent. Performing animals of all kinds played a large part in it, but equestrian skill was the big attraction. There was a comic element introduced by the clown. Philip Astley (q.v.), a very notable horseman, was the first to found a C. which had a fixed abode (on the S. side of Westminster Bridge, London). At first only the seats were roofed over, the ring itself being open to the sky. He introduced many varied acts, including singing and dancing. He had opposition from the Royal C., which

opened in 1783 and afterwards became the Surrey Theatre. Astley scored big successes with his troops of trained horses which performed tricks at the word of command, and these 'liberty horses' are still one of the most popular acts in any C. (The training of such animals, not only horses but all sorts of beasts, including seals, has now reached a high point of perfection. In no case, whether with lions, tigers, horses, or any form of animal life, is cruelty used. It is impossible to teach animals by that means.) Many others followed Astley's lead, notably Ducrow. From the C. proper arose the equine drama, full-blooded and spectacular melodramas, often of a patriotic nature, in which many horses and other animals were used. The famous 'Mazeppa' was an outstanding example of this rather curious form of dramatic art, which became so popular that it invaded the Theatre Royal, Drury Lane, itself. Lion-taming became an important part of C. programmes and there have been many famous exponents of this difficult and at times dangerous calling, one of the earliest celebrities being a Dutchman named Van Amberg or Amburgh, whose performances at Drury Lane Queen Victoria visited 4 times in 1 month. London and other cities had resident C.s for many years. Henglers, which stood on the site now occupied by the London Palladium, was outstanding. Here too horses played a large part, and the programme usually ended with a water show, the ring being inundated with water. The London Hippodrome, as its name implies, was originally used mostly as a C., although, like Astley's Amphitheatre in its later days, it had a stage as well. But the C. never entirely deserted 'the road' and many spent all the summer touring round the country. For many years 'Lord' (George Sanger's C. was the greatest in Great Britain. Mr Sanger (q.v.) was not a peer; 'Lord' was an assumed title. An outstanding success at the Agric. Hall, Islington, started his C. on its career. For many years that hall staged a C. every Christmas as part of a vast show called 'The World's Fair,' but Sanger's C. was in the main a road show. Nor must Wulff's C. be forgotten. This was a most elaborate affair and for many years was to be seen every Christmas at the Crystal Palace. It always ended with a spectacular production, such as a tournament with knights in armour jousting, or a wild boar hunt. Simple but most effective scenic tricks were used and the costumes were elaborate. Sanger, too, did not disdain a spectacular ending to his C., which frequently took the form of his version of a famous battle, in which fireworks played a prominent part.

The lure of the C. ring has attracted many and does so to-day. The tan and the sawdust, the spangles and the high efficiency of the performers, people who lived a life apart and were never seen out of the ring, touched a note of romance. This was soon found to be non-existent by those who risked all to join a C., which is a place of hard, unremitting work and

iron discipline. But the call of the C. still remains, even in these days of scientific machinery, and C.s, both in London and in the provs., lose nothing of their appeal, although to-day they are far more sophisticated than formerly. Sir Charles B. Cochran (q.v.), the great showman, was never so happy as when running a C. The greatest name in the Brit. C. world in modern times was that of Capt. Bertram Mills, whose ann. C. at Olympia drew all London, a tradition excellently carried on by his sons to-day, both in London and on the road. Other prominent names as C. impresarios are those of Tom Arnold, Chipperfield, and Billy Smart.

In America the C. has been a prime favourite in the way of entertainment for years. The vastness of the country and the multiplicity of cities, towns, and villages made a touring C. a profitable business. The greatest name in the C. world is that of the Amer. Phineas T. Barnum, who claimed, with reason, to have the greatest show in the world. He was always producing novelties; he must have everything of the largest kind and it was he who introduced the three-ringed C., with 3 separate shows going on at one and the same time. Barnum visited Great Britain with his show from time to time and created an immense sensation by buying 'Jumbo,' the biggest elephant in the world, from the London Zoo. Col. W. F. Cody (q.v.), 'Buffalo Bill,' ran his Wild W. Show in the form of a C. The Forepaughs, Adam and John, were other great Amer. C. proprietors, as were also the Sells Brothers, Robinson and Stone, and Murray. Of recent times the Ringling Brothers have been predominant, their C.s being vast affairs, far removed from the simple outfits of the old 'tenting days,' moving in their own special trains, with a huge staff of employees. But to most people the old-fashioned C., with the smell of the tan and sawdust, the naphtha lamps, the blaring brass band, and the mysterious folk who perform their wonders with such ease, presents the main romance of the C. Of the various kinds of performers, acrobats (q.v.) of many types and kinds form the sinews of the entertainment, the core of which, in true C., must always be animals.

Cire Perdue, name given to an old method of producing bronze statues (well described by Benvenuto Cellini). The molten bronze was poured into a model made in wax over a clay core and cooled over. The bronze assumed the shape of the intervening surface represented by the wax. The famous bronzes of Benin in Nigeria were made by this method.

Cirencester, parli. and urb. dist. in Glos, England, situated on the R. Churn, 16 m. S.E. of Gloucester. C. was founded by the early Britons, and became a Rom. station under the name of *Corinium*. Rom. remains have been discovered, and the town possesses a Rom. museum. The par. church dates from the 15th cent. Agriculture is the chief occupation, and there are sev. light industries. The Royal Agric. College is here, and there is a fine live-stock market. Pop. 11,540.

Cirié, It. tn, in Piedmont (q.v.), 12 m. N. of Turin (q.v.). Pop. 7000.

Ciro, It. tn, in Calabria (q.v.), near the Gulf of Taranto, 42 m. N.E. of Catanzaro (q.v.). Pop. 12,600.

Cirque (Fr.) or **Corrie** (Scottish) or **Cwm** (Welsh), semi-circular basin-like hollow forming the head of a valley or excavated in the side of a mt. In cold mountainous regions snow patches accumulate in chance hollows. The alternation of freezing and thawing around these patches causes the rocks to disintegrate and the debris is carried away by avalanches and by melt-water. The hollow is thus enlarged and bites back into the hill slope. C.s where snow accumulates in the winter faster than it melts during the summer, so that a permanent snow-field forms, serve as sources from which glaciers flow. The movement of ice plucks blocks from the corrie walls and from the floor, steepening the former and often scooping out a hollow in the latter.

Cirrhosis, chronic, progressive disease of the liver. The parenchymatous cells are gradually destroyed by inflammatory processes and replaced by fibrous tissues. The initial stages of C. are associated with enlargement, or hypertrophy, of the liver—hence the name *Hypertrophic C.* Later, with the formation of fibrous tissue, the organ shrinks, becomes hardened, and takes on a yellow colour. This is called *Atrophic C.* Some lobules of the liver are sometimes affected but not others, so that the shrinkage is uneven, giving an irregular outline to the liver. C. may be caused by substances poisonous to the liver cells, such as alcohol, or by infection (see *HEPATITIS*). *Alcoholic C.* is C. of the liver due to chronic alcoholism. *Cardiac C.* is due to destruction of the liver cells and their replacement with fibrous tissue from the increased pressure in the hepatic veins in congestive heart failure. C. leads to obstruction of the portal blood system and the estab. of a collateral circulation between the portal and the systemic circulation. Obstruction of the portal system may cause ascites (q.v.). See *under LIVER*.

Cirripedia (Lat. *cirrus*, curl, *pes*, foot), order of fixed Crustaceans which includes the barnacles and acorn-shells (q.v.). All the species are marine, and live in either a parasitic or a sessile state. Nearly all the species are hermaphrodite, but in some genera dwarf male forms known as *complemental males* are also to be found.

Cirrus, see *CLOUD*.

Cirrus, in botany, tendril formed from the apex of a leaf; the corresponding adjective is *cirrose* or *cirrhose*.

Cirta, anc. city of Numidia, the cap. of Massinissa and his successors. Restored by Constantine the Great, it was renamed after him. See *CONSTANTINE*.

Cisalpine Republic (Lat. *cis*, on this side, meaning on this side of the Alps, and originally so used by the Romans) was formed in 1797 by the joining of the Cispadane and Transpadane reps. formed the year before by Bonaparte. The whole rep. consisted of Mantua, Brescia,

Lombardy, Cremona, Verona, Rovigo, Modena, Massa, Carrara, Romano, Ferrara, and Bologna. The H.Q. of the gov. was Milan, and its army consisted of Fr. soldiers. It was eventually known as the It. rep., and formed the basis of the Napoleonic kingdom of Italy (1805-14).

Cisneros, Francis Ximenes de (1436-1517), see XIMENES, OR JIMENES, DE CISNEROS, FRANCISCO.

Cissampelos, genus of Menispermaceae. *C. Pareira*, the pareirabrava, is a native of sev. W. Indian is., and of Brazil. The root is employed in Europe as a tonic diuretic, and the juice of the fresh plant in its native country is said to be an efficacious antitoxin in cases of snake-bite.

Cissbury, large prehistoric earthwork with a number of deep, circular pits, in Sussex, England, 2 m. N. of Worthing. It contained flint instruments of the Stone Age. Rom. antiquities have also been found. Near by is Chanctonbury Ring (q.v.).

Cissoid (Gk *kissos*, ivy), cuspidal curve invented by Diocles, the mathematician of Alexandria. He came across it in his investigation of the problems of the trisection of a plane angle and the finding of 2 mean proportions between 2 straight lines. One method of describing the curve is as follows: In a circle draw any diameter. Then erect 2 perpendiculars on this diameter at equal distances from the centre and on the same side of the diameter. Let one of these cut the circumference in a point C, and let A be the extremity of the diameter on the same side of the centre. Join CA and let it cut the other (produced) perpendicular in P, then the locus of P is the C. curve. Its equation can be expressed in the form $y^2(2a-x) = x^3$. The tangent to the circle at the other end of the diameter is the asymptote to the curve which consists of 2 similar portions on either side of the diameter with a cusp at A.

Cistaceae, family of dicotyledonous shrubs and herbs, 6 genera, mostly Mediterranean, some American. Leaves opposite, flowers perfect with 3 to 5 sepals, 3 to 5 petals, many stamens, 1-celled superior ovary, and capsular fruit. Genera include *Cistus*, *Fumana*, *Halim*, *Helianthemum*, *Hudsonia*, and *Lechea*.

Cistelidae, family of coleopterous insects nearly related to the Tenebrionidae, differs from it chiefly in that the species have the claws of the tarsi comb-like. Little is known about these beetles.

Cistercians, members of a religious order founded at Cîteaux (q.v.) in 1098 by a group of about 20 monks from the Benedictine abbey of Molesmes, led by their abbot, Robert of Champagne. Their purpose was a more literal observance of St Benedict's (q.v.) rule than was in vogue among the black monks at that period. The extreme austerity of the new foundation made progress difficult during the first 10 years or so; but the arrival of St Bernard (q.v.) and his companions in 1112 marked a turning-point in the order's hist. The Cistercian influence spread rapidly during the 12th cent. On the death of St

Stephen Harding, third abbot of Cîteaux, in 1134, the order possessed 84 houses; 150 when St Bernard d. in 1153; 530 in 1199; and 700 in the following cent. After 1125 there were almost as many houses of women as of men. The first Eng. foundation (1128) was Waverley Abbey, near Farnham in Surrey; and when the monasteries were suppressed under Henry VIII there were 86 monasteries and 33 convents in England and Scotland. Besides their immense spiritual influence in the heyday of the order, the C. (known also from their habit as White Monks) developed a distinctive style of Gothic architecture, relying on form at the expense of ornament, and they were pioneers of agriculture. But by the middle of the 13th cent. the order was in decline, and it was not until the Trappist reform (see TRAPPISTS) in the 17th cent. that a return was made to the original spirit of Cîteaux. To-day the Trappists have numerous houses both in Europe and America. The habit consists of a white woollen tunic, a black scapular (with hood) of the same material, a leather girdle, and (in choir) a white woollen cowl. See Manriquez, *Annales Cistercienses* (4 vols.), 1642; Cardinal Newman, *The Cistercian Saints of England*, 1844-5; H. Collins, *Spirit and Mission of the Cistercian Order*, 1866; D. Knowles, *The Monastic Order in England*, 1940, and *The Religious Orders in England*, 1948.

Cistern, small reservoir or tank installed in buildings for storage of water where supply is intermittent, to reduce pressure or to isolate distribution pipes from the water authority's mains so as to prevent pollution of the latter. Usually a 'service pipe' connects from the water authority's main to the C., into which the flow is controlled by a ball-valve. Drinking water and culinary taps are connected direct to service pipes, while water-closets, baths, lavatory basins, etc., are served by 'distribution pipes' from the C. Cs are required by the by-laws of some, but not all, water authorities.

Cisternino, It. tn in Apulia (q.v.), 27 m. WNW. of Brindisi (q.v.). Pop. 9000.

Cists (Gk *kistê*; Lat. *cista*, a box or chest) are receptacles for the body or ashes of the deceased in burials of early man. The cist is usually in a grave which may or may not be covered by a mound (see BARROWS). C. may be made of tiles, stone dressed or in the rough state, wood, or lead. They are perhaps most common in Bronze Age and Rom. contexts. In a special sense, a cist was also a small box for the sacred utensils carried in procession during the Gk mystic festivals.

Cistus, or **Rock-rose**, genus of Cistaceae, 20 species of evergreen shrubs, native to the Mediterranean, with rose-like flowers of white, yellow, pink, purple, of which hybrid forms such as C. × 'Silver Pink', C. × *lusitanicus*, C. × *corbariensis*, and C. × *cypricus* are most esteemed for gardens.

Citadel, strong fortress situated in or near a city, to keep the inhab. of the city in due order and submission, and also to form a rallying-point and last place of

defence when the tn is attacked. Famous C.s have included the Acropolis of Athens, the Rom. Capitol, and that of Cairo.

Citation, process in the commencement of a suit by which the parties are commanded to appear before the consistorial courts (see ECCLESIASTICAL COURTS). In the old prerogative courts it was called a decree. In a wider sense C. denotes the act of summoning a person to appear before any judge. C. was formerly the method of commencing all probate proceedings requiring the aid of the court, whether arising out of common form business or otherwise; its object was to compel a representation to be taken by those who were primarily entitled to it, or to provide a substitute for a voluntary renunciation on their part. The word C. is also used to denote the citing of reports and authorities in a court of law to establish any proposition submitted to the court.

Citeaux, Fr. hamlet in the dept of Côte-d'Or, N.E. of Beaune, containing the famous abbey where was founded the Cistercian Order (see CISTERCIANS) in 1098. Some of the anct buildings remain. Pop. 250.

Cithaeron (Gk *kithairōn*), or **Elatia**, range of mts in Attica, separating Megaris and Boeotia, rising to 4626 ft.

Citharinus, fresh-water fish of tropical Africa of the suborder Cyprinoidae. C. *Geoffroyi*, the moon-fish of the Nile, is a well-known species about 3 ft in length.

Cities of Refuge. These cities were 6 in number (Num. xxxv), 3 to the E. and 3 to the W. of Jordan, and were set apart to protect people who had committed murder unintentionally, and found sanctuary there.

Citium, anct name of Larnaca (q.v.).

Citizen, see CITY.

Citral, aldehydic terpene occurring in lemon and lemon-grass oils, and in other essential oils. Chemical formula $C_{10}H_{16}O$, boiling-point 228-8°. On heating with potassium bisulphate it forms cymene. It can be obtained from geraniol, the corresponding alcohol, by mild oxidation.

Citric Acid ($C_6H_8O_7$), constituent of the juice of many fruits. It occurs in large quantities in lemons, in smaller quantities in unripe gooseberries, raspberries, etc. It is usually prepared from lemon juice, which is boiled and then treated with calcium carbonate. The resulting calcium citrate is decomposed with dilute sulphuric acid, and the C. A. filtered off, after which the filtrate is evaporated to crystallisation. C. A. is a crystalline solid melting at 100° C., soluble in water and alcohol. It has the property of preventing the precipitation of certain metallic hydroxides from solutions of their salts, and is used for this purpose in calico-printing.

Citrine, Walter McLennan, 1st Baron Citrine (1887-), trade unionist and administrator, b. Liverpool. He joined the trade union movement on Merseyside. In 1914 he was appointed dist. secretary of the Electrical Trades Union; in 1917 he became president of the Federated Engineering and Shipbuilding Trades,

Merseyside; and, in 1925, general secretary of the Trades Union Congress. He took a leading part in the struggle to secure the repeal of the Trades Dispute Act of 1927. From 1947 to 1957 C. was chairman of the Brit. Electricity Authority. He was created a peer in 1946. His publs. include *British Trade Unions*, 1942.

Citrine, yellow pellucid variety of quartz resembling topaz in colour. This yellow strain is caused by the presence of iron oxide. Also called Sp. topaz.

Citron, or *Citrus medica*, Asiatic species of Rutaceae cultivated on account of its acid fruit. The rind is candied. The sacred C. of the Jews is *Eтрог*.

Citronella, name of a fragrant ethereal oil obtained from the grass *Cymbopogon nardus*, which is cultivated in Ceylon and grows wild in Africa, Australia, and tropical Asia.

Citronwood, name applied to sev. kinds of wood used in furniture-making, is most properly applied to that of *Thuja orientalis*, a coniferous tree often spoken of as the arbor vitae of China.

Citrulline, recently discovered amino acid, first isolated from the water-melon (*Citrullus vulgaris*). It may also be isolated from the products of the tryptic digestion of caseinogen. C. is closely connected with the bodily mechanism concerned with urea excretion.

Citrus, family Rutaceae, genus of 11 evergreen shrubs or trees. C. *aurantifolia* is the Lime (q.v.); C. *aurantium*, the Seville or Bitter Orange; C. *bergamia*, the Bergamot Orange; C. *limonia*, the Lemon (q.v.); C. *maxima*, the Pummelo or Shaddock (q.v.); C. *medica*, the Citron (q.v.); C. *paradisii*, the Grapefruit or Pomelo; C. *sinensis*, the Sweet Orange; and C. *nobilis*, the King Orange. See ORANGE.

Città Della Pieve, It. tn in Umbria (q.v.), 23 m. SW. of Perugia (q.v.). It suffered considerably during the Second World War, and many buildings, including the cathedral, were damaged. Perugino (q.v.) was b. here. Pop. 9400.

Città di Castello, It. tn in Umbria (q.v.), 25 m. NW. of Perugia (q.v.). It is in the Tiber (q.v.) valley, and has anct walls, a cathedral (partly 15th cent.), a 14th-cent. tn hall, and an art gallery containing many notable pictures. There is an iron industry. Pop. (tn) 8400; (com.) 36,900.

Città Sant' Angelo, It. tn in Abruzzi e Molise (q.v.), near the Adriatic coast, 8 m. NW. of Pescara (q.v.). Pop. 3000.

Città Vecchia, see MALTA.

Cittadella, It. tn in Veneto (q.v.), 18 m. NNW. of Padua (q.v.), surrounded by superb walls. Pop. 12,500.

Cittanova: 1. (formerly **Casalnuova**) It. tn in Calabria (q.v.), 28 m. NE. of Reggio di Calabria (q.v.). It was built from the ruins of a former tn of Casalnuova, destroyed in an earthquake in 1783. Olive oil is produced. Pop. 14,000.

2. Vil. in Italy, 4 m. from Modena (q.v.). It represents the former Città Geminiana, founded in the 8th cent. by exiles from Modena after a Longobard (q.v.) devastation.

Cittanova (**Cittanuova**; Slovenian **Novigrad**; anct **Noventum**), fishing port of the Free Ter. of Trieste (q.v.), on the Adriatic, at the mouth of the Quileto R., 25 m. SW. of Trieste. It is in the Yugoslav zone. Pop. 1500.

Cittern, or **Cithern**, obsolete string instrument which resembles a guitar. It was strung with brass and steel wire, and each pair of its 4 pairs of strings was tuned in unison. It was generally played with a plectrum and its music was written in lute tablature.

CITTERN

City (through Fr. *cité*, from Lat. *civitas*), bor. or tn incorporate, which is or has been an episcopal see.

There are so many exceptions, however, to this definition that the term is often used indiscriminately of any large industrial centre. Constitutionally, however, a bor. only becomes a C. through Grant by the Crown by Order in Council. The Romans used the word *civitas* to denote the whole state or body politic, *urbs* and *municipium* being applied to tns. This meaning of the word has been totally lost

in modern times, but the large C.s of the U.K. and the U.S.A. do somewhat resemble the C.s of anct Greece in their local self-government. The Gk *polis* represented a collection of families, gathered together within a certain space, who administered their own foreign and domestic affairs, and had their own religion. These C.s were only bound by affection to the *metropolis* (mother city), of which they were, in a sense, colonies. The indeterminate use of the word C. probably began at a very early date. Du Cange in his glossary of medieval Lat. words defines the word *civitas* as *urbs episcopalis*, and says that tns were called *epipolis* or *castra*. The modern definition, given above, is derived from his glossary, yet there were exceptions to this rule at an early period. For example, Dorchester and Sherborne were once episcopal sees, but have never been called C.s, not even now that they have corporations. In the Domesday Book Gloucester and Leicester are called both *civitas* and *burgum*. The word is now used chiefly as an honorary title, as it is thought to confer more dignity than the word *town*. In 1889 Birmingham, though not an episcopal see, was raised to the rank of a C. on account of its industrial importance; since that time the title has been conferred on many other incorporated tns in the U.K., and it is the common ambition of growing tns to be so called. At the present time Hull is a C. but has no cathedral or bishop (Beverley); also Cardiff (Llandaff).

In the U.S.A. a C. may be defined as an incorporated municipality, governed like an Eng. bor. by a mayor, aldermen, and common council. For all practical purposes the term is synonymous with municipal corporation. C.s existed in Virginia from the commencement of Amer. hist., though it is not clear that these C.s were chartered, or that the title they assumed was anything more than vainglory. In certain cases, where the pop. has grown very considerably and the tn has spread into numerous suburbs, the term C. is applied to the space within the original boundaries, as, for example, the *Cité* of Paris. Thus, curiously enough, London, which is called the largest C. in the world, has within it 2 C.s, the C. of London and the C. of Westminster. A citizen, as defined by Aristotle (*Politics*, iii. 1), is one who has the right to take part in the legislative proceedings of the state to which he belongs. He is a subject with particular privileges. In anct Rome there were 2 kinds of *cives*. The majority had certain private rights of citizenship, such as the right of intermarriage (*jus connubii*) and right of trade intercourse (*jus commercii*) with the allies or friends of Rome. A few, however, had special privileges of voting in the tribe, and were eligible for the higher offices of state. The rights of citizenship were generally acquired by birth, but both parents had to be Rom. citizens. At a later period it merely denoted free birth as opposed to those who were born slaves. The word *citizen* was particularly popular during the Fr. Revolution, as it was felt to express all that *liberté, égalité, et fraternité* comprised. It was used as the common title of address, irrespective of the person's position. The term, however, fell into disuse when the gov. came into the hands of Napoleon. In Great Britain it has never been used to any great extent, and its meaning is indefinite. See also LOCAL GOVERNMENT.

City Literary Institute, institution for adult education founded in London by the L.C.C. in the 1920's to provide day and evening classes in a wide variety of cultural subjects. Tutorial and diploma courses of the univ. of London are given. Specially designed modern buildings were opened in Stukeley St in 1938.

'**City of Benares**,' Brit. liner which sailed from Liverpool for Canada, 13 Sept. 1940, with a party of 90 children being evacuated from air-raided England, together with 10 adult escorts and a crew and other passengers numbering 306. Four days later she was torpedoed by a Ger. U-boat at night in mid Atlantic, 600 m. from land, and sunk. Nearly all the children were below, and many were asleep. Rescue efforts were defeated by tempestuous weather and heavy seas, many boats being swamped. There survived of the children aboard, who had sailed under an official scheme of evacuation, only 7, and of their escorts 4. The fourth officer and 32 *Lascars* were also saved, but the remainder, including the captain, perished. See Elspeth Huxley, *Atlantic Ordeal*, 1941.

City of London School, public school for boys founded by John Carpenter, clerk of the city, in 1442. It was estab. and erected under the authority of an Act of Parliament in 1834 on the site formerly occupied by Honey Lane Market, Cheapside. In 1883 it was removed to its present site on the Victoria Embankment. It is endowed with an ann. sum derived from certain estates left by the founder for educational purposes, and is under the gov. of the Corporation of London.

City of London School for Girls, estab. by the Corporation of London in accordance with the will of the late Wm Ward, 1881, to create a girls' school on similar educational lines to the boys' school of the same name. It is in Carmelite St., E.C.4.

Ciudad Bolívar, city and cap. of the state of Bolívar, Venezuela. It stands on the r. b. of the Orinoco and is the prin. port of its basin. Steamers run to Trinidad and along the Venezuelan coast, and in the rainy season far up the riv. It was founded in 1764 as Angostura (the Narrows), but renamed C. B. in 1864. It suffered severely in the war of Independence when for a time it was Bolívar's H.Q. It is the seat of a bishop. It exports gold, diamonds, hides, balata, coffee, cocoa, tobacco, chicle, and tonka beans. The mean temp. is 83°, but the climate is healthy. Pop. 41,100.

Ciudad de Cura, see CURA.

Ciudad de las Casas, see SAN CRISTÓBAL.

Ciudad Ensenada, see CUENCA.

Ciudad Juárez, tn of Chihuahua state, Mexico, on the Rio Grande border. It was formerly known as El Paso del Norte and it is connected by 3 international bridges with the Texan tn of El Paso (q.v.). Agriculture and stockraising are carried on, and it is a river, rail, and air transport centre. Pop. 48,900.

Ciudad Real: 1. Sp. prov., in Castilla la Nueva (q.v.), occupying the greater part of the former prov. of La Mancha (q.v.). Area 7622 sq. m.; pop. 576,600.

2. (anc. Alarcos, later Villa Real) Sp. tn, cap. of the prov. of C. R. It is a medieval-looking tn, with a 13th-cent. Gothic cathedral, and a 16th-cent. synagogue. It is the seat of the bishop-prior of the military orders. Textiles and brandy are manuf., and there is a market. Pop. 34,600.

Ciudad Rodrigo, Sp. fort tn in the prov. of Salamanca, on a hill overlooking the Agueda. It was taken by the English in 1706, and again in 1812 by Wellington (see PENINSULAR WAR), who was created Duke of C. R. Leather, soap, and pottery are manuf. Pop. 12,750.

Ciudad Trujillo, until 1936 **Santo Domingo**, cathedral city and resort, cap. of the Dominican Rep., situated on the S. coast of the Is. of Santo Domingo. It is the oldest European tn of the Americas, having been founded by Bartholomew, brother of Christopher Columbus, in 1496. The old univ. of Santo Tomas is maintaining a high standard as a cultural centre. The city has become completely modernised, but care has been taken to protect the anc. monuments. It has an

artificial harbour and is chiefly engaged in the export of sugar, molasses, cacao, hides, and timber. Pop. 181,533.

Ciullo d'Alcamo, see CIELO DALCAMO.

Civet, cat-like carnivores, typical of the family Viverridae. The genus contains the largest species in its family, and, like most of its allies, has a scent gland near the sexual organs from which the perfume C. is obtained. The animals are long and thin of body, and have long heads and short ears; the legs are short, the feet are small and hairy. In habit the C.s are terrestrial, and they feed chiefly on birds and reptiles. The obnoxious and very lasting odour of C., which only on extreme dilution becomes pleasant and attractive, makes it of value as a perfume fixative. The animals are often kept in captivity in order that it may readily be extracted from them. *Civetticia civetta*, the only African species, yields the best-known C. perfume in commerce; *Viverra zibetha*, found in the Indian Archipelago, yields the widely distributed Indian C.

Civetone, ketone present in natural civet (q.v.), obtained from the civet cat and used in perfumery. It is an unsaturated ketone, melting at 31°, and having the formula $C_{17}H_{32}O$. Civetol is the corresponding secondary alcohol.

Cividale (Del Friuli), It. tn in Friuli-Venezia Giulia (q.v.), on the Natissone, 9 m. W. of Udine (q.v.). The tn dates from Rom. times, and has many anc. monuments, including an 8th-cent. oratory and a fine cathedral. There is also an important archaeological museum. Textiles are manuf. Pop. (tn) 6200; (com.) 11,700.

Civil Aviation, see AIR MAIL; AVIATION, CIVIL; etc.

Civil Defence. In Great Britain the home secretary is responsible for C. D. in England and Wales, and the secretary of state for Scotland for C. D. in Scotland. Co. councils, co. bor. councils, the councils of Scottish large burghs, the authorities of the City of London, the metropolitan bor. councils, and in a few cases co. dists., are responsible for the organisation of the local divs. of the C. D. Corps. The corps comprises 5 main sections: H.Q., Warden, Rescue, Ambulance, and Welfare. Training is carried on at local centres in volunteers' spare time; the length of training varies according to the different sections. The Home Office publishes a pamphlet giving details of conditions of service.

Precautions against air-raids on the civil pop. in a future war were ignored for the better part of 2 decades after the First World War. Undue confidence was reposed in the principle of collective security, and war-weariness led to procrastination. But the devastating effects of aerial warfare on civilians were exemplified in the Italo-Abyssinian War of 1935-6, in the Jap. invasion of China in 1937-8, and in the Sp. Civil War of 1936-9; and with the increasing tension in the European political situation from 1937, public consciousness of the danger was awakened, and by 1938 most countries had developed protective measures against

explosive and incendiary bombs and gas attacks from the air.

In the U.K. the Air-Raid Precautions Act was passed at the end of 1937. The preparation of schemes for the protection of the civil pop. is the business of the Home Office working in conjunction with the local authorities. Air-raid precautions took the form of a free issue of gas-masks to the entire pop., the provision of bomb-proof shelters, the formation of decontamination squads to deal with mustard or other liquid gases in the streets, and instructions on how to render refuge rooms gas proof and the preparation of special fire-fighting apparatus. London, with its vast pop. and congested areas, presented peculiar difficulties, and plans were soon completed for at least a partial evacuation of the pop. Sound-detectors were perfected for warning the country of the approach of enemy aircraft and experiments with balloon wire-barrages were carried out. Fighter planes and anti-aircraft guns necessarily played a large part in resisting raiders during the Second World War, as well as the counter-bombing raids on enemy soil. 'Blacking-out' experiments were made before the war (1939) in various towns, combined with fire-fighting and gas-decontamination practice.

But in spite of progress in the planning of C. D. ordinary citizens living and going about their business in crowded urb. areas are still particularly vulnerable. Among precautions to meet this danger are splinter- and blast-proof shelters, the strengthening of basements in certain types of houses, and the provision of communal and street shelters. The protection of works, offices, and public utility undertakings in time of war is covered by statute. By 1940 London's bitter experience of Ger. air-raids demonstrated the absolute necessity of an efficient 'fire-watching' organisation.

Early in the hist. of air warfare on open cities, air-raid precautions were necessarily of an improvised character. Sometimes, as in the case of the rock shelters of Malta, nature has provided a merciful means of protection. Again, in Hong Kong, the shelters were admirable. But experience suggests that in future wars, when the weight of bombs and bombers would be increased beyond measure, to say nothing of the development of nuclear bombs, C. D. of an altogether revolutionary and all-embracing character will become the first duty of the govs. of all states. See also FIRE SERVICE, AUXILIARY, and MOBILE DEFENCE CORPS. See T. H. O'Brien, *Civil Defence*, 1955 (*Official History of the Second World War*).

Civil Engineering, see CIVIL ENGINEERS, INSTITUTION OF, and ENGINEERING.

Civil Engineers, American Society of, association of professional engineers of all branches, founded in 1852 for the advancement of engineering and architectural knowledge and practice. It holds an ann. convention in the summer, at which there are technical discussions on the various papers submitted by its special committees and at which excursions

to places of professional interest are arranged. Among the more important questions considered in recent years by the society have been the preservation and utilisation of Niagara Falls, the regulation of the flow of the Great Lakes, the engineering aspects of civil aerial transport, and the engineering features of the national cap. It now comprises about 50 local sections and nearly 100 affiliated student chapters in colleges throughout the U.S.A.

Civil Engineers, Institution of, granted a charter in 1828, in which civil engineering is described as the art of directing the great sources of power in nature for the use and convenience of man and as the means of production and traffic in states, both for external and internal trade, as applied (1) in construction of roads, bridges, aqueducts, canals, and docks for internal intercourse and exchange, and in riv. navigation; (2) in construction of ports, harbours, moles, breakwaters, and lighthouses; (3) in the art of navigation by artificial power for the purpose of commerce; (4) in the construction and adaptation of machinery; and (5) in the drainage of cities and towns.

Civil Estimates, expenditure of the various depts of state, excluding that of the 3 fighting services. The C. E. are pub. annually as a White Paper. They are divided into 10 classes: central gov. and finance; Commonwealth and foreign; home dept. law and justice; education and broadcasting; health, housing and local gov.; trade, labour, and supply; common services; agriculture and food; transport, fuel, power, and industrial research; pensions, national insurance, and national assistance. Between 1933 and 1938 C. E. grew steadily each year from £109,000,000 to £521,000,000. In 1945 they had risen to £1,211,190,938, of which £574,740,038 was attributable to the ordinary services and £636,450,880 to special war services. The original Estimates (including revenue depts) for 1956-7 totalled £2,953,282,938.

Civil Law. This is generally understood to mean the municipal law of the Rom. Empire, as comprised in Justinian's Institutes, Digest or Pandects, Code, and *Novellae* (supplementary to the Institutes, containing new constitutions by himself and some of his successors). These form the *corpus juris civilis*. As applied to modern systems, C. L. means the municipal law of those countries that have founded their system upon the Rom. law. Scots law is founded upon the C. L., as is the Code Napoléon. The N. states of the U.S.A. administer a system founded on common law, whereas in Louisiana a C. L. system is in vogue. Many of the principles of the canon law as administered by the eccles. courts (q.v.) are borrowed from the Rom. law. The common law (q.v.) of England is generally assumed to be indigenous, but the Eng. law merchant which is now incorporated in the common law owes much of its uniformity to analogies drawn by such judges as Lord Mansfield from, among other sources, the Rom. Pandects.

Civil List. In former times the whole expenses of the gov., except those of the army, navy, and military depts in general, were paid from the possessions of the Crown. In the reign of William III the Commons separated the regular and domestic expenses of the king from the public expenditure, and took control of the latter. From 1697 until the reign of George II the C. L. was fixed at £700,000, in the reign of George II at £830,000, and at £800,000 in the time of George III; these amounts were often supplemented by additional grants. All salaries were taken out of the C. L. at the time of William IV's accession, and the amount was fixed at £510,000. On the accession of Queen Victoria the amount was £385,000, to be devoted solely to the support of the household of Her Majesty and the maintenance of the dignity of the Crown. The C. L. for the present reign is £475,000, subject to certain deductions in respect of the balance of the Duchy of Cornwall revenues which are placed at Her Majesty's disposal during the minority of the Duke of Cornwall. *See* ROYAL FAMILY.

Civil Service. There is no statutory definition of the term C. S., which was first used in respect of the civilian sector of the E. India Co.'s personnel; but the following working definition of what constitutes a civil servant has been adopted by successive Royal Commissions: 'Servants of the Crown, other than holders of political or judicial office, who are employed in a civil capacity and whose remuneration is paid wholly and directly out of moneys voted by Parliament.' This definition excludes the staffs of the nationalised undertakings and of Trinity House and the Crown Agents, but includes those of the national galleries and museums. It excludes judges and policemen, as well as members of the gov., the officers and servants of both Houses of Parliament, and the personal retinues of the Sovereign. This difficulty of satisfactory definition reflects the fact that what is generally thought of as the C. S. comprises the staffs of a number of separate offices and depts of state, for which, in the last resort, individual ministers are responsible.

Included in the above definition, but distinct in various ways, are the staffs of the Foreign and Imperial Services (8342 on 1 Jan. 1955) and of the Post Office (246,078 on the same date). Also included are the staffs of the civil depts responsible for trade, industry, and transport (69,444), of the social service depts (65,205), of the revenue depts (65,125), of depts such as the Ministry of Works and the Stationery Office, providing agency services (21,002), of the service and supply depts (134,423), of the Home Office, co. courts, prison commission, etc. (23,761). This total of 633,380 civil servants did not include the labourers, craftsmen, and similar workers in dockyards, ordnance factories, etc., who are termed industrial civil servants. The clerks, typists, administrators, professional officers, and others who generally

come to mind when one talks of civil servants were divided in 1953 in the following proportions:

	<i>per cent</i>
Administrative class	4
Executive classes	9.3
Clerical and sub-clerical classes	26.9
Typing grades	3.9
Professional, scientific, and technical classes	10.0
Post Office engineering and allied grades and manipulative grades (including cleaners, etc.)	37.9
Messengers, cleaners, etc. (not Post Office)	4.1
Others	7.5
	<hr/> 100.0

In the last 100 years much has been done to draw together the staffs of various depts and offices of state into a single service. The unifying process, which may be said to have begun with the pub. of the Northcote-Trevelyan Report in 1853 and the setting up of the C. S. Commission 2 years later, has owed much to the work of a succession of Royal Commissions, to the persisting influence of the Treasury, and more recently to the service-wide apparatus of collective bargaining known as Whitleyism. The Treasury is concerned, not only with such matters as salary levels and superannuation terms and the complements of the respective depts, but with the internal discipline and efficiency of the service. In its role of personnel dept for the service as a whole, it maintains and enforces a code of procedure known as *Estacode*, which is the 'Bible' of estab. (i.e. personnel) depts throughout the C. S. Treasury guidance, often imparted through the estab. or finance officers of the depts, has the effect of gradually reducing the scope for differences of procedure on staff matters in various depts. In their own respective fields, the Stationery Office and the Ministry of Works, which is responsible for accommodation, make a comparable contribution. The influence of the trade unions, exerted directly or through the Whitley machinery, has a similar effect, and it was from the recommendations of a Committee of the National Whitley Council in 1920 that the 3 main C. S. classes, the administrative, the executive, and the clerical, resulted. The process of unification is not by any means complete. There are still a number of special departmental grades within the home C. S.; and since 1945 a number of new nationalised undertakings have been estab. whose staffs are outside the C. S. and are not subject to direct Treasury control.

The 3 main service classes already mentioned have been heavily reinforced in recent years by professional, scientific, and technical officers, grouped in similar service-wide hierarchies; but they remain in many respects the core of the service. The tasks of the small body of administrators at the top of the C. S.

(there were less than 3000 of them in 1956) include advising ministers and helping to formulate policy, dealing with parl. questions and with correspondence from M.P.s, drawing up the heads of new and amending legislation, co-ordinating and improving the machinery of gov., and generally administering and controlling the public service. Among their ranks are the permanent secretaries of the great depts, who, with their deputy secretaries and under secretaries, are in day-to-day, and frequently hour-to-hour, consultation with ministers, and, at a slightly lower level, the assistant secretaries, who are for the most part in charge of branches or divs. in which rather less important but vastly more numerous decisions are taken from day to day.

Within the branches, the assistant secretaries are supported by principals and assistant principals and also by members of the executive class. Nearly half the assistant secretaries and principals in the service in 1956 entered by way of another class; and since the Second World War one fifth of the ann. intake of assistant principals has been recruited by promotion from within the service. But the main highway into the administrative class still leads direct from one of the older univs. In 1953, for instance, out of 52 successful candidates in the open competition for entry into the administrative class, 26 came from Oxford, 15 from Cambridge, 5 from the Scottish universities, 5 from London, and 1 from Nottingham. Thirty-five of the 52 were educ. at grammar schools. Once inside the service, the entrant to the administrative class spends some years in the relatively ill-paid training grade of assistant principal, in which he will frequently find himself working alongside members of the executive class and doing work not dissimilar to that of a higher executive officer. He will not reach the more responsible rank of principal much before the age of 30, or the rank of assistant secretary until much later in his official career.

The small administrative class is assisted by an executive class some 20 times as large, many of whose senior members work in close touch with the administrators. The executive class was set up as a result of the report of the reorganisation committee already mentioned, which recommended that it should be given work which 'covers a wide field, and requires in different degrees qualities of judgment, initiative, and resource. In the junior ranks it comprises the critical examination of particular cases of lesser importance not clearly within the scope of approved regulations or general decisions, initial investigations into matters of higher importance, and the immediate direction of small blocks of business. In its upper ranges it is concerned with matters of internal organisation and control, with the settlement of broad questions arising out of business in hand or in contemplation, and the responsible conduct of important operations.'

The committee recommended that the executives should be recruited by open competitive written examinations of full secondary standard, from young persons between the ages of 18 and 19; and it was originally intended that the junior grade of the class should be a training grade. It was not until after the Second World War, however, that the executives began to be used over the whole of the field contemplated by the committee, and the majority of its present members have been recruited by promotion from below, not by open competition. Nor has it so far been possible to make the junior executive grade a training grade as originally intended.

Over the C. S. as a whole, the executives are now to be found engaged in accounting and contract work; the interpretation of regulations and the solution of minor problems arising out of them; the custody of precedents; estab. and similar work involving the control and supervision of junior staff; and tasks of a quasi-administrative or quasi-professional kind, involving close contact with administrative, scientific, or professional officers. There is a considerable hierarchy within the executive class, the higher grades of which can be reached only by promotion from within.

The third of the main service classes, sometimes known as the Treasury classes, is the clerical class. It is much larger than the executive class, and, as its name implies, is engaged on work that is predominantly clerical. The clerical officer is the ubiquitous foot soldier of the service and is frequently to be found in posts involving close contact with the public. This is particularly common in the social service depts, which have expanded since the war; and clerical officers are frequently found interviewing the public and dealing with their problems, under the supervision of members of the executive class, in the local offices of the Ministry of Pensions and National Insurance and the Assistance Board. A large proportion of the class consists of former temporary civil servants, recruited by special examinations shortly after the Second World War.

Among war-time trends which have not so far been reversed are the removal of less vital depts from the London area and the great increase in the scientific ('S. S.'). So far as the latter is concerned, administrative and executive civil servants have for a long time worked alongside professional officers of various kinds: lawyers, doctors, statisticians, etc. But the number and variety of specialists is for ever increasing, and it is not always easy, either in theory or practice, to decide what should be the proper role of the administrators and their executive assistants on the one hand and of professional and specialist officers on the other. Quite apart from engineers, architects, economists, and scientists of various kinds, the service has found a use within its ranks for 2 further kinds of specialists. The first is the information officer, who acts as a buffer, or liaison

officer, between the depts and the outside world. The second is the organisation and methods officer, who is concerned with internal efficiency.

The wide variety of C. S. staffs is reflected in the large number of trade unions or staff associations catering wholly or mainly for civil servants. The C. S. Clerical Association, for example, represents the clerical grades, the Society of Civil Servants the executive and similar grades, and the First Division Association the administrative grades. The Whitley System, evolved by a committee under the chairmanship of the Rt Hon. J. H. Whitley, then deputy speaker of the House of Commons, and applied to the C. S. shortly after the First World War, brings into consultation the various staff associations on the one hand and the 'official side' on the other. The system works at 2 levels, national and departmental. There is no appeal from the departmental to the national level, and in this way the constitutional position that a civil servant is responsible to his own minister is preserved. The National Whitley Council has some 50 members, half appointed by the staff associations. It works mainly through committees, and is concerned in general with issues which are service wide in their implications. The departmental councils, which are similarly constituted, deal on the other hand with matters of departmental interest. They are chaired by the permanent secretary or other official head of the dept, and the official side is led by the estab. officer, the staff side being composed, as in the case of the national council, of nominees of the associations. The C. S. Whitley system is generally considered to be a reasonably efficient piece of joint consultation machinery. How well it works, particularly at the departmental level, depends very much, however, on the degree of co-operation vouchsafed by the official side. The departmental Whitley councils and the staff associations are much concerned with promotion, and, apart from security of tenure, which has come to be taken for granted, the hope or expectation of promotion is one of the chief factors conditioning the great majority of civil servants. Promotion within the service is regulated in the main not by any system of examinations but by a combination of seniority and merit, as measured by reports made on each individual by his senior officers. These reports are made annually, in a form which varies little from dept to dept, by the civil servant's immediate supervisor, and countersigned by the man or woman one step further up the official ladder. In most depts the official head of the dept appoints a promotion board, on which he is represented by the estab. officer or some other member of the estab. branch of the office. In some depts the board merely consider the reports of those who are adjudged, usually with the agreement of the staff side, to fall within the ambit of promotion. In others they also interview some of the most likely

candidates. At the highest level posts are filled only after consultation between the permanent secretary in the Treasury, who is the official head of the C. S., and the Prime Minister.

The structure of the service as a whole was last looked at by a Royal Commission in the years 1928-31, when the Tomlin Commission surveyed a scene which still bore numerous traces of the First World War. Since that date the service has undergone considerable growth and adjustment to new conditions. During the Second World War, for instance, there was a great influx of temporaries, and after it there were new functions to be performed. In 1947 a number of changes were made which had the effect of narrowing the gaps between the 3 main classes (administrative, executive, and clerical) and of simplifying the grading of the last mentioned. In 1953 a Royal Commission was appointed, under the chairmanship of Sir Raymond Priestley, to inquire into the pay, as distinct from the structure, of the C. S. It made a number of specific recommendations on pay and conditions of service which were subsequently the subject of negotiation between the 2 sides of the National Whitley Council and resulted in new pay scales and the introduction of the 5-day week, accompanied by an appropriate reduction of the leave allowances of various categories of civil servants. More fundamentally, the Royal Commission recommended that the principle of 'an efficient service fairly remunerated' should be adopted in fixing C. S. pay, and proposed that this object should be attained by a process of fair comparison with the remuneration of outside staffs engaged on broadly comparable work. To this end a C. S. Pay Research Unit has been set up, under the general control of a committee of the National Whitley Council, with a C. S. staff under a director appointed by the Prime Minister. The degree of efficiency with which this unit does its work may well affect decisively the level of service efficiency over the next decade, since the C. S. is no longer in the position of being able to get and keep without difficulty the kind of staff it needs.

The Brit. C. S. possesses what an Amer. authority has defined as the 6 primary criteria of bureaucracy: 'differentiation of functions; qualifications for office (as distinct from patronage); hierarchical organisation and discipline; objectivity of method; precision and consistency or continuity, involving adherence to rules, red tape, and the keeping of records; and lastly the exercise of discretion, involving secrecy in regard to certain aspects of government.' Machinery of this kind is indispensable if modern gov. is to carry out the large tasks it has assumed with efficiency and equity. The virtues of such a bureaucracy have been summarised by Prof. Robson as follows:

'It uses objective methods of recruitment in place of nepotism and patronage; it seeks to promote according to merit rather than for political or personal

reasons. It administers on the basis of rules, precedents, and policy, rather than on ground of personal feeling, influence, or favouritism. It tries to formulate quantitative measurements of efficiency. It aims at consistency of treatment in its dealings with the public.'

It is unfortunately true, however, that the Brit. C. S. is not exempt from the faults common to large bureaucratic organisations, whether governmental or non-governmental, which have been categorised by the same authority as follows:

'The maladies from which bureaucracy most frequently suffers are an excessive sense of self-importance on the part of officials, or an undue idea of the importance of their office, and indifference towards the feelings or the convenience of individual citizens; an obsession with the binding and inflexible authority of departmental decisions, precedents, arrangements or forms, regardless of how badly, or with what injustice, they may work in individual cases; a mania for regulations and formal procedure; a preoccupation with the activities of particular units of administration and an inability to consider the government as a whole; a failure to recognise the relations between the governors and the governed as an essential part of the democratic process.'

Four factors have so far prevented these faults from getting out of hand: pressure exerted by Parliament, by means of parl. questions, correspondence on behalf of individuals, and watchful scrutiny of orders and regulations; the critical eye of the press, and to some extent of those concerned with radio and television; the activities of such bodies as local authorities, trade unions, trade associations, and other pressure groups, on behalf of those they represent; and a growing tendency to self-criticism, shown by such things as new organisation and methods, and by the activities of training branches and of departmental Whitley Councils. The first 3 of these influences have helped to prevent the development in Britain of the more alarming faults displayed by official bureaucracies elsewhere; the fourth has made some impression on the procrastination, circumlocution, and sheer muddle which developed such alarming proportions during, and immediately after, the war. It is to this process of internal self-criticism that we shall have increasingly to look for improvements now that the service is engaged on so many, such large, and such multifarious tasks.

Where the scene is constantly changing it is easier to point to continuing sources of information than to recommend textbooks. Of the former the files of 'Public Administration,' the 'Whitley Bulletin,' and the journals of the staff associations are the most important. Figures for the departmental distribution of staff are to be found in a quarterly command paper; and the *Introductory Factual Memorandum on the Civil Service*, submitted by H.M. Treasury to the Royal Commission in 1953, gives a detailed account

of the staff structure of the service as it was at that time. The hist. of the service is dealt with in *The Growth of the British Civil Service, 1780-1939*, by Emmeline W. Cohen, 1941, and the account is brought up to date in *Civil Service or Bureaucracy?*, by E. N. Gladden, pub. in 1956. *The Civil Service in Britain and France*, ed. by Prof. Robson, contains a number of useful essays on various aspects of the service, and the 'New Whitehall Series,' ed. for the Royal Institute of Public Administration by Sir Robert Fraser, provides detailed accounts of various important depts. *The Higher Civil Service of Great Britain*, by H. E. Dale, pub. in 1941, and *The Civil Service: Some Human Aspects*, by Frank Dunnill, pub. in 1956, contain a great deal of interesting background information. See also separate articles on the individual ministries and boards.

Civil War, armed conflict between opposing groups of the same nationality within the same country. Foreign examples include the Amer. C. W. (1861-5) and the Sp. C. W. (1936-9).

In England, the term is specifically appropriated to the Eng. C. W., 1642-9. This falls into 2 divs.: (1) from 1642 until the Royalist defeat at Naseby, 1645; (2) from Charles I's 'engagement' with the Scots in 1647 until his execution in 1649. From 1650 until 1651 fighting again flared up, but it ended after Cromwell's victory at Worcester.

The First Civil War. The basic causes of the war were deep-rooted. Modern parl. power began when Henry VIII used Parliament to ratify his religious changes. Under James I, the conflict between Crown and Commons developed and a definite opposition party emerged. In the closing years of Elizabeth's reign, the growing fissures in the Tudor constitutional fabric were hidden by the influence of the queen's personality. The ambiguous character of Elizabeth's religious 'settlement' meant that a final religious settlement was merely postponed. Calvinism grew during her reign. It permeated the 2 classes which had received substantial material and political benefits from the Reformation and from the expansion in colonial enterprise and trade during the 16th cent., namely, a section of the squirearchy and most of the large merchants. It was these classes who returned and were returned as members of Parliament; and their power was increased by the rise in prices throughout the 16th cent., which benefited them more than the Crown, whose revenue was largely fixed.

Poor Stuart statesmanship bared these problems and added to them. James's extravagance and leanings towards the unpopular Arminians angered an already difficult Parliament. His lack of tact in the dispensing of patronage lost him the support of essential interests. Charles I increased the Crown's unpopularity by ardently supporting Arminianism, and by his foolish choice of advisers. His instability hampered the work of his best servants, like Strafford, and set a critical Commons almost continuously on the

offensive against him. The Commons (1603-42) underestimated the expenses of the gov., and represented a religious opinion which, in its positive form, was far from universal, but the clumsiness of the monarchy incited them to press their criticisms and demands to extremes, and gave them a following among the mob.

The Scottish wars precipitated the conflict, forcing Charles to summon Parliament, after 11 years of apparently successful 'personal rule,' to obtain essential supplies. The over-confidence of the Puritan parliamentarians who returned to Westminster in 1641 led them to excesses in religious and political views which did much to cause the creation of a Royalist party, and to occasion the fighting. Parliament was agreed on many subjects. Between Feb. and Aug. 1641 the king agreed to a series of limitations on his powers, such as the abolition of the Star Chamber. But the debates on the 'root and branch' (see ROOT AND BRANCH MEN) petition of Dec. 1640 showed that an unfeigned religious div. existed. A strong minority emerged which, though anti-Arminian, was not prepared to sacrifice the episcopal structure and the Book of Common Prayer (see ROYALISTS). When in Feb. 1642 Charles left Whitehall for York, many moderates joined him, and the Puritan extremists in the Commons gained the upper hand. Parliament demanded control of the militia and Charles refused.

War was at this stage virtually inevitable. The main strength of both parties at the outset was drawn fairly equally from the upper and middle classes. Their fighting men held, in the main, only slightly different views on the fundamentals of politics and religion, and though sev. historians have variously tried to base the party div. on geographical, economic, religious, or constitutional issues, the decisive factor in influencing many men's choice in favour of royalism would seem to have been their concept of loyalty so well expressed by Sir Edmund Verney (see under ROYALISTS) and the poet Lovelace. Though some Puritans (q.v.) were actuated by religious motives and others by constitutional beliefs (as in the case of Ralph Verney), many people were attracted to this party by economic or political grudges. This diversity of interest made the original Puritan party divide so rapidly in victory. Its cohesion was largely based on destructive motives. Parliament, however, controlled London and most of the ports, and soon gained control of the navy. At first Charles could rely on generous gifts of jewellery and plate from his nobles and squires to finance his army, but in the long run the wealth of London was to tell against him. Even so, had the king possessed a general of Cromwell's calibre he might have won the war.

Military significance of the wars. England in 1642 did not support a large professional military class, though in theory a large militia force existed. At first the

Royalist cavalry was superior, and the Royalist infantry inferior, to that of the Parliament. A majority of the rural gentry were for the king, and horsemanship was still the accomplishment *par excellence*. The Parliament foot contained from the outset a high proportion of the only efficient element of the militia, the urb. Trained Bands (q.v.). Here the question of arms was more decisive. Muskets and pikes had to be bought largely abroad, and the Parliament's financial and naval resources were telling. As the war went on, the training and equipment of the king's infantry improved, but not so fast as that of the Parliament's cavalry. On both sides there was a professional element of officers who had seen foreign service. Cavalry became the dominant arm, and once the Royalists had lost their superiority in this connection they lost the war. The great military development of the C. W. was the estab. of the New Model Army (q.v.), which contained the germ of a general staff and a permanent system of transport and supply.

Campaigns (1642-5). In July 1642 the Commons resolved to recruit an army and in Aug. the royal standard was raised at Nottingham. An indecisive battle was fought at Edge Hill on 23 Oct. The king estab. his H.Q. at Oxford. In Nov. he moved against London, retreating in face of the large forces assembled at Turnham Green. Charles was provided with a well-conceived plan for the 1643 campaign. The Earl of Newcastle from the N., and Hopton and Prince Maurice from the W., were to converge on Oxford and unite with the king's own force to attack London. In Lincs, Newcastle's officers refused to advance further against the strong opposition of the E. Association troops under Cromwell, while Hull lay in Parl. hands in their rear. In Sept. Parl. forces gained a victory at Wineoby (where, in Cromwell's words, his soldiers charged 'singing psalms'), reoccupied Lincs, and relieved Hull. In the SW. Hopton over-ran Devon, Dorset, and Wilts, and reached Sussex by Dec. But his Cornish forces refused to leave Plymouth in Parl. hands in their rear and Hopton retreated. Rupert took Bristol in July, but the Welsh border Royalists refused to advance on London while Gloucester held out for Parliament, and Charles was forced to besiege it. He raised the siege when a force under Essex marched to relieve the city. Charles's force then blocked the route back to London at Newbury, where it was attacked on 20 Sept. Shortage of powder compelled a Royalist retirement and Essex's forces reached London. By Oct. 1643 the balance had tilted against Charles. His plan had failed, a result to which the navy had contributed by supplying Hull and Plymouth, and for which the Royalists themselves, in refusing to leave their own areas, were much responsible. The Scots had entered the war on the side of Parliament, and in 1644 shut up Newcastle's forces in York. Waller checked Hopton's advance in

Hants, and in May Cromwell and Manchester joined the Scots before York. Rupert came N., skilfully relieved the city, but was defeated at Marston Moor on 2 July. This destruction of the king's N. army and the capture of York secured N. England for Parliament, and Charles was on the defensive for the rest of the war. There was, however, a temporary recovery during the remaining months of 1644, when Essex's foot were trapped at Lostwithiel, and Basing House was relieved. As a result Parliament decided to replace its outmoded systems of warfare. The New Model (to whose members the term Roundhead (q.v.) is most applicable) was estab. by an ordinance of 15 Feb. 1645, and commanded by Fairfax. By the Self-Denying Ordinance members of Parliament resigned their commands and left the question of re-appointment to Fairfax. Philip Skippon (d. 1660), who had served in the Low Countries, and had been angered by Essex's desertion at Lostwithiel in 1644, was made major-general of foot and chief of staff, and Cromwell became lieutenant-general of horse in May. In summer Fairfax took the field. Cromwell joined the New Model on 13 June. On 14 June he and Fairfax decisively defeated Charles at Naseby. In July Fairfax came upon Goring's demoralised army at Langport, in Somerset. It broke and fled. In Sept. 1645 Montrose was defeated by Leslie at Philiphaugh. Hopton surrendered in Cornwall in Mar. 1646, and Oxford fell in June. Charles had already surrendered to the Scots at Newark.

The Second Civil War. In 1646 it was generally assumed by all but the extreme sectaries that Charles would be restored with severely limited authority. Charles, however, was determined to regain his former position, and, shut away from his moderate advisers, his restraint vanished. The numerically inferior Presbyterians caused bitter hatred amongst their opponents by adopting unnecessarily extreme measures, such as the abolition of the Prayer Book, and the levying of heavy fines on Royalists. Parliament then broke up its own party by attempting to impose a Presbyterian State Church on all, and by proposing to disband the largely independent New Model (q.v.), without granting its arrears of pay. The army marched on London and expelled 11 leading Presbyterians from Parliament. This opened the phase in which the sectaries, whose part in causing the war was unimportant, became all powerful. In using them to fight their battles and, therefore, having of necessity to grant them temporary religious freedom and unprecedented liberty of speech, the more moderate Puritans had, in effect, surrendered control of affairs to them. Cromwell, one of the original Puritan opposition, rose to supreme power because of his generalship and emotional hold over his troops, and not by virtue of his parl. membership.

The victory of Independency in the Puritan struggle for power encouraged

and enabled the king to come to terms with the Presbyterian Scots. The apparent indiscipline of the Eng. army and the fact that the Eng. Presbyterians (whose importance he very naturally overestimated) were quarrelling with their former followers made Charles think that he could win a quick victory over a divided enemy. The renewed sacrifice which the second war entailed ensured that countless Royalists, who had consistently supported Charles, would be financially ruined.

Charles's 'engagement' with the Scots of Dec. 1647 provided for a Scots invasion of England and a Royalist rising. In July 1648 the Scots occupied Carlisle, but the following month Cromwell, having marched from Pembroke, fell on them, and in a running battle from Preston to Warrington completely destroyed their army. Charles was captured.

The New Model was now supreme. In Dec. 1648 Pride 'purged' Parliament of all opposition, leaving a 'Rump' of 50 Independents. Cromwell and other army leaders had now decided that as Charles could never be trusted to keep to any agreement which they might make with him, his death was essential to safeguard ideals for which they had fought. His execution in Jan. 1649 drove the wavering Eng. Presbyterians over to an apathetic royalism. Very soon some of the sectaries became disillusioned, and contemplated a compromise with royalism. The Scots were generally agreed on the subject of loyalty to a Stuart king. These factors encouraged Charles II to attempt a Restoration by force through Scotland.

The War of 1650-51. In 1650 Charles II came to humiliating terms with the Scots Presbyterians. Cromwell, now commander-in-chief, crossed the Tweed in July, but was hemmed in at Dunbar by Leslie. Then Leslie left his strong position on the hills, and on 3 Sept. was utterly destroyed. Within a year Cromwell was master of Scotland. A race to the S. between Cromwell and Charles's forces now began, but on 3 Sept. 1651 the Royalist army was surrounded and destroyed in Worcester. After sev. narrow escapes Charles II reached France.

The C. W. resulted in the immediate triumph of the army. England became a Commonwealth, ruled by a Council of State (dominated by army leaders) and the Rump Parliament. The real source of the Commonwealth's power was its superb army of 50,000 veterans, mostly Independents, and Cromwell, its commander. These had executed the king in the name of the people only to find that many who had fought with them against him now disowned them for this deed. For a time, by sheer force, the army was able to pursue its objectives. The Rump was dissolved: but the religious radicalism of the Barebones Parliament convinced Cromwell that only a more conservative attitude could save the essentials of the revolution, and the dissolution of this body marks the beginning of the end

of army rule and the return to more traditional methods of gov. Throughout the Protectorate, old monarchical forms were gradually revived. Had Cromwell lived some years longer, a Cromwell dynasty might have been estab. in England. As he left no strong successor in his own family, his conservative policy, with its re-estab. of traditional ideas and interests, paved the way for a Stuart restoration (q.v.). But in spite of this the C. W. effected a number of lasting changes. The interval of army power ensured the permanent estab. of a radical Nonconformity which had little connection with the religious ideals of most of the original Puritans, who had fought for an estab. Calvinist Church of England, and not for tolerated sectarianism. The Cromwellian excesses in Ireland contributed substantially and lastingly to Irish Catholic hatred of the English. Politically, the temporary victory of the Puritans ensured that England did not develop the form of monarchical absolutism which was springing up in other European countries, such as France, at the same date, and towards which Charles I's England was probably moving. The real victors of the C. W. were the wealthy merchants and landowners of the Ashley Cooper type who managed to support the winning side of the moment successfully throughout; in fact, the king returned on their terms, and the sacrifices of the small Royalist squirearchy and the New Model soldiery led to the estab. of an oligarchy from which modern Brit. democracy was eventually to evolve. One of the most astonishing features of the war was its failure to disrupt substantially the national economy. But though the country's financial position suffered comparatively little, no statistical records can illustrate adequately the amount of personal suffering and private loss sustained during the conflicts, a factor vividly illustrated in the various family memoirs of the period.

Civil War, American, see UNITED STATES, History.

Civil War, Russian (1917-22), followed the seizure of power by the Bolsheviks (see OCTOBER REVOLUTION) and the forcible dissolution of the Constituent Assembly (q.v.). There were 4 main fronts of the C. W., the E., the S., the N., and the NW., the first 2 being by far the most important. The E. front was first opened by the uprising of the Orenburg Cossacks under Gen. Dutov in Nov. 1917, and fully estab. after the overthrow of Soviet power in Siberia, the Urals, and the Middle Volga region in May-July 1918. Apart from the initial period the anti-Bolshevik forces in the E. under Adm. Kolchak (q.v.) were most successful in Mar. 1919, when they again approached the Volga; then followed a continuous retreat until Kolchak was captured in 1920 and Vladivostok taken in 1922. Similarly, the S. front was opened by the Don Cossacks under Gen. Kaledin (q.v.) in Dec. 1917 and fully estab. with the first successes of the Volunteer Army under Gen. Denikin (q.v.) in N. Caucasus in the summer of 1918. Denikin became a serious menace to the Soviet power in the summer and autumn of 1919, when his forces occupied most of S. Russia and the central black earth region and advanced towards Moscow. Here also followed a series of defeats, and a retreat which, after some new successes in S. Ukraine under the new commander Gen. Wrangel (q.v.), ended in the evacuation of Sevastopol' in 1920. The anti-Bolshevik forces in the N. were weak and largely dependent on the allied troops under Brit. leadership which landed at Murmansk and Archangel in July-Aug. 1918 and left in the autumn of 1919, after which the front was liquidated early in 1920. The NW. front resulted from the advances of a White army under Gen. Yudenich from Estonia aimed at capturing Petrograd (May-Nov. 1919); these advances were beaten off. On the Red side the most distinguished leader in the C. W. was the war commissar and chairman of the Revolutionary Military Council, Trotsky. Colonels Vacetis and S. S. Kamenev were successively commanders-in-chief. Among the successful Red commanders in the field were former imperial revolutionaries (Antonov-Ovseyenko, Frunze, Voroshilov), as well as imperial army officers (Tukhachevsky) and N.C.O.s (Budennyi). The war effort in the rear was organised by the Council of Labour and Defence.

headed by Lenin and by the Council for Army Supply headed by Krasin. The social composition of the Red and the White armies was almost identical, peasants making up the bulk in both, with considerable numbers of industrial workers in the ranks and professional soldiers and intelligentsia predominating among the officers (and among the political commissars on the Red side). The total numbers taking part in the C. W. were remarkably small, the majority of the pop. remaining passive. On the White side were the majority of Socialist Revolutionaries, right-wing Social Democrats, and all parties to the right of them, the latter gradually gaining more and more ground. On the Red side, apart from Bolsheviks, were the Left Socialist Revolutionaries, left and centre Social Democrats, and Anarchists. The main causes of the Red victory were political—the Whites had failed to produce a unifying idea and a sense of common purpose, and they antagonised the peasants by restoring land which the latter had seized to the owners. The C. W. was complicated by the intervention of the Allies, who wanted to re-establish the E. front against the Central Powers, and of Germany, Turkey, Rumania, and Poland, who had territorial designs (as also had Japan). This foreign intervention was sometimes of considerable importance (e.g. the Austro-German occupation of the Ukraine, the Czechoslovak uprising in 1918 along the Trans-Siberian Railway), but after the defeat of Germany the Allies lost interest in the Russian C. W. Other causes of complications were strong particularist tendencies (the Cossacks, Siberia, the Far E.) and the separatist movements on the periphery of the country, which led to the estab. of a number of independent states (Poland, the Baltic states, Transcaucasia), and of ephemeral nationalist govts. (the Ukraine, central Asia). In some places (the Kuban' region, central Asia) sporadic armed resistance to the Bolsheviks lasted until 1924 or even longer, almost until the new flare-up during the collectivisation of agriculture (q.v.). See G. Stewart, *The White Armies of Russia*, 1933; J. Bunyan, *Intervention, Civil War, and Communism in Russia*, Baltimore, 1936; L. I. Chamberlin, *The Russian Revolution* (vol. ii), New York, 1954; R. Pipes, *The Formation of the Soviet Union*, Cambridge, Massachusetts, 1954; L. B. Schapiro, *The Origin of the Communist Autocracy*, 1955.

Civita Castellana, It. tn in Lazio (q.v.). 19 m. SE. of Viterbo (q.v.). It is a picturesque tn, built on a high rock, and has a 13th-cent. cathedral and a 15th-cent. castle. Near by are the ruins of the Etruscan city of Falerii (q.v.). Pop. (tn) 7500; (com.) 11,500.

Civitanova Marche, It. tn in the Marche (q.v.), 12 m. W. of Macerata (q.v.). Pop. 7000. Its port, called Porto Civitanova,

on the Adriatic coast 3 m. E., is now a separate com. Pop. 8000.

Civitas Altae Ripae, see BRZEG.

Civitas Comeneliensis, see CIMIEZ.

Civitas Episcoporum, see OVIEKO.

Civitavecchia (anct. **Portus Trajanii**), It. seaport in Lazio (q.v.), on the Tyrrhenian Sea, 35 m. NW. of Rome (q.v.). The port was built by Trajan (q.v.), and is one of the best and busiest in Italy; it also provides one of the links between Sardinia (q.v.) and the mainland. The tn has a 17th-cent. cathedral, and a citadel designed by Bramante and completed by Michelangelo (qq.v.). The harbour and tn suffered very severely during the Second World War, but much of the damage has been made good. There are Rom. and Etruscan remains. Aluminium, cement, foodstuffs, and calcium carbide are manuf. Pop. 34,600.

Civitella del Tronco, It. tn in Abruzzi e Molise (q.v.), 8 m. N. of Teramo (q.v.). It is built on a hill, and is overlooked by a castle. Pop. (com.) 9600.

Civitella di Romagna, It. mkt tn in Emilia-Romagna (q.v.), on the Rabbì, 15 m. SSW. of Forlì (q.v.). Pop. 7000.

Civray (anct. **Severiaoum**), Fr. tn in the dept of Vienne, on the Charente. It has a trade in mules. Pop. 2700.

Clackmannan: 1. Smallest co. in Scotland, bordered on the SW. by the Forth and lying between the cos. of Perth, Fife, and Stirling. The SW. extremity of the Ochil Hills (Ben Clench, 2363 ft) occupies the N. half of the co. and is in marked contrast to the low-lying course between the Hillfoots and the R. Forth. The Devon and the Black Devon are the prin. rvs. Approximately two-thirds of the co. is cultivated, and oats, wheat, and beans are the chief crops. Cattle and sheep are reared. Coal has been worked for nearly 3 cents., and a new mine sinking is being developed to extract the remaining productive coal measures in the Devon valley. The main manufacturing industries are general engineering, textiles, distilling and brewing, printing and paper, woodworking and glass manuf. The chief tns are Alloa (the co. tn), Alva, Tillicoultry, and Dollar. Woollen manufacturing and paper processing are carried out in the Hillfoots tns. Central and E. Stirling form a single parl. div., returning 1 member. Area 34,983 ac.; pop. 37,532.

2. Anct tn of the above co., situated on the R. Devon, 2 m. from Alloa. By virtue of its name and historical background it was at one time the co. tn, and for many generations the seat of the Bruce family in Scotland. C. Tower, Tollbooth, and Mercat Cross are invaluable records in stone and lime of traditional Scottish architecture, and the narrow High Street, leading from the Tollbooth to the Tower, flanked by the very fine par. church to the S., would seem to have formed the site of the original hill tn. Pop. 2500.

Clacton-on-Sea, seaside resort of Essex, England, 70 m. from London by rail and also connected with it by daily express coach services, and steamer services from

the Thames during the summer. It has 5 m. of sandy beaches, and a promenade and marine parade 2 m. long. Co. cricket matches are played here during the season. Pop. 25,000.

Cladium, genus of Cyperaceae, consists of tropical and temperate plants which are extremely common in Australia. *C. germanicum*, prickly twig-rush, which derives its name from the almost prickly margins of the leaves, these latter being themselves rough, is found in various parts of England, besides being abundant in parts of Scotland.

Cladocera, or **Water-fleas**, form a sub-order of branchiopod crustaceans characterised by having not more than 6 pairs of trunk-legs.

Cladonia, genus of fruticose lichens, has sev. Brit. species. The shape of its branches gives it the appearance of a bundle of small worms or of vermicelli. *C. rangiferina*, the reindeer moss, occurs frequently on moors, heaths, and mts. In Lapland it is the most abundant of all plants, and is found chiefly in pine forests, covering the soil for miles together; it forms the prin. support of the reindeer.

Cladoselechiens, primitive order of shark-like fishes which lived in Devonian and Carboniferous times.

Claim of Right, The: 1. Act passed by the Scottish Estates in April 1689, stating the offences for which James VII had forfeited the crown, and the terms on which it was accordingly offered to William of Orange. It enacted that in future no papist should rule over Scotland, and declared the necessity of frequent parliaments.

2. Petition made by a majority of the Scottish General Assembly in 1842 against patronage and sent to the Parliament of Westminster. It stated their feelings with regard to the relation of the State to the Church. The terms of the petition were not granted by the gov., and accordingly in the following year 400 ministers seceded and formed the Free Church of Scotland (q.v.).

Clair, René (1898-), Fr. film producer and director, b. Paris. Silent films include *Paris Qui Dort* and *Le Chapeau de Paille d'Italie*. Among his sound films are *Sous les Toits de Paris*, *Le Million*, and *A Nous la Liberté*. His Eng.-speaking films include *The Ghost goes West*, *Flame of New Orleans*, *I Married a Witch*, and *It Happened To-morrow*, while more recent Fr. films are *La Beauté du Diable* and *Les Belles de Nuit*. He has pub. *Star Turn*, 1936, and *Reflections on the Cinema*, 1953. In 1957 he was awarded the Grand Prix du Cinéma Français for *Porte des Illus*.

Clairaut, Alexis Claude (1713-65), Fr. mathematician, b. Paris. He produced at the early age of 12 a treatise on 4 curves of the second order; this, together with his *Recherches sur les courbes à double courbure*, 1731, caused him to be elected a member of the academy when 19. His *Théorie de la lune*, 1752, which gained the prize at St Petersburg Academy, explains the lunar apogee, which had been omitted by Newton. He also calculated the path of Halley's comet, and wrote sev. papers

on the orbit of the moon. He evolved a theorem connecting the gravity on the surface of a rotating ellipsoid with the compression, and the centrifugal force at the equator.

Clairon (**Claire Joséphe Loris**) (1725-1803), celebrated Fr. actress, was b. near Condé in Hainaut. After playing in prov. tns and foreign countries, she made her debut at the Comédie Française in the part of Phaedra. The time of her fame was 1743-66; she played many roles and excelled in Voltaire's tragedies. C. wrote her own memoirs (1798). There is also a life by Edmund de Goncourt, 1900.

Clairvaux, hamlet in the com. of Villers-la-Ferté, in the dept of Aube, 33 m. ESE. of Troyes. It is famous for its great abbey founded by St Bernard (q.v.) in 1115. The abbey was suppressed during the Fr. Revolution, and the building is now used as a prison. See also CISTERCIANS. Pop. 700.

Clairvoyance, alleged faculty of being able to see objects not ordinarily visible to human eyes, and from these objects to describe events that are taking place at a distance. See PSYCHICAL RESEARCH.

GIANT CLAM

Clam, term applied to many Eulamelli-brachiata molluscs varying in importance in different countries. In Scotland the scallops (*Pecten*) receive this name; they are edible creatures which swim by flapping the valves of their shells. In England the very various genera *Macra* and *Mya* are known as C.s, *Mya truncata* being the soft C. The term is largely applied in the U.S.A. to sev. species of bivalve molluscs of somewhat the same order as the Scotch scallops and the Eng. cockle. The name originates from the firm manner in which the creature closes its shell when alarmed. Two kinds are eaten in the U.S.A., the soft shell C. and the hard shell. The latter is sent in great quantities to the markets. It is eaten

both raw and in a soup called C. chowder. The species are *Venus mercenaria* or hard C., and *Mya arenaria* or soft C. C.-shell is the Eng. name of the bivalve shells belonging to the molluscous genus *Tridacna*, and specially of *T. gigas*, which sometimes measures 2 ft across. A pair of valves weighing upwards of 500 lb. were used as a receptacle for holy water in the church of St Sulpice, Paris.

Clamart, Fr. tn in the dept of Seine, a SW. suburb of Paris. It is residential, and has textile manufs. Pop. 33,900.

Clamecy, Fr. tn, cap. of an arron., in the dept of Nièvre, at the confluence of the Beuvron and the Yonne, and on the Nivernais Canal. It has chemical manufs. Pop. 5800.

Clan (Gaelic *clann*, meaning children), group of kin descended through male or female descent from a single ancestor. Among primitive peoples the basic organisation of family and society is commonly by C.s (see Fortes and Evans-Pritchard, *African Political Systems*, 1940). The Highland C. of Scotland was the most highly developed of recent times. It was confined to the highland regions. The chief represented the common ancestor, and exercised patriarchal control over the clansmen. The name of the C. was frequently composed of that of the founder, with the addition of Mac (meaning 'son of'); thus we have the C. MacDonald, the C. MacPherson, and similar names. The chief of a C. ruled by the right of primogeniture, and was revered and obeyed by his clansmen. Each C. in Scotland occupied a separate portion of ter., and not infrequently bitter rivalry existed between the neighbouring C.s. In the later years of the C.s the Scottish Gov. made it a rule that every C. should supply at court a representative of rank to give security for their good behaviour. Should a C. refuse to do so they were termed a 'broken C.' and were proscribed and in a state of outlawry. The MacGregor C. was a notable example of such, holding their lands for long by the *coir* or glaive, or right of sword. The C.s played a large part in the rebellions of 1715 and 1745. After the suppression of the latter the Brit. Gov. took steps to break up the C.s. Hereditary jurisdiction was abolished, and the people were disarmed and forced to cease wearing their national costume. To-day few traces of the C.s remain save in the persons of chiefs officially recognised as such by the inheritance of ancestral arms, and in the C. associations founded on sentiment. See F. Adams, *The Clans, Septs and Regiments of the Scottish Highlands*, 1935.

There are in Ireland also recognised C.s, the various branches of which gather together from time to time. In Ireland the adoption of strangers into the family or C. was common, the adopted person being called Mac Faosma (son of protection). A group of C.s associated into tribes was called a Cinel or Kinel, of which the Kinseal-Owen, named after Owen, son of Niall, is an example, comprising the C.s of O'Cahan, MacQuillan, O'Flynn, and

many others, all tributary to the chief O'Neill.

Clan Line, Eng. shipping company, founded in 1878 with a fortnightly service between Liverpool and Indian ports. It now operates world-wide services. The company own the Houston and Scottish Shire Lines. The combined fleet numbers 58 vessels totalling over 438,000 tons gross.

Clan-na-Gael, name of a secret society formed by Fenians (q.v.) in the U.S.A. about 1883. Its object was to force the Brit. Gov. to give home rule to Ireland (see HOME RULE), an object which the members of the society believed could be achieved by terrorising Parliament and members of the public. The H.Q. of the society was in Chicago, but it had agents in England and Ireland, who were responsible for assassinations and dynamite outrages in the 1880's.

Clanis, see *Chianis*.

Clann na Poblachta, Irish political party, founded in 1946. Its aims include the reintegration of the whole of Ireland as an independent rep., the estab. of a social system based on Christian principles, and the restoration of the Irish language as the spoken language of the people. Until 1957 C. na P. co-operated with other political parties (notably Fine Gael, q.v.) in providing (under the leadership of John A. Costello, q.v.) an alternative gov. to the Fianna Fail gov. of Eamon De Valera (q.v.). In the general election of Mar. 1957 only one C. na P. deputy was returned to the Dail. The leader of the party is Sean Macbride (q.v.).

Clanvowe, Sir Thomas (fl. 1400), courtier and poet, was a friend of Prince Henry, afterwards Henry V. Prof. Skeat credited him with the authorship of *The Cuckoo and the Nightingale* (written about 1400-1410), a poem which had long been attributed to Chaucer. Wordsworth made a modernised version of it in 68 stanzas (1801).

Clanwilliam, tn, 135 m. NE. of Cape Town in a fertile dist. producing corn and oranges. The gov. cedar forests are near. White pop. 677.

Clapham, dist. in the bor. of Wandsworth, London. C. Common (partly in Battersea) is a recreation ground of 200 ac. Pepsys (q.v.) lived mostly in C. after his retirement, and there he d. The station called C. Junction is actually in Battersea.

Clapham Sect, The, name hist. has given to the little coterie of intimate political friends, all humanitarians and all Evangelicals, most of whom lived in the then vil. of Clapham and whose dominant figure was Wm Wilberforce (q.v.). Next most prominent member of this brotherhood of Christian politicians was Henry Thornton (1760-1815), like Wilberforce an independent-minded Tory. The large, lofty, oval-shaped library, designed by the architect Chatham, in Thornton's house was the usual meeting-place of the sect. Wilberforce lived in the house between 1792 and 1797 and for the ensuing 10 years in a house called 'Broomfield,' near Thornton's house. Most of the fraternity

were rich, but they were all generous givers to the poor. The patriarch of the community was Granville Sharp (1735-1813), a much older man than most of the others and almost too poor for a parl. career. He seems to have been the confidant and counsellor of the group. Next in seniority and also somewhat apart from the rest was Charles Grant (1764-1823), a servant of the E. India Co. and later chairman of the company's court of directors and M.P. for Inverness-shire. He was father of Lord Glenelg, whose notorious colonial policy owed both its strength and weakness to its inspiration in C. S. ethics. The rest of the group were Zachary Macaulay (1768-1838), father of T. B. Macaulay and a well-known philanthropist, who played a leading part in founding the Brit. colony of Sierra Leone for liberated African slaves; James Stephen (1758-1832), a barrister of St Kitts, who was early a coadjutor with Wilberforce in his abolitionist crusade and an M.P. between 1808 and 1815; Wm Smith (1756-1832), Whig. M.P. for Sudbury, Camelford, and Norwich, also an enthusiast for the abolition of the slave trade; the Hon. Edward James Eliot (1759-97), member for Liskeard; John Venn (1759-1813), the preacher and vicar of Clapham at whose par. church, as the tablet there shows, the brethren of the sect congregated for Sunday worship; John Shore (1751-1834); and Lord Teignmouth (q.v.), a great friend of Warren Hastings and later Governor-General of India. Among other intimates, who did not live at Clapham, were the Rev. Isaac Milner, dean of Carlisle (1751-1820) (q.v.); the Rev. Thomas Gisborne, vicar of Yoxall; Thomas Babington, a zealous abolitionist and collaborator with Wilberforce; and Thomas Clarkson (q.v.), the anti-slavery agitator, whose share in the abolition of the slave trade and of slavery was hardly less than that of Wilberforce himself. The fraternity was remarkable for its affinity. It not only lived for the most part in one vil.; it had one character, one mind, and one way of life. All were what Wilberforce meant by 'true Christians,' and many were related by marriage. 'It was doubtless this homogeneity that gave the group its power in public life. They might differ on party issues; but on any question of religion or philanthropy, above all on the tremendous issue of the abolition of the slave trade, the voice of the "Saints" in Parliament or in the press was as the voice of one man.' See R. I. and S. Wilberforce, *Life of Wilberforce*, second ed., 1930; Sir J. Stephen, 'The Clapham Sect,' in *Studies in Ecclesiastical Biography*, 1849; J. S. Harford, *Recollections of Wilberforce*, 1865; J. C. Colquhoun, *William Wilberforce, his Friends and his Times*, 1866; R. Rudolf, *Clapham and the Clapham Sect*, 1927; Sir R. Coupland, *Wilberforce*, 1945.

Clapiers, Luo de, see VAUVENARGUES.

Clapperton, Hugh (1788-1827), explorer, b. Dumfriesshire. He ran way from home at the age of 13 and went to sea. While in the Royal Navy he saw service in the E. and Canada. He accompanied

Dr Oudney and Denham on their exploring expedition by way of Tripoli and Murzuk to Kuka, on Lake Chad, which was reached in 1822, and thence to Sokoto, returning to England in 1825. The results of this expedition had been more of an anthropological than a geographical nature, so in Aug. 1825 a second expedition set out from the bight of Benin to determine the course of the Niger. All the members of this expedition perished save Richard Lander, C. being the last to die, at Changary, near Sokoto.

Clapton, residential dist. of NE. London, in the bor. of Hackney. It was a vil. until the mid 19th cent.

Claque (Fr. *claquer*, to clap), body of men hired to applaud in theatres, and thus ensure the success of a play. According to Suetonius, the Emperor Nero had 5000 paid applauders who attended the performances of his plays. From the Rom. origin of the custom, the *claqueurs* are sometimes called *romains*. The C. became an openly organised institution in Paris towards the end of the 18th cent. The leader, upon whom the responsibility rests, is called *entrepreneur de succès dramatique*, and under him are *pleureurs* (weepers), *bisseurs* (who cry *bis*, or *encore*), and *rieurs* (laughers), etc. The Théâtre Français and the Grand Opéra, with a few of the leading Parisian theatres, have with more or less success abolished the C. from their houses. A C. existed when ballet was featured at the Alhambra Theatre, Leicester Square, almost up to the time of the First World War, but it was privately engaged by prima ballerinas.

Clare, St. (1191-1253), founder of the order of Poor Clares. She came of a noble family of Assisi; but, through the influence of St Francis, she gave up her wealth and her social life. On his advice she founded her order, the Franciscan order for women, in 1212. St C. was canonised 2 years after death by Pope Alexander IV. See P. Robinson (ed. and trans.), *The Life of St Clare* (ascribed to Thomas of Celano), 1910.

Clare, John (1793-1864), poet, b. Helpstone, near Peterborough. The son of a poor labourer, he has often been called the 'Northamptonshire peasant poet.' At the age of 7 he was employed on a farm, and later received a post as under-gardener, but in 1812 he ran away and joined the militia. For a time he lived with gipsies, then worked as a burner on a lime kiln, but, being dismissed, was obliged to seek for par. relief. C. was fond of learning old songs, and when very young scribbled verses of his own. His inspiration came from Thomson's *Seasons*, and all his poems deal with out-of-door life and farm scenes. *Poems Descriptive of Rural Life and Scenery*, 1820, was well received, and was followed in 1821 by *The Village Minstrel*. C. was helped by men of influence and rank, by whom he was received as a friend, but to the end of his life was poor. The *Shepherd's Calendar*, 1827, and the *Rural Muse*, 1835, were not so successful, though the latter brought him £40 and was praised by Christopher North. He d. in the co.

asylum, Northants, where he composed his last poem, *I am: yet what I am who cares or knows?* See biographies by F. Martin, 1865, and J. W. and A. Tibble, 1932, and especially *Sketches in the Life of John Clare*, written by himself and ed. by E. Blunden, 1930. The fullest and best collection of C.'s poems is by J. W. Tibble, 1935, who also collected his *Letters and Prose* in 1951.

Clare, John Fitzgibbon, 1st Earl of (1749-1802), Lord Chancellor of Ireland after 1789. A barrister and a member of the Irish Parliament, he became Attorney-General. He was an antagonist of Henry Grattan (q.v.), opposed Catholic Emancipation (q.v.), and promoted the Union of Ireland with England. His title became extinct in 1864.

Clare, maritime co. of the Rep. of Ireland, situated between Galway Bay on the N. and the Shannon estuary on the S. To the N. are rugged Atlantic cliffs of Moher and the extraordinary limestone dist. of the Burren, with bare hills, rock-strewn valleys, caves, and underground streams. Lough Derg and the R. Shannon form the E. and S. boundaries. Its length is 67 m. and its greatest breadth 43 m. (average breadth 21 m.). The centre is an undulating plain. The chief ranges of mts are the Slieve Boghtia Mts, which lie partly in Galway, and the Slieve Bernagh Mts; the chief rvs. are the Shannon and the Fergus. Oats, potatoes, wheat, and barley are grown, slate and black marble are worked, and the rearing of sheep and cattle is largely carried on. Limestone, lead, and slate are found, and beds of carboniferous limestone. There are as many as 100 small lakes, and many chalybeate springs; the salmon fisheries are important, and in the N. are extensive oyster beds. The chief tns of the co. are Ennis, the cap., Kilrush, and Kilkee. The co. returns 4 members to the Dail. Area 768,295 ac.; pop. 95,000.

Clare: 1. Tn in Suffolk, England, on the R. Stour, 16 m. from Bury St Edmunds, on the E. Region of Brit. Railways. It has an old castle, formerly the seat of the earls of C., and an Augustinian priory of the 13th cent. Pop. 1400.

2. Tn of S. Australia in Stanley co., chiefly noted for its vineyards and orchards. Pop. 1800.

Clare College, Cambridge, founded as Univ. Hall in 1326 and refounded by Elizabeth de Burgh, Countess of Clare, as Clare Hall in 1338, with statutes in 1359 which provided for the education of priests and scholars to take the place of those who had d. during the Black Death. The present Old Court dates from 1638, and the chapel was consecrated in 1769. The name was changed to C. C. in 1856. The memorial building dates from 1924, and a wing was added in 1955.

Clare Island, 4000 ac., at the mouth of Clew Bay, co. Mayo, Rep. of Ireland. It was the home and H. Q. of Grainne Uaile (Grace O'Malley), the sea queen of the W. in the 16th cent., who is buried at the local abbey. Pop. 350.

Claremont: 1. Suburb of Cape Town (q.v.). The National Botanical Gardens of S. Africa, in surroundings unsurpassed for grandeur, are approached from here. The municipal gardens contain a famous collection of trees brought together by H. M. Arderne. Sir John Herschel (q.v.) had his observatory at C.; it is now the site of a girls' school.

2. Tn in Sullivan co., New Hampshire, U.S.A., on the Sugar R. and on the Boston and Maine railroad. It manufs. machinery, cotton, and woollen goods, paper, and shoes. Pop. 12,800.

Claremont Park, former royal residence, now within the urb. dist. of Esher, Surrey, England. It was built in 1768 for Lord Clive; later the Princess Charlotte of Wales (d. 1817) and Louis Philippe of France lived there. In 1882 it became the private property of Queen Victoria.

Clarence, Eng. ducal title, sometimes conferred on a younger member of the royal family. It was first held by Lionel (1338-68), the third son of Edward III, in 1362, on the occasion of his marriage to Elizabeth de Burgh. Other notable dukes of C. are Thomas (1389-1421), second son of Henry IV, who d. at the battle of Beaugé; George (1449-78), brother of Edward IV, who d. in the Tower; William IV (1765-1837), previous to his accession; and Albert Victor Christian Edward (1864-92), the eldest son of King Edward VII.

Clarence House, London, residence of H.M. Queen Elizabeth the Queen Mother. It adjoins the W. side of St James's Palace (q.v.) and was built by John Nash in 1825-9 for William IV when he was Duke of Clarence.

Clarenceux, or **Clarencieux**, Eng. heraldic officer, being the first of the 2 prov. kings-of-arms. His jurisdiction lies over England S. of the Trent, and it is his function to inspect the arms of all those who live within his prov. He also grants arms with the sanction of the earl marshal, and in conjunction with his fellow kings.

Clarendon, Edward Hyde, 1st Earl of (1609-74), statesman and historian, b. Dinton, near Salisbury, educ. at Magdalen Hall, Oxford, and called to the Bar in 1625. He was first returned to Parliament in 1640. C. supported the impeachment of Strafford, but as the parl. opposition to Charles I. grew more extreme, C. joined Falkland and the moderate Royalists, being chancellor of the exchequer, 1643. After the death of Charles I, C. became one of the prin. advisers of Charles II, and shared his exile. At the Restoration he was created Baron Hyde, and in the following year Earl of C. He had been appointed lord chancellor in 1658, and the appointment was confirmed when the king returned to England. His importance was enhanced by the marriage of his daughter Anne to the Duke of York, heir-presumptive to the throne. As a minister he was unpopular, his rigid Anglican views alienating Catholics and Puritans, his solemnity out of place in the Restoration court. C. was blamed by Royalists for their failure to obtain adequate restitution for their

Civil war losses; and he was held popularly responsible for the failure of the Dutch War. In 1667 the king reluctantly decided to sacrifice C.; he was forced to resign his chancellorship, and in the same year he was impeached, but though the Lords did not convict him, he went abroad, where he remained for the rest of

EDWARD HYDE, LORD CLARENDON

his life. There he finished his *History of the Rebellion*, which was pub. posthumously (1702-4). This is one of the most valuable sources of information on the Civil war period, and contains several sketches of the leading personalities of the time; its distinct prejudices do not invalidate its real historical worth. See lives by C. H. Firth, 1909, and H. Craik, 1911.

Clarendon, George William Frederick Villiers, 4th Earl of (1800-70). Eng. statesman and diplomatist. He was ambassador to Madrid in 1833, but returned to England on the death of his uncle (1838), when he succeeded to the title. In 1840 he was made lord privy seal in Melbourne's ministry, and became chancellor of the Duchy of Lancaster. In 1847 he was lord-lieutenant of Ireland, and was foreign secretary 1853-8, 1865-6, and 1868-70. See H. Maxwell, *The Life and Letters of the Fourth Earl of Clarendon*, 1913.

Clarendon, Constitutions of, laws, issued in 1164, at the hunting-lodge of C., near Salisbury, by which Henry II proposed to define the temporal powers of the Church in England. The constitutions were 16 in number, among the chief enactments being that titles to eccles. estates and the election of church dignitaries lay within the prov. of the Crown; that clerks found guilty in an eccles. court should be handed over to a secular court for punishment; and that no appeal to Rome could be presented without the consent of the *curia regis*. Becket's refusal to accept

the Constitutions in their written form led to his exile, and, indirectly, to his death. Henry then withdrew the Constitutions. See BECKET, THOMAS.

Clarendon Park, formerly a royal forest, in Wilts, England, 2½ m. from Salisbury. The remains of the royal hunting seat, where Henry II's council enacted the constitutions of Clarendon (1164), may still be seen.

Clarendon Press, former name of the Oxford Univ. Press (q.v.), and the present publishing dept. of the Oxford Univ. Press which produces its learned pubs. It was founded in 1672, and had its first home in the upper part of the Sheldonian theatre at Oxford. The name came from the funds being provided by Lord Clarendon's *History of the Rebellion*, the perpetual copyright of which was given to Oxford Univ. by his son. The present Oxford premises of the C. P. in Walton Street were erected by Blore and Robertson in 1825-30. All the subsidiary processes of book production, including Bibles, of which it has the right by royal patent, are done by the firm on its own premises, while paper is supplied by the Univ. mills at Wolvercote.

Clarens, vil. of Switzerland in the canton of Vaud, Lake Geneva, 1 m. from Montreux. It has a mild, pleasant climate in winter, and is therefore much frequented by persons suffering from tubercular troubles. Altitude 1245 ft. With other vills. it forms the dist. of Montreux, which has a total pop. of about 15,000.

Clareville, in Trinity Bay, site of the landing of the first transatlantic telephone cable in Sept. 1956, from Oban, Scotland. At C. the cable is joined in a single line to Terrenceville and from there an underwater leg runs to Sydney, Nova Scotia.

Claret, name applied in this country for the last 7 cents. to the red wines of Bordeaux, the Gascon wines which Edward III regarded as such a necessity that he built a fleet to ensure their transport to these is. *Claret* in French refers to a clear light-coloured wine. The vineyards of the Gironde, the Bordeaux region, the greatest wine-producing area in the world, are divided into 4 main groups of first-class importance: Médoc, Graves, Saint-Émilion, and Pomerol. In 1855 the Médoc wines of the first order were divided into 5 classes in order of merit, the first growths being Château Latour, Château Lafite, Château Margaux — Château Haut-Brion, the finest growth of Graves, being allowed to rank with them. At the head of the second growths stands Château Mouton-Rothschild. In Graves Château La Mission-Haut-Brion and Château Pape-Clément come second to Château Haut-Brion. The most famous growths of Saint-Émilion are Château Cheval-Blanc and Château Ausone, and in Pomerol Château Pétrus is the outstanding first growth. The 5 chief wine communes of Médoc are Pauillac, Cantenac, Margaux, St Julien, and St Estèphe. C. is counted by connoisseurs as the most delicate and subtle of all wines, its perfection only

challenged by the very finest growths of Burgundy.

Claretie, Jules (properly **Arsène Arnaud**) (1840-1913), Fr. novelist, playwright, and journalist, *b.* Limoges. He acted as war correspondent during the Franco-Prussian war, became dramatic critic to *L'Opinion Nationale*, 1867, and had great influence as a political writer. His plays of the revolution, *Les Muscadins*, 1874, *Le Régiment de Champagne*, 1877, and *Les Mirabeau*, 1879, were extremely popular. His novels include *L'Assassin*, 1866, *Madeleine Bertin*, 1868, *Le Train*, 1877, *Monsieur le Ministre*, 1882, and *Le Prince Zilah*, 1884. He also wrote extensively on historical subjects: *Cinq ans après*, 1877; *Les Prussiens chez eux*, 1872; *La Vie à Paris*, 1896. A complete ed. of his works was pub. 1897-1904.

Clarification, process of refining a liquid by separating or removing the substances which make it turbid. This can be done by straining through a sieve; by using a centrifugal or circular vessel, with a small outlet in the centre, which, when revolved at a high speed, will clear the liquid by lifting the particles of foreign matter to the surface; and by adding to the liquid gelatine, white of eggs, bullocks' blood, etc.

Clarimontium, *see* CLERMONT-FERRAND.

Clarinet (It. *clarinetto*, from Lat. *clarus*, clear), musical instrument of the woodwind family. It is supposed to have been first made about 1700 by Johann Christoph Denner of Nuremberg, who probably developed it out of an earlier Fr. single-reed instrument, the chalumeau—the word chalumeau is still used to define the lowest part of the compass of the C. The C. consists essentially of a mouthpiece furnished with a single beating reed—i.e. a reed which vibrates against an air-slot in the mouthpiece—a cylindrical tube ending in a bell, and provided with 18 openings in the side, half of which are closed by the fingers and half by the keys. The reed is made from a thin slip of a Sp. reed (*Arundo donax*) and is kept in place on a flattened table by means of a ligature. Since the reed at one end of the tube serves to

CLARINET

close it at that end, the pipe acts as a 'stopped' one, sounding an octave lower than an open one, which explains why the pitch of the C. differs from that of the flute. In orchestral music 2 instruments

are usually employed, namely A pitch and B \flat —the C pitch instrument, to be observed in the scores of 'classical' composers, is now very rare, but the smaller E \flat C. is used where high and rather shrill notes are required. In military bands, the C.s used are B \flat and E \flat . Some notable orchestras evidently did not use C.s until towards the close of the 18th cent., e.g. the Viennese court orchestra, and it is to Mozart's fondness for the instrument, which he first used at Mannheim and Paris in 1777-8, that is owed the earliest notably artistic treatment of it. His symphony in E \flat major, concerto and C. quintet exemplify his love of the instrument. Weber also showed great fondness for the C. and after that time 2 C.s of the normal size became a *sine qua non* of every orchestra. There are various other instruments of the C. family: high E \flat , which is pitched a perfect fourth above the B \flat instrument; the alto C. in E \flat , and F., a military band instrument now superseded by the saxophone; and the bass horn. This last, which in appearance is like the bass C., is in fact a tenor instrument, its pitch being an octave lower than that of the obsolete C. of C pitch. The bass C., in B \flat , is fairly regularly used in the modern orchestra.

Clarion: 1. A shrill-sounding trumpet, not now in use, formerly employed as a signal to arms.

2. An organ stop, having pipes with reeds, which give a piercing sound like that of a C.

3. An heraldic bearing.

Clarium, *see* CHIARI.

Clark, Charles Heber, *see* ADELER, MAX.
Clark, Edwin Charles (1835-1917), barrister, *b.* near Shrewsbury, and graduated at Trinity College, Cambridge, of which he became fellow. Subsequently he was appointed regius prof. of civil law at Cambridge. Author of *Early Roman Law: Regal Period*, 1872, *An Analysis of Criminal Liability*, 1880, *Practical Jurisprudence*, 1883, *Cambridge Legal Studies*, 1888, and *History of Roman Private Law*, vol. 1, 1906.

Clark, Francis Edward (1851-1927), Amer. clergyman (originally surnamed Symmes), *b.* Aylmer in Quebec, Canada. He became pastor of a Congregational church at Portland, Maine, in 1876, where he founded (1881) the Young People's Society of Christian Endeavour. He was editor or honorary editor of the *Christian Endeavour World* from 1886 until his death, and president of the United Society (1887-1925). He travelled round the world 5 times, and wrote many books, including *Our Journey Around the World*, 1894, and *World-wide Endeavour*, 1895. *See also* CHRISTIAN ENDEAVOUR.

Clark, George Rogers (1752-1818), Amer. frontier general, *b.* Albemarle co., Virginia; educ. at a common school. Explored the region W. of the Alleghenies in 1772; practised as a surveyor; engaged in many encounters with the Indians on the Ohio R. in 'Dunmore's war.' Removed to Kentucky (then a more dist.) in 1776 and became one of its delegates

to the Virginia legislature. In the War of Independence he defeated Lt.-Governor Henry Hamilton, 1779, at Fort Sackville; for this and similar services C. received a grant of land from the U.S. Gov. He took part in the Fr. operations against Spain in the Mississippi valley. He d. in poverty near Louisville, Kentucky. See lives by W. Harghurst, 1952, and J. C. Nolan, 1954.

Clark, John Bates (1847-1938), Amer. economist, b. Providence, Rhode Is. He studied at the Univs. of Heidelberg and Zürich, and was appointed prof. of political economy and hist. at Columbia Univ. in 1895. Works: *The Philosophy of Wealth*, 1885; *Capital and its Earnings*, 1888; *Wages*, 1889; *The Control of Trusts*, 1901; *The Distribution of Wealth*, 1901; *The Problem of Monopoly*, 1904; *Essentials of Economic Theory*, 1907; *The Modern Distributive Process*, with F. H. Giddings, 1909; *Control of Trusts*, enlarged ed., with his son J. M. Clark, 1912.

Clark, Josiah Latimer (1822-98), engineer, b. Great Marlow, Bucks. He took a junior position on the construction of the Britannia tubular bridge, after which he became assistant engineer to the Electric Telegraph Co., with which he remained till 1870. He worked out the system of enclosing underground wires by means of gutta-percha coating, of sending messages by the pneumatic tube, and invented the double-cap invert insulator and the C. cell. He also made investigations with regard to submarine cables and invented C.'s compound, a mixture of asphalt, hemp, and silica, with which such cables are now covered. The practice now in use of stamping telegrams and of registering abbreviations for cablegrams originated from a suggestion by C. He pub. sev. works, including *Electrical Tables and Formulars*, 1871, and a *Dictionary of Metric and Other Useful Measures*, 1891.

Clark, Thomas (1799-1868), publisher, b. Edinburgh, and founder, 1821, of the firm of T. & T. Clark. He took his nephew Thomas (later Sir Thomas) C. into partnership in 1846. The business, which specialises in the theology, philosophy, and law, still flourishes under the control of the C. family.

Clark, William Tierney (1783-1852), civil engineer, b. Bristol. He became chief engineer to the W. Middx. Waterworks, and constructed the Thames and Medway Canal, the Hammersmith suspension bridge (1824-7), and the suspension bridge over the Danube at Budapest (1839-49).

Clarke, Adam (1762-1832), Wesleyan Methodist preacher, b. co. Londonderry. He brought out a *Bibliographical Dictionary*, 1802-6, in 8 vols., but his chief work was a *Commentary on the Bible* (8 vols.), 1810-26. He also wrote *Memoirs of the Wesley Family*, 1823. His biography entitled *Account of the Infancy, Religious, and Literary Life of Adam Clarke*, 1833, is in 3 vols., the first being autobiographical (religious life), and the other two by his daughter. Consult also the life written by Etheridge, 1858.

Clarke, Charles Cowden (1787-1877), critic, b. Enfield, Middx. He was an intimate friend of the Shelley group. His lectures on Shakespeare, delivered in London during the years 1834-54, made him famous. His wife Mary Victoria (1809-98)(q.v.), daughter of V. Novello, compiled a complete *Concordance to Shakespeare*, 1844-5. Joint productions of the husband and wife included an annotated ed. of Shakespeare, 1869, *The Shakespeare Key, unlocking the Treasures of his Style*, 1879, and *Recollections of Writers*, 1873. C. also pub. *Tales from Chaucer in Prose*, 1833, and *Shakespeare Characters, chiefly those Subordinate*, 1863. See M. V. C. Clarke, *Centennial Biographic Sketch of Charles Cowden Clarke*, 1887, and R. D. Altick, *The Cowden Clarkes*, 1948.

Clarke, Edward Daniel (1769-1822), traveller and mineralogist, b. Willington, Sussex. After having graduated at Cambridge (1790) he accompanied Cripps on a tour through Europe, Egypt, and Asia Minor (1799-1802), from which he brought back the colossal statue of the Eleusinian Ceres, now in the Fitzwilliam Museum. He was appointed prof. of mineralogy at Cambridge in 1808. He pub. his *Travels in Various Countries of Europe, Asia, Africa*, 1810-23, and *Greek Marbles brought from the Shores of the Euxine Archipelago and Mediterranean*, 1809. See W. Otter, *Edward Daniel Clarke: Life and Remains*, 1825.

Clarke, Sir Edward George (1841-1931), barrister, eldest son of J. G. C., a London jeweller. Educ. City of London College, King's College evening classes. He was a writer in the India Office, 1859-60, and Tancred law student, 1861, and was called to the Bar 3 years later. He sat in Parliament, representing Southwark (1880), Plymouth (1880-1900), and City of London (Jan.-June 1906). In 1886, during Lord Salisbury's ministry, he was appointed solicitor-general and knighted. The chief cases that he was connected with in his legal career were the Penge case (1877), the Bartlett case (1886), the Baccarat case (1891), and the Jameson case (1896). His pubs. include a *Treatise on the Law of Extradition*, 1866 (4th ed. 1903), *Public Speeches*, 1888-90 and 1890-1900, *Selected Speeches*, 1908, *Easy Shorthand*, 1907, *The Story of my Life*, 1918, and *Benjamin Disraeli, the Romance of a Great Career*, 1926.

Clarke, Sir George Sydenham, see SYDENHAM OF COMBE, LORD.

Clarke, James Freeman (1810-88), Amer. Unitarian minister, b. Hanover, New Hampshire, U.S.A. He graduated at Harvard, 1829, and at the Harvard Divinity School, 1833. He took part in the founding of the Unitarian Church of the Disciples in Boston (1841), to which he acted as pastor (1841-50 and 1854-88). He was appointed prof. of natural religion and Christian doctrine (1867-71) and lecturer on ethnic religions (1876-7) in Harvard Univ. C. was a keen advocate of the anti-slavery cause, and a voluminous writer. His works include *Campaign of 1812*, 1848, *Eleven Weeks in Europe*, 1852, *The Christian Doctrine of*

Forgiveness of Sin, 1852, *Orthodoxy*, 1866, *Steps of Belief*, 1870, *Ten Great Religions*, 1871-83, *Self-Culture*, 1882, *The Ideas of the Apostle Paul translated into their Modern Equivalents*, 1884, *Manual of Unitarian Belief*, 1884, *Anti-Slavery Days*, 1884, and *Vexed Questions*, 1886. See his *Autobiography, Diary, and Correspondence*, ed. by E. E. Hale, 1891.

Clarke, Jeremiah (1673 or 1674-1707), Eng. organist and composer, b. perhaps at Windsor, became a choirboy in the Chapel Royal under Blow, was organist at Winchester College in 1699-5 and then at St Paul's Cathedral in London from the year 1697, when the unfinished building was ready for services. He shot himself in a fit of mental derangement on 1 Dec. 1707. C. wrote church, theatre, choral, and keyboard music. The so-called *Trumpet Voluntary*, wrongly attributed to Purcell, is one of C.'s marches for the harpsichord, *The Prince of Denmark's March*, described as a 'trumpet tune' because the melody is constructed on the natural scale of the trumpet.

Clarke, Marcus Andrew Hislop (1846-1881), Australian writer, b. Kensington. He was educ. at Highgate School, emigrated to Victoria at the age of 18, and entered upon a journalistic career, writing under the pseudonym Peripatetic Philosopher. His best work is a novel on the cruelties of the life in a prison settlement, *For the Term of his Natural Life*, pub. in 1874. Among his other works are *Long Odds*, 1869, *Holiday Peak*, 1873, and *History of the Continent of Australia, 1787-1870*, 1877.

Clarke, Mary Victoria Cowden (1809-98), wife of Charles Cowden C. (q.v.). She was a pupil and a friend of Mary Lamb. In addition to the works written with her husband she pub. *The Complete Concordance to Shakespeare*, 1844-5; *The Girlhood of Shakespeare's Heroines*, 1850; *The Iron Cousin*, a novel, 1854; *World-noted Women*, 1858; a biography of her husband, 1887; and *My Long Life*, 1896.

Clarke, Samuel (1675-1729), divine and philosopher, b. Norwich. He could not agree with the theories of Descartes in vogue at the time, and accordingly became a follower of his friend Newton. In 1706 Queen Anne chose him as her chaplain, and in 1709 appointed him to the rectory of St James, Westminster. His treatise *The Scripture Doctrine of the Trinity*, 1712, in which he stated that the doctrine of the Trinity was not held by the early Church, was considered semi-Arian, and C. was brought before Convocation. His famous discussion with Leibnitz as to the relation of time and space to God was undertaken by request of the Princess of Wales, and the papers were pub. in 1717. C. delivered the Boyle lectures in 1704-5, choosing for his subject *The Being and Attributes of God*. C. won a very high reputation as a philosopher, and in the sphere of metaphysics was regarded as second only to Locke. Other essays of his to be noted are *A Discourse concerning the Unalterable Obligations of Natural Religion*, 1708, and *A Philosophical Inquiry concerning*

Human Liberty, 1715. See the life by H. Hoadly, prefixed to the collected ed. of his works, 1738-42, and W. Whiston, *Memoirs of Clarke*, 1741.

Clarke, William Branwhite (1798-1878), geologist, b. E. Bergholt, Suffolk. In 1840 he went out to Australia and became vicar of a church in Willoughby, New S. Wales, 1847-70. He discovered gold in Australia in 1841, tin in 1849, and diamonds in 1859. He carried on valuable investigations, wrote many scientific papers, and obtained the Murchison medal from the Royal Geographical Society in 1877.

Clarkia, genus of N. Amer. ann. herbs, family Oenotheraceae, of which *C. elegans* and *C. pulchella* and their strains are popular garden flowers.

Clarksburg, city in W. Virginia, the heart of a bituminous coal region, with natural gas deposits. It manufs. stone, clay, carbon, and glass products, tin plate, chemicals, precision instruments, clothing, and lumber, food, and paper products. Pop. 32,014.

Clarkson, Thomas (1760-1846), anti-slavery agitator. In 1785 he won a prize for his Lat. essay, *An liceat inuolens in servitutem dare?*, of which his Eng. trans. (1786) had a very large sale. From this time he worked to bring about the abolition of African slavery by speaking in the chief towns of England and in Paris, and by issuing pamphlets. In 1807 the Bill for the abolition of the slave trade became law, on which occasion Wordsworth wrote his sonnet, *Clarkson, it was an obstinate hill to climb*, and in 1808 C. himself pub. *The History of the Rise, Progress, and Accomplishment of the Abolition of the African Slave Trade*. He was active in founding an Anti-Slavery Society (1823), the object of which—to suppress slavery in the W. Indies—was accomplished by the passing of the Emancipation Bill in 1833. In his latter years he founded institutions for sailors at seaports, and did philanthropic work. His essays include *On the Slavery and Commerce of the Human Species* (his trans. of the Lat. essay mentioned above, 1786) and *The Cries of Africa to the Inhabitants of Europe*, 1822. See CLAP-HAM SECT.

Clarksville, city in Tennessee, U.S.A., cap. of Montgomery co., 10 m. NW. of Nashville, is a railway centre and has an important trade in tobacco and a snuff factory. Pop. 16,246.

Clarus Mons, see under CLERMONT-FERRAND.

Classical Association, The, founded in London, 1903, with the object of impressing upon public opinion the claim of classical studies to an eminent place in the national scheme of education. This aim is maintained by organising conferences and public lectures, both through a central organisation and through 28 local branches, by encouraging research, and by improving the practice of school teaching by free discussion of methods. The association arranges prize competitions among schools for the reading of Latin and Greek aloud. The H.Q. of the

association are at the London Univ. Institute of Classical Studies, 50 Bedford Square, London, W.C.1. Its chief pubs. are *Classical Review* (quarterly), *Classical Quarterly* (thrice yearly), *Greece and Rome* (thrice yearly), and *Proceedings* (ann.). See L. J. D. Richardson, 'The Classical Association—The First Fifty Years' in *Jubilee Addresses*, 1954.

Classical Economists, academics and men of affairs, philosophers and economists, Englishmen and Scotsmen who over the cent. between 1750 and 1850 formulated the principles of the new science of economics and the theory of economic policy to which it led. They were David Hume, Adam Smith, David Ricardo, Thomas Malthus, Robert Torrens, Nassau Senior, John McCulloch, James Mill, John Stuart Mill, Jeremy Bentham, and John Elliot Cairnes. For many years historians and political theorists represented them as the apologists of pauperism and profits, the tools of capitalist exploiters, opponents of social reform, and men who conceived no other function for the State but that of the night watchman. In recent years this view has been challenged.

It is true that the dominant impression given by the writings of the C. E. may be that they were opposed to governmental action in principle and in favour of complete freedom in economic activity. But this is because they were essentially reformers writing to expose the defects of the restrictive mercantilist institutions and habits of thought which lingered from the 17th and 18th cents. They were concerned with current political controversies, and were addressing themselves not to posterity but to their contemporaries. It was natural, therefore, that they should emphasise the liberating aspect of their theories.

But it is an error to suppose that this is the sum content of their teachings. Their works show that they contemplated not *laissez-faire* in the common sense of non-interference by gov. in economic activity, but an active state in which man-made laws and institutions enabled the market economy to work to the social advantage.

Thus Adam Smith spoke of '... the duty of erecting and maintaining certain public works and certain public institutions, which it can never be for the interest of any individual or small number of individuals to erect and maintain; because the profit could never repay the expense to any individual or small number of individuals, though it may frequently do much more than repay it to a great society.' Jeremy Bentham endeavoured to erect a structure of institutions which so co-ordinated action as to create the good society. His *Constitutional Code* provided for a cabinet with ministers for elections, legislation, army, navy, preventive services (police, fire, etc.), interior communications, indigence, relief, education, domain, health, foreign relations, trade, and finance. These were to be served by administrative machinery envisaged in full detail. The

president of the Board of Trade, for example, was instructed to bear in mind the need to revise regulations following changes in the value of money produced by changes in its supply relatively to the quantity of goods. (In this respect, at least, we have yet to catch up with the C. E.) McCulloch, Senior, J. S. Mill, and other C. E. discussed the functions of the State in a 'liberal' society.

Furthermore, where it was not possible to perfect the framework of laws and institutions so that spontaneous activities promoted the general interest, e.g. where competition was not practicable, the C. E. envisaged direct State intervention. Adam Smith favoured assistance for infant industries; J. S. Mill advocated assistance for backward peoples, an upper limit on inheritance, and a tax on the increment of land values; McCulloch argued for limitation of the dividends of public utility companies. These and other 'interferences' were designed to fit into the system of economic freedom in order to increase opportunities and knowledge or reduce excessive power so that the market economy worked for the good of the community.

Nor is the familiar picture of the attitude of the Classical Economist to social conditions borne out by their writings. Smith and Malthus wanted subsidised schools. Senior (in the Report on the Handloom Weavers) said: '... both the ground landlord and the speculating builder ought to be compelled by law ... to take measures which shall prevent the towns they create being centres of disease.' With one exception, all the C. E. opposed truck. (Ricardo thought that Robert Owen's experiment at New Lanark might benefit from a truck shop.) The C. E. supported the Factory Act restrictions on the employment of children. Senior favoured restrictions on the employment of women in mines. Although some of the C. E. thought that most women should be treated as being as responsible as men, it was because, J. S. Mill urged, it would allow them access to industrial employment as a means of emancipation. Torrens wanted compensation for handloom weavers displaced by machinery. (In 1956 the question of compensation for workers displaced by automation became a live political issue.)

The C. E. were generally opposed to minimum wage-fixing, not because they wished to depress wages but because they considered the demand for labour might diminish. Most of them supported trade unionism, but not without misgivings about the effects on the workers. J. S. Mill wrote: 'There must be some better mode of sharing the fruits of human productive power than by diminishing their amount. Yet this is not only the effect but the intention of many of the conditions imposed by some unions on workmen and on employers. All restrictions on the employment of machinery, or on arrangements for economising labour, deserve this censure. Some of the union regulations go even further than to

prohibit improvements; they are contrived for the express purpose of making work inefficient; they positively prevent the workmen from working hard and well. . . . This is a judgment which many could dispassionately pass on trends in mid-19th-cent. trade unionism.

The strength of the C. E. was that they made realistic assumptions about man and the world he inhabits. These were two; first, that man sought his own interest (and this did not mean self-interest but the interest of any whom he chose to benefit by his efforts); second, that while the world was getting richer, it was still poor and that all had to be given incentives to contribute to the common good. Hence the need for machinery that would gear self-interest to the social advantage. The record of the 19th and 20th cents. suggests that no system known to man or conceived by him, except a market economy, can, in modern industrial society, achieve these objectives and leave man to live out his life in freedom. The C. E. must be judged not from the interpretations of others, but from their own writings; and from the experience of those who have ignored or learned from their teachings. See also INDIVIDUALISM. See W. H. Hutt, *Economists and the Public*, 1936, and Lionel C. Robbins, *The Theory of Economic Policy in English Classical Political Economy*, 1952, and Robert Torrens and the *Evolution of Classical Economics*, 1958.

Classics. The term derived through Fr. *classique* from Lat. *classicus*, which was first used by Aulus Gellius (2nd cent. AD) to denote a writer of the highest class. In due course it was applied to the works of such authors; hence we speak of a 'classic' when referring to a book of acknowledged excellence or recognised authority. To-day classic is used most commonly with reference to the literatures (including sometimes the histories and languages) of ancient Greece and Rome (qq.v.). Modern classical scholarship begins with the Renaissance, although much work on Greek literature had already been done by the Alexandrian scholars (e.g. Aristarchus of Samothrace, and Aristophanes of Byzantium, qq.v.), who in the 3rd cent. BC classified the texts that were then extant. After the Renaissance, scholarship was naturally intent on going over the newly discovered treasures of classical literature. The printing of the C. in Italy in the 16th cent.—which was an event in itself—made classical study an integral part of the humanistic education, advocated by such a man as Erasmus (q.v.). The founder of historical criticism was the younger Scaliger (q.v., 1540–1609), who was also an adept at textual emendation, and his methods were inherited by the 2 great Eng. scholars of the 18th cent., Bentley and Porson (qq.v.). In the 19th cent. scholarship in the hands of the Ger. scholars (see BEKKER, I.; BOECKH, A.; DINDORF, W.; HERMANN, G.; MOMMSEN, T.; WOLF, F. A.) was mostly devoted to the editing and collating of the classical

texts, while in England the Porsonian tradition passed from Cambridge to Oxford in the person of Elmsley (q.v., 1773–1825). In Victorian England scholarship was marked by such names as G. Grote, R. C. Jebb, J. E. Sandys, J. Burnet (qq.v.), and by the great lexicons of Liddell and Scott (Greek), and Lewis and Short (Lat.). In the U.S.A. during the 19th cent. classical studies became of increasing importance, represented at Harvard by the Lat. scholar Lane, and at Yale by the Greek scholar Seymour. An Amer. school was founded at Athens in 1881 and a Brit. school 2 years later. Since then archaeology has been a stimulus to modern scholarship, which in recent years has been actively fostered by societies both in England and America, and this in spite of the fact that the value of a classical education has been called in question.

Classification, see STATISTICS.

Classification (Lat. *classis*, a class), name given to the process whereby a number of objects which are alike in one or more respects are collected under a common name. Systematic C. is essential to any science; artificial C. is the name given to a collection of facts for some special purpose, such as statistics of various kinds. Each science has its own system of C., but the problem which has engaged the minds of scientists and philosophers from very early times is that of the relation of sciences to each other—that is, the C. of sciences as a whole. Of the many attempts made in this direction, those of Bacon, Comte, and Spencer may be briefly outlined as being representative of various views. Bacon's C. was based on a subjective criterion of the various faculties which are concerned in the study of different sciences. Hist. is, according to this theory, the science of memory, philosophy that of reason, etc. Comte's C. was based on an objective criterion; all sciences pass through 3 stages, according to him—theological, metaphysical, and positive. Of the positive sciences mathematics is the lowest, sociology the highest. Spencer classified sciences under 3 heads, as abstract, such as logic, etc.; abstract concrete, such as physics, mechanics, etc.; and as concrete, such as astronomy, sociology, etc. It is obvious that no system of C. inspired by a preconceived theory can be wholly satisfactory. See also CATALOGUES AND CLASSIFICATION, and CLASSIFICATION, PLANT.

Classification, Plant, naming and grouping of members of the plant kingdom in such a way that those most nearly related in form and structure are placed together, and so that, as far as possible, the order of their appearance in the world and their natural origins are made evident. The arrangement of plants into their related groups is termed Systematics, and their naming and description concern Taxonomy. The system of modern botanical C. was founded by Carl Linnaeus, the Swedish botanist, on a binomial basis, whereby each plant is given a generic and specific name in Latin, common to

botanists of all countries. The grouping of plants is necessarily artificial and amenable in the light of discovery and a more certain knowledge of plant affinities and evolution, compelling name changes.

In present-day C. plants may be divided in 2 main groups as: (1) rootless, non-vascular plants with or without simple leaves, reproduced usually by spores; and (2) plants with roots, vascular, with stem and leaf; or in 4 groups or subcommunities: (1) Thallophyta, the Thallophytes; (2) Bryophyta, Mosses, and Liverworts; (3) Pteridophyta, Ferns, and their allies; and (4) Spermatophyta, the Spermatophytes or seed- or flower-plants. These groups are split into divs. (Algae, Bacteria, Fungi, Diatoms, Charophytes, Liverworts, Mosses, Ferns, Club Mosses, Horsetails, Gymnospermae, and Angiospermae) which are often themselves grouped into sub-divs. Divs. and sub-divs. are divided into classes, and sometimes subclasses; i.e. the div. Angiospermae has 2 classes, Monocotyledonae and Dicotyledonae, of which the latter has 2 subclasses, Archichlamydeae and Metachlamydeae. The classes are divided into orders (often ending in -ales), and the larger orders into suborders (ending in -neae). Orders (or suborders) are divided into families, usually ending in -aceae, with exceptions in Compositae, Gramineae, and Labiatae. Families are divided into subfamilies with names terminating in -oideae; and again into tribes, usually ending in -eae, and subtribes, ending in -inae. In their turn these groups are divided into genera (sing. genus), which give us the first name of an individual plant, and a large genus may sometimes be split into subgenera. The genus is divided into species, which give the second epithet of a plant's botanical name. The species may be divided into subspecies, and again into varieties, and sometimes races, forms, or clones, the last being individual plants which have definite characteristics propagated by vegetative means. Under species may also be placed hybrids, plants derived from the cross-fertilisation of one species with another.

Classis, see RAVENNA.

Clathrate Compounds, see INERT GASES.

Claude of Lorraine (1600-82) properly called **Claude Gellée**, Fr. landscape painter, b. Chânamagne, Lorraine. Being left an orphan at the age of 12, he went to live with an older brother, a wood-carver at Freiburg, and when still a boy travelled in Italy. At Rome he received employment in artists' studios, and was fortunate in coming under the notice of Agostino Tassi, the landscape painter, who gave him lessons. He may also have studied under Gottfried Waals at Naples, and finally settled in Rome in 1627. Not long after he attracted the attention of Cardinal Bentivoglio, who procured him an introduction to Pope Urban VIII, and a commission for 2 paintings: 'La Fête Villageoise,' and 'Un Port de mer au soleil couchant,' now in the Louvre. C.'s pictures commanded high prices even during his lifetime (Clement IX offered for 'Villa Madama' as many pieces of

gold as could cover the canvas), and he was troubled with many forgers. Accordingly, he kept sketches of his pictures in paper books, which he called his *Liber Veritatis*. These were afterwards engraved by Earlom; the originals belong to the Duke of Devonshire. C. excelled as a landscape painter. His colouring is very delicate and harmonious, and perhaps no other painter has so well represented the radiance of a morning or evening sky. He was not so adept in figure-drawing, in which he sometimes

CLAUDE OF LORRAINE

Engraving after a painting in the
Royale, Paris.

received help from fellow artists, and is supposed to have once said that he sold the landscape and gave away the figures free. His landscapes number about 400, and are to be found in all the chief galleries of Europe. His drawings are distinct from his paintings in their directness, and magnificent examples are in the Brit. Museum. Consult Ruskin, *Modern Painters*, 1843-60; Mrs Mark Pattison, *Claude Lorraine, sa vie et ses œuvres*, 1884; A. M. Hind, *The Drawings of Claude Lorrain*, 1925; P. Courthion, *Claude Gellée, dit le Lorrain*, 1932.

Claude, Jean (1619-87), Fr. Protestant preacher and controversialist, pastor at Charenton (1666-85), who on the revocation of the Edict of Nantes fled to Holland. His works include *Défense de la réformation* (4 vols.), 1671, and *Réponse à la conférence de Bossuet*, 1681.

Claudel, Paul Louis Charles (1868-1955), Fr. poet, dramatist, and essayist, b. Ville-neuve-sur-Fère. He filled many consular posts, and was Fr. ambas. to Japan, to the U.S.A. (1927-33), and to Belgium (1933-1935). But he is chiefly known to fame as one of the greatest Catholic writers of France. His dramas take place in time

rather than in space, the drama being one of the salvation or destruction of the soul. His prin. dramas are *Télé d'or*, 1889; *L'Annonce faite à Marie*, originally written as *La Jeune Vierge Violaine*, 1910; *L'Otage*, 1918; *Le Soutier de satin*, 1929. His prin. poetic works are *Cinq Grandes Odes*, 1911, *Corona benignitatis anni Dei*, 1915, and *Poèmes de guerre*, 1922. Other publs.: *Feuilles de saints*, 1925, *Les Euménides d'Eschyle*, 1920, and *Conversation dans le Loir-et-Cher*, 1937. A synthetic and obscure writer, he adopted a form of verse recalling that of the Psalms. C.'s place in the literary firmament is both eminent and questioned. Some derive a novel aesthetic and spiritual experience from his drama and, to a less degree, from his verse, while others are unmoved. Yet no other modern verse is at once so cosmic and yet personal, for it is the fruit of C.'s preoccupation with his own spiritual salvation, written without much regard for the contemporary world. His metrical ingenuity is marked and, like T. S. Eliot, he is skilful in the use of long unrhymed periods. C.'s plays are by no means easily adaptable to ordinary stage requirements. A less-known play is *Partage de Midi*, written in the Far E. in 1906. Yet it is regarded by the critics as one of his greatest works. He became a member of the Fr. Academy in 1946.

Claudia Celea, see **CELEA**.

Claudianus, Claudius (Claudian) (d. c. AD 408). Lat. poet. b. Alexandria. His native tongue was Greek, but he acquired a perfect command over Latin. In 395 he gained the favour of Stilicho, whom he enlisted in his *De Laudibus Stilichonis* (3 books). His other writings are *Raptus Proserpinae*, an epic poem; *Gigantomachia*, a fragment; *De Bello Gothico*; and sev. occasional poems and panegyrics. After the Gothic war, he was honoured by the Senate with a bronze statue in the forum of Trajan. His poems are vivid and written in a somewhat ornamental style. The best eds. are those of Th. Birt, 1892; J. Koch, 1895; and M. Platnauer (with trans., Loeb Library (2 vols.)), 1922. See T. Hodgkin, *Claudian: the Last of the Roman Poets*, 1876, and J. W. Mackail, *Latin Literature*, 1895.

Claudius I, Rom. emperor (AD 41-54), whose full name was Tiberius Claudius Drusus Nero; son of Drusus Nero and nephew of the Emperor Tiberius, b. Lugdunum (Lyons) in 10 BC. He was sickly and neglected as a child; but despite undoubted eccentricity, he was not, as is commonly alleged, an imbecile. On the assassination of Caligula in AD 41, C. was proclaimed emperor by the praetorian guards. In the first years of his reign the imperial boundaries were extended, and a foothold secured in Britain (43). At Rome he built 2 aqueducts, and constructed a new harbour at Ostia. But C.'s reign as a whole was marred by the influence of 2 freedmen, Pallas and Narcissus, as well as by the evil genius of 2 wives, Messalina and Agrippina the younger (qq.v.). C. d. by poison, which, according to Tacitus, was administered by

Agrippina; and his subsequent deification is satirised in Seneca's *Apocolocyntosis*. See V. M. Saramuzza, *The Emperor Claudius*, 1940.

Claudius II (Marcus Aurelius Claudius), surnamed Gothicus, Rom. emperor AD 268-70. He was b. in Illyricum of a family of no note, but distinguished himself in military service and was made governor of his native prov. under Valerian. On the death of Gallienus, the army proclaimed C. emperor. He defeated the Alemanni in the N. of Italy (268); and won a great victory over the Goths near Naissus, in Dardania, on which occasion he received his surname Gothicus. He d. at Sirmium in Pannonia.

Claudius, Appius, surnamed **Caecus**, Rom. censor, to which office he was elected in 312 BC, without having previously been consul. He retained it for 4 years, though according to Rom. law no man might be censor for longer than 18 months. He was supposed to have become blind, hence his name **Caecus**. He built the Appian aqueduct, which brought water to Rome from Tusculum, and began the construction of the Via Appia. In the war with Pyrrhus, the terms of peace, drawn up by Cincus, were rejected by the Senate largely because of Appius's spirited opposition to them. C. was consul in 307 and 296 BC.

Claudius, Appius Sabinus Regillensis, Sabine of the tn of Regillum, where he was known as Attus Claudius; founder of the gens Claudia. About 504 BC he settled in Rome, where he was admitted to patrician rank. He became consul in 495, and the enmity he displayed towards the plebeians led to their secession to the Mons Sacer in the following year. The Sabinus who accompanied him to Rome were given lands by the Aulo.

Claudius, Publius, surnamed Pulcher, generally known as Clodius (d. 52 BC), Rom. profligate and politician. After a chequered military career in the E., he returned to Rome in 65 BC. In 62 he entered the house of Julius Caesar and profaned the mysteries of the Bona Dea, which were being celebrated by Pompeia, Caesar's wife, and other Rom. matrons. Clodius was brought to trial in the following year, but by corrupting the judges he obtained an acquittal. Cicero had given evidence at the trial, for which Clodius never forgave him. He descended from patrician rank, and was adopted into a plebeian family that he might become a tribune of the plebeians. He was chosen tribune in 58, and used his influence to banish Cicero from Rome on the grounds that the latter had unlawfully punished the adherents of Catiline with death. In 56 C. was aedile. He was murdered in Jan. 52, on the Appian road, by the supporters of his enemy Milo (q.v.).

Claudius Albinus, see **CLODIUS**.

Claus, Emile (1849-1924), Flem. painter, popular for his studies of children and open-air scenes. Examples of his works are in the galleries of many of the chief tns of Europe.

Claus, Santa, see **CHRISTMAS** and **NICHOLAS, ST.**

together with which it forms the arm socket. In animals it is shorter than in man, where it is a long bone shaped like an S and lying nearly horizontal. The bone is easily fractured or dislocated, but can be fairly easily returned to its place and pieced together when the arm is supported. The merry-thought, or wish-bone, of a fowl is composed of the 2 C.s.

Clavicornes (Lat. *clava*, club; *cornu*, horn), name given by Latreille to those coleopterous insects in the section Pentamera which have their antennae thickened at the apex and thus resemble a club in shape. Burying-beetles and bacon-beetles belong to the group.

Clavie, Burning the, an ancient Scottish custom, once more widely distributed, but now only kept up at Burghhead, a small fishing vil. on the Moray Firth. The custom takes its name from the Lat. word *clavis*, a nail, as a bonfire is first made of split casks, one of which is then joined together again by large nails. The cask is then filled with tar, ignited, and carried round the vil. up to a headland where there are the remains of a Rom. altar; the assembled people scramble to get a piece of the C. with which to light their New Year's fire, and the charcoal of the C. is put up the chimneys, as it is supposed to prevent witches and evil spirits from descending. The date of this old custom is 12 Jan., the old New Year's Day.

Clavijero, Francisco Xavier (c. 1720-1787), Sp.-Mexican historian, b. Veracruz, Mexico. Pub. in Italian *Storia Antica del Messico*, Cesena (4 vols.), 1780-1. It was trans. into English by Cullen in 1787. C. also wrote *Storia della California*, Venice, 1789.

Clavijo y Fajardo, Don José (1730-1806), Sp. publicist and naturalist, b. in the Canaries. He was challenged to a duel by Beaumarchais, whose sister he had jilted. He trans. Buffon's *Histoire Naturelle* in 1785-90, for which he was rewarded by being appointed director of the Natural Hist. Museum in Madrid. Goethe (q.v.) drew largely on C.'s story for his *Clavigo*, 1774.

Clavius, Christopher (1537-1612), Ger. Jesuit priest and mathematician, who was employed by Pope Gregory XIII to superintend the reformation of the calendar. In 1612 he compiled a treatise on the construction and use of sundials.

Claws, term applied in zoology to various sharp appendages on the limbs of different animals, and frequently they are not homologous. The sharp nails of a vertebrate, the chelipeds of a lobster, and the chelicerae of a scorpion are all termed C. In vertebrates they are formed of hardened and thickened epidermal tissue, and in the cat they are retractile, i.e. they can be drawn in and thrust out at will.

Clay, Alfred Borron (1831-68), painter. He attended the Royal Academy school, 1852, and exhibited historical pictures, 1854-68. Among his works may be mentioned 'The Return to Whitehall, 29 May 1660,' 1867, now at Liverpool, and

'Imprisonment of Mary Queen of Scots at Lochleven Castle,' 1861.

Clay, Cassius Marcellus (1810-1903), Amer. politician, b. in Madison co., Kentucky, and educ. at Centre College, Danville, and at Yale Univ. He was passionately opposed to slavery, and spent much of his energy opposing it; as a result of his sympathies he made many enemies. He was U.S. minister to Russia, 1861-9. In 1872 he was one of the organisers of the Liberal Republican revolt, and took a prominent part in politics until he retired.

Clay, Frederic (1838-89), musical composer, the son of James C., the famous authority on whist. He studied music at Paris, where he was b., under W. B. Molière, and under Hauptmann at Leipzig. His works include a number of operettas, but he was best known by his songs, 'I'll sing thee songs of Araby' (from a cantata setting of Moore's *Lalla Rookh*), 'She wandered down the mountain side,' and 'The Sands of Dee.'

Clay, Henry (1777-1852), Amer. statesman and lawyer, b. in Virginia. Called to the Bar at an early age, after an indifferent education, he quickly distinguished himself as an advocate. In 1803, to fill an unexpired term, he was elected member of the Kentucky legislature, in 1806 and 1810 of the U.S. Senate, and in 1811 of Congress, becoming speaker of that body. His fiery speeches did much to bring about the war of 1812, and in 1814 he represented the U.S.A. at Ghent in the peace negotiations with Great Britain. He thrice unsuccessfully contested the presidency: first in 1824, when he lost to Adams, and again in 1832 to President Jackson, and in 1844 to Polk. In 1825 Adams made him secretary of state. After a period of retirement from politics he again entered the Senate (1831), and till his death retained all his old influence either there or as an adviser of the Whigs. In his foreign policy he warmly espoused the cause of the S. Amer. reps. in their struggle for independence. His objective was that the U.S.A. should recognise the reps. as such, and accordingly, after the rising in Spain in 1820, he moved in Congress an appropriation for sending ministers to these reps. His resolution was defeated, but he followed it up by another in 1821, expressing the sympathy of the people of the U.S.A. with the struggle of the reps. to throw off the Sp. yoke. This was passed, but not until the Sp. treaty of 1819 respecting the boundaries of the Floridas and Texas and other ter. had been ratified by Spain, when the resolution could hardly prejudice Amer. interests. His name will ever be stamped on Amer. economic hist. by reason of his part in the development of the Amer. system of protection of manuf. goods by tariffs, and the fostering of internal improvements by state grants or loans. C. came out as a protectionist during the nullification campaign of 1832-3 (see NULLIFICATION), when he astounded his followers by introducing a new Tariff Bill in which he proposed to reduce all existing duties to

an *ad valorem* basis of 20 per cent, such duties as exceeded that rate to be gradually diminished over a period of 10 years, when the rate should become uniform. The Bill, which was a mere compromise, was passed mainly to appease S. Carolina; but in his subsequent speeches it is clear C. was for a protectionist policy on general grounds of political expediency, viz. that the European nations had adopted the system, that it was necessary to create a home market for agriculture so as to keep pace with the rapid increase in Amer. power of production; and that a compact system of home manufs. made for union among the states. He advocated a convertible paper currency, demanded state assistance in the development of rail and water communications, and effected a compromise between the slave states and the Abolitionists (see on this COMPROMISE MEASURES OF 1850). His many successful efforts to bring about national harmony gained him the sobriquets of 'the Great Compromiser' or 'the Great Pacificator.' See C. Colton (ed.), *Works of Henry Clay*, 1863.

Clay, name applied indefinitely to the finer waste matter arising from the decomposition of rocks. C. is distinguished by its ductility and tenacity, and consists mainly of alumina and silica with a small quantity of water. It is rarely found in a pure state except where rocks containing felspar have decomposed, and is used chiefly in the manuf. of bricks.

Clay Cross, urb. dist. of Derbyshire, England, 5½ m. S.E. of Chesterfield, centre of an extensive coal- and iron-field. Pop. 8550.

Clay Ironstone, name given to the ore from which iron is smelted, in particular the carbonate (siderite) which occurs mixed with clay. In common with blackband ironstone, the ore is found chiefly in beds composed of small balls or nodules, and fossils are frequently met with embedded in the plastic substance. Before smelting, C. I. is usually subjected to roasting for a period of a month or so—the ore being broken up for this purpose—and during this time it loses from one-quarter to one-third of its weight. The method of smelting adopted is, in most cases, that of the blast furnace. Analysis has demonstrated that C. I. contains a large number of impurities, but the 2 chief constituents are ferrous oxide (about 40 per cent) and carbonic acid (about 25 per cent). The total metallic iron present averages 30 per cent. The condition in which this is present (ferric or ferrous) depends on the extent to which the processes of oxidation and hydration have been carried by the atmosphere. Ironstone in some form or other is found in practically all the coalfields of Great Britain, generally in convenient proximity to the limestone, which then forms its fuel. The earthy nature of the ore renders the addition of calcareous fuel necessary before it can be properly smelted, and the convenient distribution of ironstone and limestone referred to has formed a big factor in the industrial development of Great Britain.

Clay Pigeon, see PIGEON SHOOTING.

Clay Soils derive their specific character from the hydrated silicates of alumina which are found in them, both in a state of mixture and in chemical combination. China clay or kaolin is a very pure form of one such silicate. When farmers speak of a clay soil, they mean an intractable earth, which, when dry, becomes baked as hard as a brick, and which in its wet state is so sticky as to resist all efforts to work it with ordinary agric. implements. A pure clay soil would be quite infertile, but its felspars are almost always composed partly of lime, potash, and soda, which render the soil amenable to cultivation. As they hold water, are cold, and fairly impervious to air, C. S. are unsuitable for building purposes.

Claymore (Gaelic *claidheamh mor*, great sword), two-handed sword of the Scottish highlanders. The guard (quillon) often ends in an open quaterfoil. The name is quite incorrectly given to the single-handed basket-hilted broadsword, which was frequently single-edged. These are still carried by the officers of Scottish regiments in the Brit. Army.

Clays, Paul Jean (1819-1900), Belgian painter of the school of Willems and Leys. Among his best-known pictures are 'Calm in Zealand,' 'The Open North Sea,' 'A Squall on the Scheldt,' and 'Dutch Boats in the Flushing Roads.'

Clayton, John Middleton (1796-1856), Amer. politician, was b. Dagsborough, in Sussex co., Delaware. He was engaged in politics from a comparatively early age, and sat in U.S. Senate 1826-30, 1845-9, and again from 1852 till his death. He is chiefly known by his negotiation of the C.-Bulwer Treaty (q.v.), when he was secretary of state in 1850. He d. at Dover in Delaware.

Clayton, Robert (1695-1758). Irish bishop, whose motion in 1756 in the Irish House of Lords, for the expunging of the Athanasian and Nicæan Creeds from the liturgy, gave great offence. The feeling against him was increased by his pub. of *A Vindication of the Old and New Testament* in 1757. C. was threatened with a legal prosecution, but d. before the proceedings opened.

Clayton, see MANCHESTER.

Clayton, city, cap. of St Louis co., Missouri, U.S.A., at W. of St Louis. It is a farm trade centre with dairy and textile products. Pop. 16,000.

Clayton-Bulwer Treaty, between Great Britain and the U.S.A., was so called from the names of the statesmen representing the respective countries. The U.S.A. was represented by J. M. Clayton, Great Britain by Sir Henry Bulwer. By the terms of the treaty both parties pledged themselves to respect the neutrality of the proposed ship canal across Central America. Between 1880 and 1884 the gov. of the U.S.A. put forward sev. reasons why it might, when it thought fit, withdraw from its contract. These reasons, it may be stated, could not be reconciled with any system of law, national or international. The C.-B. T., which was concluded at Washington

on 19 April and ratified on 4 July 1850, was abrogated in 1901 by the Hay-Pauncefote Treaty (q.v.), which embraced the neutrality rule for the Panama Canal.

Clayton-le-Moors, par. and tn of Lancs, England, in the div. of Accrington, from which it is distant 1½ m. It is situated on the Leeds and Liverpool Canal, and engineering, brick-making, cotton, and blanket weaving, and soap-making are carried on. Pop. 6817.

Clazomenae (modern *Kelisman*), anct. tn of Ionia, and a member of the Ionian Confederation of Twelve Cities, or Dodecapolis. The inhab., alarmed by the Persian invasions, removed to one of the small is. of the bay from an isthmus which connected the mainland to a peninsula. Alexander the Great built a pier to the mainland, and the remains are still visible. It was the bp. of Anaxagoras, and is famous for the terra-cotta sarcophagi found there.

Cleaning, see **HOUSEWIFERY**.

Cleanthes (331-232 bc), Stoic philosopher, the successor of Zeno of Citium, was b. Assos, in the Troad. He attended the lectures of Zeno for 19 years, and, in order to obtain money to pay his class fee, he used to draw water for the gardens about Athens and to grind corn at night. On the death of his teacher, C. became the recognised head of the Stoic school (263), and was himself succeeded by his pupil, Chrysippus. He wrote many treatises, but the only work of his that is extant is a beautiful *Hymn to Zeus* which is among the most important evidences of Gk. religious thought. He d. of voluntary starvation. See A. C. Pearson, *The Fragments of Zeus and Cleanthes*, 1891.

Clear Island, small is. in the co. of Cork, Rep. of Ireland, about 4 m. from Baltimore, with an area of only 1504 ac. The chief occupation is fishing. Cape Clear is the most southerly point of Ireland. Pop. 565.

Clear-story, see **CLERESTORY**.

Clearance and Redevelopment (Housing). The Housing Act, 1957, deals with the subject under 2 headings, C. and R., in Sections 42 to 75.

I. CLEARANCE AREAS. The machinery for dealing with clearance areas is the same, initially, as it was under the Housing Act, 1930, and then under the Housing Act, 1936. There was no change under the Housing Repairs and Rents Act, 1954. Local authorities have been required to submit to the minister a 5-year programme for dealing with this problem.

A *clearance area* is one in which all the properties therein have to be demolished, although 'islands' of satisfactory property may be excluded. The area must contain more than one building of which at least one must be a dwelling-house. Houses may be included in a clearance area not only on grounds of being unfit for human habitation but also (and this applies to other buildings as well as houses) because by reason of their bad arrangement or the narrowness or bad arrangement of the streets they are dangerous or injurious to the health of

the inhab. of the area. 'Other buildings,' such as workshops and factories, might, therefore, be included because they obstruct the free admission of light and air into the neighbouring houses. Bad internal arrangement within a house is not one of the factors set out in the Housing Act, 1957. It may well be a factor for consideration when, it having been determined that a house is unfit, the next problem is what is the most satisfactory method of dealing with the conditions.

The local authority may act on information in its possession and must have regard to a written official representation from the Medical Officer of Health, who must make such a representation upon complaint of a Justice of the Peace or at least 4 local gov. electors. The local authority must discover if: (1) The most satisfactory method of dealing with the conditions in the area is the demolition of all buildings. (2) Suitable accommodation for the persons displaced is, or will be, available—and provide or secure it, as far as it does not exist in advance of displacement. (3) Its resources are sufficient for the purpose of carrying its decisions into effect.

Clearance orders. It is the duty of the local authority to implement its resolution in one of two ways or partly in one and partly in the other, viz.: (1) by issuing a clearance order, under which the owner is himself required to demolish the buildings; or (2) by issuing a compulsory purchase order, under which the local authority acquires and demolishes the buildings. The local authority may acquire a site cleared by owners if not developed by them after 18 months.

The Housing Repairs and Rents Act, 1954, enabled the local authority to include in a clearance order, in respect of any house which can provide a standard of accommodation adequate for the time being and of which it has or will acquire a tenancy before the order becomes operative, a provision postponing demolition until after it has determined it is no longer required for housing purposes. Owners must be given at least 6 weeks to demolish, and 28 days' notice must be given to the occupiers to vacate. In the case of houses subject to a compulsory purchase order, demolition may be delayed in the case of any house capable of providing a standard of accommodation adequate for the time being. The local authority may retain any other house belonging to it if either it is required for the support of a house which is being retained for housing purposes or there is some other special reason connected with these purposes for its retention. It may also acquire a house for any such purpose which is subject to a clearance order. On completion of the purchase the clearance order ceases to have effect.

Treatment of a clearance area. The authority must, as soon as possible, cause every building to be vacated and either: (a) demolish the same within 6 weeks or a reasonable extension and thereafter sell

or let the land or, subject to ministerial approval, appropriate it for an authorised purpose, or (b) sell or let the land subject to a condition that the buildings be demolished forthwith and to such restrictions and conditions as it thinks fit.

The London Co. Council and the Metropolitan Bor. Councils are the authorities concerned with clearance areas in London. Where an official representation relating to not more than 10 houses is made to the co. council it must forward it to the bor. council affected unless it considers that the area should be dealt with by itself.

II. REDEVELOPMENT AREAS. The local authority may pass a resolution declaring to be a proposed redevelopment area any area in its dist. in which the following conditions are found on inspection to exist: (a) that the area contains 50 or more working-class houses; (b) that at least one-third of the working-class houses in the area are (i) overcrowded, or (ii) unfit for human habitation, and (iii) not capable at a reasonable expense of being rendered so fit, or (iv) so arranged as to be congested; (c) that the industrial and social conditions of the dist. are such that the area should be used to a substantial extent for housing the working-classes; and (d) that it is expedient in connection with the provision of housing accommodation for the working-classes that the area should be redeveloped as a whole.

Within 6 months after a local authority has passed such a resolution, or within such extended period as the minister may allow, the authority must prepare and submit to the minister a redevelopment plan indicating (i) the land intended to be used for the provision of houses for the working-classes, for streets, for open spaces, and (ii) generally the manner in which it is proposed that the defined area should be laid out. In the preparation of the plan the local authority must have regard to the provisions of any development plan relating to the defined area or land in the neighbourhood. After a specified period the local authority must acquire all land in respect of which it has not been able to make arrangements with other persons for the carrying out of the redevelopment plan.

The local authority for redevelopment areas in London (other than the City) is generally the London Co. Council, but there are arrangements whereby the Metropolitan Bor. Council for the area may act.

GENERAL PROVISIONS AS TO CLEARANCE AND REDEVELOPMENT. The compensation in respect of land purchased compulsorily is assessed in accordance with the Acquisition of Land (Assessment of Compensation) Act, 1919. Land which surrounds or adjoins a clearance area is acquired at market value either by agreement or compulsorily if necessary to implement a scheme. Land belonging to the local authority may be appropriated for the purpose.

The minister or a local authority is obliged to state reasons for deciding that

a building is unfit if there has been objection to the order; and an objector must appear at the local inquiry to be entitled to a written statement from the minister. A clearance area having been declared, and a clearance order or a compulsory order made, a notice must be served on all owners who object on the grounds that the houses are *not* unfit, setting out the prin. grounds on which the local authority is satisfied as to unfitness.

A special payment may be made by a local authority on the direction of the

London County Council

MAISONETTE BLOCK, LOUGHBOROUGH ROAD

minister to the owner of a house which, in spite of being unfit, has been well maintained.

A local authority may, by order, with the approval of the minister, extinguish any public right of way over any land included in C. or R. areas.

Slum Clearance (Compensation) Act, 1956. Compensation in respect of land purchased compulsorily under Part III of the Housing Act, 1957, is paid generally at site value only for insanitary property as the buildings are considered worthless. Market value is paid for land and buildings acquired because of bad arrangement or narrowness or bad arrangement of streets, or merely by reason of disrepair or sanitary defects. Market value is also paid for land acquired either by agreement or compulsorily because it surrounds or adjoins a clearance area and is reasonably necessary to implement the scheme.

During the severe housing shortage many people purchased houses which were unfit for occupation and which, but for this Act, are due to be acquired at site value under slum clearance schemes. This Act provides additional compensation to these owner-occupiers who bought between 1 Sept. 1939 and 13 Dec. 1955, and who were in residence on the latter date. If the house is purchased compulsorily within the next 10 years as being unfit, compensation will be paid at the same rate as if it were not unfit. The house must be vacated under a clearance order, closing order, or demolition order. Under certain exceptional circumstances, the provisions apply even if the house was vacated before 13 Dec. 1955, such as through a posting as a member of the armed forces of the Crown. The courts have power to discharge or modify any liabilities where the interest in a house covered by the above provisions is subject to mortgage or similar charge. Occupiers of business premises in unfit houses compulsorily acquired may receive compensation on the basis stated above.

Clearances. The dispossession of the crofters of the Scottish highlands, dating from 1750, by landowners who introduced sheep-rearing. This led to a considerable emigration to N. America.

Clearchus, Spartan general of the 5th cent. BC. After commanding a portion of the fleet in the battle of Cyzicus, he was sent as harmost to Byzantium, but so infuriated the people by his despotism that the inhab. opened the gates to Alcibiades. He assisted the young Prince Cyrus against Artaxerxes. He received the command-in-chief of the Greeks after the battle of Cunaxa, and directed the retreat of the Ten Thousand, until he was led into an ambush by Tissaphernes, and delivered to Artaxerxes, who put him to death in 401 BC. See also TEN THOUSAND, EXPEDITION OF THE.

Clearing-houses, institutions estab. by bankers for the adjustment of mutual claims for cheques and bills, by exchanging them and settling the balances. The London bankers' clearing-house was estab. by the prin. bankers in London in 1770. There are 2 clearings, the balance being struck only at the afternoon clearing. Clerks representing the different banks first go to the clearing-house for the purpose of getting 'in' clearings entered (i.e. drafts against their banks); they then return to their offices so that the 'out-books' there may be cast and sent down to the clearing-house to be checked against the 'in-books' of other banks. The London bankers' clearing-house enables the claims of the member banks to be set off against each other, only the balance of account (e.g. cheques) being met by a transfer of funds at the Bank of England. See also BANKS AND BANKING.

Clearing Nut, seed of a tree (*Strychnos potatorum*) of the family Loganiaceae. The fruit is a single seed enveloped in pulp. The people of India use it for scouring the inside of their pots before filling them with water from rivers or ponds, the impurities in the water sinking

to the bottom as a result of the albumen and casein in the seed.

Clearwater, city, cap. of Pinellas co., on the W. coast of Florida, U.S.A., 20 m. W. of Tampa, a winter resort with orchards and market gardens and fisheries. Pop. 15,580.

Cleat, nautical term for a double hook used for making ropes fast without tying them by a knot. They are of different shapes, and are placed in various parts of a boat. A thumb C. is a small piece of wood affixed to a spar so that a rope can be bent around it. A comb C. resembles a small double-arched bridge.

Cleator, vill. of SW. Cumberland, England, in the Ennerdale (q.v.) rural dist. The par. church incorporates Norman work, and the Rom. Catholic church was designed by Pugin in Gothic style. Near by on C. moor is a prehistoric stone circle. Pop (with C. Moor) 6411.

Cleavage, property of some minerals and rocks whereby they split readily in a predetermined direction. In minerals the orientation of the C.s is determined by the atomic structure of the crystals. In some minerals the ions are bound into sheets, chains, or groups which are linked together by weaker bonds. Such minerals cleave by parting along the weak planes, and the shape of the C. fragments depends on the pattern of the ions. Rock salt splits into cubes, calcite into rhombs and micas, which possess an extremely good C., into flakes of microscopic thickness.

In rocks C. is due to quite different causes. It is produced by the parallel alignment of flaky or tabular minerals in finely crystalline metamorphic rocks. C. of this kind is best developed in slates, which are derived from argillaceous rocks and which are rich in flaky micaceous minerals. The parallel orientation of these minerals is due to the effect of strong pressures in the earth's crust during their growth. The rocks split into thin sheets suitable for roofing, etc.

Cleavers, or **Goose-grass,** *Galum aparine*, ann. wayside weed of the Rubiaceae. Has small white flowers and bristly purple fruits which cling to wool or fur.

Cleburne, city of Texas, U.S.A., the cap. of Johnson co., situated 55 m. SW. of Dallas. Pop. 12,900.

Cleckheaton, par. and tn in the urb. dist. of Spenborough (q.v.), Yorks, England. The tn has a very fine tn hall, and industries of textile fabric manuf. and machine-making; there are collieries in the dist. The par. has an area of 1756 ac. Pop. 11,312.

Clee Hills, range of hills situated in S. Shropshire, which rise here and there into fairly high peaks, of which the chief are Brown Clee Hill (1792 ft) and Titterstone Clee Hill (1750 ft). There is some coal in the dist., and a noted hard rock called Dhu stone is quarried in large quantities.

Cleethorpes, watering-place of Lincs. England, adjacent to Great Grimsby, on a flat, sandy beach at the mouth of the Humber, here over 7 m. wide. There is a sea wall of nearly a mile in length, and a promenade and marine embankment about 3 m. in length. C. is connected

with Grimsby by train and bus. Pop. 31,000.

Clef, in music, a character placed at the beginning of the staff to determine the pitch and name of the notes. In modern notation there are 3 clefs: the G, or treble clef, placed on the second line; the C clef, placed on the third or fourth line (alto or tenor clef respectively); and the F, or bass clef, placed on the fourth line. The C clef could formerly be used on any line, but only as the soprano clef, with C on the bottom line of the staff, was it as frequent as the alto and tenor position.

Cleft Palate, congenital failure of development in the roof of the mouth, resulting in a fissure which may extend along the middle line of the hard palate and soft palate as far as the uvula. The reason for such lack of development is not known; it is often hereditary and frequently associated with hare-lip, where the upper lip is divided on one side, or on both sides, of the middle line. The condition, whether of C. P., or hare-lip, or both combined, is one dangerous to the welfare of the child, as swallowing is rendered difficult and sucking is rendered impossible, or results in the return of the milk through the nasal passages. In later years an additional disability is sustained through the impossibility of rendering some of the elements of speech, and the senses of taste, smell, and hearing may be considerably impaired. These considerations make an operation advisable. If hare-lip exists, the gap should also be closed by surgical operation. Advances in plastic surgery have enabled modern surgical treatment of this condition to bring about splendid cures. The cosmetic effect is such as to render the deformity practically, or even absolutely, invisible as the child grows older.

Cleg, dipterous insect of the family Tabanidae with delicately spotted wings. The larvae, which are carnivorous, feed on earthworms and insect larvae.

Cleisthenes (fl. 508 BC), Athenian reformer, the son of Megacles and Agariste, and grandson of Cleisthenes, the tyrant of Sicily. He was the leader of the Alcmaeonidae, and after the expulsion of the Pisistratidae (510 BC), headed the democratic party. He was opposed by the whole party of nobles, and in particular by Hippas and Isagoras, the former of whom he expelled in accordance with the Delphic oracle. C.'s chief reforms were (1) the abolition of the 4 ancient tribes and the substitution of 10 new ones; (2) the introduction of ostracism, by which a party leader might be got rid of without resorting to bloodshed; (3) the re-establishment of election by lot. Isagoras called in the help of the Spartans, and for a time C. was obliged to withdraw from Athens; but Isagoras was ultimately defeated, and C. was recalled and his laws confirmed.

Cleitus, see CLITUS.

Cleland, William (c. 1661-89), Scottish soldier and poet, was brought up on the estate of the Marquess of Douglas, to whom his father was gamekeeper. He joined the Covenanters, with whom he

fought at Drumclog and Bothwell Bridge. Later he was agent for William of Orange, and was made lieutenant-colonel of the Cameronian regiment which defended Dunkeld; he was killed there.

Cleland, small tn of Lanarkshire, Scotland, on S. Calder Water, situated 3 m. NE. of Motherwell. There are collieries and iron works. Pop. (including the small suburb Omoa), 2848.

Clematis, genus of about 240 species of Ranunculaceae; herbaceous and woody plants, with opposite leaves, mostly climbing by means of their petioles, widely distributed in temperate regions of N. and S. hemispheres. Flowers vary from solitary to paniculate, with 4, sometimes 8, sepals, many stamens; fruits are achenes in large heads, with persistent styles, often plumose with silky hairs. *C. vitalba*, Traveller's Joy or Old Man's Beard, is found in England on calcareous soils. Climbing *C.* grown in gardens include hybrids and varieties of the large-flowered *C. florida*, greenish-white, *C. lanuginosa*, white, both of China, *C. patens*, violet, Japan, and *C. x jackmanii*, a hybrid of *C. lanuginosa* x *C. viticella*; and the small-flowered *C. armandii*, evergreen, white, China, *C. alpina*, blue, Europe, *C. montana*, white, Himalaya, *C. viticella*, purple, SE. Europe, and *C. tangutica*, yellow, China. *C. crispa*, fragrant, bluish-purple, U.S.A., and other Amer. species are popularly called Virgin's Bower.

Clemence Isaure, Fr. poetess, b. near Toulouse towards the early part of the 15th cent. Guillaume Benoit, a jurist of the 15th cent., ascribes to her the *jeux floraux*, held at Toulouse on 3 May, although her existence has been called in doubt by others. There is a statue of her at Toulouse and another in the Jardin du Luxembourg, Paris.

Clemenceau, Georges Eugène Benjamin (1841-1929), Fr. statesman, b. Fesle, the son of a doctor of strongly republican views. C. studied medicine, first at Nantes and then in Paris, where he took his degree. At the univ. he was a fire-brand republican, noted for his polemics against Bonapartism. Later, C. went to the U.S.A. to study Amer. sociological conditions, maintaining himself by teaching in a young ladies' school in Connecticut. He married one of his pupils, a Miss Mary Plummer. On his return to France, he set up practice in Montmartre, and became prominent during the revolution of 1870 at which period he was mayor of Montmartre and a deputy for Paris at the national assembly at Bordeaux. Here, he voted against making peace with Prussia. By 1876, as the representative of Paris in the Deputies, his biting eloquence marked him out as the outstanding radical spokesman. Thenceforth he was essentially the destroying force in Fr. politics, overthrowing with mordant wit and unflinching energy one gov. after another. He brought about the fall of the Gambetta Cabinet in 1882, that of Ferry in 1885, and that of Brisson in 1886. He also played a leading role in the fall of Boulanger. In 1893, defeated

in the election, he took to journalism, collaborating in the editing of the *Echo de Paris*, *Figaro*, and other journals, and starting his own paper, *La Justice*. He was chief editor of *L'Aurore* in 1897 during the famous period of his journalistic activities when he headed the campaign in favour of Dreyfus (q.v.).

He became senator for the Var in 1903. In the Radical struggle against the Catholic Church, he succeeded Sarrien as premier, but in 1909, after 3 years of office his gov. was defeated after a violent debate in which he accused Delcasse of

Topical Press

GEORGES CLEMENCEAU

humiliating France in the Algerias affair (q.v.). But his gov. had been generally successful; he had done much in the way of social reform, but had ruled labour with firmness, as was proved during the strike of miners in the Pas-de-Calais in 1906, when he showed the iron hand by employing the military. Thereby C. alienated the sympathy of the Socialist party, but he had emerged as the strong man of France, a role which he was destined to repeat in the First World War with most dramatic effect. He had, besides, greatly enhanced Fr. prestige abroad, especially by his firm attitude towards Germany. His desire to redress the wrong done by Germany over Alsace-Lorraine was lifelong.

His early political career is distinguished by its iconoclasm and preoccupation with inter-party warfare. It was the First World War which made C. a national, almost legendary figure, the symbol of Fr.

resistance to Ger. aggression, and, at the end, an unforgiving victor. While in opposition, he was a bitter critic of the administrative shortcomings of successive Fr. war govts. Finally, in 1917, came the formation of the Victory Cabinet under C.'s celebrated slogan 'Je combattrai devant Paris. Je combattrai à Paris. Je combattrai derrière Paris.' In Mar. 1918, during the dark days of the final Ger. offensive, he supported Milner in the decision to appoint Foch as generalissimo of the allied armies. After the war he presided and directed the proceedings at the Peace Conference in Paris in 1919, where he was tenacious of Fr. security. His enthusiastic support for the allied policy of fostering the growth of new or enlarged states in Central and E. Europe, was actuated chiefly by the desire to create buffer states against Germany, whereas Wilson and Lloyd George were concerned rather with removing causes of friction by the application of the principle of self-determination. C. persuaded both President Wilson and Lloyd George to sign treaties binding their nations to aid France against unprovoked aggression, but the treaties lapsed through the refusal of the Amer. Senate to ratify. In conveying to the Ger. representatives the terms of the treaty, which he did in a few curt words, C. permitted no oral discussion. His subsequent reply to the written Ger. observations was a brilliant document, the purport of which was that no peace could be founded on a condonation of the war which Germany had brought about and that reparation by Germany was a *sine qua non* of justice. During the conference in Feb. 1919, an unsuccessful attempt was made on his life. In 1920 he resigned from the premiership, was nominated for the presidency, but withdrew his candidature, and after travelling abroad, settled at his home in La Vendée and devoted his remaining years to his literary work.

C. became known as 'The Tiger' for his political vehemence in the days before he became an international figure, and the sobriquet remained for the rest of his life. He was one of the outstanding political figures of the war period, his inspiration and energy doing much to sustain Fr. resistance at a time when national morale was low. It has been well said of him that, like Foch, he fired the soul of France and steered her will. His pub. works include *Grandeurs et misères d'une victoire* (memoirs), 1929, and *Au soir de la pensée* (on philosophy and morals), 1927 (trans. *In the Evening of my Thought*, 1929). See also *Clemenceau: the Events of his Life as told by himself to his former secretary, Jean Martel*, trans. by M. Waldman, 1930; G. Adam, *The Tiger: Georges Clemenceau, 1841-1929*, 1930; G. Braun, *Clemenceau*, 1943; J. H. Jackson, *Clemenceau and the Third Republic*, 1946.

Clemens, Samuel Langhorne (1835-1910), Amer. novelist and humorist, better known by his pen-name Mark Twain, b. Florida, Missouri, son of a lawyer. His education was cut short when his father

d. in 1847, and he was apprenticed to a printer and wrote articles for his brother Orion, who ran the *Missouri Courier*. As a journeyman printer he travelled E. to New York and Philadelphia. In 1857 he became an apprentice pilot on the Mississippi, where he remained till the river boats stopped running on the outbreak of the Civil war. After 2 weeks as a second lieutenant in the Confederate volunteers he went back to journalism, and as city editor of the Virginia City, Nevada, *Enterprise* first used the pseudonym Mark Twain, the call of the pilots when taking soundings, meaning 2 fathoms. A meeting with Artemus Ward (q.v.) gave him greater literary ambitions, and later he collaborated with Bret Harte (q.v.). In 1865 his story 'The Celebrated Jumping Frog of Calaveras County' was pub. in a New York paper and made him a famous humorist.

He was now commissioned by the Sacramento Union as a writer of travel articles, sent first to Hawaii and then told to go round the world. Instead, he joined a party going to the Mediterranean and wrote *The Innocents Abroad*, 1869, a debunking account of the trip, which established him as a writer of note. Returning to America he married Olivia Langdon, who belonged to a wealthy New York family, and they lived at Hartford from 1871 to 1891. This was the happiest time of his life, during which he wrote his most famous books, *The Adventures of Tom Sawyer*, 1876, *A Tramp Abroad*, 1880, *Life on the Mississippi*, 1883, *The Adventures of Huckleberry Finn*, 1884, and *A Connecticut Yankee in King Arthur's Court*, 1889. But misfortune now entered his life. In 1884 he had invested money in the Charles L. Webster Co., a publishing house, which went bankrupt in 1894 and left him penniless. In 1895 he went on a world lecture tour, of which he wrote in *Following the Equator*, 1897, and earned enough to pay his debts. Private tragedy followed; his wife and 2 daughters d., leaving only his daughter Clara. The work of this period is uneven. *Pudd'nhead Wilson*, 1894, and *Personal Recollections of Joan of Arc*, 1896, rank with his best, but *Tom Sawyer Abroad*, 1894, and *Tom Sawyer, Detective*, 1895, are feeble sequels of the earlier book.

As his life drew to a close public honours were heaped upon him. Yale, which had given him an M.A. degree, made him LL.D. in 1901; the Univ. of Missouri followed suit in 1902 and Oxford in 1907. He built himself a house at Redding, Connecticut, where he d., as he had superstitiously expected, during the appearance of Halley's Comet, which had appeared at his birth 75 years before. His *Autobiography* was pub. in 1924, and material from the papers he left behind was ed. in sev. vols., including *Mark Twain's Travels with Mr. Brown*, 1940. During his later years he had become a sort of national legend, much as Bernard Shaw did in England. He was an artist in grotesque and somewhat obvious humour, his style and cadence suggesting a talker rather than a writer. He has

been called 'the Lincoln of Amer. literature.' His works were ed. in 37 vols. by A. B. Paine, 1922-5, who also wrote a 3-vol. biography, 1912. See also Van Wyck Brooks, *The Ordeal of Mark Twain*, 1920; C. Clemens, *My Father, Mark Twain*, 1931; S. Leacock, *Mark Twain*, 1933; B. De Voto, *Mark Twain's America*, 1932 and *Mark Twain at Work*, 1942.

Clemens Alexandrinus, Titus Flavius, see CLEMENT OF ALEXANDRIA.

Clement, name of 14 Popes:

Clement I, commonly known as C. of Rome (fl. AD 90). He is thought by some to be identical with C., the fellow-worker of Paul (see Phil. iv. 3). He succeeded Anacletus as Bishop of Rome. He was the author of the *First Epistle of Clement*, written to the church at Corinth about AD 95. This early document is of great value to the student of primitive Church hist. A fragment of it was found at the end of the *Codex Alexandrinus*, and was pub. in 1833 by Patrick Young (Patricius Junius). A complete MS. found at Constantinople was pub. in 1875. Sev. other documents have, with little or no authority, been attributed to this C. Consult J. B. Lightfoot, *The Apostolic Fathers*, vol. 1, *S. Clement of Rome*, 1869, 1877; J. A. F. Gregg, *The Epistle of Saint Clement*, 1899.

Clement II (1046-7), formerly Sulzger, the chancellor of Emperor Henry III, who created him Pope.

Clement III (1187-91), Paolo Scolari, cardinal-bishop of Palestrina; urged the necessity of the third crusade upon Henry II of England and Philip Augustus.

Clement IV (1265-8), Guy Foulques le Gros, of a noble Provençal family, began life as a soldier, but later became cardinal-bishop of Sabina. He supported the claim of Charles of Anjou in Sicily, and was a friend to Roger Bacon.

Clement V (1305-14), Bertrand de Goth, was unduly influenced by Philip the Fair, at whose suggestion he suppressed the Order of Templars. He removed the papal seat to Avignon. Consult Rabines, *Clement V et Philippe le Bel*, 1858.

Clement VI (1342-52), Pierre Roger, a Frenchman, Archbishop of Rouen. He took the part of Queen Joanna of Naples against her brother-in-law, Louis of Hungary, who had invaded her dominions to avenge the murder of her husband.

Clement VII (1523-34), Giulio de' Medici. After the battle of Pavia (1525) he joined the It. cities in a Holy Alliance with France against the Emperor Charles V, but in 1527 Rome was sacked by the Imperial troops, and he was kept prisoner in the castle of Sant' Angelo for 6 months. He refused to sanction Henry VIII's divorce from Catherine, which fact brought about the Reformation in England.

Clement VIII (1592-1605), Ippolito Aldobrandini, received the public profession of Catholicism made by Henry IV of France, whom he reconciled with his subjects. He annexed the Duchy of Ferrara to the papal states.

Clement IX (1667-9), Giulio Rospigliosi, brought about the peace of Aix-la-Chapelle in 1668 between France and

Spain; and for a while conciliated the Jansenists and Jesuits in France.

Clement X (1670-8), Emilio Altieri, was 80 years of age at the time of his election, and left the administration of affairs to his adopted nephew, Cardinal Paluzzo Paluzzi.

Clement XI (1700-21), Gian Francesco Albani, had trouble with the Jansenists in France, against whom he issued 2 bulls, *Vineam Domini Sabaoth*, 1705, and *Unigenitus*, 1713.

Clement XII (1730-40), Lorenzo Corsini, condemned the Freemasons (1738), and restored the rep. of San Marino to its liberties (1740).

Clement XIII (1758-69), Carlo Rezzonico, endeavoured with little success, to support the Jesuits, but before his death they were expelled from France, Spain, and Portugal.

Clement XIV (1769-74), Giovanni Vincenzo Antonio Ganganelli, succeeded C. XIII in troublous times. After vain negotiation he issued his famous brief, *Dominus ac Redemptor noster*, suppressing the Jesuits (1773). He was a liberal-minded statesman and a patron of art. He founded the Clementine Museum in the Vatican. *Consult Ravignan, Clément XIII et Clément XIV* (1854), and *Uschner, Clément XIV*, 1867.

Clément, Jacques (1564-89), Dominican friar, notorious as the murderer of Henry III of France. He was himself killed by Henry's attendants, and was regarded by his fanatical Catholic supporters as a martyr.

Clement of Alexandria (Titus Flavius Clemens Alexandrinus) (b. c. AD 150), distinguished Christian writer, b. probably at Athens, and spent most of his life in Alexandria, where he studied under Pantænus. During the persecutions of Severus he and his master fled to Palestine (c. 202-6), and in 211 he succeeded Pantænus as master of the school of Alexandria. His extant works are *Logos Protrepticos pros Hellenas* (*Hortatory Address to the Greeks*), *Paedagogos* (*The Tutor*, 3 books), *Stromateis* (*Miscellanies*, 8 books), and *Tis ho Sôzomenos Plousios?* (*Who is the rich man that is saved?*). See C. Biggs, *Christian Platonists of Alexandria*, 1886; B. Tollington, *Clement of Alexandria, a Study in Christian Liberalism*, 1914; E. Leigh-Bennett, *Handbook of the Early Fathers*, 1920.

Clementi, Muzio (1752-1832), pianist and composer, b. Rome, where he studied as a child and at the age of 9 was appointed to a post as organist. He afterwards studied under Santarelli and Carpani, and by the age of 14 had composed sev. contrapuntal works. He attracted the attention of Peter Beckford, M.P., a cousin of the author of *Valhek*, who brought him to England, where C. continued to pursue his studies until the year 1773 when he made his début. He conducted the Royal It. Opera (1777-80); he then made a continental tour, and while at Vienna had a piano combat with Mozart, the victory being left undecided. On his return to England he founded a business as pianoforte-maker and musical

publisher in London. John Field was his assistant and pupil there, and in 1802 C. took Field on a continental tour. In 1813 he assisted in forming the Philharmonic Society. C. left about 70 sonatas, also symphonies and overtures, and was regarded as the father of modern pianoforte technique. His best-known work is the *Gradius ad Parnassum*, 1817—a collection of progressive studies, which have remained a valuable aid to piano technique. He is buried in the cloisters of Westminster Abbey.

Clement's Inn, formerly an inn of Chancery; took its name from the church of St Clement Danes, which stands in the Strand, London, opposite the street called C. I. A considerable part of the former site of the inn is now occupied by the Law Courts, while its functions as an inn of Court are now performed by the Inner Temple.

Clemmensen Reduction, in chem. a method of reduction (see REDUCING AGENT), applicable to a number of organic compounds, especially to aromatic ketones and secondary alcohols. It is named after the discoverer. The substance to be reduced is boiled in aqueous suspension or aqueous alcoholic solution with amalgamated zinc or zinc wool with sufficient hydrochloric acid to maintain its concentration above 6N. The presence of nitro or amino groups renders the reduction unsatisfactory. See also BENZON.

Cleobis, see BIRON and CLEOBIS.

Cleobulus of Lindus in Rhodes, one of the Seven Sages of Greece; he lived about 580 BC. He was distinguished for his strength and handsome person; and also for his riddles, in which his daughter Cleobule is said to have been no less proficient.

Cleombrotus I (380-371 BC), King of Sparta, brother and successor of Agelopis. He waged war against the Thebans; in 371 BC he led the Spartans at Leuctra against the Thebans under Epaminondas, and was defeated and mortally wounded.

Cleombrotus II (c. 242-c. 240 BC), King of Sparta. On the expulsion of his father-in-law, Leonidas II, he was elected king by the party of Agis IV. On his return, about 3 years later, C. was deposed and banished to Tegea.

Cleomedes, Gk mathematician, who probably flourished in the 2nd cent. AD. He wrote, in 2 books, a *treatise On the Circular Theory of the Heavenly Bodies*. It sets forth the Stoic system of the universe, and gives various arguments in proof of the rotundity of the earth. Ed. by Baeke (1820) and Ziegler (1891).

Cleomenes I (520-487 BC), King of Sparta, son of Anaxandrides. In 510 BC he took part in the expulsion of Hippas, the last of the Pisistratidae, from Athens. His assistance was called for by Isagoras and the aristocratical party in Athens against Cleisthenes, and he helped in the expulsion of 700 families. During the war with Argos he was successful in defeating the Argives near Tiryns.

Cleomenes II (370-309 BC), King of Sparta, succeeded his brother Agelopis II.

Cleomenes III (c. 235–220 BC), King of Sparta, son of Leonidas II, last of the Agidae. He endeavoured to restore the ancient institutions of Lycurgus and strongly opposed Aratus and the Achaean League, by forming an alliance with Ptolemy, King of Egypt. He was at first successful in his campaigns against the Achaeans, but in 222 he was himself defeated at Sellasia in Laconica, and fled to Egypt, where he committed suicide.

Cleon (d. 422 BC), Athenian democrat, the son of Cleaneus. He was originally a tanner, and came forward into public life as an opponent of Pericles. During the Peloponnesian war, C. set himself up as the champion of the people and the leader of the peace party (428–422). In 427 he advocated in the assembly that the Mytilenaeans prisoners, sent to Athens by Paches, should be put to death, and in 424 he won great glory by his capture of the Spartans on the is. of Sphacteria. Much elated by his success, C. accepted the command of the Athenian army to oppose Brasidas in Macedonia and Thrace, but was defeated, and fell in battle under the walls of Amphipolis. C. is represented by Thucydides and Aristophanes as a demagogue of the lowest type, mean, ignorant, cowardly, self-seeking, and unscrupulous, pandering to the mob to obtain his own selfish ends. He is made to figure among the *dramatis personae* in Aristophanes' comedy, *The Knights*, but the poet was obliged to take the part himself as he could find no actor bold enough to personate C. It should, however, be remembered that both Thucydides and Aristophanes had a grudge against him; the former having been banished at his instance, and the latter's comedy, *The Babylonians* was brought to the notice of the authorities by C. as an unpatriotic play and harmful to the country in time of war.

Cleonus, genus of Curculionidae, or weevils, consists of between 100 and 200 species of beetles. They have elongated and convex bodies, and both larvae and perfect insects are vegetarian, feeding chiefly on coniferous trees, such as the larch and pine.

Cleopatra, 'having a famous father,' name of many queens of the Ptolemaic dynasty of Egypt after C. daughter of the Seleucid Antiochus III, wife of Ptolemy V. The best known was the daughter of Ptolemy XI, b. c. 69 BC. At the age of 17 she became ruler of Egypt, jointly with a younger brother, Ptolemy XII. Two years later, deprived of authority by Ptolemy's guardians, Pothinus and Achillas, she withdrew to Syria and was on the frontier with a force when Caesar arrived at Alexandria in pursuit of Ptolemy. The personal fascination of C. induced Caesar to undertake a war on her behalf, in which Ptolemy lost his life, and she was replaced on the throne with a younger brother, Ptolemy XIII, of whom she soon rid herself by poison. In Rome she lived openly as Caesar's mistress, until his assassination in 44, when aware of her unpopularity she returned at once to Egypt, declaring

her son by Caesar, nicknamed Caesarion, joint ruler with her. In the civil war which followed Caesar's death she became the ally and mistress of Mark Antony. Their relationship was highly unpopular in Rome, and led to Antony's losing much support. Octavian, later Augustus, declared war on them, and defeated them in the sea battle of Actium (31) from which she fled with her fleet followed by Antony. Hearing a rumour of her death, Antony stabbed himself. C. made overtures to Augustus, but was unable to fascinate him, and in order to avoid being led in triumph through Rome as a captive at the wheel of his chariot, she killed herself by a cobra bite. To an imperious will, masculine boldness, and boundless ambition typical of most Macedonian queens, C. added great intellectual power and physical seductiveness, with which she twice nearly succeeded in becoming queen of the known world. See A. Stahr, *Cleopatra*, 1879, and Edwyn Bevan, *History of Egypt under the Ptolemaic Dynasty*, 1927.

Cleopatra's Needles, 2 granite obelisks erected by Thothmes III at Heliopolis in Egypt (c. 1475 BC) and re-erected by Augustus at Alexandria. During the removal to Alexandria the lower part broke away, and the Rom. engineers supported the angles on bronze slabs, one of which, with 3 reproductions, still supports the angles of the needle or obelisk which was placed on the Victoria Embankment in 1878. This needle weighs 186 tons and is 68½ ft high. The other was presented by the khedive to the U.S.A., and in 1881 was erected in Central Park, New York.

Clepsydra. Time-measuring (see HOROLOGY) by the rate of flow of water was brought into use almost at the same time as the sundial. Clepsydrae, or water clocks, were of many forms; they were used in many countries long before the sundial was perfected. They served to measure time during darkness as well as when the sun was not shining, thereby having an undoubted advantage over the sundial. The earliest Egyptian type comprised a vessel of flower-pot shape with a small hole near the base through which the water slowly escaped. The time was indicated by the level of the water in the vessel. With this type time measurement could not be accurate, since the rate of flow of the water must have varied as it got lower in the container, due to the force of gravity. In a much improved type, the water flowed from an upper vessel, which was always kept full to overflowing, into a lower one, and the passing of time was indicated by the rise of the water in the lower part. Later clepsydrae became complicated machines and developed on mechanical lines, employing toothed wheels, racks, and pinions. Plato (q.v.) is said to have introduced them into Greece; and Aristotle (*Athenian Constitution*) describes their use in the Athenian law-courts, c. 325 BC. Ctesibius (c. 250 BC), the son of an Alexandria baker, was admired for the invention of many ingenious clepsydrae.

In one of these the water dropped into a funnel from the eyes of a figure placed near a constantly full reservoir. Thence it was conveyed into an open cylinder in which there was a float carrying a light post. On top of this post was another figure, which pointed with a stick to a scale, engraved to indicate the hours.

Scipio Nasica introduced the C. into Rome c. 157 B.C. Later the Romans made sounding water clocks depicting the blowing of the wind, roaring lions, drums, etc. The elder Pliny states (*Historia Naturalis*) that Pompey (q.v.) brought back from the E. a valuable water clock which he used for limiting the duration of speeches by Rom. orators.

In the 1st cent. B.C. Andronicus of Cyrrhus built the Tower of the Winds at Athens. An octagonal structure of marble, it housed a C., was surmounted by a weather-vane, and carried sundials on each of its 8 sides.

The anc. Britons used clepsydrae working on the opposite principle. A bronze bowl with a small hole in its bottom was made to float in a pond or tank of water. The water leaking in through this hole gradually filled the bowl until it sank, to be retrieved, emptied, and replaced in the water, indicating the passage of an hour or some other period.

Water clocks are believed to have been generally unreliable and not so accurate as the sundials of the period, by which they were frequently checked.

Clerestorey (*also* **Clear-story**; Fr. *claire-voie*), term used in architecture to denote the windows in the upper part of the central nave of a church. Its purpose is to admit clear light, and this method of lighting was constantly used by the Romans in their baths and palaces.

Clergy (from Low Lat. *clericatus*, derived from Gk *klēros*, an inheritance), a collective term for clerks, or men in holy orders. In the N.T. Christians generally are described as the *klēros*, or the Lord's inheritance, or portion. But the term naturally came to apply most appropriately to those who were set apart from the ordinary faithful laity (Gk *laos*, people) and dedicated to the ministry. This distinction between C. and laity was marked by the development of clerical clothing, vestments, and insignia and by the introduction of the tonsure. At the Reformation this distinction was purposely diminished in Protestant communities. During the Dark Ages the Church, pursuing her civilising mission among the barbarians who had overrun the empire, preserved and maintained, at least among her clergy, the principles of Rom. law, modified by her own canons. Later, in the Middle Ages, when both kings and popes grew in power, the privilege of the C. to be subject to the milder Church law in eccles. courts with appeal to Rome, caused great envy and friction between Church and State, as did also the exemption of the clergy from direct civil taxation. It must be remembered that vast numbers of people were in minor

orders (*see* **ORDERS**), in addition to those we now recognise as C., and could claim clerical privilege. They included a high percentage of the total literate pop. The Anglican C. are still technically one of the 3 estates of the realm in England. Though bishops, however, sit in the House of Lords, they do so by reason of the baronies attached to their sees and not because they are Church dignitaries. C. suffer from disabilities now rather than privileges, being deprived of the normal citizen's right to become an M.P., or to teach in state schools. These disabilities do not affect Free Church ministers.

Clergy, Benefit of, see **BENEFIT OF CLERGY.**

Clergy Discipline Act, 1892. relates to the consequences of crimes or offences against morality by clergymen, and, in regard to the latter, provided a new form of procedure. The Act is divided into 2 parts, the first of which renders a beneficed clergyman liable to deprivation who is convicted in temporal court of an indictable offence, or against whom a bastardy order has been made, or adultery found in a divorce suit. The second part of the Act provides that a clergyman convicted by a temporal court of an act constituting an eccles. offence, or against whom any immoral act, conduct, or habit, being an offence against morality and not doctrine or ritual, is alleged, may be prosecuted by any of the parishioners of the par. in which he holds preferment, or by the bishop of the diocese, or a person approved by the bishop, and tried in the consistory court of the diocese. A conviction under the Act enables the bishop to treat preferment of the convicted clergyman as void, while conviction for an immoral act under the second part of the Act renders the clergyman liable, subject to an appeal to the queen in council, either to suspension or deprivation, with incapacity to hold another preferment. A clergyman may be re-instituted if pardoned by the Crown and if the benefice has not been filled.

Clergymen, Deposition of, see **DEPOSITION.**

Clericis Laicos, first words of a bull of Pope Boniface VIII (1294-1303). His arrogance made him many foes, his most noted conflict being that with Philip IV of France. In 1296, by the bull named C. L., the Pope forbade the levying of taxes, however disguised, on the clergy without his consent. Boniface was forced to recede from his position, and canonised Louis IX. Hostilities were later renewed, and in 1302 Boniface drafted and pub. the bull 'Unam Sanctam,' one of the strongest official statements of the papal prerogative ever made.

Clericus, Johannes, see **LE CLERC, JEAN.**

Clerihew (from E. *Clerihew* Bentley), short nonsensical or satirical poem, usually of 4 lines of varying length, e.g.:

Sir Christopher Wren
Said, 'I'm going to dine with some men.
If any one calls
Say I'm designing St Paul's.'

Clerk, John (1728-1812), author of

Essay on Naval Tactics, worked on his estate at Eldin at geology and etching, besides his new theories of naval manoeuvres. His naval schemes were adopted with complete success in 1782 when Lord Rodney gained a complete victory at sea over the French. His essay was not pub. entire till 1804.

Clerk (from Lat. *clericus*, which comes from the Gk *κλῆρος*, a lot, or inheritance) was at first a synonym of canon, and was used indifferently of all who were servants of the Church. Soon the term C. was used only of one in a minor as opposed to a major or holy order. But C. in holy orders is still the legal designation of ordained ministers of the Church. After the Reformation in England, the name C. was applied to members of the laity who assisted at baptisms, marriages, etc., and who led the responses for the congregation. In this sense the C. became known as the par. C. But the word has had another distinct, though parallel, development. Chaucer's poor 'clerk of Oxenford' was, above all, a devotee of learning. This sense of the term arose from the fact that in medieval times learning was practically confined to the clergy. Now this meaning is applied to all employees who write, make entries, and discharge the correspondence of any firm, company, or profession. In America a C. also means a retail salesman.

Clerk-Maxwell, see MAXWELL, J. CLERK.

Clerk of the Peace. This Eng. functionary is usually clerk to the co. council and is appointed by a joint committee of quarter sessions and the co. council. He receives a salary. He keeps the records of quarter sessions, and attends either personally or by deputy the justices in quarter sessions and advises them on the law relating to cases before them, and receives and takes custody of the quarterly returns of deaths from the local registrars of births, deaths, and marriages. A C. of the P. is generally by profession a solicitor, like a tn clerk of a bor. He cannot sit in parliament, as he is bound to devote all his time to his official duties. Formerly voters' lists were dealt with by the C. of the P. through the overseers, but these duties are now performed by the registration officer, who is usually the tn clerk. See also LOCAL AUTHORITIES, OFFICERS OF.

Clerke, Agnes Mary (1842-1907), astronomer and writer, b. Skibbereen, Co. Cork, lived in Italy and London, and made astronomical observations at the Cape when she stayed there with Sir David and Lady Gill. Although not a practical astronomer in the true sense of the word, she was endowed with remarkable talent for collecting and summarising results of scientific (including astronomical) research. Her pub. works include *A Popular History of Astronomy during the Nineteenth Century*, 1885, *The System of the Stars*, 1890, *Problems in Astrophysics*, 1903, and *Modern Cosmogonies*, 1905.

Clerkenwell, dist. in the N. of London in the bor. of Finsbury (q.v.), so called from a well in Foy St near which the par. clerks occasionally acted mystery plays. The site of the well is at 18 Farringdon St.

In St John's par. are the remains of the priory of the Knights of St John of Jerusalem. The order was suppressed at the Dissolution (1540), revived under Mary I., and suppressed again under Elizabeth I. A jail called the C. Bridewell was built here in 1615 to house the rogues and vagabonds of Middx; it was burned down in 1669 but rebuilt. It was succeeded in 1775 by the House of Detention, notorious as the scene of a Fenian outrage in 1867, and closed in 1877. C. became noted in the late 17th cent. as a spa (see SADLER'S WELLS). Watchmaking, an old industry in C., is still carried on, also the trades of jeweller and optician.

Clermont, (-en-Beauvais), Fr. tn, cap. of an arron., in the dept of Oise, on a hill overlooking the Brèche. The tn hall is partly 14th cent., and there is a 15th-cent. church. Pop. 5300.

'Clermont,' The, was one of the earliest steamships. Its inventor and builder was an American, Robert Fulton (1765-1815), who in 1803 obtained jointly with Robert Livingston the exclusive privilege of navigating with steamers the waters of New York. The engines of the C. were provided by Boulton & Watt of Birmingham, and it traded on the Hudson between Albany and New York from 1807 onward.

Clermont-Ferrand, tn of France, cap. of the dept of Puy-de-Dôme, and anct cap. of Auvergne (q.v.). The 2 tns of which it is composed, Clermont and Montferrand, grew up on the slopes of a small eminence and were united in 1731. Clermont was built around a citadel, *Clarus Mons* or *Clarimontium*. It was the meeting-place of 7 ecclcs. councils between 535 and 1130. A bishopric since the 3rd cent., it has a splendid Gothic cathedral, begun in 1248, which contains fine medieval stained glass and frescoes. In the cathedral square is a monument to Pope Urban II (q.v.), who made here in 1095 the proclamation of the first crusade (see CRUSADES); on the same occasion Peter the Hermit (q.v.) preached in the 12th-cent. Romanesque church of Notre-Dame du Port. In Montferrand there is a medieval tn hall, and a church (13th-16th cents.) containing notable 17th-cent. wood carvings. In both parts of C.-F. there are remarkable Gothic and Renaissance houses. The univ. was founded in 1810. Rubber goods (including tyres), foodstuffs, textiles, and metal goods are manuf. St Gregory of Tours and Blaise Pascal (qq.v.) were b. at C. Pop. 108,000.

Clermont-Ganneau, Charles Simon (1846-1923), Fr. orientalist, b. Paris. C.-G. was educ. at the École des Langues Orientales, and afterwards entered the diplomatic service as dragoman to the consulate at Jerusalem. Later he occupied a similar position at Alexandria. In 1870 he discovered the *stèle* of Mesha, a stone bearing the oldest Semitic inscription then known. He commanded a Brit. archaeological expedition to Palestine in 1874, and later a Fr. expedition to the Red Sea and Syria. Subsequently he became director of the École des Langues Orientales. He became consul-general in 1896, and minister plenipotentiary in

1906. His chief pubs. include *Études d'archéologie orientale*, 1880, *Les Fraudes archéologiques*, 1885, *Recueil d'archéologie orientale*, 1885-1924, and *La Palestine inconnue*, 1886. He was principally instrumental in exposing the Shapira forgeries of Heb. texts offered to the Brit. Museum; other frauds he exposed were the Moabite potteries and the tiara of Saitarpharnes (see his *Les Fraudes archéologiques* above).

Clermont-L'Hérault, Fr. tn in the dept of Hérault. It has a textile industry. Pop. 5200.

Clerodendron, genus of Verbenaceae, flourishes in its wild state in tropical and warm climates, but in Britain grows only in greenhouses. *C. thomsonae* is a commonly cultivated evergreen plant which bears red and white flowers. *C. fragrans* and *C. trichotomum* are both shrubs, the former with white, the later with variegated flowers.

Cléry, Sir Cornelius François (1838-1926), soldier. He saw active service in the Zulu war of 1879; was present at the battles of Isandhlwana and Ulundi. Fought in the battles of El Teb and Tamal, and was mentioned in dispatches. He served in the Gordon relief expedition, 1885, and during the years 1886-8 was chief of staff of the army of occupation in Egypt. He commanded the 2nd Div. in the S. African war of 1899-1902. K.C.M.G., 1900.

Cléry-Saint-André, Fr. tn in the dept of Loiret, near Orleans. Near it is a tumulus, called by the peasants the tomb of Attila. Pop. 1800.

Clésinger, Jean Baptiste Auguste (1814-1883), Fr. sculptor, b. Besançon. intimately connected with the story of George Sand and Chopin. George Sand's daughter Solange, who inherited her mother's passionate nature without any of her genius, eloped with C. after sitting to him for her bust. The mother arranged a private marriage, estab. the young people in Paris, and settled a large share of her property upon them. But C. proved himself an ungrateful rogue, and George Sand was obliged to disown him and her daughter. C. was nevertheless one of the leading sculptors of his day, and executed noteworthy portraits of George Sand and Chopin. Among his works, many of which were objected to on the ground of their immodesty, are allegorical representations of Tragedy and Literature and a marble statue of Louise de Savoy.

Clethra, genus of lime-hating shrubs or small trees, about 30 species, family Clethraceae; *C. alnifolia* is the Sweet Pepper Bush, and with other species is grown in gardens for their fragrant late summer flowers.

Clevedon, par. and attractive watering-place, 1 m. from the Severn and 16 m. SW. of Bristol, in the N. of Somerset, England. Interesting for its associations, for here lived Coleridge and his bride at Myrtle Cottage (1795), and in the par. church lie Henry Hallam, the historian (d. 1859), and his poet son, Arthur (d. 1833), to whose memory Tennyson's *In*

Memoriam was written, whilst the original of Thackeray's Castlewood in *Esmond* is C. Court. Pop. 9765.

Cleveland, Barbara Villiers, Duchess of (1641-1704), mistress of Charles II of England, daughter of Wm Villiers, 2nd Viscount Grandison, b. Westminster. In 1659 she married Roger Palmer, who was made Earl of Castlemaine 2 years later. She became intimate with Charles II about May 1680, and had great influence with the king for about 10 years, being created Duchess of C. in 1670. Her sons by the king became dukes of C., Grafton, and Northumberland.

Cleveland, or Cleiveland, John (1613-1658), poet, b. Loughborough, Leics., son of a curate. At Christ's College, Cambridge, he was a contemporary of Milton, and in 1634 he became a fellow of St John's, but was ejected in 1645 because of his Royalist sympathies. He became judge-advocate of Newark for a time, but in 1655 was imprisoned at Yarmouth as a Royalist. C. belongs to the group of Cavalier poets that included Lovelace and Suckling, with this great difference that his genius was for satire. It was his trenchant invective, coupled with his wealth of allusive conceits and his rare command of rhythm, that gave him a contemporary popularity far eclipsing Milton's; at his best he can be compared with his friend Samuel Butler, of *Hudibras* fame. His first vol. of poems appeared in 1647. His most famous satire is 'The Rebel Scot,' denouncing the Scots' betrayal of Charles I; others are 'The Mixed Assembly,' 'Smectymnus,' and 'Rupertismus.' His work as a 'character' writer in the manner of Theophrastus is best seen in *The Character of a London Diurnall*, 1647.

Cleveland, Stephen Grover (1837-1908), 22nd and 24th President of the U.S.A., b. Caldwell, New Jersey. He was descended from Moses C. of England, who settled near Woburn, Massachusetts, in 1635. His father was the son of a watchmaker and was pastor of the Presbyterian church at Caldwell. When he was 16 his father d., and the son left school to become self-supporting. He then studied law, being admitted to the Bar at Buffalo in 1859. He entered politics as a Democrat, and his rise was rapid. In 1863 he became assistant dist. attorney for Erie co., in which Buffalo is situated. He was elected sheriff in 1870, and in 1881 he became mayor, being noted for his reforms. This attracted the attention of the state leaders, who brought about his nomination for governor, and he was elected to that office in 1882. He was nominated for the presidency in 1884, and was elected after an exceedingly bitter campaign. C. resisted the old system of 'to the victor belong the spoils,' by steadily advocating that an increasing number of governmental employees and officials should be placed in the civil service and, therefore, not be removable except for cause. In 1887 in a message to Congress he pleaded for the admission to the country of raw materials needed in manufacturing free from duty. This

was his famous battle cry of 'Tariff for revenue only.' He was renominated by the Democrats for the presidency in 1888, and, much to the country's surprise, was defeated by Benjamin Harrison, the Republican candidate. In 1892 the Democrats nominated C. for the presidency again, and he was triumphantly elected. Difficulties soon arose. In the first place he fought Republican tariff schemes. Then, against the wishes of many of his own party, he forced Congress to repeal the Sherman Silver Purchasing Act, thereby safeguarding the gold standard. In 1895 his strong advocacy of the Monroe doctrine in a dispute between Great Britain and Venezuela over the boundaries between the latter country and Brit. Guiana almost involved the U.S.A. in a war with England. Feeling was tense in both nations, but the situation was saved by the statesmanship of Lord Salisbury, who was then Brit. Prime Minister. Before he left the White House C. saw his gold-standard policy repudiated by his party, which had nominated to succeed him W. J. Bryan (q.v.), who ran on a free silver platform. C. retired and settled quietly at Princeton, New Jersey. See biographies by Robert McElroy, 1923, and Allan Nevins, 1932.

Cleveland (cliff-land), parl. div. in the E. of the N. Riding of Yorks, extending from Whitby to the R. Tees. It received its name from the cliffs which form the NE. borders of the Yorks moors. It is a dist. of wild highlands, interspersed with a few cultivated and pleasant valleys. Since the discovery of the rich beds of iron ore in its hills (see CLEVELAND IRONSTONE) C. has grown into a great industrial centre, with Middlesbrough as its chief tn, supplying Great Britain with one-third of its pig-iron. The pop. is not returned separately.

Cleveland, one of the largest industrial cities of the U.S.A., in Ohio, cap. of Cuyahoga co., and a railway centre, on the S. shore of Lake Erie. The 2 divs. of C., on either side of the R. Cuyahoga, are united by viaducts. The first, built in 1878, is of stone, and spans the riv. at a height of 60 ft, whilst the second, of iron, which was erected in 1888, is 3931 ft long, and rises 100 ft above the valley's base. Numerous bridges cross the riv. harbour, whilst beyond the mouth a breakwater, 2 m. long, encloses an excellent outer roadstead. During 1890-1900 the tonnage of ships constructed in C. exceeded that of the vessels built in any other Amer. tn. A great deal of traffic passes over the lake. The wealth of the city depends on its manufs., and above all on its flourishing iron industry. Thus engines, steel and iron vessels, automobiles, boilers, steel rails, and bridges are constructed at the various works, besides nails, agric. implements, and screws. The reason of this is that the city is centrally situated for obtaining coal from N. Ohio, iron ores from Lake Superior, and limestone from the ls. of Lake Erie. The Detroit-Superior high-level bridge affords a wide view of lake and riv., harbour and breakwater, iron and steel, lumber and coal,

ore vessels, blast furnaces and foundries, flour mills and grain elevators, and on the banks above the valley vast manufacturing plants. Rising from a plain from 50 to 140 ft above the lake, C., the Forest City, presents an imposing appearance, with the fine public buildings of its Mall, including the C. Public Library (2,700,000 vols.), the Auditorium (seating 12,000), and the stadium, its large squares and stately mansions, its famous Euclid Avenue with winding walks and flower-bordered driveways, its W. Reserve Univ., Cast Institute of Technology, and technical high school, and its municipal airport, one of the largest in the world. Other points of interest: C. Museum of Art, Severance Hall (home of the C. Symphony Orchestra), and the Play House (civic theatre). Founded in 1796 by Moses Cleveland, it is now the seventh city in the U.S.A. Pop. 914,800.

Cleveland Bay Breed, see HORSE.

Cleveland Heights, city in Ohio, U.S.A., residential suburb E. of Cleveland. Pop. 59,100.

Cleveland Ironstone is mined in the M'ddle Lias of C., which is situated in the N. Riding of Yorks, between the Tees and Whitby. Certain geologists believe that this dark green clay ironstone, which is not so valuable as that of the coal measures, was 'derived partly from mechanical deposition and partly from subsequent chemical replacement of the originally deposited carbonate of lime.' The theory that once the bed was limestone is supported by the discovery of shells such as *Pecten* and *Avicula*. Only 60 per cent of the ore is carbonate of iron, the rest being composed of phosphates, silica, and argillaceous matter. It is found in seams 20 ft thick, and is worked on the bord-and-pillar system, Middlesbrough being the centre. Its discovery, which dates from 1851, has revolutionised sleepy hamlets into industrial tns.

Cleves, Anne of, see ANNE OF CLEVES.

Cleves (Ger. *Cleve*, or *Kleve*): 1. Former duchy of Rhenish Prussia, united with Brandenburg (q.v.) in 1666.

2. Ger. tn in the Land of N. Rhine-Westphalia (q.v.), lying between the Rhine (q.v.) and the Dutch border, 47 m. NW. by N. of Düsseldorf. It was very severely damaged during the Second World War. The Schwanenburg castle, partly built on a high rock, is associated with the legend of Lohengrin (q.v.). Ann of C. (q.v.) was b. here. There are textile manufs. Pop. 31,000.

Clew Bay, inlet on the W. coast of co. Mayo, Rep. of Ireland. From the Atlantic it passes inland for 15 m., with an almost uniform breadth of 8½ m. Clare ls. faces its entrance, whilst the upper portion is dotted with an archipelago of some 300 fertile islets.

Clewer, name of 2 pars., C. Without and C. Within, part of the royal bor. of New Windsor, Berks, England, on the R. Thames. The par. church of St Andrew at C. Without dates from 1040. Pop. of C. Without is about 18,000; of both pars. 22,000.

Clews, 2 bottom corners of a square

sail. In a fore-and-aft sail the aftmost corner is termed a clew, the other, or weather clew, being more generally called the tack.

Clianthus, genus of Leguminosae cultivated in greenhouses on account of their showy flowers. *C. formosa* is the Glory Pea. *C. puniceus*, the parrot's beak, can be grown outdoors in the mildest parts of Britain.

Cliché, literally a stereotype plate, signifies a hackneyed phrase or expression which, though vivid and arresting when it was first coined, has lost its force through constant use. Typical C.s are 'to explore every avenue,' 'last but not least,' 'a foregone conclusion,' 'the long arm of coincidence.' Excessive use of such terms is a fault, though the over-scrupulous avoidance of them may produce an affected style. See E. Partridge, *A Dictionary of Clichés*, 1947.

Clichy, or **Clichy-la-Garenne** (ancient Clippiance), Fr. tn in the dept. of Seine, a N.W. suburb of Paris. St Vincent de Paul (q.v.) was curé here. It has chemical, gas, rubber, and foodstuff manufs., and oil refineries. Pop. 53,000.

Click-beetles, or *Elateridae*, form a family of coleopterous insects, most of which have the useful characteristic of being able to right themselves when fallen on their backs: this they accomplish by springing into the air by means of special processes in the back, and the movement is accompanied by a loud clicking sound. They are also called skip-jacks when possessed of this habit. The larvae are often known as wire-worms, and are very destructive; their home is usually underground, and their food the roots of crops.

Client, supposed by some writers to be derived from Lat. *clere*, to hear. From the very beginnings of ancient Rome there appears to have existed the relation of patronage (*patronatus*) and clientship (*clientela*). When a man manumitted (analogous to emancipated) a slave, he became the *patronus* instead of the *dominus* of the slave, who was thenceforth a freed man (*libertus*). The tutelage of the *patronus* entitled him to a specific share in the freedman's estate after death. This relationship at Rome fostered the formation of similar relationships between foreigners and Rom. citizens, the result being that the foreigner obtained a protector and the Romans an accession of influence from occasionally becoming the patrons of a man of letters. The poet Terence, for example, was a *libertus*, being manumitted by E. Terentius Lucarius, a Rom. senator. The Rom. C. was defended in lawsuits by his patron; hence the adoption of the term in modern legal practice.

Clifden, mkt tn and port, cap. of Connemara, co. Galway, Rep. of Ireland, 40 m. SW. of Westport. There is magnificent mountain scenery inland (The Twelve Pins), and Kylesmore Castle, now a convent school, is 12 m. to the N. Alcock and Brown landed near here (1819) on their first non-stop flight across the Atlantic from St John's, Newfoundland. Pop. 800.

Cliff Dwellings, certain remarkable ruins of houses, built in horizontal recesses down precipitous cliffs in W. Colorado, Arizona, Utah, and New Mexico. The traveller, as he sees the remains of what must once have been a well-constructed dwelling of lime and stone, with windows and doors both rectangular in frame, is struck above all by its extreme solitude and inaccessibility. Its former inhab. must surely have been in hiding from his foes, for his home was built in a hollow, with beetling crags overhead, so that it was quite invisible from the cliff summit. In one such ruin the footholes carved in the rock-face may still be seen, but it seems certain that the ascent from the valley below was usually made by ladders or ropes, which could be carried up after use. For the most part these perilous homes are found dotted here and there along the great canyons or gorges, but in the Rio de Chelly there is a cluster of them large enough to be called a tn. There is one in Colorado above the R. Mancos, which looks down from a giddy height of 800 ft, but the most renowned in that country is the great cliff dwelling known as the palace of Chaplin's Mesa. These dwellings, which rose sometimes to 2 or even 3 storeys, so strongly resemble the pueblos of the Indians near by that most archaeologists are agreed in referring their construction to the immediate fore-runners of the Pueblo tribes. Another type of dwelling found in this region is in caves formed by volcanic action in the side of canyons. The honeycomb of openings formed similarly on the face of the cliffs provided windows for the Indian inhab.

Clifford, Anglo-Norman family descended from Richard Fitzponce. His son Walter, who adopted the name C. on acquiring by marriage C. Castle on the Wye, near Hereford, was the father of Fair Rosamond, Henry II's mistress. According to popular legend she was kept by the king in a secret tower at Woodstock, in the heart of a labyrinth which only he could thread. On her death in 1176 she was buried in Godstow nunnery, there being little foundation for the legend that she was murdered by order of Queen Eleanor.

Clifford, Sir Hugh Charles (1866-1941), colonial governor; b. London and educ. at Woburn Park and Sandhurst. In 1883 he became a cadet in the Malay States civil service. In Pahang he became Brit. resident (1895-9 and 1901). In later years he was associated first with Trinidad and Tobago (1903-7) and then with Ceylon (1907 and 1909), always as colonial secretary. Governor of the Gold Coast, 1912-19; of Nigeria, 1919-25. As Governor of the Gold Coast C. was responsible for the Brit. sphere of occupation in Togoland, 1914-19. Governor of Ceylon, 1924-7; then Governor of Straits Settlements until 1929. G.O.M.G., 1921; G.B.E., 1925. He married Mrs Henry de la Pasture, the novelist and playwright, who d. 1945. C. was joint editor of a Malay language dictionary. Other pubs. include *Further India*, 1904, *Malayan Monochromes*, 1913, *The German*

Colonies, 1916, *The Gold Coast Regiment in the East African Campaign*, 1920, and *Bush-Whacking and other Asiatic Tales and Memories*, 1929.

Clifford, John, (1836-1923), Baptist minister, was b. in poverty at Sawley, Derbyshire; eldest child of Samuel C., Chartist and Calvinist. As a child he worked in a lace factory. Some Baptists became interested in him, and started him in education at the Baptist College, Nottingham. He received a call to Praed St Chapel, Paddington, in 1858, and while in that ministry he attended Univ. College. He took B.A. degree, Lond., in 1861; B.Sc. in 1862, with honours in logic, moral philosophy, geology, and palaeontology. In 1864 he became M.A. (coming out first); in 1866, LL.B. The Geological Society made him a fellow in 1879. In 1883 he was made honorary D.D. of Bates College, Maine, U.S.A.; thereafter he was known as Doctor C. His ministry had been transferred to Westbourne Park when the chapel there opened in 1877: he was its minister till 1915, when he released himself for more general activity. In 1897 he made a tour round the world. He was president of the London Baptist Association, 1879; the Baptist Union, 1888 and 1899; the National Council of Evangelical Free Churches, 1898-9; the Brit. Chautauqua, 1899-1900; Baptist World Alliance, 1905 and 1911; and Baptist European Congress, 1913. He was an ardent and pugnacious Liberal, and was a leader of the Passive Resistance Movement against the payment of rates for denominational schools. Many of his printed works (about 100 titles) concern social problems. They include *Is Life Worth Living?*, 1880, *Inspiration and Authority of the Bible*, 1892, *The Secret of Jesus*, 1904, *The Ultimate Problems of Christianity*, 1906, *State Education after the War*, 1916, *The League of Free Nations*, 1919, and *The World Brotherhood according to Jesus*, 1920. He ed. the *General Baptist Magazine*, 1870-83. He d. suddenly at a meeting of the Baptist Union Council, 20 Nov. 1923.

Clifford, Lucy, née Lane (d. 1929), Brit. novelist and playwright, b. Barbados. In 1857 she married Wm Kingdon C. (q.v.). Her first pub. was *Anyhow Stories*, 1882, a book for children. *Mrs Keith's Crime*, 1885, was her first novel, and *Aunt Anne*, 1893, was her most popular. Others are *Sir George's Objection*, 1910, *The House in Marylebone*, 1917, and *Miss Fingall*, 1919. Her plays include *A Supreme Moment*, 1900, *The Searchlight*, 1903, *The Latch*, 1908, *A Woman Alone*, 1914, and *Eve's Lover*, 1927.

Clifford, Rosamond, see CLIFFORD (family).

Clifford, Thomas, 1st Baron Clifford of Chudeleigh (1630-73), statesman, b. Devon and educ. at Exeter College, Oxford. He was one of the members of the 'Cabal,' being instrumental in arranging the treaty of Dover, 1670. A Rom. Catholic, he supported the Declaration of Indulgence issued by Charles II. and on the bringing in of the Test Act resigned from

public life. See life by C. H. Hartmann, 1937.

Clifford, William Kingdon (1845-79), mathematician and philosopher, b. Exeter. He was educ. at King's College, London, and Trinity College, Cambridge (fellow, 1868); prof. of mathematics at Univ. College, London, 1871, and F.R.S., 1874. He delivered many lectures before the Brit. Association and at the Royal Institution which were very popular. Amongst his works are *Elements of Dynamics*, 1879-87, *Seeing and Thinking*, 1879, *Lectures and Essays, Mathematical Papers*, 1882, *The Common Sense of the Exact Sciences*, completed by Prof. Karl Pearson, 1885, and papers on loci, biquaternions, and Riemannian space.

Clifford's Inn, once the tn house of the barons Clifford, was left to students of law. It became an inn of Chancery and, like Clement's Inn (q.v.), was subsequently absorbed by the Inner Temple. The buildings are now used as offices and flats.

Clifton, suburb and residential dist. of Bristol in Glos., England. The fine gorge of the Avon, spanned by Brunel's famous suspension bridge, cuts through the plateau on which the tn is built. The bridge, which took from 1832 to 1864 to build, has a span of 702 ft. and is 245 ft above high-tide level. C. is the seat of a Rom. Catholic bishop. Pop. included in Bristol. (See photograph on p. 532.)

Clifton Brown, Douglas, see RUFFSIDE, 1st VISCOUNT.

Clifton College, public school for boys, founded in 1862, and incorporated by royal charter in 1877.

Climacteric Years (Gk *klimakter*, rung of a ladder) were supposed to be certain years in a man's life which specially affected him as regards health and general circumstances of life. These years were those made up by the odd multiples of 7, as 49, and the grand C. was reached at 63, when 9 and 7, the 2 mystical figures, were multiplied. As applied to a woman, it refers to the period known as the change of life, occurring usually between the ages of 45 and 50.

Climatology (from Gk *klinein*, to slope), that part of meteorology (q.v.) which deals with the average weather of a region, the period of averaging being months, years, or cents. The word is derived from the fact that one of the most important factors in climate is the average inclination of the sun's rays, which in turn depends on lat., or distance N. and S. of the equator. Of equal importance are the position of the region relative to the oceans and its geographical features, such as mts. The 3 prin. divs. of the subject are C. at breathing level, upper-air C., and microclimatology.

For C. at breathing level the observations are taken at a height of about 4 ft above the surface, and the data studied cover all the elements of weather that affect human activities and health. Special attention is now given to the needs of agriculture, industry, transport, etc. The records include mean daily, monthly, and ann. temps., and monthly and ann.

rainful totals, as well as maximum and minimum values. Other data collected relate to pressure, humidity, sunshine, cloud amount, and the frequency of days of frost, snow, hail, thunderstorms, and gales. The main facts are summarised in *Tables of Normals* and *Climatological Atlases* pub. by nearly all the national meteorological services of the world. These facts indicate that it is possible to consider a div. of the world into a number of *climatic zones* with comparable climatic features. The main zones are: (a) the

conditions, such as severe icing. Micro-climatology refers to the detailed study of the atmosphere very near the surface and is of importance in public health, agriculture, water conservation, and the prevention of atmospheric pollution.

The climate of any large region changes very slowly, but it is possible to recognise that important variations have taken place during the hist. of the earth. Some hundreds of thousands of years ago the climate of N. Europe was glacial (the Ice Age), but this was followed by a warm

Valentine & Sons Ltd, Dundee

CLIFTON SUSPENSION BRIDGE AND THE RIVER AVON

equatorial zone, covering the hot wet forests and the Doldrums (q.v.); (b) the subtropical zones, which include most of the great deserts and the steppes and, over the oceans, the trade-wind belts (q.v.) and the horse lats. (q.v.); (c) the zones of temperate rainy climates (such as that of NW. Europe); and (d) the polar regions. Within these zones, however, great variations may occur, especially in relation to continental and maritime climates. Great Britain has a typical maritime climate, with an equable temp. throughout the year and rain in all seasons. The U.S.A., because of its great area, has both maritime and continental climates.

Upper-air C. is a comparatively new study, necessitated by the development of air transport on a global basis. The data collected, which are essential for the economic running of civil air lines, refer chiefly to winds and temps. at all heights, including the stratosphere (q.v.), and the frequency of occurrence of dangerous

period from about 5000 to 3000 BC. Other evidence indicates that during the great voyages of exploration of the Vikings, Greenland was more habitable than at present, and there is evidence of enhanced rainfall and storminess in Europe in the 12th and 14th cents. AD. The exact cause of these major fluctuations is not yet decided, and there is no known method whereby future changes, if they will occur, can be forecast. Some authorities claim to have traced a connection between climatic changes and the rise and fall of cultures in the early days of civilisation, but their views are not universally accepted.

For further information see GEOGRAPHY; METEOROLOGY; TOPOGRAPHY. See also: H. W. Dickson, *Climate and Weather*, 1928; A. A. Miller, *Climatology*, 1931; C. E. P. Brooks, *Climate*, 1932, and *The British Climate*, 1954; W. C. Kendrew, *The Climate of the Continents*, 1937; S. F. Markham, *Climate and the Energy of*

Nations, 1942; O. G. Sutton. *Micro-meteorology*, 1953.

Climax (Gk *klimax*, ladder) is a figure of speech in which words, phrases, or clauses are arranged so as to increase in force or impressiveness till the last, as in this passage from Cicero: 'It is an outrage to bind a Roman citizen; to scourge him is an atrocious crime; to put him to death is almost a parricide; but to crucify him, what shall I call it?' See also **FIGURE OF SPEECH**.

Climbers, popular form of the old term *Scansores*, which was applied to birds of a climbing habit, many of which were characterised by having 2 toes turned backwards and 2 forwards. Examples of this obsolete order are woodpeckers, parrots, cuckoos, and cockatoos.

Climbing, **Mountain**, see **MOUNTAIN-CLIMBING** and **ROCK-CLIMBING**.

Climbing Plants. At least 6 distinct and different ways of climbing are used by plants: (1) by twining their stems round a support, like honeysuckle, hop, etc.; usually anti-clockwise, though the hop twists clockwise; (2) by tendrils, like passion flower, sweet pea, etc.; (3) by aerial roots, like ivy, Virginia creeper, etc.; (4) by hooked prickles, like roses, brambles, etc.; (5) by petioles or leaf stalks, like clematis, nasturtium (*Tropaeolum*), etc.; (6) by leaf stipules, modified as tendrils, like *Smilax*. They also climb by just scrambling through growth, like *Polygonum*. C. P. are cultivated for their beauty and utility, to dress bare walls, trolleys, pergolas, arbours, tree stumps, etc. Hardy perennial C. P. include *Aristolochia*, *Campsis*, *Celastrus*, *Clematis*, *Hedera*, *Hydrangea petiolaris*, *Lonicera*, *Polygonum*, *Parthenocissus*, *Vitis*, and *Wisteria*. Half-hardy C. P. like sweet pea, *Tropaeolum*, etc., are raised from seed each year, others may be grown under glass. There are deciduous and evergreen C. P.

Clincher, see **CLINKER**.

Clinical Thermometer, see **THERMOMETER** and **THERMOMETRY**.

Clinker, or **Clincher**: 1. Term used in small boat construction, to indicate that the planking of the hull is laid with overlapping edges and not edge to edge as in carvel.

2. Incombustible residue left in coal- and coke-fired furnaces. It tends to collect in masses in the furnace and would adhere to the fire-bars if not removed from time to time. When cold it hardens and is usually employed in concrete-mixing and in road-making.

Clinograph, draughtsman's instrument for drawing a number of similar triangles in succession. It resembles the carpenter's bevel in principle, but its stock and blade are of the same thickness. It is very useful in graphic calculations in statics.

Clinometer, instrument for measuring the angle of inclination of surfaces. A simple form consists of a stout folding footrule with a level on each limb. It is held firmly against a vertical rod and opened until the line of sight along the inclined limb is in the required direction,

the other limb being kept horizontal. The angle is shown on a graduated brass dial at the hinge. The India C., used in plane-tables, is an 8-in.-long base with level and levelling screw and a folding vane at each end. One vane has a longitudinal slit and is graduated in natural tangents and degrees, the other has an eye-hole on the level of the zero of the scale. The Abney C. is a 4-in.-long square or circular tube with a pinhole eyepiece. A level is pivoted on a transverse horizontal axis fixed above the tube and may be turned by a milled wheel. A hole in the upper wall of the tube allows the bubble of the level to be seen reflected on a small mirror at 45° to the tube axis, the mirror filling half the cross-section. The direction is sighted through the tube and the wheel is turned until the reflected image of the bubble is seen. The rotation of the wheel is read on a circular scale, the level carrying an index.

Clinton, Amer. family founded by Charles C. (1690-1773), b. Ireland. He left Ireland for America and estab. himself in Ulster co., New York.

James Clinton (1736-1812) was the son of Charles C., and served in the U.S. Army. He was the father of De Witt C. **George Clinton** (1739-1812), son of Charles C.; in 1775 joined the army, after having sat in the New York Assembly. He held a high place in the army, and in 1777 was appointed Governor of New York, becoming finally vice-president of the U.S.A., an office which he held till his death.

Clinton, De Witt (1769-1828), Amer. statesman, began his political career by acting as private secretary to his uncle, George, the leader of the Republican party at New York (1790-5). From 1798 to 1801 he was a member of the State Legislature, and was a U.S. senator, 1802-3. Three times (1803-7, 1808-10, and 1811-15) he was mayor of New York city. He was Governor of New York state, 1817-21 and 1825-8. In Congress he identified himself with the movements for abolition of slavery and of imprisonment for debt, and for improvement of the free public schools system. In 1825 he was present at the opening of the canal between the Hudson R. and Lake Erie—an undertaking which had been carried through largely as the result of his persistent efforts.

Clinton, Sir Henry (c. 1738-95), son of Adm. George C. He began service in the militia in New York, but became lieutenant in the Grenadier Guards in England in 1751, and captain and lieutenant-colonel in 1758. Major-general, 1772. He took part in the Seven Years War and the Amer. War of Independence. In 1778 became commander-in-chief in N. America, quarrelled with his second in command and resigned, 1781. General, 1793. In 1772-84 and 1790 he sat in Parliament, and in 1794 was appointed Governor of Gibraltar.

Clinton, Sir Henry (1771-1829), younger son of Gen. Sir Henry C. He served in the Corunna campaign; commanded the

6th Div. under Wellington in the Peninsula; lieutenant-general, 1814; served at Waterloo; M.P., 1808-18.

Clinton, Henry Fynes (1781-1852), scholar, b. Gamston, Notts. Educ. at Westminster and Oxford, he produced important works on Gk and Rom. chronology, *Fasti Hellenici*, 1824-30, and *Fasti Romani*, 1845-50. Epitomes of both were pub. later.

Clinton, city, co. seat of C. co., Iowa. U.S.A., on the Mississippi R. (with bridges) 138 m. W. of Chicago. It is an industrial and railway centre. Pop. 30,400.

Clipperton Island, isolated coral atoll at 10-18° N. lat., 109-15° W. long., officially part of Fr. Oceania (q.v.), called after John Clipperton, mate on a ship of the Eng. navigator Wm Dampier. In 1704 he mutinied and, with 21 others, made the atoll his hide-out. Listed as one of the U.S. guano is. in 1856, it was later annexed by France. In 1897 it was seized by Mexico, who kept a garrison there for some years. A Brit. firm worked phosphate deposits on the is. between 1906 and 1917, about 100 people regularly receiving supplies from Mexico. At the

Hulton Picture Library

THE CLIPPERS 'ARIEL' AND 'TEAPING,' 1866

A contemporary print of the meeting of the two vessels off the Downs after a voyage of ninety-nine days from Foochow.

Clinton Group, name assigned by geologists in New York to the Upper Silurian series of rocks, composed chiefly of argillaceous sandstone.

Clio, muse of hist., represented crowned with laurels, with a book in one hand, and in the other a trumpet.

Clio, genus of naked marine gastropod or wing-footed molluscs (pteropods) so called because they are constructed for moving through water by means of fin-like membranes which are lateral expansions of the foot. *C. borealis* is a species which abounds in N. seas and constitutes a great portion of the food of the Greenland whale.

Clipper, sailing ship constructed for very rapid sailing. It is longer and narrower than an ordinary sailing vessel. Many of these C.s, which were used frequently in the transport of tea from the E., were built at Aberdeen, but they are not used now. The term has been borrowed for the craft of a U.S. airline which provides service on long sea routes.

outbreak of war in 1914 they were forgotten by the Mexican authorities, and in the following 3 years most of them d. of starvation or sickness. To-day the is. is uninhabited.

Clippiacum, see CLICHTY.

Clissold Park, public park in the bor. of Stoke Newington, N. London. It was acquired in 1887, and opened in 1889.

Clisson, tn in the dept Loire-Inférieure, France, 17 m. SE. of Nantes. The tn and castle, belonging to the celebrated C. family, were destroyed in 1792-3 during the Vendean wars; the former was rebuilt in the 19th cent. Pop. 3200.

Clitheroe, mrkt tn and municipal bor. on the Ribble, at the foot of Ponder Hill, in the C. parl. div. of Lancs, England, 35 m. N. by W. from Manchester. C. has cotton mills, foundries, printing establs., and important lime and cement works in the neighbourhood. Its free grammar school was estab. in 1554, and there are still some remains of an 11th-cent. castle, which with the grounds were

purchased for the tn as a memorial of the First World War. Pop. 12,000.

Clitus, or **Cleitus**, surnamed 'Melas,' 'the Black,' was the brother of Alexander's nurse, Helleniké. C. was made one of Alexander's lieutenants, and saved his life at the battle of Granicus in 334 B.C. He was made satrap of Bactriana in place of Artabazus in 328. At a banquet, when Alexander was present, he dared to criticise the luxury of the latter's court, and to extol the virtues of Philip. Alexander, who was drunk, killed C. on the spot, and was afterwards overcome by remorse.

Clive, Caroline (1801-73), authoress, b. London, daughter of Edmund Meysey-Wigley. In 1840 she married the Rev. Archer C. She pub. sev. sets of poems, signed 'V.,' but her best book is a novel, *Paul Ferroll*, 1841.

Clive, Catherine (Kitty) (1711-85), actress, daughter of Wm Rafter, a man of good family. About 1727 she came under the notice of Colley Cibber, manager of Drury Lane, and a place was found for her in the company, where she played Ismene, the page in *Mithridates*. Not long after this she married George C., a barrister, but they separated very soon after their marriage. She joined Garrick in 1746 and remained with his company until 1769. She won recognition as a comedy actress by her performance in *The Devil to Pay*, 1731. She took part also in some oratorios, possessing a fine, well-trained voice.

Clive, Robert Clive, Baron (1725-74), Indian administrator, came of an old Shropshire family. Many stories are told of his schooldays, which go far to prove that in this case the boy was father of the man. Though dull at books, he was notorious for reckless courage; and there is the tradition, most delightfully prophetic, that as a lad he formed a small army of boys and levied a tax on the shopkeepers of Market Drayton, which they paid lest otherwise their windows should be broken. In his eighteenth year he received the offer of a writership in the Honourable E. India Co.'s service at Madras, an opening which, needless to say, was as welcome to him as to his parents. He scented adventure in the E., adventure that was to come surely enough, though not quite so soon as he expected. The outward voyage was unduly protracted, and he did not arrive at his destination until late in 1744. The long delay had swallowed up the contents of a meagre purse, and he reached Madras in debt. In that city he knew no one, and was far too shy to take advantage of such opportunities to make acquaintance as did occur. Loneliness and the slenderness of his resources made him so miserable that after a few months' sojourn in India he decided to commit suicide, and he desisted only when he had pointed a pistol at his head and twice pulled the trigger without obtaining the desired result. He then examined the weapon, and finding that it was properly loaded, he put it aside, remarking that it was evident from this intervention of providence that he was intended for something great. Fate

did not keep him waiting long. In 1746 Labourdonnais captured Madras, and among many took C. prisoner. The young man escaped, however, to Fort St David. He now desired to abandon the civil and enter the military side of the company's service, and he applied for, and in 1747 obtained, an ensign's commission. Though he had had no previous training in arms, he showed signs of military genius, and elicited the commendation of Maj. Lawrence. A treaty of peace between England and France was signed at Aix-la-Chapelle in Oct. 1748, and C. returned to

ROBERT CLIVE

his former occupation. He was not destined long to remain at his desk. He was given a command, again under Maj. Lawrence, in the expedition against the Rajah of Tanjore, during which he showed the same bravery that he had previously displayed in the unsuccessful siege of Pondicherry. After the conclusion of this campaign he was appointed commissariat officer to the Brit. troops, and shortly after was promoted captain. He submitted in 1751 a plan for the capture of Arcot, the cap. of the Carnatic, and was, to his great delight, permitted to endeavour to carry it out. He occupied the tn, and held it for 2 months, with his 500 men, of whom only 200 were English, against an army of 10,000. At the end of that period the enemy retired. The defence of Arcot, Malleson, the military historian, has said, may be regarded as 'the turning-point in the eastern career of the English.' Though not at the time regarded as so important as, in the light of subsequent events, it is now, C.'s defence made a great reputation for him, which was enhanced by his later achievement in the campaign. C. was in 1753 invalided home, and was welcomed

by the court of directors of the E. India Co., who, as a token of the high esteem in which they held him, presented him with a very valuable sword mounted in diamonds, which, very properly and modestly, he declined to receive unless a similar mark of honour was bestowed upon Maj. Lawrence. He returned to India in 1756, and, after serving for a short time in Bombay, went to Madras, where the news came that Suraj-ud-Dowlah had captured Calcutta and imprisoned the Eng. captives in the Black Hole (q.v.). C. went forth to retake Calcutta and to avenge the victims of the outrage. He defeated Suraj-ud-Dowlah at Plassey (23 June 1757), and dethroned him in favour of Jafar Ali. From 1757 C. was Governor of Bengal until 1760, when he returned to England where he was received as a popular hero by everyone, from the king to the mob. He was elected member of Parliament for Shrewsbury, and in 1762 was created Baron C. in the Irish peerage. Two years later he went out as Governor of Bengal to put the administration on a sound footing. This he did, but in 1766 he had to return owing to ill health. In England he was attacked for having abused his position, and many charges were brought against him. A parl. inquiry was held, and the House of Commons unanimously accepted a resolution that he had rendered 'great and meritorious services to the State.' He d. by his own hand, after long suffering severe bodily agony, on 22 Nov. 1774, at the age of 49. C. no doubt often acted in a way that in a 20th-cent. official would be regarded as little less than criminal; thus he accepted vast sums from native princes, but that was the custom of his day, when the Englishman in India was not as a rule, and was not expected to be, very scrupulous as to the manner in which he acquired a fortune. On the other hand, he was a just administrator, a great ruler, and a brilliant soldier; and he it was who securely laid the foundation of the Brit. Empire in India. See Sir J. Malcolm, *The Life of Robert, Lord Clive*, 1836 (reviewed by Macaulay, 1840); C. Wilson, *Clive*, 1890; Sir G. W. Forrest, *Life of Lord Clive*, 1918; R. J. Minney, *Clive*, 1931.

Cloaca, in zoology, is the name given to the common chamber in some vertebrates into which open the alimentary canal, the genital and urinary ducts; it is present in all amphibians, birds, and reptiles, in the monotremes and some fishes. In higher mammals the urinogenital orifice and the anus take the place of the C.

Cloacae, sewers of anc. Rome. The fact that Pliny called the city 'urbs pensilis' (hanging) shows to what an extent they undermined it. Ruins of many still exist, of which the most famous is the Cloaca Maxima, built in about the 6th cent. BC to drain the forum which stood on marshy ground between the Palatine and Capitoline hills, and barrel-vaulted a cent. or two later. It is 14 ft high and 10½ ft wide. Under the rep. C. were supervised by the censors; under the empire by the *curatores cloacarum*.

Cloche Gardening, system of using

cloches, bell-glasses, and hand-lights out of doors to give protection to plants from adverse weather conditions and hasten their growth to maturity. The appliances used may be of glass or plastic, and are valuable in obtaining crops or flowers early in the season, and to prolong the season in some cases.

Clock, time-telling instrument in which energy is stored, either by winding up a weight or a mainspring or by some other contrivance, the energy being then released in regular fashion and in such a way that a hand or hands will record the passage of time on a dial. There is very little authoritative information as to the progress of horology (q.v.) from the early years of the Christian era right down to the 14th cent.; and this is much to be regretted, for at some time during that period the C. evolved from a more or less elaborate clepsydra (q.v.) into a mechanism driven by weight. Nothing definite is known as to when or by whom the mechanical C. was invented, but we may safely assume that it developed gradually as the outcome of many experiments by a large number of people. There are many early references to 'horologes' in all parts of Europe. In England, for example, records of the year 1286 speak of a 'horologe keeper' at St Paul's Cathedral. There is also mention (c. 1298) of a 'horologe' being fixed in a turret opposite Westminster Hall. Between 1292 and 1313 both Canterbury and Exeter Cathedrals are reputed to have possessed 'horologes.' The 'horologe' at Glastonbury Abbey was supposed to have been made by Peter Lightfoot, a Benedictine monk, c. 1335; but he is now regarded as a legendary figure. In early times, however, all time-measurers were indiscriminately described as 'horologes,' whether they were sundials, water C.s, or sand glasses.

Until comparatively recently it was believed that C.s operated by wheels and weights, and controlled by some form of escapement, had begun to make their appearance in monasteries in Europe during the 11th cent.; but so many vague and contradictory records exist that any attempt to fix the exact date of their introduction would be mere guess-work. That such C.s were set up first in monasteries and churches is more than probable. In the Middle Ages, the monastic houses were the prin. repositories of the arts and sciences, and the monks would have found a mechanically sounded bell a valuable aid to their observances. It may well be that a train of wheels, actuated by a weight and controlled by some slowing-down device, and made for just such a purpose, preceded the escapement for timekeepers, and possibly even suggested the application of the same sort of contrivance for controlling a machine to show the time.

The word 'clock' is derived from the Lat. *clocca*. Other equivalents are the Saxon *clugga*, the Fr. *cloche*, and the Teutonic *glocke*—all signifying a bell. The first mechanical C.s had no dial, but were purely for the purpose of striking a

bell to denote the time at each hour. Strictly speaking, a C. that does not strike is known as a timepiece. According to the late G. H. Badlie, who did much original work in accumulating documentary evidence connected with horological hist., the weight-driven C. was unknown until about 1300. About that time its use spread steadily across Europe from Italy, but did not reach England

*reproduced by gracious permission of
Her Majesty the Queen*

ANNE BOLEYN CLOCK

The ornamental case of copper gilt is in a fine state of preservation.

until about 1386. He considers that all prior records referred to water C.s and *not* to weight-driven, escapement mechanisms, which had hitherto been assumed to exist all over Europe from the 13th cent. onwards.

The making of C.s in England was started by 'three horologists from Delft in Holland' to whom in 1386 Edward III granted a patent or passport giving them leave to stay in England for the purpose of carrying on their craft. The earliest C.s were made for churches and public buildings, and as their size decreased they became more suited for domestic

use. The earliest Eng. turret C.s still in existence were installed at Salisbury Cathedral, Wells Cathedral, and Dover Castle. The Salisbury and Wells C.s are attributed to the early half of the 14th cent., not long after the temporal hours of unequal length had been superseded by the system of dividing the day and night into 2 periods each of 12 hrs of equal duration. The Dover Castle C. is perhaps the most interesting, since it still has its original escapement. A good example of clockmaking in its earliest and simplest form, it is now one of the exhibits at the Science Museum, S. Kensington.

The Salisbury C., which has been 'modernised' from time to time during its long life, was restored to its original condition in 1956 and set up in a position inside the cathedral, where it can now be seen working.

General construction of clocks. The frame of an ordinary C. usually comprises 2 brass plates, held apart at the appropriate distance by 4 pillars. The driving force may be either a weight, a spring, or electricity. The simplest and most reliable form of driving force is provided by a *weight* suspended from a *line* which is wound round a *barrel*. The pull of a weight acting in this way is practically constant, since it relies upon gravity for its power. Moreover, with a reasonable distance of fall for the weight, and by the employment of suitable pulley arrangements, the mechanism can be made to go for a convenient period with one winding. The great disadvantage is that a weight-driven C. is not portable. Hence, generally, only long-case, or 'grandfather' C.s, are weight driven. In bracket C.s, and many of the smaller C.s now available, the driving force takes the form of a mainspring (*see WATCH*). The latter is a thin ribbon of steel, coiled up, frequently in a barrel, round an arbor to which one end of the spring is attached, the other end being anchored to the wall of the barrel. No barrel is provided in cheap alarm C.s, in which the outer end of the spring is anchored to one of the pillars. C.s can be made to go for a day or a week with one winding; sometimes for much longer periods. Winding is accomplished by means of a key which winds the line on to the barrel, or alternatively energises the mainspring. A ratchet and click, or pawl, is provided to prevent the wheels from turning backwards.

Of the wheels and pinions that constitute the gearing, there is one 'set' pivoted between the plates; this is called the *train*, or more correctly the *going train*, since its function is to transmit the energy of the driving force to the escapement and thus to keep the movement going. Another 'set' is planted, usually on the front plate; this is known as the *motion work*, and it comprises an ingenious 12/1 reduction in which the axes of 2 wheels, carrying respectively the hour and minute hands, turn at the correct speeds, concentrically and in the same direction. Sometimes, a one-stage reduction is used; in modern C.s and in all watches a two-stage reduction is employed.

The great wheel is mounted on the same arbor as the barrel; suitable ratchet and click work is provided to enable the barrel to be turned when winding, while the wheel itself does not turn. The great wheel gears with the centre pinion, on which the centre wheel is mounted. The centre arbor turns once in an hour; it is extended through the front plate and carries the cannon pinion to which the minute hand is fixed. The cannon pinion is mounted on a pipe, which bears the centre arbor, and a friction spring ensures

Crown Copyright: Science Museum, London

MODEL SHOWING GALILEO'S APPLICATION OF THE PENDULUM

that it will be carried round with the arbor; but the spring is not too strong to prevent the hands being turned independently when setting the C. to time. The hour wheel, which turns once in 12 hrs, is mounted on another pipe carrying the hour hand, and bearing on the pipe of the cannon pinion. The centre wheel gears with the third pinion, on the arbor of which the third wheel is mounted. This gears with the escape pinion, and the escape wheel is mounted on its arbor. In modern 8-day spring-driven C.s there is an intermediate wheel between the great and centre wheels to allow for an 8 days' run with 1 winding. The wheels are made of hard brass; they are cut or hobbled on gear-cutting machines. The pinions are of steel; in the best work they are hardened, tempered, and highly polished.

It should be noted that there is a fundamental difference between the gearing in a

C. and almost every other machine, in that the gearing is stepped up from the great wheel, which generally turns once in 12 hrs, to the escape wheel which, in a grandfather C., usually turns once in a minute. Special tooth forms are required—the gearing is known as cycloidal as against the more usual involute form used in most machinery.

The escapement is the device which controls the driving force. Its primary function is to release and then arrest the train at regular intervals of time; its secondary function is to impart impulse to the controller, which is generally either a pendulum or a balance and spring. The time of swing or oscillation can be and, in fact, is predetermined. In a grandfather C. it is 1 sec.; in an ordinary modern watch it is $\frac{1}{2}$ sec. Hence, gearing can be so arranged that one wheel will turn once in a minute, another once in an hour, and another once in 12 hrs.

The escapement employed in the earliest mechanical C.s, like the Dover Castle C., was that known as the verge escapement. Exactly when and by whom it was invented is unknown, but it was commonly used in one form or another in C.s until after the middle of the 17th cent. and in watches for more than 100 years after that. The controlling device in the earliest verge escapement is a horizontal bar, called a foliot, mounted centrally on an arbor, called the verge, provided with 2 pallets which alternately release and lock the teeth of the escape wheel. The foliot swings to and fro and at each swing one tooth of the escape wheel is permitted to escape. A small movable weight is suspended from each end of the foliot for the purpose of regulating the period of swing. Moving these weights nearer to the centre causes the foliot to swing at a quicker rate; moving them outwards causes it to swing more slowly. The foliot as a controlling device was far from satisfactory; it had no natural period of swing, it was also sensitive to variations in the power of the driving force transmitted through the train to the escape wheel, and these variations were often great, chiefly owing to inaccuracies in the gearing. As a result, the period of swing was very variable, and only a crude regulation was possible by moving the weights on the arms of the foliot. The correct principles of toothed gearing were not understood until the 18th cent., but before that time great improvements in timekeeping became possible as a result of the discovery of the properties of the pendulum and its application to C.s.

Galileo (q.v.), when a youth of 17, watching the swinging of the great lamps in the cathedral of Pisa and timing the swings by counting his own pulse beats, observed that they appeared to take just the same time to swing through a small arc as for a large one. This property of describing either large or small arcs in equal periods of time is known as isochronism (from the Gk *isos*, equal; *chronos*, time). Galileo's deductions that the large and small swings were isochronous is not absolutely correct, but it is very nearly

true for all arcs of swing of a pendulum under about 3° . This is the reason why the swing of the pendulum in a high-class C. is kept as small as possible, often about 2° or even less. Slight variations in the arc do not then affect the timekeeping very much. If it is large, however, small changes in its size will make appreciable variations in the time of swing. In his later years Galileo made many experiments with the pendulum, but apparently they all necessitated manual operation. When an old man and blind, in collaboration with his son Vincenzo, he devised plans for a pendulum C., but it was not finished in his lifetime.

It was left to others to bring the possibilities of Galileo's discovery to fruition. Although three-quarters of a cent. elapsed before the first pendulum-controlled C. saw the light of day, it can be stated that following the invention of toothed wheels and then the verge escapement, *accurate* timekeeping was first made possible as a result of the discovery of the properties of the pendulum and of its subsequent application to C. work. The first successful application of a pendulum in an actual C. is often credited to the Dutch physicist, Christian Huygens (1629-95), who, on Christmas Day 1656, completed his first pendulum C. In this the escapement was the original verge, but now controlled by a pendulum instead of a foliot. The arc of swing was large (about 30° - 45°), and it was only possible to use short and light pendulums. Hence, Huygens's application of the pendulum, important as it seemed to be in a theoretical sense, and bringing about, as it did, some improvement in timekeeping, did not solve the problem of making a C. keep really accurate time. Pendulum C.s on Huygens's system were first made in England in 1658 by Abasuerus Fromanteel 'on the Bank Side in Mosses Alley, Southwark, and at the sign of the Mermaid in Lothbury near Bartholomew Lane End, London.'

Eng. C. makers soon realised that the timekeeping of pendulum C.s could never be really accurate unless the pendulum arc could be made quite small. They went right to the heart of the problem and accomplished the desired object by designing an entirely new escapement, in which the arc of swing of the pendulum could be made a few degrees each side of the line of centres. The horizontal wheel of the verge escapement was abandoned and replaced by a vertical, flat wheel with saw-shaped teeth, controlled by pallets at either side of a curved piece of steel, the shape of which was rather like an anchor. This came to be known as the *anchor escapement*. The practical result of being able to keep the arc of swing small was that the vibrations of the pendulum were very nearly isochronous. It was also convenient to use long and relatively heavy pendulums, the vibrations of which were much less subject to accidental disturbances than was the case with short and light pendulums; furthermore, a heavy bob is not so likely to be influenced by irregularities of the train. It soon

became the practice to use a seconds pendulum in long-case C.s, whether for domestic or scientific purposes. Thus, the main difficulties were overcome at one stroke, and for the first time it became possible to take real advantage of the valuable properties of the pendulum as a controller for C.s, and to secure timekeeping accurate to seconds per day instead of minutes. The anchor escapement laid the foundation for all progress towards precision timekeeping by pendulum C.s. Its inventor is not definitely known. Until recently it was attributed to Dr Robert Hooke (q.v.), but there appears to be no direct evidence for such an attribution. The first C.s, with the anchor escapement are believed to have been made by Wm Clement of London, c. 1670, and it is quite possible that it was actually his invention. The earliest known anchor escapement C. by Wm Clement, dated 1671, was made for King's College, Cambridge; it is now in the Science Museum, S. Kensington. The anchor escapement comprises escape wheel, and pallets secured to the pallet arbor, to which an arm called the crutch is fixed at right angles, terminating in a fork or loop to embrace the pendulum rod. The action is simple. As the pendulum swings in either direction, it carries the crutch with it and this causes the pallets to oscillate. One is raised clear of the teeth of the escape wheel, while the other is lowered into the path of the teeth on the opposite side of the wheel. The driving force is trying all the time to make the wheels turn, and, as the first pallet is being raised, the escape wheel is permitted to start moving. As it does so, it pushes the pallet out of the way and this action gives impulse to the pendulum through the crutch. When the tip of the tooth clears the discharge corner of the pallet, the escapement is unlocked and the wheel moves freely through a short distance until a tooth on its opposite side drops on to the face of the second pallet; this locks the escapement. It is the drop of the tooth on to the pallet that gives the audible 'tick' of the C. As the pendulum continues to swing after a tooth has been locked, the pallet is driven further into the space between 2 teeth of the escape wheel and this causes a slight recoil, or in other words the wheel is forced to turn backwards slightly. Because of this, the anchor escapement is also known as the *recoil escapement*. When the pendulum commences its return swing the cycle is repeated. With only slight modification, the anchor escapement is still found in all moderately priced pendulum C.s made to-day.

About 1720, George Graham (q.v.) invented the *dead-beat escapement*, which marks one of the most important steps in the progress of horology. The Graham dead-beat escapement is an improved form of anchor escapement, to which it is somewhat similar both in appearance and action; but there is no recoil because the locking faces of the pallets are arcs of circles struck from the pallet arbor. Graham aimed at more accurate timekeeping

as a result of eliminating unnecessary resistances, still further reducing the arc of vibration of the pendulum, and superior workmanship. This escapement was used in astronomical clocks for nearly 200 years, until superseded by the free pendulum.

Pendulum. The length of a pendulum is directly proportional to the square of the time of swing. The theoretical length of a seconds pendulum—i.e. from centre of suspension to centre of oscillation—is approximately 39.14 in., and of a half-second pendulum approximately 9.78 in.

Compensation. A compensation pendulum is one which will maintain constant length between the centres of suspension and of oscillation in all varying changes of temp.

When pendulums were first applied to C.s., although a great improvement on the foliot, the variation in timekeeping, resulting from primitive gearing and the interference set up by the verge escapement with its short pendulum, was considerable, far greater than any likely to be caused by changes of temp. The invention of the anchor escapement and the introduction of the seconds pendulum produced a standard of timekeeping incomparably better than had been possible hitherto. Nevertheless, clockmakers and physicists of the period were unable to account for variations in rate that were still apparent. The invention of the dead-beat escapement, which greatly reduced escapement disturbance, thereby making an improved rate possible, enabled Graham to detect the effects of changes of temp. on the swing of the pendulum, and to compensate for the errors thus set up he conceived the idea of providing a jar filled with a quantity of mercury as a pendulum bob. He set up 2 C.s. in an attic, facing S., where the daily extremes of temp. both in winter and summer would be experienced at their greatest, one fitted with an ordinary pendulum and the other with a mercurial pendulum of this nature. After a trial extending over about 4 years he found that the mercurial pendulum maintained a much superior rate, and that adequate compensation for temp. changes could be achieved, provided the quantity of mercury of the jar was right. He communicated his invention to the Royal Society in 1726. Many mercurial pendulums have been made. In some bracket C.s. there is a double jar instead of a single one. The close adjustment of a mercurial pendulum, however, is a tedious business, and other, more simple, methods were also attempted.

Some time before 1727 and working quite independently of Graham, John Harrison (q.v.), contrived what is generally called the *grid-iron pendulum*, which consists of 9 rods, 5 of steel and 4 of brass. It takes advantage of the different coefficients of expansion of the 2 metals. The sev. rods are so arranged that the steel rods expand downwards in heat, tending to increase the length of the pendulum, while the brass rods expand upwards. The lengths of the 2 materials

are calculated so that the downward expansion of the steel will be compensated by the upward expansion of the brass.

Many other compensation pendulums have been introduced using the same principle. Some have been made by using concentric tubes of steel and brass or zinc. The modern method of compensating for temp. errors is to use pendulums made of materials which have such small coefficients of expansion as to require very little compensation. The material generally used to-day for pendulums of this nature is the alloy called *invar* (short for *invariable*), which consists of 36 per cent nickel, 59 per cent iron, 4 per cent manganese, and 1 per cent carbon. The original *invar* alloy was developed in France, c. 1900, by Dr Charles-Edouard Guillaume; Brit. alloys are now available.

Maintaining power. In high-grade C.s., or where more than usual accuracy is required, maintaining power must be provided to keep the C. going during the process of winding up. The earliest form of maintaining power is known as Huygens's endless rope, in which the weight is hung on a rope or, more recently, a chain between 2 pulleys with suitable spikes to hold the rope or chain, one of which is fixed to the main arbor and the other is provided with ratchet or click and is secured to the frame. Half the power of the weight is thus always being exerted on either side of the rope. Pulling on the endless rope, after it has passed over the second pulley, raises the weight without taking the power off the great wheel. The most usual form, invented by John Harrison, was that in which connection between the great wheel of the C. and the winding arbor is maintained by means of a subsidiary spring. This latter is always kept under tension while the C. is going; but immediately winding starts, it automatically comes into action by a click acting on a ratchet on the great wheel, and its force is sufficient to keep the C. going while winding proceeds. The going barrel employed in modern C.s. and watches requires no maintaining power, since the mainspring is wound from the arbor end and exerts its power from the barrel end. Thus, the act of winding does not remove the power from the great wheel.

Electric clocks. The first electric C. was made by Alexander Bain, an Edinburgh clockmaker who settled in London. He devised and made many different types, and from his inventions many of the modern electric C.s. developed. None of his C.s. was entirely successful because of bad contacts, improvements in which were to come with the introduction of better materials.

In 1894, Frank Hope-Jones and George B. Bowell invented a system whereby a pendulum could be maintained in motion by an electric battery, being given an impulse every half-minute by a gravity arm, released by the pendulum and restored by the current. At the same time, an impulse could be sent to any number of secondary or impulse dials, for each of

which an additional 1 to 1½ volts was used. By this system a master C. can control any number of impulse dials, giving the same time in any required number of places. Many municipal buildings, railway stations, and the like employ this Master C. System.

In 1922 Wm Hamilton Shortt invented a free pendulum, the accuracy of which was such as to enable astronomers to detect slight variations in the speed of rotation of the earth. The first free pendulum was installed at the Edinburgh Observatory. The principle is that an electrically driven pendulum, which is used to show the time, gives impulse to an otherwise entirely swinging pendulum. The free pendulum then corrects the slave pendulum by means of electric contacts and a device known as the 'hit and miss synchroniser.' Until just before the Second World War the Shortt Free Pendulum was used as the standard C. in most of the observatories throughout the world. It has now been superseded by the quartz crystal C.

In 1918 H. E. Warren, in the U.S.A., invented the synchronous electric C., which relies on pulses of alternating current for its power. With the advent of the grid scheme in Britain the alternations of the current were time-controlled at 50 cycles per sec. Since 1930 synchronous C.s, which are merely plugged in to the mains, have been produced in large quantities. They are really electric meters counting out the number of alternations of the supply, and, by means of suitable reduction gearing, showing the time of day on a conventional dial. A synchronous C. must conform to the alternations of the current. It cannot go either faster or slower. Hence so long as the alternations are time-controlled a synchronous C. cannot gain or lose. The control at the power station is effected by means of a frequency control meter, comprising a very accurate pendulum C. showing Greenwich Mean Time and checked at frequent intervals, and a synchronous motor C. showing the time being produced by the station. By observing the 2 sets of hands the engineer in charge can either speed up or slow down his generator. It sometimes happens in peak periods that the alternations will drop off, causing the C. to go slow, but any such errors are corrected in the power station, generally at night, so that the C. is brought to exact time at least once every day. It has no cumulative error like an ordinary mechanical C. Moreover, since it is geared down, larger pivots and bearings, also heavier oil or even grease can be used, and since it has neither escapement, mainspring, nor weight, wear is less than in an ordinary C. One of the disadvantages is that, should the current fall for any reason, the C. will stop. Some are made with self-starting motors, which will start up immediately the current is restored, but showing the wrong time. Others need to be manually restarted.

Many modern electric C.s have a more or less conventional movement, driven by a spring which is rewound electrically

every few minutes; an ordinary torch battery will keep such a C. going for upwards of a year. In others, the pendulum or balance is driven by electricity, and in turn drives the train.

Striking and chiming clocks. The method now employed in striking C.s was invented in 1675 by Edward Booth, who later changed his name to Barlow. An entirely separate train of wheels, operated by its own driving force, is required. Its object is to raise the hammer and then release it to strike on the bell or gong. Mechanism for locking and releasing the striking train and counting the number of blows to be struck is also provided. The striking train is released by the going train, and only comes into action when the C. is about to strike; it locks itself after the appropriate number of blows has been struck. The mechanism controlling the striking work is planted on the front plate of the movement behind the dial. It comprises a series of levers, which are raised by a pin on the minute wheel, or cannon pinion; a rack provided with a number of teeth, and a snail-shaped cam mounted on the hour wheel of the motion work, divided into 12 steps, each of which is progressively deeper from the highest to the lowest, which together determine the number of blows to be struck. As the C. goes, the levers are raised, and the rack is released so that its tail falls on one of the steps of the snail. This liberates the number of teeth on the rack to correspond with the hour to be struck. At the precise hour the levers drop off the pin on the motion work and this unlocks the striking train; one blow is struck for each tooth of the rack that was liberated and which is now 'gathered' by the striking train. When all the teeth of the rack have been gathered, the striking train locks itself ready to be released at the next hour (or half hour as the case may be).

Quarter-chiming work for domestic C.s was first introduced c. 1630, both hours and quarters being sounded upon bells. Circular gongs were first made in about 1830, and the type of straight rod gong now almost universally employed in chiming C.s was invented c. 1890. A third train is necessary in a chiming C., similar to the striking train. The going train discharges the chiming train which, in turn, discharges the striking train after completing the chimes at the hour. Usually, there is a 'self-correcting' device to ensure that the quarters will always be chimed in the correct sequence.

The most popular chime tune is the 'Westminster,' as chimed by the great C. at the Houses of Parliament, generally known as 'Big Ben,' although strictly speaking that is the name given to the 13½-ton bell upon which the hours are struck, and which is named after Sir Benjamin Hall, First Commissioner of Works at the time of its installation (1860) (see GRIMTHORPE). The chime was originally composed for the C. at Great St Mary's Church, Cambridge; it was developed by Dr Crotch and Dr Jowett from a phrase in Handel's 'I know that my Redeemer liveth.'

Most striking and chiming C.s have a device whereby they can be silenced at will. Many have alternate chiming. Some old Eng. C.s, notably by Joseph Knibb, struck the Rom. numeral equivalent to the hour on 2 bells. In this the 'I' of the Rom. number is struck on a higher pitched bell, while the 'V' is struck on a lower pitched bell. 'X' is represented by 2 successive blows on the lower pitched bell. C.s are also made to strike ship's time.

Romans to the Etruscans, who released her on account of her bravery. She was allowed also to choose other hostages for release, and she chose the youngest. A statue was erected to her in the Via Sacra.

Clog Almanac, anct kind of calendar, usually made of wood, though sometimes of metal. It was square in shape, and on it were notched the months and the days with special marks for saints' days. It was supposed to have originated in Denmark.

THE CLOISTERS OF ST JOHN LATERAN, ROME

Anderson

Alarm clocks. The alarm C. has a separate train for the alarm mechanism, which is set by means of a hand in connection with a small dial. The alarm mechanism is held locked by the going train until the appropriate time, when it is released to ring the alarm until silenced or run down. See also CHRONOGRAPH; CHRONOMETER; HOROLOGY; WATCH. See F. J. Britten, *Watch and Clock Makers' Handbook*, 1896; G. H. Baillie, *Watches*, 1929; J. D. Robertson, *The Evolution of Clockwork*, 1931; J. E. Haswell, *Horology*, 1937; D. de Carle, *British Time*, 1947, and *Watchmakers' and Clockmakers' Encyclopaedic Dictionary*, 1950; G. F. C. Gordon, *Clock-making, Past and Present* (2nd revised ed. by A. V. May), 1949; T. P. Camerer Cuss, *The Story of Watches*, 1952.

Clodius, see CLAUDIUS, PUBLIUS.

Clodius, Albinus, see ALBINUS.

Cloelia, Rom. maiden sent as a hostage to Porsena. After escaping by swimming the Tiber she was sent back by the

Clogheen, tn of Rep. of Ireland in the co. of Tipperary, about 13½ m. WSW. of Clonmel, at the N. end of the famous 'Vee' road, Pop. 700.

Clogher, vil. of co. Tyrone, N. Ireland, near the S. border of the co., the original cathedral tn of the diocese. F.M. Viscount Alexander was b. in the C. valley. Pop. 300.

Clogs, shoes worn by peasant people in sev. countries of the Continent, and also used in the N. of England and parts of Scotland and Wales. The uppers are of leather and the soles are made of wood.

Cloister (Lat. *claustrum*, an enclosure; Fr. *cloître*), quadrilateral space, surrounded by an ambulatory or covered passage to shelter from rain, etc., attached to monastic buildings and cathedrals, and often also to colleges. The C. was usually built on the S. side of the church, so as to benefit by the sunshine. Canterbury, Chester, and Gloucester have fine examples of Benedictine C.s. In the

Middle Ages the church was on one side of the ambulatory and the refectory on the side opposite, whilst E. and W. were the chapter-house, larders, and cellars. Almost invariably the dormitories were on the upper storey. On the side skirting the quadrangle pillars and arches, sometimes decorated with elaborate carving and delicate-patterned traceries, supported the cloistral roof, which was often vaulted. At Gloucester, the exquisite fan-tracied vaulting is still in perfect preservation. Besides walking daily in the C.s for recreation—from the ambulatory at Mont St Michel they could see on all sides the great Atlantic—the monks used also to hold schools for novices and to paint, carve, and read theology in the recesses or stalls on the inner side. Here, too, they could talk at certain hours. The central space was usually occupied by a square grass-plot, as at Westminster Abbey. Among many beautiful C.s still in existence may be cited those of St John Lateran at Rome, of Monreale in Sicily, and of the Campo Santo at Pisa, where the spacious ambulatories are actually 4 in number.

Clonakilty, seaport and mrkt tn on C. Bay in SW. of co. Cork, Rep. of Ireland. It is the terminus of a branch of the Cork, Bandon, and S. Coast Railway, and has flax and mineral water industries. Michael Collins (1890–1922) was b. in C. Pop. 2865.

Clonard, vil. of co. Meath, Rep. of Ireland, 16 m. SW. of Trim, where the great monastic school of C., renowned throughout Europe in the Middle Ages, was founded by St Finian in the 6th cent.

Clone (from Gk *klón*, a twig, spray, or slip of a plant chosen for propagation), a term applied to a group of plant progeny vegetatively produced of a single individual plant, and having the same genetical constitution.

Clones, tn of Rep. of Ireland, in the co. of Monaghan. It possesses the ruins of an old abbey. Pop. 2400.

Clonfert, par. and tn on the Shannon and the Grand Canal, in the SE. of co. Galway, Rep. of Ireland. Pop. 1633.

Clongowes Wood College, Naas, co. Kildare, Rep. of Ireland, secondary boarding school for boys, founded in 1814. It was the first stable Jesuit College in Ireland. There are now 360 boys in the college, and courses prescribed by the Irish Dept of Secondary Education are followed.

Clonmacnois, vil. of co. Offaly, Rep. of Ireland, one of the most celebrated of Ireland's holy places. The monastic city fl. from AD 548 for 1000 years until its despoliation by the Eng. garrison of Athlone. See P. C. Molloy, *Guide* to C. Pop. 925.

Clonmel, municipal bor. and co. tn of co. Tipperary, Rep. of Ireland, on the Suir. It is a tourist centre, and is famous as the bp. of Sterne. Formerly the centre for Bianconi's system of jaunting cars (1815). Besides exporting agric. produce it has tanneries and flour-mills. Pop. 10,500.

Clontarf, residential dist. of the city of

Dublin, Rep. of Ireland, incorporated under the Dublin Corporation Act, 1900.

Clonus, involuntary, rapid, alternating contraction and relaxation of antagonistic pairs of muscles. See also under **REFLEXES**.

Cloots, or **Clootz**, Jean Baptiste, Baron von (1755–94), Fr. revolutionary, b. at Gnadenfahl near Cleves, Rhineland. He was of Prussian nationality, and took a prominent part in the affairs of the Fr. Revolution. After travelling in Europe he went to Paris in 1789, on the outbreak of the Revolution, and joined the Jacobin Club. He renounced his title, and took the name of 'Anacharsis C.' In 1792 he became a Fr. citizen, and became notorious for his denunciations of religion. But he made an enemy of Robespierre, and was guillotined during the Terror.

Close (Lat. *clausum*, shut), in England, an enclosed space forming the precinct of a cathedral or monastery. In Scotland and in colloquial English the word is used for a narrow passage leading to a block of tenement houses, to the entrance of a court, or from a main street.

Close-hauled, term applied to the general arrangement of the sails of a ship when she is travelling as near as possible to the direction of the wind. Square-rigged vessels when C. make a small angle with the line of the wind's direction, but cutters and luggers can sail very much nearer to it.

Close Times, those seasons of the year during which, by law or by mutual agreement, game, wild birds, salmon, certain animals, and certain fish may not be shot or caught. These C. T. vary to a certain extent in different countries and localities, but they will generally be found to include the breeding or spawning times of the species in question. In most cases the C. T. in Great Britain are fixed by the game laws and a series of Wild Birds Protection Acts, of which the chief were passed in 1880, 1904, and 1908, but in some cases sportsmen are ruled by unwritten but equally binding rules. There are, for example, no statutory C. T. for foxes and rabbits, but in practice there is no fox-hunting from April till 1 Nov. Unwritten law likewise fixes the deer-hunting period for stags from about 12 Aug. to 12 Oct., and for hinds from 10 Nov. to the end of Mar. An Act of 1892 prohibits the sale of hares or leverets caught in Great Britain from Mar. to July, under penalty of a heavy fine, and this has the effect of creating a close time. In Ireland this period is fixed from the beginning of April to 12 Aug.

In England and Wales hares, rabbits, woodcock, snipe, quail, landrail, and heath or moor game (and the eggs of swan, wild duck, teal, and widgeon) are protected under the game laws, though no close time is fixed for them by those laws. In Scotland the same remarks apply to deer and hares, to the first 4 birds, and to wild duck. The close time for all wild birds in Great Britain, under the Wild Birds Protection Acts, 1880 to 1939, is from 2 Mar. to 31 July (inclusive), and certain eggs are also protected under the same Acts.

The game laws fix the following close times for various kinds of game, all dates inclusive: black game or heath fowl, 11 Dec. to 19 Aug. (in certain parts 31 Aug.); grouse, 11 Dec. (10 Dec. Scotland) to 11 Aug. in all parts of the U.K.; ptarmigan, in England none, in Scotland 11 Dec. to 11 Aug., in Ireland 11 Dec. to 19 Aug.; partridge, 2 Feb. to 31 Aug. throughout; pheasant, 2 Feb. to 30 Sept. throughout. Christmas Day and all Sundays are C. T. for game. In Ireland male deer are protected from 1 Jan. to 9 June, fallow deer from 29 Sept. to 9 June, hares from 20 April to 12 Aug., landrail from 11 Jan. to 19 Sept., and quail from 11 Jan. to 19 Sept. In England and Scotland the 2 last-named come under the Wild Birds Protection Acts already referred to. Otter-hunting lasts from 15 April to 15 Sept. In addition to these general rules, provisions are made by the secretary of state by which protection may be granted to certain birds in particular localities at other times on application from the local authorities. The Salmon Fisheries Act, fixing the close time in England and Wales for nets from 1 Sept. to 1 Feb., and for rods from 2 Nov. to 1 Feb., has been varied considerably in different parts of the country, but it always begins for nets not later than 1 Nov., and lasts for a minimum of 154 days. For rods it must not begin later than 1 Dec., and the minimum period is 92 days. In Scotland the close time for salmon, usually lasting from 27 Aug. to 10 Feb. for nets, and from 1 Nov. to 10 Feb. for rods, must not be less than 168 days for nets.

There are also weekly C. T. in the British Isles, including Sunday, which vary from 24 to 48 hrs. The Fresh-water Fisheries Act of 1873 fixed a close time for fresh-water fish not caught in private waters from mid Mar. to mid June, except for certain specified parts of the country. Crabs and lobsters under a certain size (crabs 4½ in. across back, lobsters 8 in. in length) may not be sold, and protection is also given to soft crabs and crabs with spawn. The protection of oysters varies according to local regulations. A general close time for deep-sea oysters is fixed by the Fisheries Act of 1877 in Great Britain from 15 June to 4 Aug. There are game laws and various regulations for the protection of animals in most countries, sometimes of an extremely stringent nature.

Closed Shop, term, first used in America, to indicate shops or factories from which non-union labour is excluded at the insistence of trade-union workers. The guildsmen or craftsmen of the late Middle Ages vigorously insisted in England on the exclusion from their work of workers who were not of their crafts or guilds. In the U.S.A. (where there is no political levy) a C. S. is an industrial estab. in which the employer prescribes, as a condition of employment, that each worker shall belong to his appropriate trade union. Where 2 trade unions compete for the support of a craft, the union which is accepted as 'appropriate' is determined by a somewhat intricate process operated

by a Federal Board of Industrial Relations, a gov. body the like of which does not exist in Britain. The position of the employer is that the unions compel him to lay down the condition of union membership, and the board tells him which is the union, in each craft, to which a monopoly has been granted. In effect he acts as honorary treasurer of the monopoly union, deducting its subscriptions from the employees' wages. In Britain, theoretically at least, an employer insists only upon trade-union membership, leaving the employee free to choose his union. The effect of the C. S. is to compel men to associate with a movement which is quasi-political, to reduce the supply of labour in an industry, raise the wages of union labour, and make consumers pay higher prices than are necessary.

Closure, or **Clôture**, in parl. procedure a method of putting an end to a debate which compels the House to decide upon the matter under discussion. The C. was first authorised by the Urgency Rules of 1881, upon a motion to vest in the Speaker the powers of the House for the regulation of its business. The obstructionist methods of the Irish Nationalist members induced the House to carry the motion, which was afterwards permanently estab. by a standing order in 1882. That order provides that the opinion of the House may be taken forthwith upon any motion 'that the question be now put'; the C. may be moved either at the conclusion of a speech or whilst a member is addressing the House, and, in the latter event, it intercepts any motion which it was the Speaker's intention to submit. The Speaker (or chairman of ways and means has an absolute discretion in allowing a C. motion to be put; but in practice he intervenes where such a motion is in his opinion an abuse of the rules of the House or an infringement of the rights of the minority. Analogous to the C. are the motions 'that certain words in the clause stand part of the clause,' or 'that a clause stand part of (or be added to) the Bill'; such motions override all power of amendment. C. may also be moved at the moment for 'interruption of business'—that is, at the expiration of the time fixed for the transaction of certain business, when the Speaker adjourns the debate and vacates the chair to make his report to the House. Reflections on the vote of C. are out of order, as are also questions to ministers respecting C. The presence of more than 100 members is required to make the C. vote effectual, or 20 in the case of the C. being put in a standing committee. A far more drastic method of curtailing the length of a debate is that of C. by compartments, called also the guillotine. This is a device whereby a definite period or periods may be set apart by the rules of the House for the discussion of the various stages and portions of a Bill; at the expiration of each period of time the discussion is automatically closed, whether concluded or not, without the leave of the Speaker or chairman being required, and the majority in the House

carry that portion of the Bill. It was first used in 1887 on the occasion of the Common Law Procedure (Ireland) Bill; it was also used in the debates on the Home Rule Bill, 1893, and the Education Bill, 1902. From the return of the Liberals in 1906 it became a characteristic feature of parl. procedure. See PARLIAMENT.

Clotaire I (497-561), Frankish king, was one of the 4 sons of Clovis who, at his father's death (511), received his share of the kingdom, including the cities of Soissons, Cambrai, and Laon. By arranging for the murder of his brother's children he secured Tours and Poitiers in 524, and 10 years later, after the fall of Burgundy, acquired Grenoble. In fact his whole reign was one of annexations. At the death of Childebert, his brother, with whom he had warred against the Visigoths, he became King of all Gaul (558), and he also ruled over much of Germany and exacted tribute from the Saxons.

Clotaire II (d. 629), Frankish king, finally obtained the whole Frankish kingdom in 613. The many concessions he made to the nobility account for the comparative tranquillity of his rule.

Cloth, see CLOTH MANUFACTURE AND FINISHING; COTTON; FABRICS; TEXTILE.

Cloth Manufacture and Finishing. Woven cloth or fabric is made in looms which permit a long 'sheet' of closely spaced parallel warp yarns to be interlaced by weft yarn passing backwards and forwards from one side of the 'sheet' to the other, being directed under some and over others of the warp yarns according to the particular weaving pattern desired. The character of the fairly rigid structure thus produced is determined by the thickness of the yarns, their spacing in the warp and weft, and also by the type of fibre used—cotton, wool, silk, linen, regenerated cellulose and protein rayons, cellulose acetate, or the newer synthetic fibres such as nylon, Terylene, Orion, Dynel, etc. Non-woven cloth such as wool felt having considerable industrial importance is made by processing a web of intermingled wool fibres under suitable conditions of pressure and moist heat to cause the fibres to matt together—no yarn is used. Of increasing importance is the production of non-woven or bonded-fibre fabrics, made by first preparing a web of intermingled fibres of almost any type, not necessarily including wool, but having evenly distributed among them a bonding agent which under appropriate conditions can be made active to cement the fibres loosely, together and thus give a relatively thick, soft, porous cloth. A much favoured method for bonding the fibres in this type of cloth is to intermix a suitable proportion of thermoplastic fibres, such as the synthetic or cellulose acetate fibres, and then cause these to become effective by heat and pressure, possibly assisted by treatment of the composite material with an organic solvent to render these bonding fibres tacky.

Following manufacture cloths have to

be inspected for faults which may then be corrected by hand. But even after such inspection the cloth is generally unsuitable for immediate use in the manuf. of clothing—the cloth as it comes from the loom is usually thready and harsh to handle and may be oily, stained, and dirty. It is thus usually sent forward for scouring, bleaching, dyeing, or printing, and finally finishing. Such treatment may make the cloth not only more attractive but also more useful and durable.

Cloth finishing. However the cloth may have been treated subsequently to weaving, finishing is the last important stage of processing, and there are many different forms of finishing. One form is concerned with modifying the compactness of cloth structure. It may consist of raising a pile on the fabric surface by suitable treatment with rollers covered with wire carding or teazles (usually the former), thus making the fabric soft and spongy, or it may consist of running the cloth between heavy rollers (these may be heated and subject to slip) to flatten it and give it a smooth lustrous appearance. Another method for compacting the structure of a cloth, particularly linen cloth, is that of pounding it with heavy wooden 'fallers' in a beetling machine. A schreiner finish involves running the fabric between a compressed paper roller and a hot steel roller engraved with skew parallel lines (250 to 300 per linear in.), thus giving it a very high lustre not attainable by any other method. An embossed finish is obtained similarly using a steel roller appropriately engraved.

The emphasis to-day is on finishing cloths so that the particular effect produced is fast to washing, and with cotton and viscose rayon cloths particularly success in this direction has been achieved by having a thermosetting resin (made from urea- or melamine-formaldehyde condensation products) present at the time of application of the finish and then running the cloth through a chamber where it is exposed for a few minutes to a temp. of about 150° C. to set and insolubilise the resin. Simple formation of such a resin in cotton and rayon cloth in this way can produce fast-to-washing crease-resist and shrink-resist finishes, it usually being necessary to apply a higher proportion, say 15 to 20 per cent, of resin to secure a useful degree of crease resistance. Embossed and schreiner finishes produced with the aid of a resin are fast to water, whereas without resin such finishes are easily washed out.

The new 'wash and wear' cloths which do not require to be ironed after washing, since they dry (in air) to their original state, are produced by resin finishing. Washable glazed chintz cloths are similarly produced with a resin being present during the calendaring treatment, involving passage between 2 rollers geared to run with different surface velocities so as to produce friction on the surface.

Wool cloths are not subjected to so wide a variety of finishes as are cotton and rayon cloths. The most usual form of

finishing involves a hot pressing in the presence of moisture which contributes to the setting of the wool fibres. A very important wool finish is that by which the cloth is treated with a hypochlorite (other chemicals may be used) solution to render the fibres non-felting, and the cloth is thus not likely to shrink in washing as a result of felting.

Softness of handle in all types of cloth can usually be secured by impregnating them with one of the many types of softeners now available; increased fullness of handle and even stiffness can be obtained by the use of selected filling substances. Modern softening and stiffening agents have the useful property of being strongly retained by the cloth so that the finish is permanent.

Shrink-resist finishes are produced by running the cloth through a special machine which can close up the weft threads (this shortens the cloth) to a point at which in washing the cloth shows no tendency to close up further. This mechanical finish can be combined with treatment with a resin or formaldehyde to make the closing up more permanent in the case of regenerated cellulose (viscose) fibre materials. However the cloth is finished it must (usually by a stentering treatment) be brought to a desired length and width with its warp and weft threads straight and crossing at right angles to each other. It is then ready for immediate use or for making up into various articles and garments.

Clothes, see DRESS.

Clothilde, or Clothilda, St (475-545), daughter of Chilperic, King of Burgundy, and the wife of Clovis, King of the Franks. She exerted great influence over her husband, and persuaded him to become a Christian. Together they built the church of the Holy Apostles at Paris, afterwards called St Geneviève, in which they were both buried. At the death of Clovis C. retired to the abbey of St Martin at Tours.

Clothing, see DRESS.

Clotho, one of the Fates. See MOIRAE. **Clothworkers' Company**, one of the 12 greater livery companies of the city of London. A royal charter was granted in 1528 on the amalgamation of the Fullers (1480) and Shearmen (1507). The company's first hall, built in Mining Lane in 1480 by the Shearmen, was destroyed in the Great Fire (1666). The third hall (opened 1860) was destroyed during the Second World War, and a fourth hall is now being rebuilt on the old site. The diarist Pepys was master of the company in 1677.

Clôture, see CLOSURE.

Cloud, mass of mist consisting of minute globules of water formed of condensed aqueous vapour floating in the atmosphere. Sometimes the condensed vapour is

solidified into minute fragments of ice or snow, this being particularly the case with cirrus, cirrostratus, and cirrocumulus C.s, where the refraction of light by the ice-crystals often gives the appearance of a halo. In outline the classification of the C.s is based upon that originally put forward by Luke Howard at the beginning of the 19th cent., namely cirrus, the thread C.; cumulus, the heap C.; stratus, the flat C. or level sheet; and nimbus, the rain C. The details of a more precise classification occupied the attention of meteorologists in many countries during the latter part of the cent., among whom were specially prominent the Englishmen, the Rev. Clement Ley and the Honourable Ralph Abercromby. Other meteorologists who were specially active in this work were Prof. H. H. Hildebrandsson, of Uppsala, Sweden; M. Léon Teisserenc de Bort, of Paris; and M. A. Riegenbach, of Zurich, Switzerland. A classification was agreed at the international conference at Munich in 1891, and as a sequel the first ed. of the *International Atlas of Clouds* appeared in 1895; the last appeared in 1910, and is now out of print. After the First World War the need for a new atlas was acutely felt, and an international commission for the study of C.s was set up in 1922, under the presidency of Gen. E. Delcambre, the director of the Office National Météorologique de France, to undertake this work. An 'abridged edition for the use of observers' was produced in 1930, and the complete atlas with separate eds. having the text in French, English, and German was pub. in 1932. In this atlas a modification was introduced which was of very great importance. In the earlier atlas the C. had been considered as an entity rather than as a feature of the sky which should be considered in relation, not only to all the other C.s present, but also to the development in time. This involved some radical changes in the conception of how C.s should be viewed, and some differences in the nomenclature of C.s. This conception has led to the international codes for reporting C. types, and in the atlas an attempt was made to give in order examples not only of the basic classification but also of the sky types to which numbers are given in the reporting codes. After the Second World War, 1939-45, some amendments were made to the reporting codes at the twelfth conference of directors, held at Washington, D.C., in 1947: the most important new features are the omission of 'nimbus' and the inclusion of the new type 'nimbostratus.'

The following summary of the international classification is based on Part I of the Eng. ed. of the *International Atlas of Clouds*. A new *International Cloud Atlas* has been pub. by the World Meteorological Organisation.

TABLE OF CLOUD CLASSIFICATION

At nearly all levels C.s may appear under the following forms: (a) isolated heap C.s with vertical development during

their formation, and a spreading out when they are dissolving; (b) sheet C.s which are divided up into filaments, scales, or rounded masses, and which are often stable or in process of disintegration; (c) more or less continuous C. sheets, often in process of formation or growth.

Classification into families and genera is as follows:

Family A consists of high C.s (mean lower level 6000 metres (20,000 ft)). It should be noted that the heights given are for temperate lats. and refer, not to sea level, but to the general level of the land in the region. In certain cases there may be large departures from the given mean heights, especially as regards cirrus, which may be found at any height where ice crystals can exist.

Form b 1. Genus Cirrus.

2. Genus Cirrocumulus.

Form c 3. Genus Cirrostratus.

Family B: Middle C.s (mean upper level 6000 metres (20,000 ft), mean lower level 2000 metres (6500 ft)).

Form a } 4. Genus Altopumulus.

Form b } 5. Genus Altostratus.

Most altocumulus and stratocumulus C.s come under category b; but the varieties cumuliformis and particularly castellatus belong to category a.

Form c 5. Genus Altostratus.

Family C: Low C.s (mean upper level 2000 metres (6500 ft), mean lower level close to the ground).

Form a } 6. Genus Stratocumulus.

Form b } 7. Genus Stratus.

Most altocumulus and stratocumulus C.s come under category b; but the varieties cumuliformis and particularly castellatus belong to category a.

Form c } 7. Genus Stratus.

Form d } 8. Genus Nimbostratus.

Family D: C.s with vertical development (mean upper level that of the cirrus, mean lower level 500 metres (1600 ft)).

Form a } 9. Genus Cumulus.

Form b } 10. Genus Cumulonimbus.

DEFINITIONS AND DESCRIPTIONS OF THE FORMS OF CLOUDS.

(1) *Cirrus* (Ci.), detached clouds of delicate and fibrous appearance, without shading, generally white in colour, often of a silky appearance. Cirrus appears in the most varied forms such as isolated tufts, lines drawn across a blue sky, branching feather-like plumes, curved lines ending in tufts, etc.; they are often arranged in bands which cross the sky like meridian lines, and which, owing to the effect of perspective, converge to a point on the horizon, or to 2 opposite points (cirrostratus and cirrocumulus often take part in the formation of these bands).

(2) *Cirrocumulus* (Cc.), cirriform layer or patch composed of small white flakes or of very small globular masses, without shadows, which are arranged in groups of

lines, or more often in ripples resembling those of the sands on the sea shore. In general cirrocumulus represents a degraded state of cirrus and cirrostratus, both of which may change into it. In this case the changing patches often retain some fibrous structure in places.

Real cirrocumulus is uncommon. It must not be confused with small altocumulus on the edges of altocumulus sheets.

(3) *Cirrostratus* (Cs.), thin whitish veil, which does not blur the outlines of the sun or moon, but gives rise to halos. Sometimes it is quite diffuse and merely gives the sky a milky look; sometimes it more or less distinctly shows a fibrous structure with disordered filaments.

(4) *Altopumulus* (Ac.), layer (or patches) composed of laminae or rather flattened globular masses, the smallest elements of the regularly arranged layer being fairly small and thin, with or without shading. These elements are arranged in groups, in lines or waves, following 1 or 2 directions, and are sometimes so close together that their edges join. The thin and translucent edges of the elements often show *irisations* which are rather characteristic of this class of C.

(5) *Altostratus* (As.), striated or fibrous veil, more or less grey or bluish in colour. This C. is like thick cirrostratus, but without halo phenomena; the sun or moon shows vaguely, with a faint gleam, as though through ground glass. Sometimes the sheet is thin with forms intermediate with cirrostratus (altostratus translucidus). Sometimes it is very thick and dark (altostratus opacus), sometimes even completely hiding the sun or moon. In this case differences of thickness may cause relatively light patches between very dark parts; but the surface never shows real relief, and the striated or fibrous structure is always seen in places in the body of the C.

(6) *Stratocumulus* (Sc.), layer (or patches) composed of globular masses or rolls; the smallest of the regularly arranged elements are fairly large; they are soft and grey, with darker parts. These elements are arranged in groups, in lines, or in waves, aligned in 1 or in 2 directions. Very often the rolls are so close that their edges join together; when they cover the whole sky—the Continent, especially in winter—they have a wavy appearance.

(7) *Stratus* (St.), uniform layer of C., resembling fog, but not resting on the ground. When this very low layer is broken up into irregular shreds it is designated *fractostratus* (Fs.).

(8) *Nimbostratus* (Ns.), low, amorphous, and rainy layer, of a dark grey colour and nearly uniform. It appears as though feebly illuminated seemingly from inside. When it gives precipitation this is in the form of continuous rain or snow. But precipitation alone is not sufficient criterion to distinguish the C., which should be called nimbostratus even when no rain or snow falls from it. There is often precipitation which does not reach the ground; in this case the base of the

C. is always diffuse and looks 'wet' on account of the general trailing precipitation, *virga*, so that it is not possible to determine the limit of its lower surface.

(9) *Cumulus* (Cu.), thick Cs with vertical development; the upper surface is dome shaped and exhibits rounded protuberances, while the base is nearly horizontal. When the C. is opposite the sun the surfaces normal to the observer are brighter than the edges of the protuberances. When the light comes from the side the Cs exhibit strong contrasts of light and shade; against the sun, on the other hand, they look dark with a bright edge. True cumulus is definitely limited above and below; its surface often appears hard and clear cut. But one may also observe a C. resembling rugged cumulus in which the different parts show constant change. This C. is designated *fractocumulus* (Fc.).

(10) *Cumulonimbus* (Cb.), heavy masses of C., with great vertical development, whose cumuliform summits rise in the form of mts or towers, the upper parts having a fibrous texture and often spreading out in the shape of an anvil. The base resembles nimbostratus, and one generally notices *virga*. This base has often a layer of very low ragged Cs below it (*fractostratus*, *fractocumulus*). *Cumulonimbus* Cs generally produce showers of rain or snow and sometimes of hail or soft hail, and often thunderstorms as well. If the whole of the C. cannot be seen the fall of a real shower is enough to characterise the C. as a *cumulonimbus*.

PRINCIPAL VARIETIES OF CLOUDS

In addition to *families* and *genera* which suffice for the broad classification of C. forms, the new International Atlas also recognises *sub-genera*, *species*, *varieties*, and *casual details* to which distinguishing Lat. adjectives are applied for purposes of more precise differentiation. For details of these sub-classifications reference should be made to the atlas. Among the most important of these sub-classifications are those distinguished by the adjectives 'cumuliformis,' 'lenticularis,' 'castellatus,' and 'mammatus.'

See Air Ministry (Meteorological Office) M.O. 233, *Cloud Forms*, 1949, from which the above text is reprinted, by permission of the Controller of Her Majesty's Stationery Office; also G. A. Clarke, *Clouds*, 1920; A. W. Clayton, *Cloud Studies*, 1925; C. J. P. Cave, *Clouds and Weather Phenomena*, 1926, 1943.

Cloudberry, see RUBUS.

Clouded Leopard, see LEOPARD.

Clouet, François (c. 1510-72), Fr. painter, son of Jean C. the Younger (c. 1485-1545). Father and son were noted miniaturists. He succeeded his father in the twofold office of *valet de chambre* and painter-in-ordinary to Francis I in 1545 and held the post under Henry II and Charles IX. He executed portraits of Henry II, Mary Queen of Scots, and Catherine de' Medici (now in Castle Howard, Yorks). There is a portrait of Francis II as an infant in the Antwerp

Museum, and sev. of his paintings are in the Louvre, Vienna, Florence, and other European cities and there is a fine series of his drawings in the National Library, Paris, some crayon heads in the Brit. Museum, and examples of his portraiture in Hampton Court and Hertford House, London.

Clough, Anne Jemima (1820-92), b. Liverpool, pioneer in the higher education of women. In 1871 she became head of the first house for women students in Cambridge. This house developed into Newnham Hall and, in 1880, into Newnham College (q.v.), of which she was first principal.

Clough, Arthur Hugh (1819-61), poet, b. Liverpool. In 1822 his father, a cotton merchant, emigrated to Charleston, S. Carolina, with his family. In 1828 C. returned to England to school at Chester; from there he passed to Rugby, then under Dr Arnold, and to Balliol College, Oxford. In 1842 he was elected to a fellowship at Oriel College. Oxford at this time was in the throes of fierce theological controversy, and C. fell for a time under the influence of Newman's High Church principles; this was followed by a period of scepticism, and in 1848 he felt called upon to resign his post. Then he travelled for a time, and was in Paris during the revolutionary movements of 1849, and at Rome during its siege by the French. From 1849 to 1852 he was principal of Univ. Hall, London. In 1854 he married, and in 1856 was appointed secretary to the commission for examining scientific military schools on the Continent. In 1848 he pub. *The Bothie of Tober-na-Vuolich*, a 'long-vacation pastoral' in hexameters; in 1849 a collection of poems, called *Ambarratlin*, with his friend, Thomas Burbridge. In the same year he wrote *Amours de Voyage*, a novel, also in hexameters, at Rome; *Dipsychus*, a satire, followed in 1850; and *Mari Magno*, or *Tales on Board*, a series of idylls, in 1861. *Plutarch's Lives*, 1859, was a revision of Dryden's and other 17th-cent. translators' ed. of Plutarch. His work contains much deep thought and clever experiment with hexameters, but, except in the case of a few of his lyrics, never rises to great worth or beauty. C. is the subject of Matthew Arnold's beautiful elegy, *Thyrsis*. His collected *Poems* were ed., with a memoir by F. T. Palgrave, 1862. See monographs by S. Waddington, 1882, J. I. Osborne, 1920, and G. Levy, 1938.

Clouston, Joseph Storer (1870-1944), novelist, b. Cumberland, came of an old Orkney family. Educ. at Merchiston Castle and Oxford, he was called to the bar but never practised law. In 1899 he pub. his first novel, *The Lunic at Large*, which was so successful that he later added a number of sequels. He wrote sev. other novels, including 2 war thrillers, and also a *History of Orkney*, 1932.

Clovell, fishing vil. of N. Devon, England, 11 m. WSW. of Bideford in the Barnstaple par. div. It is situated in a sheltered valley; the main street, being of cobbles with steps here and there,

descends 400 ft to a rude little pier. Transportation is by slides or sledge downwards, and by donkeys upwards. There is an ant. Brit. encampment a mile away. Pop. 533.

Clover, name given to various species of *Trifolium*, the leguminous genus to which belong the shamrock and trefoil. C. was introduced into the agriculture of Great Britain about the 16th cent. from the Low Countries, where it had long been cultivated as green food for cattle in situations where natural pastures were scarce. The species are ann., biennial, or perennial plants, and of these the biennial produces the richest crop. Red C. is the most approved variety, and is usually sown with barley or oats, sometimes along wheat or rye in spring. The first crop is generally mown and made into hay, which must be perfectly dry before it is stacked, and in winter it provides a very nutritious food for cattle. White C. is a perennial which grows rapidly and forms excellent pasture, especially for sheep; a light calcareous soil is best adapted for its growth. It is also valuable to man as a source of honey. Another perennial C. is the cow-grass, which is found in all rich meadows, and is often sown in conjunction with white C. *T. minus*, the lesser yellow trefoil, and *T. procumbens*, the hop trefoil, are also valuable varieties found in good pastures. The only ann. C. which is cultivated is *T. incarnatum*, a species which has been brought from the E. The lt. rye-grass, *Lolium perenne italicum*, is often sown with it and will grow as rapidly; it is a good corrective of the heating qualities of C. hay. The prin. use of this C. is to raise very early food for ewes and lambs.

Cloves (M.E. *clow* (e) from Fr. *clou*, a nail), dried, unexpanding flower-buds of the clove-tree (*Eugenia caryophyllata*), a plant belonging to the family Myrtaceae, a native of the Molucca Is. The tree is an evergreen, growing to about 40 ft in height, with large oval leaves and small flowers, produced in great numbers in cymes, which become red when ready for picking. The entire plant has an aromatic odour. The buds, when gathered, are a little over half an inch long, and consist of a cylindrical calyx, at the end of which are 4 extended sepals and a ball formed by 4 unopened petals. They are dried either in the sun or by wood smoke, and then become of a reddish-brown colour. They have a very powerful odour and a hot and acrid taste, and on pressure exude a volatile oil, of which they contain a large proportion, about one-fifth of their entire weight. C. are mainly used for flavouring in cookery and confectionery, and also to preserve clothing from moths. The essential oil is extracted by means of repeated distillation with water, and when carefully prepared is of a pale yellow colour, later turning to brown, and with the taste and odour of C. It is known to the pharmacopoeia as *Oleum caryophylli*, and is a mixture of eugenol ($C_{15}H_{12}O_2$) and a hydrocarbon ($C_{15}H_{14}$). The oil is soluble

in alcohol, ether, and fixed oils. It is used in medicine as a flavouring agent and to prevent nausea and griping caused by purgatives. Its volatile qualities make it valuable to relieve toothache, and it is also used as a local anaesthetic. C. are now chiefly cultivated in Amboyna, Zanzibar, Pemba, Java, Sumatra, Réunion, and the W. Indies. The Dutch long held the monopoly of clove-growing in the Moluccas.

Clovis, Chlodowech, or Chlodwig, name of 2 Merovingian kings of the Franks:

Clovis I (c. 465-511) succeeded his father Childeric in the year 481 as king of the Salian Franks. In 486 he overthrew the Gallo-Romans under Syagrius, near Soissons; in 493 married Clothilde (q.v.), a Christian Burgundian princess, and in 496 embraced her faith. In 507 he defeated and killed Alaric II, the Arian king of the Visigoths, at Vouille, but was checked at Arles by Theodoric, King of the Ostrogoths. He then settled in Paris, where he d. He was the real founder of the united Frankish kingdom.

Clovis II (633-56) succeeded his father, Dagobert I, in 638 as King of Neustria and Burgundy. In 656 he instigated the assassination of the usurping King of Austrasia, annexed his dominions, and thus became king of the whole Frankish empire.

Clovis, cap. of Curry co., E. New Mexico, U.S.A., on Llano Estacado, near Texas line. It is a railroad div. point and an important trade and live-stock centre. It has repair shops and manufs. flour, dairy products, and beverages. Artifacts of the Folsom period have been found near by. E. New Mexico State Park is 11 m. S. Pop. 17,318.

Clowes, William (1544-1604), surgeon, b. Kingsbury, Warwickshire. He was surgeon at St Bartholomew's Hospital, served in the Netherlands with Leicester, and took part in the defeat of the Sp. Armada, later becoming surgeon to Elizabeth I. He was the greatest of the Elizabethan surgeons. He wrote *A Prooved Practise for all Young Chirurgeians*, 1588, and books on syphilis and scrofula. A vol. of his *Selected Works* was pub. in 1949.

Clowes, William (1780-1851), joint founder with Hugh Bourne of Primitive Methodism, was a native of Burslem, who came to live at Tunstall. Here he worked as a potter and gained a reputation as an excellent dancer. Attracted by the open-air meetings of Bourne, which differed from Wesley's 'camp meeting' in having both prayers and singing, he early joined a Methodist class, visited the country cottages as an evangelist, and held prayer meetings and love-feasts in his home. C. supported Bourne in his efforts to hold religious meetings, which should persuade men to renounce their wakes and the drunkenness and other vicious habits there practised. The new brotherhood, which had at first availed itself of Wesleyan Methodist protection, definitely repudiated all connection with Wesleyans in 1810. Even C., who had leanings towards the older sect, was cut off from his church in 1808 and 1810 for

officiating at camp meetings in Ramsor. In 1811 he became the preacher at a chapel in Tunstall of a small society of Primitive Methodists who had first met together in a kitchen. After 1827 C. gave up circuit work, but continued his mission of evangelisation till his death. He was a man of fine presence and engaging disposition, and his strong personality, with which was combined a fine and enthusiastic delivery, secured many converts to his cause. The influence of the movement to which C. gave his life is well reflected in the works of George Eliot, George Borrow, and Arnold Bennett.

Clowes, Sir William Laird (1856-1905), naval writer and historian. His series of articles, under the pseudonym 'Nauticus,' in the *Daily Graphic* (1893), entitled 'The Needs of the Navy,' had an enormous influence on public and official opinion. In 1891 he had been largely instrumental in the foundation of the Navy Records Society, and between 1897 and 1903 he compiled *The Royal Navy: its History from the Earliest Times*, in collaboration with Sir Clements Markham and others. Among his other works are *Black America: a Study of the Ex-Slave and his Late Master*, 1891, *The Great Peril*, 1893, *The Naval Campaign of Lissa*, 1901, *The Mercantile Marine in War Time*, 1902, and *Four Modern Naval Campaigns*, 1902.

Clown, buffoon, formerly attached to the households of nobles, now a comic character in a pantomime. See JESTER.

Cloyne, mkr̄t tn of co. Cork. Rep. of Ireland, 15 m. ESE. of Cork. It gives its name to a Rom. Catholic diocese, the cathedral of which is at Cobh, but it also has a Protestant cathedral (founded by St Colman in the 6th cent.), opposite which is a splendid and well-preserved round tower rising to a height of 90 ft. Pop. 620.

Club, an association of people with common interests, objects, tastes, or pursuits. Social C.s demand good fellowship, conversation, and an accepted standard of behaviour. Periodic meetings are held for conviviality, for co-operation, or merely to enable the members to eat and drink together. By pooling subscriptions and sharing amenities the members may enjoy the occupation of valuable land and fine buildings while each member retains his independence. To prevent overcrowding the number of members is usually limited and each member may oppose the entry of any newcomer. Elections are by ballot or by a selection committee. Every C. has an ann. meeting and periodic changes in its committees. The ownership of many C.s is proprietary and the liability of members is limited. Early records of civilisation show that people gathered together for communal life. Apart from Gk and Rom. accounts, there are anct buildings in Africa, Asia, and Europe which were used as meeting-places. Secret societies were concerned with religion and politics, and guilds handled commerce. In their most indefinite form the foundation of Eng. C.s began in the

15th cent. Taverns and coffee-houses were used. Towards the end of the 16th cent. Raleigh and Shakespeare used the Mermaid Tavern at Bread St. and Ben Jonson the Devil Tavern; later Steele and Addison frequented Button's Coffee-house. The cult of coffee-drinking led to the use of coffee-houses (q.v.) for free speech and for the spreading of news; Charles II failed in his attempt to suppress such meetings. Some of the most popular coffee-houses were Garraway's, Child's in St Paul's Churchyard, the Grecian beside the Temple, Will's in Covent Garden, and Lloyd's in Tower St (before it moved to Abchurch Lane). In the days of Pepys each of these places had their own patrons and it was not until the 17th cent. that exclusive C.s were first set up. Strangers could intrude into select gatherings, and a desire to prevent this led to the formation of what is to-day the accepted type of Brit. C. Men sought and came to value the privilege of exclusive company. A political C., the Rota, was founded in 1659, and the Kit-Kat in 1700. Two years earlier Mrs White was running her Chocolate House in St James's St. and she proved so successful that her name survives to-day as that of the famous London C., White's. So great was the demand for membership of her C. that another known as the 'Young Whites' was formed among prospective members awaiting election. The Dilettante C. was started in 1734 and subsequently its dinners were perpetuated at the St James's C. The Royal Society in 1743 provided the first dining-room for learned men. The passage of time saw the disappearance of many famous C.s, but one world-renowned London C. remains to-day, the Athenaeum. At the house of John Murray in Albemarle St a notable gathering took place in 1823. It was there that John Wilson Croker persuaded a score of learned men to adopt his plan for a meeting-place for gentlemen of scientific or literary attainment. Scott and Moore were members of the original committee. The C. takes its name from a building in Athens dedicated to Minerva where philosophers recited their works, and above the entry there is a statue of Athene. The imposing C. building was designed by Decimus Burton. In prov. tns also, including Bristol and Manchester, the name Athenaeum is perpetuated.

In the West End of London to-day there are some 3 dozen purely social C.s, apart from a further 2 dozen with a more specialised membership. Long ago the members of the most exclusive C.s were more demonstrative than they are to-day. They indulged in singing, speech-making, drinking, eating, and gambling on the grand scale. Stakes ran high at places such as Almack's and Crookford's, and a glass of port or mulled sack cost but a few coppers. Univ. C.s were estab. early in the 19th cent. and political C.s included the Carlton, the Junior Carlton, the Conservative, the Reform, the Devonshire, Brooks's, and the National Liberal. Specialist C.s were the United Service

(now E. India and Sports), the Oriental, the Garrick, the Savage, the Arts, the Bath, and Boodles'. There are many other C.s of note in the tiny area forming London's clubland, while outside London there are more than 150 first-class C.s in England alone. Scotland has more than 2 dozen and there are half a dozen in N. Ireland. Within Great Britain there are about 4 dozen C.s devoted to yachting, to mention only one form of sport. Early in the 20th cent., due to increasing urbanisation, London lost its country C.s, which had included the Royal Botanic Society (at Regent's Park), Roehampton, Ranelagh, and the open polo ground at Hurlingham. Three unique C.s worthy of mention are the Jockey C., 1750, the

C., New York, from 1836; other New York C.s are the Century, the Manhattan, the Knickerbocker, and the University. The Puritan C. is in Boston. In addition there are C.s concerned with every kind of sport and others interested in welfare and in commerce. There are more than 1800 golf C.s.

In Canada there are more than 150 prin. C.s. The number in each prov. varies considerably; Ontario has more than 60, Quebec 40, and Brit. Columbia 20, with fewer in Alberta, Manitoba, New Brunswick, Saskatchewan, and Nova Scotia. The number of members in individual C.s of note varies from around 200 to well over 2000 persons. Some C.s date back more than 100 years; in the

Cadbury Brothers Ltd

WHITE'S CHOCOLATE HOUSE, ST JAMES'S, IN 1708

A modern painting by H. W. White.

Royal Blackheath Golf C. (18th cent.), and the Marylebone Cricket C., whose members long ago leased their grounds from a Mr Lord. The last attracted players from the Hambledon C., where the members wore a uniform, a fashion which once had its counterpart in the Royal Burgess C., Edinburgh. In Princes St, Edinburgh, stands the New C., which dates from 1787. For generations Brit. C.s barred lady members, but the position of ladies has changed considerably within recent years; many C.s have rooms set aside where ladies are entertained. There are other C.s with a mixed membership of men and women, but these are not numerous. The first C. formed for women was the Alexandria in 1883.

In the U.S.A. country C.s are the great social gathering places, and there are no comparable country C.s in Great Britain. There are very early mentions of such C.s as the Old South, the Temple, the San Souci (1780), and the League (1863). In most cities there are fine C.s. Among the prin. social C.s, the Brookline Country C., Brookline, Massachusetts, is probably the oldest. The Bohemian, San Francisco, California, dates from 1887; the Lotus C., New York, from 1870; the Lamb's, New York, from 1874; the Union

main the Canadian C.s exist as country C.s, golf or yacht C.s. All these cater for both sexes. In addition there are a few social C.s of high standing where the C. maintains fine buildings, meals are served, and in some cases there are bedrooms for members. Prin. Canadian C.s include the Montreal Amateur Athletic C., which has 5000 members and is residential; the Granite C., Toronto, has a still larger membership, and also dining facilities; at Calgary too there is another fine C., the Glenoco, and these are social C.s in the fullest sense. C.s may also be estab. for purposes of sport or welfare or as youth organisations or for combat service, or based on projects such as those of Rotary.

New Zealand has numerous C.s for yachting, seaboard activities, and golf, but apart from these special interests, social C.s are found in the larger cities. In Auckland there are 3, and in Christchurch, Dunedin, and Wellington 2 each. All these C.s serve meals, and some provide bedrooms for members; one New Zealand C. is run in many respects on the lines of London's Savage C. In Australia the Sydney Savage C. was founded in 1934 and based its rules and constitution on those of the older C. of that name in

London; it is for men only. In Australian C.s gatherings are held called *Corroborees*. Also in Sydney is the Arts C.; another social C. of standing. An exclusive C. is the Pioneer, also in Sydney, and at Melbourne there is a first-rate social C., the Melbourne C. Somewhat different is Sydney's Legacy C., whose members are returned ex-service men; it aims to help survivors of fallen comrades. It is a mixed C. where parents attend with their children, and has a number of prov. branches. A. C. specially formed for women is the Queen's C. in Sydney. Apart from the few purely social C.s which are conducted on rather more progressive lines than the oldest London C.s, there are countless C.s with sporting, welfare, and trade interests, but without C. premises; meetings are held at places where meals are served.

C.s were formed in France as a direct result of the revolution. The C. Breton, 1782, was subsequently renamed C. des Jacobins and, linking up with the C. des Cordeliers, it caused the formation of a political party. In early days Fr. C.s confined their activities to public affairs, and in 1794, during the Directory, they were suppressed. Although C.s were re-established after the revolutionary period, in 1848 they were once more suppressed. To-day the position is very different. There are various Fr. Academies, where membership is small and limited to persons notable in their respective fields, but these are not C.s in the wider sense. There are also Fr. C.s for a variety of purposes, for welfare and for sport, run in the same way as in the Brit. Is. In the big cities of France there are more than 4 dozen first-rate C.s, foremost among these being the Nouveau Cercle, Paris. It is linked to other C.s outside France and is in every sense a quality C. On payment of a far more modest fee, at 2 other C.s visitors are admitted to membership; there are also the Cercle de l'Union, and the Cercle Central des Lettres et des Arts. The leading military C. is the renowned Cercle Militaire. There are no women's C.s comparable with those to be found in London's West End, but for ladies there are countless C.s concerned with educational work and with every form of religion; besides these there are sev. with a general appeal to women. The 5 prin. ones are Conseil National des Femmes Français, the Union Nationale des Femmes, the Fédération Nationale des Femmes, the Union Feminine Civique et Sociale, and the Union Française des Femmes.

Club-foot (*Talipes*), deformity of the foot resulting on contraction of certain muscles or tendons. It may be congenital or acquired. If congenital the cause may be long-sustained pressure upon the foot in the womb. Many mild cases of the congenital defect submit to early treatment. When the deformity is acquired it is almost invariably the result of infantile paralysis; certain muscles retain their function, and their prolonged contraction is followed by shortening of the ligaments connecting the bones.

The varieties of C. are (1) *T. equinus*, where the subject walks upon the fore part of the foot, the heel not touching the ground; (2) *T. varus*, where the outer edge of the sole touches the ground, the foot being turned inwards; (3) *T. calcaneus*, where the heel only touches the ground, the toes being pointed upwards; and (4) *T. valgus*, where the subject walks upon the inner edge of the sole. The former two are the congenital types, and are often combined, when the deformity is known as *T. equino-varus*. The latter two are nearly always acquired. Treatment of C. should, above all, be prompt. If it is congenital efforts should be made by constant manipulation to encourage the foot to take up a normal position. If this is unsuccessful it may be necessary to separate the contracted tendons by surgical operation. The foot is then kept immovable in the normal position by being set in plaster of Paris until the tendons and ligaments have grown to the required extent. Generally it is also necessary to apply a splint which keeps the foot in the correct position, so that, as growth goes on, the bones are moulded to the proper shape in a few months.

Club-hand, deformity of the hand similar to that of club-foot. The hand is permanently bent at the wrist, by contraction of the flexor muscles, or is bent backwards, as by contraction of the extensors. It is often associated with other deformities. The fingers of the affected hand are weak or useless. Treatment, where possible, is surgical.

Club-root, see CLUBBING.

Club-shell, see CLAVAGELLA.

Club Mosses, see LYCOPODIUM.

Clubbing, or Club-root, disease which often attacks the roots of turnips, cabbages, and other cruciferous plants, usually the result of improper cultivation. It is due to the ravages of a slime fungus, *Plasmodiophora brassicae*. It causes the host plant to send out nodular outgrowths from the root with subsequent gradual decay of the plant itself. Lime is the best disinfectant against C., because the spores of the fungus cannot germinate in it or penetrate it. Any cruciferous plant can spread the disease, so it is not safe to grow them in soil that has once been infected, unless it is previously thoroughly dressed with lime. The spores will lie dormant for sev. years if no suitable host presents itself, but germinate actively as soon as any crucifer is present.

Clugia, see CHIOGGIA.

Cluj (Hungarian Kolozsvár; Ger. Klausenburg), tn and episcopal see of Transylvania, Rumania, 210 m. NW. of Bucharest, and cap. of the prov. of C. Formerly the cap. of Transylvania, the tn is well built and has a Gothic church, a museum, and a citadel. There were 4 bishoprics—Rumanian Orthodox, Uniate, Reformed Church, and Unitarian; the tn is the literary centre of Transylvania and has many educational establs, including a univ. Before the Second World War there were manufs. of linen and woollen goods, earthenware, beer, sugar, paper, and soap.

Formerly Hungarian, it passed to Rumania after the First World War. By the end of Aug. 1944 Soviet forces were consolidating their grip on the passes leading into Transylvania, and C. would have been stormed had not the Rumanian Gov. surrendered. Pop. (1948) 118,000.

Clumber Spaniel, see SPANIEL.

Clunes, tn of Talbot co., Victoria, Australia, 97 m. NW. of Melbourne by rail. It is in the gold-mining dist. opened up in 1851, and is also the centre of an agric. and pastoral industry. Pop. 1225.

Cluny, Fr. tn on the Grosne, 14½ m. NW. of Mâcon by rail, in the dept of Saône-et-Loire. A vil. in 910, the year of the abbey's foundation, it owed its later importance entirely to the monastery. The fame of the order of Cluniac Benedictines is due to the greatness of its abbots, who from 910 to 1157 were, with one exception, conspicuous alike for their piety and strength of will. Odo, the second abbot, made C. the centre of a great monastic revival. The result of his work and that of his successors was that, by 1150, 314 monasteries in all parts of Europe had embraced the Cluniac regime, and were completely subject to C. The order declined rapidly after the death of Peter the Venerable in 1157, so that in 1528 the monastery fell into 'commendam' (q.v.); in 1790, after a regrettable schism between the Reformed and Unreformed, the order was finally abolished. As commendatory abbots both Richelieu and Mazarin had initiated projects of reform. A great normal school was estab. here in 1865. Pop. 4100.

Clupeidae, family of soft-rayed fishes, contains many well-known species, such as the anchovy, herring, pilchard, and sprat. They have scaly bodies and a naked head, and the species inhabit temperate and tropical seas near the coast.

Cluseret, Gustave Paul (1823-1900), Fr. soldier and politician, b. Paris, and educ. at Saint-Cyr. He served in the Crimean War, as a *garde mobile* in the revolution of 1848, in sev. expeditions under Garibaldi in 1860, and 1861-4 on the side of the Unionists in America. On his return to France he became a member of the Internationale, and in 1871 he was for a short time at the head of the military operations of the Paris Commune, and narrowly escaped arrest by fleeing to London; in his absence he was condemned to death by the Third Council of War, 1872. In 1884 under an amnesty he returned to France, and in 1888-9 sat in the Chamber as deputy for Toulon.

Clusia, Amer. genus of Guttiferac, consists of climbing trees and shrubs, often epiphytes, which yield a viscid resinous juice of a balsamic flavour; hence they are in England called balsam-trees. *C. alba* has a scarlet fruit with seeds embedded in scarlet pulp. The plant abounds in balsamic juice of a green colour, which becomes brown when exposed to the air; the seeds are a favourite food of birds, and are plucked from the fruit while hanging on the tree. *C. quapoya* is a climbing shrub with

yellow flowers, and yields a white, transparent juice.

Clusium, see CHIUSI.

Clusone, It. tn in Lombardy (q.v.), 19 m. NE. of Bergamo (q.v.). It has copper and iron works, and a trade in corn. Pop. 6000.

Cluster, see STAR, *Star Clusters*.

Cluster Cup, see AECIDIUM.

Clutch, device by which one shaft may be coupled to another, or released. It consists of a fixed and a movable part and when these parts are in contact the 2 shafts revolve together, and when the C. is disengaged or its 1 part moved away from the other, the shafts are independent of one another. The friction C. is commoner than the dog C., which operates rather in the manner of a zip fastener. But the materials used, the method of pressing the 2 surfaces together, and the details of construction vary widely according to the conditions in which the C. is used. Cast iron in contact with cast iron, steel on bronze, and steel or cast iron on a fabric lining are commonly used. The fabric lining consists mostly of asbestos and brass wire. In the magnetic C. the operating force, provided by a spring in other C.s of the axial type, is produced by the magnetic attraction of one plate towards the other, acting as an electro-magnet.

New Zealand Gov.
THE CLUTHA RIVER, SOUTH ISLAND,
NEW ZEALAND

Clutha, or **Molyneux**, riv. in the S. Is. of New Zealand. It rises in Lake Wanaka and, traversing the prov. of Otago, falls into the sea at Molyneux.

Cluthalite, mineral obtaining its name from the Clyde valley, where it was found. It is a red, flesh-coloured variety of analcime (a zeolite mineral which occurs as pellucid crystals in basalt). It occurs in vitreous crystals, and is a hydrous silicate of the zeolite section.

Cluwer, or **Cluwerius**, Philip (1580-

1623), Ger. geographer and historian, and a great traveller. He served as a soldier in Bohemia and Hungary, and was for a time in prison. After tours in France and the Brit. Isles he returned to Leyden, where the academy allowed him a regular pension. His chief works were *Germania Antiqua*, 1616, a treatise on anc. Sicily, Sardinia, and Corsica, 1619, and his *Introductio in Universam Geographiam*, pub. posthumously in 1629.

Clwyd, riv. which rises in S. Denbighshire, Wales, and flows past St Asaph and Rhuddlan to the Irish Sea at Rhyl. The Elwy is the chief trib. Its valley is noted for its fine scenery.

Clyde, Baron, see CAMPBELL, SIR COLIN.

Clyde, chief riv. of Lanarkshire, Scotland, and one of the world's greatest commercial waterways. Its estuary forms the Firth of Clyde, the finest on the W. coast. Daer Water, which rises in the Lowthers at Gana Hill (2190 ft), and Potrall Water, which unite near Elvanfoot, are the chief head-streams of the C. It rounds Tinto Hill, and its course is fairly devious till a point 4 m. above Lanark is reached, after which it is, broadly speaking, N.-westerly as far as Dumbarton, where it discharges itself into the Firth. On the l. b. the prin. tribs. are the Duneaton (19 m. long), entering above Robertson; the Douglas (20 m.), above Bonnington; the Avon (28 m.), at Hamilton; and the White Cart (19 m.), below Renfrew; the affluents on the right are the Medwin (16 m.), joining the main stream near Carnwath; the Mouse, at Lanark; the N. Calder (16 m.), above Bothwell; the N. Calder (12 m.); and the Kelvin (21 m.), at Glasgow. Near Lanark the C. rapidly falls 230 ft within 3½ m., forming the 4 famous falls of C., namely, the Bonnington Linn, which is the most graceful; the Corra Linn, which in 3 leaps makes a magnificent cascade 84 ft in height; and the Dundaff and the Stonebyres Linn, the latter of which resembles the Corra. In flood-time the Corra Linn makes a single descent of 80 ft or more. Stretching some 106 m. from its source in the Daer to Dumbarton, the C. is the third longest riv. in the country, the other 2 being the Spey and the Tay. Altogether it drains an area of 1481 sq. m. Above the falls it is a pure trout stream, watering pastoral uplands. Below it traverses a fertile valley, sometimes pent up between wooded slopes, sometimes broadening out into a plain. But long before the riv. reaches Glasgow, where the pollution is completed, it grows every mile more sluggish and begrimed as it receives the contamination of various trade effluents. Even in the 18th cent. the C. was fordable in the heart of Glasgow. But neither effort nor money has been spared in deepening the channel, which is now 19 ft at Glasgow even at low tide. Thus the docks at Glasgow can hold the largest vessels, and since Henry Bell launched the first commercially successful steamer, the *Comet*, on the C. in 1812, the ship-building and shipping traffic has increased by leaps and bounds. A weir prevents the further ascent of the tide above

Glasgow. The chief tns on its banks from Elvanfoot to Glasgow are Crawford, Lanark, Hamilton, Bothwell, and Blantyre. The junction for the Forth and C. Canal is at Bowling. The ports are Glasgow, Port Glasgow, Greenock, Ardrossan, Troon, Ayr, and Campbeltown. The fairway of the Firth, which reaches from Dumbarton to Ailsa Craig, measures over 60 m., and from the Mull of Kintyre to Girvan is nearly 40 m. across. The chief is. in the Firth are Arran, Bute, and the Cumbraes, and among the sea lochs, many of which are popular holiday and health resorts, are Gareloch, Loch Long, Holy Loch, and Loch Fyne. These are all on the highland coast.

'Clyde,' The, see GALLIPOLI CAMPAIGN.

Clydebank, burgh of Dumbartonshire, Scotland, on the r. b. of the Clyde, 6 m. NW. of Glasgow. Since 1886 Kilbowie and Dalmuir have been included in the burgh. At C. there are a shipbuilding yard and engineering works, at Kilbowie the factories of the Singer Manufacturing Co., and at Dalmuir a shipbuilding yard, a new tin hall, and public library. Pop. 46,400.

Clydesdale, valley of the Clyde (q.v.), in Lanarkshire, Scotland. Iron and coal are mined in it, and there are many orchards. It gives its name to a well-known breed of heavy horses.

Clydesdale Breed, see HORSE.

Clydesdale Terrier, or **Paisley Terrier**, resembles the prick-eared variety of Skye terrier. It was only introduced about 50 years ago, and is kept entirely as a house-dog. It has a long, silky coat, and is light-coloured with tan legs. Weight 15 to 20 lb.

Clynes, John Robert (1869-1949), Labour politician, b. Oldham. C. attended St Anne's elementary school when a half-timer in a cotton-mill; but he began self-education as a plecer aged 17. He took part in the estab. of a (short-lived) Piecers' Union, which helped to make a speaker of him. He was enlisted by Will Thorne, M.P., as an unpaid speaker at his organising meetings of the Gas and General Workers throughout Lancs. At 22 he was appointed organiser at 30s. a week; he held the post for 6 years, and then became secretary of the Lancs dist. of the union. In 1906 he won, at his first attempt, a parl. seat, becoming Labour member for NE. Manchester—a constituency he represented till its disappearance in 1918; after that he sat for the Plating div. He was parl. secretary to the Ministry of Food, 1917-18; became food controller (and privy councillor) in the latter year, but resigned when his party withdrew from the Coalition. Vice-chairman of the Labour party, 1919; chairman, 1921—but in 1922 was relegated to deputy-chairmanship. In the Labour Gov. of 1924 he was lord privy seal and deputy-leader of the Commons. When the party took office again in 1929, he became home secretary. He was defeated in the general election, 1931, but re-elected in 1935. He did not contest the general election of 1945. C. pub. his memoirs in 1937.

Clypeus Sobieski (Lat. *clypeus*, a shield), constellation formed by Hevelius (1611-1687) out of some small stars S. of Aquila. It was named in honour of John Sobieski III, King of Poland (1674-96). It has a large number of splendid telescopic fields.

Clytaemnestra, daughter of Leda, wife of Tyndareus, King of Sparta, by Zeus, and sister of Castor (q.v.), married Agamemnon, King of Argos. During his absence at Troy, C. lived with his cousin, Aegisthus, and to save herself, on his return murdered him in his bath (according to some accounts to avenge the sacrifice of her daughter, Iphigenia). C. then married Aegisthus, who usurped the throne of Argos. Orestes, her son, with the aid of his sister Electra, killed the guilty pair. See AEGISTHUS; AGAMEMNON; ELECTRA; IPHIGENIA; ORESTES.

Clyde, sea-nymph, daughter of Oceanus, pined for love of Apollo, who deserted her for Leucothea, and was turned into a sunflower or heliotropium.

Cnidoblasts, see THREAD CELLS.

Cnidus, anct Gk city on the coast of Caria, Asia Minor, at the end of the peninsula of Triopium (Cape Krio); colonised from the Peloponnese. One of the 6 cities of the Dorian League, C. was the bp. of the astronomer Eudoxus (q.v.). Originally on an is., the settlement spread to the mainland. The city was famed for its worship of Aphrodite, her celebrated statue (by Praxiteles) being in one of its temples. In 394 bc the Athenian admiral Conon, commanding a Persian fleet, defeated the Spartan fleet under Pisander near C. The fine seated statue of Demeter (Brit. Museum) was excavated from the ruins of C. See C. T. Newton and R. P. Pullen, *Discoveries at Halicarnassus, Cnidus, and Branchidae*, 1892-3, and *Travels and Discoveries in the Levant*, 1865.

Cnosus, see KNOSSOS.

Cnut, see CANUTE.

Coach and Coaching (Magyar kocsi, the kind of vehicle used at Kocs, W. Hungary, 15th cent.). A C. is a large, enclosed 4-wheeled carriage for passengers. As a general term it may be used for all carriages (e.g. in C.-building), or combined with other words for special forms (e.g. stage-C., mail-C., hackney-C., mourning-C.). The typical C., however, has as special characteristics 4 wheels, springs, a roof forming part of the framing of the body, and more than 1 seat for passengers. It was perhaps a later development of the huge agric. wagons in use on the Continent in the 12th and 13th cents. In the Middle Ages very elaborate C.s were used by royalty and nobility and for State purposes. The first C. in England was made by Walter Rippon (1555) for the Earl of Rutland; in 1564 he also made one for Elizabeth I. This stage-C. had seats outside and in, and was much used in England as a public conveyance from the 16th cent. At least 6 existed in 1675, but they did not enter very largely into Eng. life till the 18th cent. In earlier times broad-wheeled vans or wagons were used to convey passengers who could not afford to travel on horseback. Fares were naturally

very high, as the pace was slow. At first there were no actual seats outside, but 'outsides' were taken at a reduced rate (about half-price), and had to cling on by the luggage as best they could. In 1767 a basket, called the convenience, was attached to the back of the C. for half-price passengers. In 1659 the first stage-C. ran between London and Coventry. In 1784 the mail-C. system was introduced by John Palmer, M.P. for Bath, to replace the post-boys who were employed up to that time. The post office vehemently opposed his suggestion, but it was carried out, the first mail-C. running between London and Bristol in 1784. In 1789 springs were introduced by John Warde, the 'father of fox-hunting.' Tubbs and Davis's 'machine' was one of the first fast C.s that ran between London and Brighton. In 1791 lighter vehicles were introduced. Some C.s took only 11 hours to Brighton from London—'flying' C.s could even do it in 8. The fare for a single journey was 14s. or 16s. Before railways came into general use (c. 1840) C.s had regular routes all over the country; similar ones were used in America and on the Continent, where alternative names, such as *Diligence*, *Stellwagen*, and *Eilwagen*, were used for vehicles of the kind. In the U.K. the 2 best-known C.s of historical interest are the queen's state-C. and the lord mayor's (which figures yearly in the procession of the Lord Mayor of London, 9 Nov.). This is the oldest, first used for the procession of Sir Charles Asgill, lord mayor elect, 1757. The body is hung on leather straps, and has much ornamental carving, gilding, and paintwork. The panels and doors are covered with various allegorical groups of figures and heraldic devices. The queen's C. was designed by Sir Wm Chambers and described as 'the most superb carriage ever built.' The paintings were done by Cipriani, the whole being completed in 1761. In the later years of Victoria's reign it was rarely seen, but on the accession of Edward VII it was again made fit for use on State occasions. In 1824 the art of coaching had been perfected; it was often a form of sport, and the custom of driving for high wagers was very popular. When the steam railway had ousted mail-C.s as a necessity, coaching still continued to a certain extent as an amusement for the richer classes. In the early 19th cent. McAdam and Telford improved road-making to such an extent that the conditions for driving were much pleasanter. Considering the unprotected state of the road, highway robberies were not so frequent as might be expected, though, of course, many tales of them survive (Dick Turpin). Much skill was needed to drive 4 horses, and the difficulties and humours of 'the road' are very often referred to in Eng. literature. From the sense of driving, the word C. came to be applied to a tutor for examinations or for athletic contests, especially rowing (army C., varsity boatrace C.). By 1824 over 300 C.s used to pass Hyde Park daily. The most famous coaching

clubs of England have been the old Bensington Driving Club, 1807-52, and the Four Horse Club, 1808-29. These drove a kind of landau. The Richmond Driving Club (promoted by Lord Chesterfield) was instituted in 1838. The Four-in-Hand Club was started in 1856, with the Duke of Beaufort as president, and the Coaching Club in 1870. In America the New York Coaching Club was formed in 1875. Coaching was chiefly the sport of the richer classes, but has been ousted by motoring. From 1896 coaching became a favourite pastime of Amer. millionaires,

Par. Clerks, issued 1732; 'Nimrod' (C. J. Apperley), *Essays on the Road*, 1876; Duke of Beaufort, *Driving* (Badminton Library), 1889; F. Rogers, *Manual of Driving*, 1900; R. Straus, *Carriages and Coaches*, 1912; H. Belloc, *The Highway and its Vehicles*, 1926; T. Read, *The Evolution of the Horse-drawn Vehicles*, 1933; O. O. Winther, *Express and Stage-coach Days in California, 1835-1860*, 1936; B. Darwin, *British Clubs*, 1943; H. McCausland, *The English Carriage*, 1948.

Coachbuilding, or Coachmaking, term

Corporation of London: Guildhall Library

A MEETING OF THE FOUR-IN-HAND CLUB, HYDE PARK, LONDON
An aquatint by J. Harris after James Pollard.

but its true home was in England. Professional drivers of the 'Brighton Age' were Charles Jones, Sir St Vincent Cotton, Dick Brackenbury, and others. Robert Parks for 18 seasons in succession drove the C. from Keswick Hotel to Windermere and back (42½ m.) every week-day. The last sensational driving match was in July 1888, when James Selby drove the 'Old Times' from London to Brighton in 3 hrs 56 min., and back in 3 hrs 54 min., at an average speed of 12 to 13 m.p.h. In some parts of England (London to Brighton, Lake Dist.), in America and Europe, public C.s ran until comparatively recent years at regular times along certain routes. A modern C. has 2 parts, the carriage and the body. The latter typically measures 4 ft 10 in. long, 4 ft wide, 4 ft 2 in. high. They have brakes, but good drivers only need them in emergencies. The Amer. Concord C. has no springs, but leather straps. See *New Remarks on London*, by the Company of

originally applied to the building of horse-drawn carriages and coaches; in the modern sense, the name given to that section of the motor body industry where skilled craftsmen hand-build and finish vehicle bodies, as distinct from the mass production of bodies built with machinery and semi-skilled operators. The development of the motor body industry from the early days of the horse-drawn carriage has now divided into 2 parts, mass production, usually applied to the majority of private motor-cars, and C., referring to the private motor-car body individually hand-built to special order on a high-class chassis. The term C. is also applied to the production of the many different coach and omnibus fleets built in small batches for coach owners, as well as of special purpose trailers and caravans. A coachbuilt body is usually mounted on a separate chassis carrying the engine, transmission, wheels, etc., but latterly some coaches are of unitary construction, i.e. the body is the

main structure and the engine, wheels, etc., are added to it. This method has not yet been developed for private car bodies.

Formerly many different types of private car bodies were produced, but these have now resolved into the following main categories: fixed head 2- and 4-door saloon bodies; limousines with div. fitted between driver and rear compartment; estate cars with partition between passenger compartment and luggage space; miniature or 'bubble' cars running on small engines; and drop-head or convertible bodies such as 2-door coupé bodies, 4-door cabriolet bodies, and sports-car bodies without glass to the doors. Landauettes (with the rear part of the roof folding) and sedans (with the front part of the roof sliding or folding) are practically non-existent now. Similarly, on the commercial side, the charabanc of the early 1900's, with its rows of forward-facing seats stretching the width of the body and separate doors to each row, has been superseded by the modern centre gangway coach and omnibus.

As so many different materials are used in the production of coachbuilt bodies, craftsmen skilled in many trades are employed. Ash, oak, beech, and birch plywood are the prin. timbers used, although owing to world shortage various substitute timbers have been tried. Mild and alloy steels, such as nickel and chromium, aluminium and various aluminium alloys are used for the body structure and panels, while brass, copper, glass, rubber, decorative timbers and veneers, leather, wool cloth, carpets, and paints are all materials used in the production of the finished motor-car.

After the body has been designed and drawn in the drawing office, the setting out dept lays out the size and shape of the various parts, making templates and jigs where required. Machinists in the wood-mill produce the necessary timber parts. Sheet metal workers produce floors and folded metal members, while fitters or engineers produce structural members and body fittings such as door stops, locks, special hinges and brackets, etc. Body-makers assemble and build the bodies to dimensions from templates, hang doors, make and slide the seat frames, etc., and panel beaters produce the body skin from flat aluminium or steel sheets. Panel fixers fix the shaped panels to the body, re-hang the doors, and correct the door lines and clearances. Brass workers make and fit such items as windscreen and door frames, mouldings, cover plates, etc., and also prepare these parts for chromium plating. Joiners make and fit the inside fascia boards, fillets, instrument boards, etc., which are then polished by polishers, while trimmers fit the headlining, make seats, trim the doors, fit carpets, and generally cover the body structure internally. Glaziers fix glass to windscreens, backlight, div., and doors, and ensure its easy raising and lowering. Painting a high-class coachbuilt car body involves priming, filling with oil base filler, rubbing down the filler to obtain a perfect finish,

then spraying with cellulose or synthetic paint and polishing to a high gloss finish. Mounters are employed to assemble such accessories as bumpers, wing undershields, headlamps, side lamps, etc., while electricians have to complete the complicated wiring of various internal and external fittings.

Basically these processes have not changed, but methods have improved and materials have altered since the early days of motor body C. Present day mild steels have replaced wrought iron, and aluminium alloys are being more widely used; glass fibre bound with synthetic resins is coming into use for structures. Many new adhesives are now available, and cellulose and synthetic paints have replaced oil base paints and varnishes. Vinyl interlayer for laminated safety glass has replaced celluloid, and the toughening process and shaping processes for glass have helped to change design. In the trimming field, polyvinyl chloride materials have replaced leather-cloth, while heavy quality polyvinyl chloride materials are now used for hoodings for drophead cars. Foam rubber and wire springing for seats has improved comfort and saved weight. Better draught sealing and the introduction of controlled heating and ventilation systems have now almost eliminated sunshine roofs, and with refrigeration units installed the modern coachbuilt car has complete air conditioning.

Coadjutor, in the Rom. Catholic Church, assistant of a bishop who is unable to perform his work owing either to ill health or old age. He often succeeds to the bishop's see when that dignitary dies.

Coagulation, change which occurs in the physical properties of certain proteins when heated or subjected to various chemical actions. The typical examples are egg albumin, or white of egg, which is a colourless, sticky fluid, miscible in water at ordinary temps., but solidifying into an opaque white mass when placed in boiling water; and blood albumin, which clots on exposure to the air, thus serving a useful purpose in preventing escape of blood from small wounds. See **THROMBIN**.

Coahuila, inland state of N.E. Mexico, bounded on the N. by the U.S.A. Area 58,067 sq. m.; pop. (1950) 720,619. The climate is salubrious, although there are somewhat rapid changes in the thermometer. Agriculture, cattle-farming, and mining form the chief occupations. It is the main Mexican state in which coal is produced (1,432,000 metric tons in 1953). This state is rising in importance owing to the extensive railway development; it possesses 5 dists., and the chief products are cotton, wheat, maize, sugar, and tobacco. Its cap. is Saltillo (70,000).

Coal, that form of fuel which is obtained as a mineral from pits. It is one of the organically formed rocks, and occurs chiefly in the C. measures. It consists chiefly of carbon, hydrogen, and oxygen, and is derived from plant remains. It is a black or blackish-brown rock, with a low sp. gr. C. may be divided into (1) *Bituminous*, (2) *Anthracite*. *Lignite*, or

brown C., is a stage in the conversion of vegetable matter into bituminous C. Graphite is the final stage in the transition. In the Carboniferous age great masses of luxuriant vegetation grew near sea levels. As the land covered with this vegetation became submerged, sediments of mud and sand, etc., formed over it. When this land became raised again above sea level, new vegetation grew, which, in its turn, would undergo a similar treatment. These processes would at length produce stratified measures, which, under the ensuing great pressure and certain chemical changes would result in the formation of seams of C. The table below (compiled by Prof. J. W. Gregory) gives results of analysis, excluding nitrogen and sulphur.

which gives bituminous C. Microscopic examination shows that C. consists of 4 main constituents, called durain, clarain, fassin, and vitrain. As a whole, C. appears to be a colloid (q.v.), but the general structure is complicated and variable.

All C., as would be expected from its vegetable origin, contains a proportion of nitrogen, and is important as the source of the ammonia obtained as a by-product in the manuf. of C. gas.

The effect of heat on C. in the absence of air varies according to the conditions, especially the temp. (see CARBONISATION (Low Temp.)). Gaseous and liquid products are always found, however (see COAL TAR and GAS MANUFACTURE), while a residue of coke (q.v.) is left in the retorts.

	Carbon per cent	Hydrogen per cent	Oxygen per cent	Ash per cent	Moisture per cent
Air-dried Wood	39	4.5	35.5	1	20
Air-dried Peat	44.5	4.5	26.5	8.5	16
Air-dried Lignite	45	3.75	26.25	10 *	15
Bituminous Coal	72	4.0	11.0	10 *	3
Anthracite	91.5	2.5	1.0	3	2
Graphite	95	—	—	5	—

* Very variable.

Anthracite is always found deeper in the earth than bituminous, bituminous than lignite, and peat on the surface. The deeper the layer, the greater the heat and the pressure, and as a result the greater is the evolution of the separating gases, and an increasing percentage of the C. will be carbon, the sp. gr. will rise, the colour darken, and we shall arrive at a rock formation. If the leaves and branches of trees accumulate a mould will be formed, rich in carbon, while mosses growing in swamps will form peat. If either or both be buried, the carbonaceous layer will be preserved. Heat and pressure will cause the volatile elements to pass off, leaving lignite. Greater pressure will resolve this into bituminous C., while the same process intensified will produce the hard lustrous form of C. known as anthracite, which is free of dust and will burn without smoke or flame. It might also be formed by the intrusion of igneous rock. Igneous rock, having intense heat, flowing into dykes in this anthracite would convert it into graphite, which is practically pure carbon. This theory is partly illustrated in the S. Wales coal-field. If we pass from the SE. to the NW. of the field, we pass from bituminous C. seams through steam C. to the anthracite, steam C. being intermediate in composition and properties between the bituminous and anthracite. Not all graphite formations can be ascribed to this process; and in some cases anthracite and bituminous C. occur together, and seem to have been formed under the same conditions. It has been thought that anthracite C. may be formed from a different kind of vegetation from that

Lignite (q.v.) is sometimes termed brown C., although it is inferior to true C. It is, however, used a good deal in Germany and N. America, where a variety is found which cokes well.

Bituminous coals form the greater part of the C. measures, and are the forms in general use for domestic and commercial purposes. They are black, brittle, and opaque, and have a cross-jointed structure, often breaking into rhomboidal or cubical fragments. They have a sp. gr. of about 1.3, and, if they are good varieties, will give 10 per cent ash or less. This ash, or incombustible inorganic matter, occurs in all C.s, and consists of sand and mud which has mixed with the layer of C. at the time of its formation. In some C.s (mainly continental) the percentage of ash may rise to over 30. When a large amount of these impurities enter, causing a great lowering of the value of the seam as fuel, it is called bituminous shale or sandstone, not C. From some of these shales and cannel C., oil is obtained by distillation. Bituminous C.s are also used for obtaining gas. They are heated in closed retorts, and the C. gas, together with C. tar and ammonia, is formed, leaving coke as a residue. This coke is practically carbon, and is used in smelting. There are many different varieties of bituminous C., and sev. ways of classifying them are adopted. In S. Wales the general classification is into house C. and steam C. Under the first heading are placed C.s with a fairly low percentage of carbon which, possessing comparatively large amounts of occluded gas, will burn with a large amount of flame. These seams are found all over the coal-field,

and are those nearest the surface, in some places outcropping from the mountainside. The steam C., on the other hand, is always derived from pits of a fair depth. It has a higher percentage of carbon, is harder, and has a greater lustre; and as a consequence of its comparatively small amount of composing gases, it burns without a great deal of flame or smoke, and has a greater amount of available heat. Local names are given to those seams which are first worked near them, and these names remain with the seams wherever they may be worked. This will be seen from the names Wallsend, Derby Brights, Mynyddyslwyn, etc.

also. It is much used as a gas-producing C., and also in some dists. for burning in open grates.

Anthracite (q.v.) is a hard, rocky form of C. with an almost metallic lustre. It is difficult to kindle, but when burning it gives out great heat. It is found in the W. of the S. Wales coal-field and also in America. It burns practically without smoke and flame, and has a greater heating power than any other form of C.

Heating power of coal. C. is judged by the number of pounds of water which will be raised 1° F. by the burning of 1 lb. of the fuel, by the amount of water evaporated at 212° F. by 1 lb. of it, and these

National Coal Board

COMRIE COLLIERY, FIFESHIRE

General view, showing the two shafts and pithead baths.

Steam C. is intermediate between bituminous and anthracite C., and the finest steam C. in the world is that found in S. Wales and Monmouthshire. While only anthracite is found in the W., bituminous and steam C. can be found right to the E. of the field. The Monmouthshire coal-field contains vast supplies of steam C. which are not inferior to those of Glamorgan, and they are at present being developed. Caking C.s burn freely, with great flame and smoke, but as they cake into clinkers, these prevent perfect combustion, and require efforts to free them from the fire-bars. Non-caking C.s burn free, and since the ash remains separate, are easy to stoke. Newcastle C. is among the caking varieties. Among other well-known forms of bituminous C. may be mentioned splint C., a hard C., found in Scotland, which is used in smelting. Cannel C. burns with a crackling noise, and is therefore sometimes known as parrot C. It is hard, and does not soil the fingers, and some forms of it can be polished and made into inkstands, etc. Some forms of Amer. C. are capable of this

tests are always carried out on boilers of the type in which it is to be used, for it is found that the heating power of any variety of C. varies considerably, according to the conditions under which it is to be burnt. Coal, Hydrogenation of. conversion of coal into a mixture of oils by treatment with hydrogen. The best method of hydrogenation is that of Bergius, which consists, essentially, of converting coke into a mixture of hydrogen and carbon monoxide by heating in steam and purifying the mixed gases from sulphur. The next stage is to oxidise the carbon monoxide to carbon dioxide,

which is effected with further steam heating and a catalyst. The carbon dioxide is then removed by water under a pressure of 750 lb. to the square inch, and the hydrogen is freed from any remaining traces of carbon monoxide by treatment with a solution of copper compound and ammonia. The coal, having been cleansed by flotation, is then mixed with creosote oil and a catalyst and ground to a fluid paste, which latter is heated, with the hydrogen, at a pressure of 250 times that of the atmosphere. It is thus converted into a mixture of oils which, on fractional distillation, can be separated into petrol and heavy and middle oil. Some 4 tons of coal are required to yield 1 of petrol, and the ensuing petrol is of good quality and volatile.

Coal, Low Temperature Carbonisation of, see CARBONISATION.

Coal-fields are constituted of those areas where the coal-bearing strata appear at the surface, or where their coal and ironstones can be worked at a profit. In England very few workable seams are found lower than the coal measures or the Upper Carboniferous div. of the Carboniferous system. The 2 other divs. are the millstone grit and the carboniferous limestone. In Scotland, however, valuable seams are found lower than the millstone grit, while oil shale is obtained even below the Carboniferous limestone. Coal is, however, worked from other strata both older and younger than the Carboniferous, being worked from the Devonian, Miocene, Pliocene, Oolitic, and other formations, although coal obtained from these seams is of relatively small commercial value as compared with that obtained from the coal measures. C. are usually found in the form of a syncline or basin, dipping inwards at the edges and lying more or less level at the centre, thus causing the seams to crop out very frequently at the surface. This allows the coal to be easily reached and worked, and has saved the C. from the destroying effects of denudation, to which they would have been very susceptible owing to the comparative softness of the coal-bearing strata. Among the many C. in the Brit. Isles are the following: in the neighbourhood of the Bristol Channel, the S. Wales coal-field, and that of the Forest of Dean, with a small one at Bristol; in the Midlands occur the C. of Leics, E. Warwicks, S. Staffs, Coalbrookdale, Shrewsbury, and Flint; around the Pennine chain occur those of N. Staffs, Yorks, Lancs, Durham, Northumberland, and Cumberland; in 1953 the existence of a new coal-field in S. Derby, around Repton, possibly extending into Leics, was proved; in Scotland occur the Lanarkshire, Ayrshire, and Fifeshire, and in Ireland the Tyrone, Kilkenny, and Clare C. The S. Wales coal-field is famous all over the world as providing the greater proportion of the steam and anthracite coals used in the various mercantile marines and navies, while at the same time it provides coals of the kinds suited for smelting, manufacturing, and house coals, together with those varieties used in the production of

gas. The coal from the Midlands and the N. is generally used in all these branches, but it is not of such great value for shipping purposes, and it is chiefly used in the great manufacturing and engineering centres of the N. The largest C. are probably those of America, which are over 80 times as large as the whole of those of Great Britain, covering as they do nearly 200,000 sq. m. The term coal is used in the U.S.A. with no such narrow restriction as in England to varieties occurring in the older Carboniferous formations; but, as on the continent of Europe, includes anthracite and bituminous coals, lignitic coal, cannel coal, and ordinary lignite. The coal output of the U.S.A., no less than the splendid quality of the numerous varieties, surpasses that of any other country. The coal-bearing areas are to be found scattered over more than 30 of the states, and indeed it is only in a few of the New England states that no coal occurs. The Appalachian mt system, extending from E. Pennsylvania to the S., indicates the line of the prin. coal-bearing country, and it is here that the most valuable deposits of hard anthracite are to be found. The group of fields of next importance is the E. interior group in Illinois, Kentucky, Indiana, Ohio, where are to be found the best qualities of bituminous and cannel coal. In the W. interior group of Missouri, Iowa, Kansas, the output of the same varieties is no less important. Next in importance come the large lignitic and bituminous C. of Arkansas, Texas, Oklahoma, Colorado, and New Mexico, which last-mentioned fields continue along the line of the Rockies northward into Canada. Anthracite also occurs in Massachusetts, Arkansas, and Virginia; bituminous coal in Nebraska, Michigan, and Alabama; and lignitic coal in nearly all the states W. of 105° W. long., especially New Mexico, Colorado, California, and Utah. Lignite is found mainly in the W. states. Speaking geologically, the better qualities of both the anthracite and bituminous coals belong to the Carboniferous formations, but the quality varies only to a very uncertain degree with the geologic age, and it is curious that whereas up to about 1870 more anthracite was mined in Pennsylvania than bituminous coal throughout the country, since that year the production of bituminous coal has far exceeded the former. According to the U.S. Geological Survey, the geologic age of the coal-beds ranges from Carboniferous in the Appalachian and Mississippi valley provs. to Miocene on the Atlantic coast provs. After Great Britain and the U.S.A., Germany is the prin. exporting country. (See statistics under COAL SUPPLIES.) The partition of Silesia, with its rich coal-field, was hotly contested after the First World War, and settlement was attempted by plebiscite in 1920. Eventually the mining area of Teschen, Lower Silesia, formerly Austrian, was allotted to Czechoslovakia, already rich in minerals, while Upper Silesia, formerly German, was given to Poland.

Other productive European fields are located in Belgium (Charleroi, Mons, Liège; and the Kempen, yet to be exploited), France (St Etienne), Germany (Westphalia and Rhineland), Spain (Asturias), and Russia (Donetz), while coal is also found in the Alps, the Urals, and at Spitzbergen. Other C. are those in China, India, Japan, the Malay Archipelago, Australia, New Zealand, S. Rhodesia, S. Africa, and Canada. Most of the Chinese provs. contain coal, and China, judging by its immense estimated resources, may be regarded as one of the leading coal countries of the world. Japan and India, however, actually produce considerably more coal than China. Except in Nigeria and S. Rhodesia, little coal is produced in the Brit. Colonial Empire. Coal deposits are extensive in the SW. of Tanganyika. Coal is not the only commercial product obtained in the C., for included in the same strata are ironstone, oil shale, fire-clay, sandstone, and igneous rocks which supply a good paving and building stone, in fact the oil shales and sandstones usually make up by far the greatest proportion of the thickness of the coal-bearing strata. See also CARBONIFEROUS SYSTEM and GEOLOGY. See Sir A. G. Ramsay, *Physical Geography and Geology of Great Britain*, 1863; E. A. N. Arber, *The Natural History of Coal*, 1912; J. Park, *Mining Geology*, 1918; J. Louax, *Microstructure of a Coal Seam*, 1925; E. A. Martin, *Coal and its Story*, 1926; B. E. Dahlgren, *A Forest of the Coal Age*, 1933. See also bibliographies for COAL; COAL-MINING; COAL SUPPLIES.

Coal-fish, Greencod, or Saithe, or *Gadus virens*, is a member of the cod-fish family. It is carnivorous and is itself eaten by man, and on the W. coast of Scotland is often caught in great abundance, as it preys on herring. The fish inhabits the seas between the Arctic and the Mediterranean, and is sometimes known as C. from the dark colour of its back.

Coal-mining. Prospecting and exploration. In prospecting for coal a knowledge of geology is essential in order to determine whether the rocks belong to the Carboniferous system. In countries where C. operations are in progress, valuable information may be obtained from neighbouring collieries, and records such as the Brit. Geological Survey memoirs and maps. In most cases, the coal outcrops have been worked away, but their former existence may be marked by blackened earth or old rubbish heaps. The bed of a stream may contain coal fragments derived from some outcrop of a seam. Where the nature of the rocks indicates that coal exists in the area, the expense of boring to prove it may be justified. Two, three, or more boreholes are put down at points selected from the geological survey. These boreholes will provide information regarding (a) the number, thickness, and quality of the seams, (b) the nature of the rocks through which the shafts will have to be sunk, (c) the depth from the surface of the individual seams, (d) the amount and direction of dip, (e) the presence of water, and (f) the existence and position

of faults, which information will help to determine the best location for the shafts. It is then possible to estimate the expense of sinking the shafts; the total quantity of coal available; the cost of working and the probable profit. The boring methods may be classified under 2 main systems: (1) *Percussive* system, carried out with free-falling tools, or (2) *Rotary* system, which involves the cutting out of a solid core of the strata passed through. Generally, the second method is preferred, as the rock cores enable a complete record of the strata passed through to be obtained.

Sinking and fitting shafts. The best position for sinking depends upon (a) the proximity of a main railway; (b) the existence of a good road for transport; (c) the limitation of underground roadways; (d) the presence of faults which may damage the shaft; and (e) the presence of a supply of clean water for steam boilers, etc. In mountainous areas, valleys are naturally preferred for shafts as they ensure the minimum depth to reach the coal. With dipping seams, the shafts are often sunk to the deeper part so that the bulk of the coal and water will gravitate to the shaft bottom and thus save power. Normally, the shafts are sunk near the centre of the taking so as to limit the length of haulage and ventilation roads in all directions. The law requires that at least 2 shafts, 15 yds or more apart, be sunk to work each independent coal taking. One will act as the *downcast* or ingress and the other as the *upcast* or egress. Both shafts must be provided with winding gear for the conveyance of workmen. The shaft must be adequate in size, and the factors which determine this are (a) the required daily output of coal; (b) the total quantity of coal in the taking; (c) the period of the lease (in England it varies from 30 to 99 years and in Scotland from 20 to 30 years); and (d) an additional space must be allowed for water and compressed-air pipes and ventilation. The above information will determine the size of the tubs or trams for carrying the coal, the size of the cages in the shaft, and finally the size of the shaft itself. Engineers are nowadays generous in shaft sizes to allow ample space for ventilation. In Great Britain, shafts up to 24 and 25 ft in diameter are not uncommon. A depth of 4000 to 5000 ft is considered to be about the maximum at which coal can be profitably mined in Great Britain. There is a great variety of shaft forms, such as the rectangular, octagonal, elliptical, and circular. The rectangular is easy to secure with timber and divide into compartments. The circular shape is the strongest and can be lined easily with brick, concrete, or cast-iron tubing. The circular is the form usually adopted in England and Wales. When sinking through the incoherent surface deposits, special precautions are necessary. Sometimes beds of water-logged gravel or quicksand will render the sinking difficult and necessitate special methods. Having reached the hard rock, the sinking operations include blasting and excavating,

removal of debris in special buckets, raising the water, and finally lining or supporting the shaft sides (*see SINKING*). When the coal is reached, the mining engineer provides for the protection of the shaft and surface buildings from damage, due to ground subsidence, by leaving a large pillar of coal around the shaft bottom.

Methods of working. When the shafts have reached the coal and the shaft pillar is formed, the method of working the seam must be decided. In the longwall method, the coal face is opened out at the edge of the shaft pillar and the whole of the seam removed in one operation. The space from which the coal has been removed is completely or partly filled with dirt obtained from the seam or the rock beds above or below the seam. This area filled with dirt is known as the goaf or gob, and through this all roads to gain access to the coal face are maintained. In the pillar and stall method, the seam is divided into rectangular pillars by driving stalls or boards at right angles to each other.

FIG. 1. TIMBERING IN COAL FACE

After a certain area of coal has been split up into pillars, the work of extracting them is commenced. There are numerous modifications of these 2 main systems to meet the varying conditions. As a general rule, seams of 4 ft or under in thickness are worked longwall, and seams over this thickness by some form of pillar and stall. The system of working to be adopted will depend upon (a) the thickness and inclination of the seam; (b) the depth below the surface; (c) the nature of roof and floor; (d) the presence of gas or water; (e) the presence of old workings; (f) the existence of valuable surface buildings requiring protection. In *longwall advancing*, the coal is worked from the shaft pillar towards the boundary, while in *longwall retreating* the main roads are driven to the boundary and the seam is worked backwards towards the shaft. The bearing of the main roads driven from the shaft bottom varies with the haulage requirements, the inclination of the seam, and the position of the shaft relative to coal taking. The advantages of the longwall system of working are (a) it is very suitable for machine cutting and conveying; (b) concentration of men; (c) the ventilation is better; (d) better roof control and therefore greater safety. Fig. 1 shows a section across a longwall coal face, with the goaf packed with dirt, props for supporting the roof, and a sprag to hold the face slip until the miner is ready to work it. The pillar and stall method is usually adopted in thick seams or when

working under valuable property or water, in which case the pillars are left to support the strata.

Timbering. The roof and sides of mine roadways and coal faces must be supported and made secure to prevent accidents and to maintain traffic and ventilation. Ordinary timbering will only resist the minor pressure caused by the

FIG. 2. PLAN OF SYSTEMATIC TIMBERING

weight of the rock immediately above the coal. The major rock pressure is irresistible and can only be controlled by systematic packing of the goaf. In Northumberland and Durham, a special body of trained men are employed in each pit to do this work, while in Wales, Lancs, and Scotland, the colliers do most of the timbering required in their places. At the coal face single props are set with a lid on top. This lid distributes the pressure over a greater area. With hard floors, the feet of the props are often tapered to prevent their crushing when the roof weight comes on. With soft floors, a sole piece is often placed under the prop as well as above it. Another method used in the coal face and on the sides of roadways is that of chocks consisting of pieces of wood placed in the form of squares, which are built up to the roof and wedged tightly. Fig. 2 shows the systematic timbering method being applied in a longwall face.

FIG. 3. TIMBERING IN INCLINED SEAM

Roadways are usually supported by means of a cross-bar and props, although when only the roof requires securing, a cross-bar alone may be sufficient. Fig. 3 shows double timbering in an inclined and moderately thick seam where part of the hard floor is removed for headroom. The joint between the cross-bar and the uprights is known as the Welsh notch.

In the case of wide roadways, the cross-bars are sometimes supported by a centre prop. Nowadays, main roadways that require supporting are lined with brick or reinforced concrete arches, or by brick side walls with steel girders as cross-bars. Semicircular steel arches are now a frequent method of supporting roadways. These are placed 2 to 4 ft apart with tie-rods to secure them one to the other. This method of support is less cumbersome than wood and it is fireproof and not liable to decay. Even at the coal face, steel is gradually replacing wood. Steel props may be cylinders or girders. The chief methods of preserving mine timber are thorough drying before use, stripping the bark, and the use of preservatives such as zinc chloride, copper sulphate, iron sulphate, lime, and creosote (from tar). The timber in return airways is usually sprayed with a solution of copper sulphate at regular intervals. In America, shaft timber is often sprayed with cement, which renders it fireproof and fungus-proof.

Winning the coal. Most seams have joints or cleavage planes, and there is always one direction along which the coal will yield most readily. The cleats in the coal are known as back or face slips, depending on the direction from which they are worked. When the slips are as shown in Fig. 1 the miner works away the lower part or butt, when the coal can be readily parted slip by slip. The miner's tools consist of picks, shovels, hammers, wedges, and hatchets. Drilling machines are worked either by hand, electric power, or compressed air. They are used for boring in the seam, roof, or floor to blast it loose. When the seam has been undercut, sprigs may be necessary to hold the coal until the loading commences. A sprig is an inclined prop against the coal as shown in Fig. 1. If the coal is hard, it may be necessary to use mechanical wedges or

cutting a groove or channel to a depth of 3 to 6 ft as it travels along. The disk machine acts in principle like a circular saw laid horizontally. In the chain machine the cutters are fixed to an endless chain resembling that of a band saw. The bar machine carries teeth along its length and in action resembles a saw-file. Different types of conveyors are in use, the

FIG. 4. FACE CONVEYORS

most popular being the belt, jigger (or shaker), and the scraper chain. The conveyor extends the whole length of the coal face and delivers the coal either into the tubs at the roadway or on to a gate or main conveyor. There are machines now in operation which simultaneously cut and load the coal on longwall faces, which may be 100 yds in length, and give an output of 250-300 tons of coal per shift. Fig. 4 is a section along a coal face showing 2 face belt conveyors (A) delivering coal on to a tub (B). In some cases these face conveyors deliver the coal on to a gate conveyor, which in turn discharges into tubs some distance back on the gate road.

Haulage of coal underground. There is a great variety of haulage systems in use underground. The system to be adopted depends upon (a) the amount and direction of gradient; (b) the regularity of gradient; (c) the daily and total tonnage of coal to be hauled; and (d) the power available. Mine trams (or tubs) are usually built of steel or steel alloyed with copper to prevent corrosion. Locomotives, which are popular in America, may be driven by petrol, electric power, or compressed air. Safety from fire or explosions is obtained by using compressed air or storage battery locomotives. In Brit. mines, electric and compressed-air power are favoured for haulage purposes. Electric power is largely confined to the main haulage planes where the ventilation is good, and compressed air is preferred for the inbye haulages. Where the full tubs have to be brought downhill on an inclined plane a self-acting incline can be used. In this case, the gravity pull of the full tubs is utilised to haul up the empty tubs. Sometimes full tubs haul a bogie containing iron weights up the incline, and the bogie, when descending, hauls up the empty tubs. The endless-rope system of haulage is greatly favoured on long, fairly flat roadways. One endless rope travels continuously in one direction. The trams are attached to the rope in various ways, and can be attached or detached by hand or by other means.

Fox Photos

MINERS BREAKING COAL FOR REMOVAL IN TUBS

even shot-firing to bring it down. In gasey or fiery mines, only certain specified explosives may be employed.

Coal face machinery. A coal-cutting machine consists of a motor which works either a disk, chain, or a bar type of cutter. A longwall coal-cutter is fixed at one end of the coal face and by means of a rope or chain is hauled along the face whilst

Coal winding. The coal tubs, on reaching the shaft bottom, are run into cages. Two cages are provided in each shaft, one ascending while the other descends. The cages are guided in the shaft by wood, rail, or wire-rope guides. Each cage may have from 1 to 4 decks, each deck holding 1 or more tubs. Totally enclosed double-decked cages of wrought iron or steel and holding 2 tubs on each deck are common. The cages are attached to the winding rope by chains. Winding ropes are now almost exclusively made of plough steel owing to its great tensile strength, elasticity, and wearing qualities. A plough steel rope has a breaking stress of 93-125 tons per sq. in. The load on the winding engine varies considerably during a complete wind, being a maximum at the start. To counterbalance the weight of the winding rope, a rope is fixed to the bottom of each cage and run around a pulley at the bottom of the shaft. If this tail rope equals the weight of the winding rope, the dead load on the winding engine is only that of the coal. Coal winding is sometimes performed by the skip or bucket method which, in conjunction with face and gate-road conveyors, is a further step towards the elimination of tubs underground.

Mine gases. The chief noxious gases with which miners are concerned are firedamp, carbon dioxide, and carbon monoxide. Firedamp, methane, or carburetted hydrogen, is the most common mine gas. It is colourless, odourless, tasteless, and a non-poisonous gas, although it will cause suffocation when breathed, owing to the absence of air. Since it is only about half as dense as air, it is generally found near the roof or in cavities. When mixed with air in certain proportions it is very explosive. Its presence in mine air is detected by its effect on the flame of a miner's safety lamp, on which a bluish cap is formed when sufficient gas is present. Firedamp is given off from the coal and the surrounding rocks, sometimes suddenly as 'blowers.' Carbon dioxide also exists in varying small quantities in coal and is produced by the combustion of carbonaceous material, the burning of lamps, and the breathing of men and horses. It is a colourless and odourless gas and, being about one and a half times as dense as air, it gathers near the floor and in dip workings. This gas will not burn, neither will it support combustion. It is detected by the dimness of the flame of a safety lamp, and the flame is extinguished when large quantities are present. When breathed it causes fatigue, panting, and headache according to the amount present. Carbon monoxide is principally produced as a result of gob fires and by the explosion of firedamp and coal dust. It is a colourless and odourless gas, slightly lighter than air. This gas is a very deadly poison and the breathing of even minute traces will cause poisonous effects. The symptoms of carbon monoxide poisoning are breathlessness and palpitation, severe headaches, drowsiness, or collapse according to the amount present.

Ventilation. The prin. function of ventilation is to convey fresh air to all parts of the mine and to carry away gases and waste products, and thus provide a safe and wholesome atmosphere in all parts where men work or travel. In certain small mines, the ventilation is natural, owing to a difference in temp. of the air in the downcast and the upcast.

FIG. 5. VENTILATING FAN

Natural ventilation is, however, unreliable, and is always liable to cease or even change its direction according to the season of the year. The Coal Mines Act, 1911, of Great Britain states that a place is not fit to work in if the air contains either less than 19 per cent of oxygen or more than 1½ per cent of carbon dioxide. Formerly, many mines were ventilated by steam jets, waterfalls, or furnaces. Fans are almost

FIG. 6. AIR CROSSING

exclusively used nowadays. These are either exhausting or forcing fans. The former exhausts the air from the top of the upcast shaft, while the latter forces the air down the downcast shaft. Most fans are of the exhausting type (Fig. 5). The air current which is created by a fan must be circulated throughout the mine. This is accomplished by ventilation doors, air-crossings, brattices, etc. When the air

FIG. 7. USE OF BRATTICE

current has to be deflected or turned at branch roads a door is used, which can close automatically. When an intake airway crosses a return airway, an air-crossing, as shown in Fig. 6, is constructed to prevent the 2 currents mixing. Brattice sheets are sometimes necessary in narrow places to direct the air to the working face as shown in plan in Fig. 7.

Pumping. The following systems of dealing with pit water are employed according to circumstances: (a) raising water in chests or tanks from dip workings; (b) winding water in barrels in shafts; (c) removing water by means of siphons; and (d) removing water by means of pumps driven by steam, compressed air, or electric motors. When the quantity of water to be dealt with is small, tanks or barrels are used to remove it to the surface. With greater quantities it is usual to employ pumps of various types. Of late years great strides have been made in the use of 3-throw, centrifugal, and turbine pumps driven electrically. Sev. of these pumping units may be installed between the workings and the surface, one pump delivering its water to the next pump and so on until the surface is reached.

Lighting of mines. The various methods of mine lighting are (a) oil safety lamps,

Fox Photos

SORTING

and (b) electric lamps. The danger of using candles and open lamps in mines is that the pressure of firedamp in the right percentage would cause an explosion. An oil safety lamp is one which has its flame protected in such a way that it should not ignite firedamp if present in the air. Sev. types of oil safety lamps are in use, being modifications of the original Davy, Stephenson, and Clanny lamps (see DAVY LAMP). Electric safety lamps are now made of satisfactory design, either to be carried by hand or worn in the hat. They possess many advantages over the oil lamps, and are now very popular in Great Britain, U.S.A., and Canada.

Sorting and cleaning. When the coal reaches the surface, the tubs are run on to a weighing machine and the weight is registered. They are then run on to a revolving 'tippler,' where the coal is discharged on to either a fixed bar or a jigging screen which separates the small from the large coal. The large coal passes on travelling belts to picking belts or tables where pieces of shale are removed. From there it is either subjected to further screening and sizing by machines or loaded direct into railway wagons under-

neath. The removal of dirt on the picking belts is only a preliminary cleaning, as small coal and some varieties of large coal are so full of impurities that they can only be efficiently cleaned by washing in water or other liquid. There is a large variety of coal washers but the principle in all cases is more or less the same. If raw coal be placed in an upward current of water of a certain velocity, the coal particles will be carried upwards by the stream, but the impurities such as shale, being heavier, will descend through the upcoming water. This principle is used in all coal-washing plants.

Coal Mines, Nationalisation of. By the Coal Act, 1938, a Coal Commission was constituted, in which was vested, as from 1 July 1942, the ownership of all coal (and certain associated minerals and rights), with the duty of exercising their functions as owners in such manner as they might think best for promoting the interests, efficiency, and better organisation of the coal-mining industry. The aggregate amount of compensation to be paid by the commission for coal and coal rights was fixed by the Act at £66,450,000, with additional sums for other associated property and rights; and the commission might borrow up to £76,450,000 for the payment of compensation and other expenses payable by them. The valuation of separate coal holdings, as registered under the Coal (Registration of Ownership) Act, 1937, was carried out by valuation boards appointed by the Ministry of Fuel and Power, and payment of the compensation completed. The commission was also charged with duties of promoting amalgamation of colliery undertakings in any

area in which they considered the number of separate undertakings to be so great as to be detrimental to the efficient working, treating, or disposing of coal. After the Second World War, the Coal Commission was replaced by the National Coal Board, constituted under the Coal Industry Nationalisation Act, 1946, and a tribunal was set up to determine the global sum of compensation to be paid for certain assets of the coal industry to be transferred to the Coal Board. The tribunal fixed the amount of compensation at £164,660,000. The assets transferred may be described broadly as the assets of the coal industry, excluding assets such as coke ovens and by-product plant. The award is dated 1 Aug. 1946. In pursuance of an order made under the Coal Mines Nationalisation Act the transfer of the C. M. to national ownership was effected on 1 Jan. 1947.

Coal Supplies. On the initiative of the XIth International Geological Congress, which met in Toronto in 1913, an inquiry was made into the C. S. of the world. Actual world resources were estimated in metric tons at 716,154,000,000, while the possible and probable reserves totalled 6,681,399,000,000.

A list of the European coal-producing countries and their production (1954) is given in Table 1. Table 2 gives production and consumption in the U.K. for the first quarter of 1955, and Table 3 the production and export for 1934-8, for comparison. In view of the large output of the U.K. fields and their comparatively small size, thought has been given to the possible exhaustion of our C. S. Two royal commissions have thoroughly studied the subject, one being under the chairmanship of the Duke of Argyll, and the other under Lord Allerton. The first of these commissions pub. its report in 1871, and the conclusion reached was that the attainable amount of coal in the known coal-fields was 90,207,000,000 tons, and the probable amount available in other places was 56,273,000,000 tons, thus making a total coal supply of 146,480,000,000 tons. The second commission reported in 1905 that the net estimate of unworked coal was 100,915,000,000 long tons. This allowed for all possible losses, but at the same time it was recognised that inferior coal and small coal, hitherto discounted, had become of use to sev. important industries, such as the patent fuel trade and the gas and by-product industry. In 1913 Dr Strahan compiled the report in Great Britain for the XIth International Congress, basing his statistics on the findings of the 1905 commission, modified, however, by further exploration. Estimates were reckoned to a depth of 6000 ft, as against the 4000 ft hitherto held to be the limit, and the total reserve of coal for the U.K., including Ireland, was put at 189,434,749,920 metric tons. Less than 10 per cent of this reserve is anthracite. The Samuel Coal Commission, 1925, basing its assumption on the figures of previous estimates, reported that at the present rate of output the actual reserve

of coal, mined at a depth of 4000 ft, would last 5 centuries. Taking into account all probable reserves, including the possibility of mining at a depth lower than 4000 ft, the reserve would last 7 centuries or more. At the same time, coal consumption has increased to the extent that production at the present rate is insufficient to cover the demand. Increased productivity is necessary to meet the expected demand for 250 million tons per annum in 1965. A specialist group of the Brit. Productivity Council pub. a report in Sept. 1953, recommending (1) a declaration by the gov. that it envisaged the country's almost complete dependence on coal for 30 years; (2) Investigation of the possibility of reserving high-grade coal for specific purposes; (3) Early cessation of opencast mining and retention of reserves for emergency; (4) High priority for means of improving fuel utilisation, incentives to industry to instal economising plant, and estab. of a fuel-efficiency organisation; (5) Speeding up of economy measures in nationalised industries; (6) Abandonment of manufacturing processes inimical to fuel economy; (7) Confinement of use of solid fuel, gas, and electricity to purposes for which each is best suited, and a closer integration of gasworks with power stations.

United States of America. The Amer. coal trade was fully estab. in 1820, although the output was not then very large, when the Schuylkill Navigation Co. sent coal down the Lehigh and Delaware R.s to Philadelphia. Up to the year 1870 the coal output of the U.S.A. was less than that of either Great Britain or Germany. Then, in 1871, the U.S.A. began to pass Germany, and from 1877 onwards completely left Germany behind. Great Britain's output was passed in 1899, and the U.S.A. are now producing nearly one-third of the world's C. S. In 1920 over 587,000,000 long tons were produced, while in 1923 and 1926 the total was 587,000,000 tons in each year, the average for the decade 1920-9 being over 500,000,000 tons. In 1932 the figure dropped to 317,000,000 tons, and in 1933 to 336,000,000 tons. In the same decade exports averaged nearly 28,000,000 tons. Recent export figures have been lower. In 1929 the U.S.A. had 11.7 per cent of world coal exports; in 1936 the proportion was 9.2, as against the U.K.'s 40.1 and 34.9 respectively, and Germany's 19.8 and 26.4. The total area estimated to contain coal-beds is close on 500,000 sq. m., of which about 250,530 contain anthracite and bituminous coal, about 100,000 varying grades of bituminous, cannel, and lignitic coal, and the rest ordinary lignite. In the 1913 estimate for the Geological Congress the original tonnage of all kinds of coal on levels above 3000 ft was reckoned at 3,225,394,300,000 metric tons. The total production of coal to the end of 1910 was 7,480,355,040 metric tons, and an amount equal to half this figure was allowed for waste; it followed that 11,220,532,560 tons out of the original tonnage had been exhausted, leaving a reserve of over 3,200,000,000.

TABLE 1. COAL PRODUCTION IN WESTERN EUROPE, 1954

	1000 metric tons	Output per manshift tons	Number of workers
Belgium	29,429	1.098	147,000
Czechoslovakia	21,500		
France	54,405	1.504	216,000
Saar	16,818	1.744	57,300
W. Germany	128,035	1.492	429,000
Italy	1,074		8,500
Netherlands	12,071	1.497	47,900
Poland	91,300		
Spain	12,429		
U.K.	227,875	1.614	705,000

Germany also produced 87,811,000 tons lignite.

Germany exported (in 1954) 16,711,000 tons, the U.K. 13,918,000 tons, while the U.S.A. exported 9,810,000 tons to W. Europe. Exports from the Saar reached 8,994,000 tons. The following countries imported coal:

France	11,683,000 tons	Denmark	4,470,000 tons
Italy	9,634,000 "	U.K.	3,053,000 "
W. Germany	9,285,000 "	Sweden	3,024,000 "
Netherlands	7,148,000		

TABLE 2. COAL PRODUCTION AND CONSUMPTION IN THE U.K., 1 JANUARY-31 MARCH 1955

	Mined tons	Open- cast	Total	Inland consumption	Shipment overseas
January	4,265,500	142,000	4,408,400	4,737,500	284,500
February	4,358,675	159,000	4,517,675	4,822,000	267,500
March	4,420,860	192,860	4,613,720	4,754,000	274,000

TABLE 3. THE OUTPUT OF COAL IN GREAT BRITAIN, AND THE COAL, COKE, AND PATENT FUEL EXPORTED, IN THE FIVE YEARS PRECEDING THE SECOND WORLD WAR

Year	Coal produced		Coal, coke, etc., exported		Bunkers for Ships in Foreign Trade *
	Tons	Value	Tons	Value	
		£		£	Tons
1934	220,726,000	142,119,000	42,582,000	34,603,000	13,487,000
1935	222,249,000	144,539,000	41,870,000	34,578,000	12,526,000
1936	228,448,000	160,119,000	37,348,000	32,292,000	11,948,000
1937	240,409,000	182,674,000	43,463,000	41,888,000	11,703,000
1938	227,915,000	188,822,000	38,196,000	40,713,000	10,489,000

* Not included in exports.

In 1948, the proved world resources were stated as follows:

	Million tons
Europe	548,000
N. America	42,000
Central and S. America	2,000
Africa	9,000
Asia	11,000
Australasia	4,000
Total	616,000

In 1955 the total world coal production was estimated at 1,504,100,000 metric tons; the chief coal-producing countries in 1955 are given below:

	Thousands of metric tons
U.S.A.	447,577
U.S.S.R.	276,100
U.K.	225,157
Federal Ger. Rep.	131,811
Poland	94,476
China (continental)	93,170
France	55,335
Japan	42,423
India	38,826
Union of S. Africa	32,111
Belgium	29,978
Czechoslovakia	22,100
Australasia	20,399
Saar	17,329
Spain	12,426
Netherlands	11,895
Canada	11,362
Turkey	5,496

Coal Tar, one of the products obtained by the carbonisation of bituminous coal the others being coal gas or coke oven gas, coke, crude benzole, and ammoniacal liquor. C. T. is condensed with the ammoniacal liquor forming a dark-coloured viscous lower layer. Originally C. T. was an unwanted by-product, although the earliest patent for the destructive distillation of coal, taken out by Becher and Serle in 1681, was for the production of C. T. and pitch. Fortunately the rapid development of the gas industry and the replacement of the old bee-hive coke ovens by by-product ovens coincided with an increasing demand for some of the products of C. T., particularly for creosote for the preservation of railway sleepers and for naphtha as a rubber solvent. The rapidly developing science of organic chem. too, found C. T. a veritable treasure chest of new chemicals which rapidly became the raw materials for synthetic dyestuffs and drugs. Thus C. T. was transformed from an embarrassing waste

product to the valuable by-product it is to-day. In Great Britain the present production of C. T. is close to 3,000,000 tons per year, of which about 42 per cent is derived from gas-works' continuous vertical retorts and about 50 per cent from coke ovens or horizontal retorts. Chemically C. T. is an extremely complex mixture; over 400 individual compounds have so far been identified in or isolated from it. While comparatively little is known of the chemical nature of the components whose molecular weights range from 400 to 2000, the chemical nature of the 70-80 per cent of C. T. whose molecular weight range is from 80 to 400 is now fairly well established. Aromatic hydrocarbons, particularly polynuclear hydrocarbons with or without substituent methyl groups predominate; over 90 per cent of coke oven and horizontal retort tars consist of such components with up to 5 per cent of paraffinic hydrocarbons, a small percentage of hydroxy-aromatic compounds, and smaller amounts of heterocyclic nitrogen, sulphur, and oxygen compounds. C. T. derived from continuous vertical retorts differs in that it may contain 15-25 per cent of paraffins, 20-25 per cent of hydroxy-aromatic compounds (phenols) and of the remaining aromatic hydrocarbons the majority contain one or more methyl or ethyl substituent groups. Commercially the components of C. T. are separated into fractions by distillation. Formerly this process was carried out in batch pot-stills and the fractions—light oil, light creosote or middle oil, heavy creosote or heavy oil—pitch-treated for the recovery of certain major components. Over the past 25 years there has been an increasing tendency to replace pot-stills by large continuous pipe-stills which may process up to 400 tons per day of crude tar, and in 1955 about two-thirds of the C. T. distilled in Britain was processed in continuous plants. These plants give narrower and better designed fractions which leads to an increase in the yield and purity of the separated components. In view of the difference in the chemical nature of the 2 main types of tar, the fractions taken from coke oven tar are different from those taken from continuous vertical retort tar. From these former, light oil (distilling up to 200° C.), naphthalene oil (220-230° C.), wash oil (230-270° C.), anthracene oil (270-330° C.), and heavy oil (330-360° C.) are the main fractions; from the latter the fractions taken are crude benzole (0-15° C.), crude naphtha (150-180° C.), carbolic oil (180-230° C.), wash oil (230-270° C.), and heavy oil (270-360° C.). All the distillates boiling up to 200° C. are refined and redistilled to give benzole, toluene, xylenes, and naphthas which supply the chemical industries with the benzene, toluene, xylenes, etc., used as starting materials for a vast range of intermediates for the synthesis of dyestuffs, pharmaceuticals, explosives, plastics, etc. Naphthalene is extracted from the naphthalene and carbolic oils, and from the latter come phenol, cresols, and xylenols. The main use for naphthalene is for the production

of phthalic anhydride, while the phenol, creosols, and xylenols are extensively used for the production of thermosetting resins, bactericides, anti-oxidants, etc. The other major by-product is anthracene, used for the production of dyestuff intermediates; it is derived from the anthracene oil fraction. However, the separated chemicals from C. T. amount to only 10-15 per cent of the crude tar. Pitch (q.v.), the residue left on distillation, represents 50-65 per cent, and the remaining 25-35 per cent consists of creosote, a mixture of oil from which the by-products have been removed. C. T. pitch is used extensively as a binding agent for coal

Fox Photos

LEICESTERSHIRE MINERS ON THEIR WAY TO PIT-HEAD BATHS

briquettes and carbon electrodes, and either alone or mixed with creosote as a liquid fuel. Large amounts of pitch fluxed back with creosote oils are used as road tar and as an anti-corrosion protective coating for steel and concrete pipes and structural steel work. Creosote is the most extensively used material for preserving wood against attack by fungi and insects; other uses include the production of motor spirit by hydrogenation (about 150,000 tons per year), as a disinfectant, and as a solvent for extracting benzole from coal gas. The yield of crude C. T. from continuous vertical retorts is approximately 7.5 per cent by weight and from coke ovens and horizontal retorts about 6 per cent by weight. See articles on the various substances mentioned above. See also C. Lungo, *Coal Tar and Ammonia*, 1916; A. R. Warnes, *Coal Tar Distillation*, 1923; Winkler, *Der Steinkohlenteer*, 1951.

Coal Trade. Various laws have been passed regulating the C. T. From very early times the Corporation of London used to weigh or measure all coal brought into the port, while the mayor and aldermen of London and the justices of the

cos. could also, by virtue of Acts of Parliament dating back to Edward VI's reign, fix the retail price of coal. Further, general taxes have been levied on coal at different times. At one time the Corporation of London could exact these dues. In 1667 they were exacted to aid in repairing the damage done by the Great Fire, and they were continued till 1889, and the proceeds used for civic improvements. In William III's reign a tax was levied on sea-borne coal. This tax was abolished for a short time in 1830, re-exacted in 1842, and dropped in 1845. From 1901 to 1906 there was a tax of one shilling levied on every ton of coal exported from this country. Up to 1913 the C. T. prospered under individualistic control, and immediately after the First World War the coal industry was in better working condition in England than in the rest of Europe. In 1921 came a depression with a mining stoppage of 3 months. The C. T. improved in 1922, until in 1924 foreign competition began to have its effect, and in 1925, 500 of the Brit. mines were closed. A stoppage of 7 months followed in 1926, during which year the U.S.A. nearly doubled their exports and a great stimulus was given to the European C. T., especially in Poland. In 1928 the Yorks and Midland coal-fields were combined under the Central Collieries Commercial Association (C.C.C.A.), based on the Rhenish-Westphalian Syndicate, which after 1893 had rationalised the Ger. C. T. with marked success. The C.C.C.A. and similar marketing schemes in Scotland and S. Wales regulated the output and stabilised the prices of over 60 per cent of the national production. These schemes were an attempt to overcome the inter-colliery competition, due to the individualistic traditions of the coal-owners, and to eliminate the profits of the middleman, thus paving the way towards a national selling organisation for the export trade. (See COAL MINES, NATIONALISATION OF.)

Increase of production of Amer. coal, and consequently of Amer. C. T., is due to technical administration and a high standard of output due to machine-cutting. Output per man rose from 3.73 tons in 1913 to 4.78 tons in 1927. An important factor in production, too, has been the increasing regard to the welfare of the miner, evidenced in the provision widely of pit-head baths, canteens, private bus services, and housing schemes. Under a scheme announced in June 1948, univ. scholarships are awarded by the National Coal Board to selected pit workers to enable them to qualify in mining engineering and allied subjects. Statistics of Brit. and Amer. export trade are given under COAL SUPPLIES. See also R. C. Smart, *The Economics of the Coal Industry*, 1930.

Coalbrookdale, vil. of Shropshire, England, on the banks of the Severn, 11 m. from Shrewsbury, and forming part of the bor. of Wenlock. C. has an iron industry, founded in 1740, with the distinction of making the first iron bridge. Pop. 2000.

Coaling Stations, see BUNKERING STATIONS.

Coalition, combination of states or political parties having different or opposed interests, effected for the purpose of attaining a specific end or carrying out or resisting a particular policy. Some international C.s were the first C. against France in 1793, formed by England, Spain, Holland, Austria, and Prussia; the second C. against France in 1798 after the battle of the Nile; and the third C., of which the chief members were England, Austria, and Russia, formed in 1805, largely through the exertions of Pitt. One of the most famous C.s of political parties in past Eng. hist. was the C. ministry of 1783, with the Duke of Portland as nominal Prime Minister, the two antagonists Fox and North being the secretaries of state, following on the C. of Fox and Burke in 1782 to turn Shelburne out of office, both C.s arising out of the bitterness and personal recriminations engendered by the loss of the Amer. colonies. In 1804 Pitt, Fox, and Grenville united to oppose the Addington ministry, but on Pitt becoming Prime Minister the C. broke up because the king refused to receive Fox. The object of this last C., which sank the differences of its members over the question of Catholic emancipation, was to secure a stronger ministry in view of the general menace to Europe from France under Bonaparte. Most C.s between parties either break up at once or become permanent through the absorption of one party by the other. The latter happened in the case of the Liberal and Conservative C. against Gladstone's Home Rule Bill of 1893. Another important Eng. political C. was that of the Liberal, Nationalist, and Labour parties after the general election of 1910, the dominant motive of which was the determination to give Home Rule to Ireland. The necessity, on the outbreak of the First World War, of sinking party politics in the larger issues led in Great Britain to the formation of a C. Gov., representative of all shades of political opinion, and during the Second World War a C. gov. existed in Britain, under Churchill, from May 1940 until June 1945. The 'National' Gov. of 1931 was also essentially a C. Gov. of the Conservative party together with such of the representatives of the Liberal and Labour parties as were opposed to the previous Socialist regime. Its formation, however, soon estranged the bulk of the Labour and orthodox Liberal parties. **Coalville**, in and dist. of Leics, England, 5 m. from Ashby-de-la-Zouch and 12 m. from Leicester. Coal-mines are in the dist. Pop. 25,630.

Coanza, *see* QUANZA.

Coast (Lat. *costa*, a rib), border of the land as it meets the sea, forming a shore line of more or less irregularity of contour, according to the various causes which have been at work. Though the sea-C. is generally meant when the word C. is used, it is also applied to the shores of large rivs. or lakes. Many elements combine in producing the various types and varieties of C., of which the broad outlines may be described, though, of course, no 2 C.s are exactly alike in

detail. The chief agents in the sculpture and formation of the C. are the currents of the sea and the erosion caused by the waves; these agents have to work on widely different kinds of material, as some C.s are of hard rock, others of sand, and others again of heterogeneous rocks. It is estimated that nine-tenths of the world's coastline is fringed with sand. The waves formed by the winds run ashore and beat upon the land, the C. of which is gradually worn away by this unheating but unrelenting attack; the land which is washed away is carried into deeper water, and so the area of the land is reduced. The character of the C. has a great effect on both the coastwise trade and the international trade of a country; for neither form of commerce can attain great proportions unless there is a sufficiency of safe harbours for the vessels engaged in it. Shore-lines in an immature form, that is to say, before they are changed by the action of the sea, may be divided into 2 main categories. The first class is that produced by the land having been raised, the second where it has been lowered. Where the sea lies on an uplifted bottom, the shore-line will be of an unbroken and simple character, and will be bordered by shallow water. The shore-line will be of a broken and more complicated nature, and bordered by deeper water, where the sea lies on a depressed land surface. Shore-lines belonging to the first category are generally deficient in harbours, and traffic between land and sea is by no means easy. As an example the C.-line of Buenos Aires may be cited; the waters are shallow for a long distance from the shore-line, and artificial harbours have to be dredged before vessels of any size can approach close to the land. The shore-lines of the second class are, as a rule, well supplied with harbours situated in sheltered bays. An irregular C. is favourable to the development of the maritime arts and to the breeding of expert sailors and fishermen; among examples of shores of this class may be mentioned those of Patagonia and Norway. If the C.-line runs parallel to a mt range it is, as a rule, of a more regular character than when it crosses the folds of the range. A recently elevated C. is more irregular in outline than one which has been exposed to the action of the waves for a long time. The irregularities which were impressed upon the surface of a recently depressed C. before submergence took place will be traceable in the C.-line. If a C. is composed of homogeneous rock, and the action of the waves is similar along its extent, the outline formed will be regular; if, however, the rocks composing the C. are of varying degrees of hardness, bays and inlets will be eaten out of the softer rocks, and headlands, etc., will be formed of the harder rocks. The same results will be obtained if the rocks of the C. are homogeneous, but the action of the waves varies, as where the waves are more violent bays will be formed. In shores of the first class, the waves of the sea, especially in stormy weather, beat up the

sands of the bottom, and in course of time build sand-reefs off the shore. These reefs enclose long, narrow lagoons; the finer particles which compose them are swept away, but the reef is not destroyed thereby, for the loss occasioned is repaired by the sand which is brought in from the sea bottom. The ebb and flow of the tides and the action of the rivers preserve inlets through the reefs; the number and size of these inlets are, of course, regulated by the strength of the tides. The depth and even the outline of the channels on C.s of this nature may be changed so rapidly by the action of tidal currents that charts are unreliable, and local pilots must be employed by the captains of vessels. Tidal deltas are also formed by the action of the tides, and their outer edge often forms a bar which is only navigable at high tide. When the sand is brought to a reef in greater quantities than it is carried away, the reef advances into the sea, and may be a mile or more wide; at Atlantic City, in New Jersey, U.S.A., the reef is gaining on the sea in this manner. If, on the other hand, more sand is carried away than is gained, the reef gradually becomes smaller, and at length disappears, when the mainland is once more exposed directly to the action of the sea; the low C. of the middle Netherlands has thus retreated. It is of rare occurrence for coastal plains to end in cliffs which are at a great height above the sea. Such a phenomenon would be of comparatively frequent occurrence if the action of the sea on a coastal plain were uninterrupted for a long time; it is therefore inferred that such a development is generally interrupted by either a subsidence or an upheaval of the land. The best example of the results of such an uninterrupted development may be seen in the coastal cliffs of Normandy in France. The progress of formation of C.-lines of the regular first class is often interrupted by depression of the land. The C. is then changed into one of the second class, though the bays and headlands will not be of extraordinary magnitude. In the same way, the land may be elevated and interrupt the C. formation, but in such cases the effects are not so easily visible. The former C.-line will be marked by low sand dunes and ridges, if no very advanced stage of development had been reached before the upheaval, or by higher terraces and bluffs, the height of which will vary according to the progress made. The coastal plain of Mexico, for example, is marked by several terrace-like benches or steps; it is inferred from this that the elevation of the country took place gradually, thus giving time for the effects of the action of the sea between each upheaval to be perceptible. When an uneven land surface is partly submerged, the valleys become bays and the hills is. The forms of the land present more variety than those of the sea bottom, and hence shores of the second class are more varied in outline. The sea's action will be greatest on the projecting headlands and outlying is. The rock fragments weathered from the C., after being

rounded by the action of the waves, grind the rocks at their base and cut a notch in the edge of the land. The base of the cliff thus attacked is eroded by the dashing of the waves, great masses of rock fall, and the shore is gradually worn away. Isolated rocks, 'needles,' and columns are often left off the shore in such cases; the 'Old Man of Hoy,' off the N. of Scotland, is an example. If a shore-line of the second class suffers a further depression, the sea will begin its action on the cliffs in much the same way as before; the lines of the C. will naturally be altered, and the former is. will in many cases be submerged. When an upheaval takes place, the former C.-line may be traced at some distance from the new one; the cliffs and beaches which composed it are distinct at first, but in course of time are affected by the weather, and become merged in the general character of the land. Along the W. C. of Scotland there are evidences that the land has been uplifted for 20 or 25 ft; the cliffs of it stretch inland, and the former C.-line was more advanced in character than most of the present C. The bays of the former shore-line, when elevated, form coastal plains lying between rugged headlands; such formations form most beautiful scenery, and abound along the shores of Italy. The W. C. of Norway now stands some hundreds of feet higher than in former times, as is evidenced by the platform or bench of low land which borders the mts which formed the ancient sea cliff. From the fjord and its configuration of the C., it is probable that after the platform mentioned above had been cut, the land was raised even higher than it now is, and was eroded by glaciers. A depression then took place which drowned the valleys and created the present multiplicity of is. Where one part of the cliff is weaker or composed of softer rocks than the rest, the waves in time excavate a cave; among the numerous examples of such, Fingal's Cave on the is. of Staffa, Scotland, and many caves on the C. of Maine, U.S.A., may be mentioned. Shore-lines are affected by climate and temp. as much as the land. In Arctic climates the land is bordered by a fringe of ice, known as the 'ice foot.' In the equatorial and warm seas certain kinds of trees grow on the shores and impede landing; of these the most important is the mangrove-tree. Coral reefs also are found in these waters (for their formation and action, see ATOLL; CORAL; GREAT BARRIER REEF, etc.). The waves and currents of lakes are not so violent as those of the open sea, but the C.s of lakes exhibit many features analogous to those of sea-C.s. The S. shore of Lake Erie, for instance, has been washed away so as to develop low cliffs of a fairly even front for many m. When lakes are formed at the back of barriers of glacial drift, their waters may rise upon a land surface of much irregularity, and the C.s of the lake thus be of very varied character. Lake Lucerne, Lake of the Woods, and Lake Superior are examples of irregular lakes. The indication and measurement of C.-lines vary on maps according to the scale

thereof, as it is, of course, impossible to show as much detail on a small-scale map as on a large one. When the scale is very large 2 C.-lines will be shown, the one showing the position at high-water, the other at low-water mark. The measurement of the C.-line may be a matter of some difficulty, as if all irregularities possible are included, the length is of necessity greater. There are 2 methods of measuring; the first way is simply from point to point of the headlands of the C. The other way is to include every bay and inlet, and to measure up every riv. to the point where the action of the tide ceases. The ratio between these measurements is an indication of the coastal development of the country measured. See R. R. Minikin, *Coast Erosion and Protection*, 1952, and J. A. Steers, *The Sea Coast*, 1953.

Coast Defence. Elaborate systems of C. D. formed part of the military organisation of maritime nations until comparatively recent years. These included fortifications equipped with heavy artillery, special naval forces detached for the purpose (torpedo-boats, etc.), and C. D. troops. The advent of the guided missile has rendered most of those arrangements obsolete. The Brit. Coastal Artillery was disbanded in 1956 and similar action is being taken in other countries.

During the First World War, the greatest attack on C. D.s was that at the entrance of the Dardanelles (q.v.) in 1915, when the allied fleets of Great Britain and France attacked the Turkish fortresses. The attack was carried on intermittently for about a month, but the fleets lost so heavily that it was decided to await the land attack. The combined attacks by land and sea failed to reduce the Turkish defences and the allied forces withdrew from the Gallipoli peninsula (q.v.). It was expected in this war that the extensive use of aircraft and submarines would change the character of C. D.s, but it was found that the counter-measures neutralised any forms of attack from these new machines of war. In the Second World War coastal anti-aircraft guns were far more powerful than in the First World War and were far more numerous. Moreover, fighter planes had to be regarded as an essential factor in C. D. (See also COASTAL COMMAND for measures taken to protect coastal and other convoys.) Shore defences were more elaborate than in the First World War. In anticipation of a possible Ger. invasion cement blocks of anti-tank obstructions were sown thickly along the coast wherever a landing might seem to be practicable, and formidable iron and wire barriers were erected in the sea a short distance off-shore. Further, mine-laying was much extended so as to render approach by enemy surface or other sea craft both difficult and hazardous. See ARTILLERY; FORTIFICATION; MINES, MILITARY AND NAVAL; TORPEDO.

Coast Erosion, see COAST PROTECTION AND EROSION.

Coast Protection, result aimed at by the various devices which are adopted for

the protection of the land from erosion, damage by waves, etc. The main object in the reclamation of land is the increase of cultivable ground; it is principally in connection with such reclaimed land that protective works are necessary, though in many cases they are adopted rather to prevent the encroachment of the sea than to retain land already won. There are 2 prin. kinds of protective works, sea-walls or banks, and groynes. There are 3 main kinds of wall, those with very sloping batter, vertical, or stepped batter. The best form appears to be a wall with an almost vertical face, or alternatively slightly stepped. The vertical face resists the action of the waves most, and is thus opposed to more force, but it also breaks the recoil; a wall with a face sloping inward has not so much resistance to meet at the first onslaught of the waves, but by its form it accentuates the recoil; a stepped wall breaks the force of both the waves and the recoil. In the case of the 2 former kinds of wall, they are particularly liable to be undermined by the action of the waves, and should be protected at the foot by an 'apron.' If the foreshore consists of hard rock this is not so necessary, as the shore itself fulfils the function. Generally speaking, however, sea-walls are not satisfactory, regarded as the sole means of protection for the coast, and must generally be supplemented with groynes. Walls are very costly, and although they may seem at first to resist the erosive action of the sea, in reality they increase it.

The other form of C. P., that afforded by the construction of groynes, is on a different principle. Groynes promote the natural accretion of detritus or eroded material on a beach by the construction of artificial shelter. The littoral drift of sand down a beach may be intercepted by means of groynes projecting from the beach line, and so accretion of sand may take the place of erosion. This is, of course, the ideal result of groynes, but there are sev. difficulties and disadvantages to be overcome. The building of groynes has, in fact, been a matter of trial and error. Erosion produces a littoral drift, and much of the drifted material is of necessity carried out and deposited in deep water. If high groynes are used, the 2 sides of the groyne will not receive the detritus equally, and one side will be denuded; this difficulty is found at Dungeness, Cromer, and Hastings, for example. The general effect of groynes is to render the adjacent portion, not so protected, more liable to the eroding influence of the waves. The distance to which groynes can be carried out to sea determines their efficacy in collecting drift: they should always reach low-water mark. The beach of any shore which is composed of movable material should gradually slope up to high-water mark in the form of an ellipse: the sea will then not do much damage but roll in and out without erosion. This result is attained by raising the groynes slightly above the beach and promoting the accumulation of drift to leeward, as the scour of the

waves is lessened and the passage of the detritus over the obstacle facilitated. As the drift accumulates the groynes should be gradually raised, if necessary, and extended. The direction of the wind controls the travel of the drift, as the latter veers with the wind. In England there are examples of groynes of every design, laid out at every sort of angle. They used to be laid out at right angles, but no rule can be applied to a varying coastline, for the groyne should be designed to meet squarely the waves driven by the prevailing winds. The proof of good design in

LOWER CLIFF WALK, BRIGHTON
Promenade on sea-wall, and stone and
wooden groyneage.

groyneage is that the accumulation either side of the groyne should be equal. Where a coast is fringed with sand dunes, the beach should be protected from erosion by a regular series of groynes; the dunes and the promenade then receive sufficient protection by a simple sloping wall, with a maximum inclination of 2 to 1. Bridlington beach is protected by groynes, with very good results, as are the sand-banks at Poole harbour. Among other places at which groynes have been instrumental in improving the condition of the beach may be mentioned Sheringham, Weymouth, Cromer, Eastbourne, Dymchurch, and Deal. A more detailed account of the groynes at Bridlington will serve to show the results in this particular case, and the general principles acted upon. The Bridlington beach, which rests upon boulder clay, was rapidly being lessened as the result of increased erosion due to the erection of sea-walls. Groynes consisting of piles with dimensions of

14 ft by 9 in. by 9 in., made of pitch-pine, and 11-in.-by-4-in. planks were erected along the seashore. To obviate the denudation of the sand to leeward, the planking was at no time raised more than 2 strakes above sea level, but fresh planks were added as necessary. The prevailing gales in the winter are SE., and hence the groynes were slanted 10° S. of E. from the perpendicular. The cost of this operation was between 12s. 3d. and 18s. per linear ft., and very good results were obtained. In Poole harbour the groynes were built at varying angles, and there is no doubt that if it had not been for these preventive measures the harbour would have been silted up. The timber groynes which were built on the beach between Lancing and Shoreham had the effect, in the course of a few years, of causing the high-water mark to recede 85 ft. Low wooden groyneage has been used for the preservation of Romney Marsh. It was inexpensive and has proved successful. At Blankenberge, groynes were constructed which had an excellent effect in checking the eroding action of the R. Scheldt. They were 820 ft long, and at intervals of 680 ft; they extended to below low-water mark, and were at right angles to the beach. In order to facilitate the even distribution of drift over the whole area to be protected, and to lessen the erosion from wave action, the groynes were raised only slightly above the beach. They were built with wide tops and had a foundation of fascines and concrete, faced with brickwork or stone pitching. The result was to form a practically ideal sloping beach (cf. *supra*), on which wave action was reduced to a minimum. This type of groyne is, however, too expensive for general use. The extension of groynes below low-water mark is advocated by some engineers, and as submerged wood, even when treated by a creosoting process, is always liable to be attacked by such enemies as the teredo, concrete and other similar materials have been suggested for groynes. Experience alone will prove which is the best material. For C. P. in Holland sea-walls or dikes are used in addition to groynes, and for the protection of submerged banks fascine mattresses. The latter are made of willow brushwood and are ballasted with stone. The Zuider Zee has now been enclosed and partly reclaimed. The prin. method of construction for the enclosing dike is an exterior dam of boulder clay, and behind this sand covered with a layer of clay, having a facing of stone on both sides.

Another important feature of C. P. is dune fixation. The importance of this is recognised in the U.S.A., and grass is generally planted. In England marram grass has been used successfully, notably on the Norfolk coast, and on shingle beaches for protection against on-shore gales tamarisk is recommended.

Under the Coast Protection Bill (introduced in 1948), amending the law on C. P. against erosion, the council of each maritime co., bor., or co. dist. becomes the protection authority. Orders may be made for setting up C. P. Boards, which

will be empowered to raise money for protection work and to hold land. Development of land will not be allowed unless the protection authority certifies that it is consistent with C. P. See W. H. Wheeler, *History of the Fens*, 1897, and *The Sea Coast*, 1902; F. M. du Plat Taylor, *The Reclamation of Land from the Sea*, 1931; E. R. Matthews, *Coast Erosion and Protection*, 1934; R. R. Minikin, *Coast Erosion and Protection*, 1952.

Coast Ranges, system of mts in N. America extending along Brit. Columbia, Washington, Oregon, California, Lower California, and Mexico, almost parallel to the Pacific coast. These mts are very irregular, sometimes attaining to a great height and then remaining at a comparatively low one for a considerable distance. The character of the scenery is also very varied, the mts in some places being almost bare, and in other places being densely covered with thick forests. In Brit. Columbia the Coast Range, called also Cascade Range, averages a height of 6000-7000 ft, although some peaks attain a height of 9000 ft. Many of the trees on the slopes of the C. R. grow to an enormous height, of which the Douglas spruce is an excellent example, being 250-300 ft high. In Washington the mts are called the Olympic group and are very rugged, the highest peak, Olympus, being 9544 ft high. The mt range diminishes in size in Oregon, averaging between 4000 and 5000 ft in most parts. In California the C. R. present an insignificant appearance for about 400 m. Further on, nearer San Francisco, they attain to a great height in some peaks, whilst not far from Los Angeles San Bernardino Mt rises 10,630 ft high, and Mt San Geronio 11,485 ft.

Coastal Command, development of 'Coastal Area, R.A.F.' which was formed towards the end of the First World War to develop, in relationship with the Admiralty, all aspects of air co-operation in war at sea, to administer and train the Fleet Air Arm on land, and to develop flying-boats for the defence of trade and imperial communications. In 1937 the administration of the Fleet Air Arm was transferred from the C. C. to the Admiralty. That the work of the C. C. airmen in the Second World War was of the highest importance might be inferred from the fact that their patrols for the protection of ocean convoys covered more than half the seas from the Arctic to the Equator, and from the Bay of Biscay to the Amer. shores, throughout the duration of the battle of the Atlantic. It was owing to spotting by their craft of the *Bismarck* (q.v.) weighing anchor for her first and final sortie that she was so soon sunk. From the outset the command joined with the navy in attacking the U-boat wherever and whenever it was located. By the end of the war C. C. squadrons had destroyed and shared in the destruction of 212 enemy submarines. The prison-ship *Altmark* (see NAVAL OPERATIONS IN SECOND WORLD WAR) was discovered in Josing Fjord by C. C. reconnaissance. Frequently U-boat crews surfaced and surrendered to C. C. aircraft. With mine,

bomb, and torpedo C. C. maintained throughout the war an unrelenting offensive against the enemy's shipping along the coasts of Europe, and thus imposed an ever-increasing strain upon his land communications. See H.M.S.O., *Coastal Command*, 1942.

Coastguard. The modern C. service has developed from a preventive service of the 16th cent. It was under the control of the Customs until 1856, when it was transferred for administrative purposes to the Admiralty. By the Coastguard Act, 1925, the control of the C. service passed to the Board of Trade Marine Dept. The service is now under the control of the Ministry of Transport and Civil Aviation, although for a time during the Second World War it was again administered by the Admiralty. The coasts of the U.K. are organised into 10 divs. i.e. N. Scotland, E. Scotland, N.E., E., S.E., S., S.W., Cambrian, N.W. and N. Ireland. The divs., each under an inspector, are subdivided into 31 dists., each under a dist. officer. There are 155 regular C. stations and 153 auxiliary stations (manned by Coast Life Saving Corps); regular stations are in the charge of a station officer or coastguardsman-in-charge. There are over 530 regular C. staff, and the Coast Life Saving Corps has some 6400 voluntary members. The regular C.s are generally men who have seen active naval service. The C. is concerned with marine casualties of all kinds and is based on a watch from coastal look-out huts, in most places set only during periods of bad weather. In 1925 it became largely a life-saving service with very much reduced numbers. In the U.S.A. a C. service was created by an Act of Congress in 1915, absorbing the previous duties of the revenue cutter and the life-saving services. This service is responsible for maintaining the N. Atlantic International Ice Patrol. See also SIGNALS.

Coasting Trade, shipping trade carried on between ports of the same country. The different coasting areas of the world have produced coasting ships (coasters) of many markedly different types evolved to suit local conditions. In the U.K. participation in the C. T. was formerly reserved to Brit. ships, but since 1854 the trade has been open to foreign shipping; even so Brit. ships accounted for 93.9 per cent (51,525,000 tons net) of the movement of shipping in the U.K. general C. T. in 1956; for comparison it may be mentioned that the total foreign trade movement of shipping at U.K. ports in 1956 was 127,054,000 tons net. Coastal shipping forms an integral part of Britain's transport system as a whole, the tonnage of the goods carried having been estimated as more than a third of that carried by rail. The prin. cargo carried is coal (28,800,000 tons in 1956); other items are cement, minerals (especially sand, chalk, slate, stone, ore, scrap iron, china clay, and fertilisers), food (especially grain and potatoes), timber, and wool and cotton.

There are 5 prin. classes of vessel engaged in the Brit. C. T.: liners (i.e. vessels running in a scheduled service);

large tramps (over 1000 tons gross); small tramps (under 1000 tons gross); tankers (which with the advent of the giant deep-sea tanker may come to be increasingly important as a means of local distribution); and estuarial craft. The types of vessel falling into these prin. classes are too numerous to enlarge upon, but one highly specialised craft that many must have seen passing under London's bridges with lowered funnel and mast is the 'flat-iron' collier, which keeps the Thames-side power stations supplied with coal. Machinery aft is a frequent characteristic of the coaster; so too is the raised quarter-deck.

The table below shows the movement of shipping with cargo in the general C. T. of the U.K. (excluding the Rep. of Ireland) in 1938, 1947, and 1956 (figures in thousands of tons net):

	British	Foreign
	1938	
Arrivals	21,310	332
Departures	21,452	346
Total	42,762	678
	1947	
Arrivals	19,755	484
Departures	19,716	514
Total	39,471	998
	1956	
Arrivals	26,159	1685
Departures	25,366	1634
Total	51,525	3319

See P. Ford and J. A. Bound, *Coastwise Shipping and the Small Port*, 1951.

Coat of Arms, see ARMS, COATS OF and HERALDRY.

Coatbridge, burgh of Lanarkshire, Scotland, 9 m. E. of Glasgow, and one of the 11 vills. in the par. of Old Monkland. It became a municipal bor., with the privileges of a royal burgh, in 1885. C. lies in the centre of a mineral dist., and possesses in addition to sev. churches a technical school, various municipal buildings, and 4 fine parks. There is an important iron and steel industry. Pop. 43,000.

Coatepec, tn in the Atlantic state of Veracruz, Mexico. 56 m. distant from Veracruz city, an agric. centre with sugar and coffee industries and alcohol distilling, and famous for orchids. Pop. 11,460.

Coates, Albert (1882-1953), musical conductor, b. St Petersburg of wholly Eng. parentage. Educ. at Buckhurst Hill School, and studied science at Liverpool under Sir Oliver Lodge. Returned to Russia. Entered Leipzig Conservatorium; joined Nikisch's conducting class. Conducted the Opera at St Petersburg for 5 years. Came to England in 1919, conductor to Sir Thomas Beecham at Covent Garden. Conductor of London Symphony Orchestra and Royal Philharmonic Society. Director, Philharmonic Orchestra, Rochester, New York. 1923 to 1925,

when he returned to England. His last years were spent in S. Africa. Operas: *Samuel Pepys*, 1929, and *Pickwick*, 1936.

Coates, Eric (1886-1957), composer, b. Hucknall, Notts. He won a scholarship at the Royal Academy of Music in 1906. For some years after 1912 he was prin. viola at Queen's Hall. His compositions include chamber music and many light orchestral pieces, songs, and marches.

Coates, John (1865-1941), tenor singer, b. near Bradford; began his music as a choirboy. When his voice broke he was trained as a baritone, but after a career in light opera in England and America he achieved a reputation as a tenor by rendering Sullivan's setting of Kipling's *Absent-minded Beggar* in 1899. His chance came at Worcester 3 years later, and henceforward the prov. festivals sought him for leading parts, especially in

modern oratorio. He made his first appearance in London in 1894 at the Savoy Theatre, and eventually, in 1901, took part in the Covent Garden opera. His name is inseparably linked with Elgar's *The Dream of Gerontius*, the occasion of his first singing the name-part at the Worcester Festival in 1902 being the real launching of Elgar's masterpiece on its career of wide popularity in England. C. sang in different parts of Germany and the U.S.A.

Coates, Joseph Gordon (1878-1943), New Zealand statesman, b. Matakaho, son of Edward C., farmer. Educ. privately. Became M.P. for Kaipara, 1911. Served with infantry in France, Jan. 1917 till Feb. 1919. Attained rank of major and received Military Cross. On return home took office under premier Massey; filled offices of postmaster-general and minister of public works. Became first New Zealand-born Prime Minister on death of Massey, 1925. His Reform party was defeated at the general election of 1928, and he was succeeded by Sir Joseph Ward, leader of the new United party. Held various offices in the Coalition Gov., 1931-5, and d. in office during the Second World War.

Coatesville, city in Chester co., Pennsylvania, U.S.A., 34 m. W. of Philadelphia. It is situated on Brandywine Creek. Its chief manufs. are paper, steel

plate, boilers, textiles, and metal products. Pop. 13,826.

Coati, or **Coati-mundi** (*Nasua*), genus of Procyonidae, related to the racoon. They are indigenous to central and S. America, are gregarious and arboreal; the nose forms a mobile proboscis useful in digging up its food.

Coats, James (1774-1857), founder of a cotton-thread business in Paisley, which is now known as J. and P. Coats Ltd.

Coats, Sir Peter (1808-90), and **Thomas** (1809-83), sons of James C., b. Paisley, both Scottish thread manufacturers. Both gave generously to many philanthropic schemes, and Paisley owes much to them.

Coats Land, region of Antarctica, skirting Weddell Sea. It was discovered by W. S. Bruce (q.v.), and named after the brothers Coats in 1904, during the Scottish National Antarctic Expedition. It is included in the Falkland Is. Dependencies sector of the Antarctic.

Coatzacoalcos: 1. Riv. in Mexico which rises in the Sierra Madre, Tehuantepec Isthmus, and ultimately falls into Campeche Bay. It is 175 m. long, and navigable for about 125 m. from its mouth. Ocean-going vessels go 24 m. up to the great oil refinery of Minatitlán.

2. (formerly called **Puerto Mexico**). Port in Veracruz, Mexico, on the Gulf of Campeche; N. terminus of the Tehuantepec railway and road across the isthmus, standing 1 m. from the mouth of the wide and 50-ft-deep C. R. The climate is hot. Two converging jetties about 4333 ft long extend from the mouth of the riv. to the sea to prevent the formation of a bar. Its wharves are equipped with all modern equipment. Exports are hardwood, petroleum products, sulphur, cereals, and fruit. The beach is the main street. Pop. 13,740.

Cob, see **HORSE**.

Cob-nut, **Filbert**, and **Hazel-nut** are all names of the fruits of various species of the cultivated hazel (*Corylus*), the parent form of which is *C. avellana*. The 3 fruits differ chiefly in the length of the husks or involucre, which in filberts (q.v.) are longer than the nuts, about equal in cobs, and shorter in hazels. The fruits are edible and are largely cultivated as dessert fruits. *C. maxima* is the Kentish cob or great cob, also known as Lambert's filbert. It has a large thick-shelled nut, the kernel of which is covered by a reddish coat. Barcelona nut is sometimes mentioned as a kind of cob or as a variety of Kentish cob.

Cobalt, tn in Ontario, Canada, 330 m. N. of Toronto, named from the abundant supply of cobalt ore. Nearly 300,000 oz. of silver were produced in 1903-18, but much less later. The first valuable discovery of ore was made in 1903. Pop. 2407.

Cobalt and Cobalt Ores. Cobalt (symbol Co, atomic weight 59.0) is a metal of the iron group of elements. It is a hard white metal with a bluish cast resembling nickel, produced by the reduction of its oxide or chloride by hydrogen or carbon. Like iron and nickel it is magnetic, although to a lesser degree. The element

is remarkable for the brilliant colours of some of its compounds. Thus a blue colour is imparted to potash glass by the addition of a little C. salt, when C. silicate is formed. C. is a relatively rare metal, but plenty of it is found mined with the silver ores in Ontario around Cobalt City. The chief ores are C. glance (CoAsS), the arsenide-and-sulphide; smaltite (CoAs₂), the arsenide; and C. bloom, which is an arsenate of the metal. These are converted into oxide by roasting and reduced with carbon. The metal itself is becoming increasingly important as a constituent of various alloys, while its compounds are used in the mann. of paints (both as pigments and as driers). C. chloride gives a pink solution in water, which forms a favourite invisible ink; writing done with this liquid is invisible—more or less—when dry, but goes brilliantly blue on warming. The incorporation of C. salts in silica gel (drying agent) is based on this colour change.

Cobán, commercial and agric. tn, cap. of Alta Verapaz dept. N. Central Guatemala. It is situated at 4331 ft. in the finest coffee-growing dist. of the rep. There are textile, net and rope making, and other industries. The nearby underground Lanquin caves and riv. are noted for their blind white fish. Famous also for Maya ruins in the forest. Pop. 6860.

Cobb, Irvin Shrewsbury (1876-1944), Amer. journalist and author, b. Paducah, Kentucky. He held various positions as reporter and on editorial desks at Paducah, Louisville, and New York and then became a regular staff contributor to various Amer. magazines, specialising in the short story, of which he is considered one of the best modern exponents, particularly of the story in a humorous vein. Many of his stories deal with his native Kentucky, of which he has made himself a sort of prose laureate. Among his best-known books are *Old Judge Priest*, 1915, and *Red Likker*, 1929. *Exit Laughing*, 1941, is autobiographical.

Cobb, John Rhodes (1899-1952), racing motorist, b. Esher, Surrey, and educ. at Eton and Trinity Hall, Cambridge. He began his racing career at Brooklands in the early 1920's. In 1938 he broke the world land speed record, beating George Eyston's 346.49 m.p.h. with a speed of 350.20 m.p.h.; but Eyston afterwards achieved a new record speed of 357.52 m.p.h. The following year C. raised the record to 369.7 m.p.h.; and in 1947 raised it again to 394.2 m.p.h. He was the first man to exceed 400 m.p.h. on land, having reached 403.135 m.p.h. in one direction. He was killed while attempting to break the world's water speed record on Loch Ness—his first attempt at speed on water.

Cobbe, Frances Power (1822-1904), writer and social investigator. She was a staunch supporter of women's suffrage and the founder of the National Antivivisection Society, and of the Brit. Union for the Abolition of Vivisection. Pub. *An Essay on Invidious Morals*, 1855. *The Duties of Women*, 1881, and *The Scientific Spirit of the Age*, 1888.

Cobbett, William (1763–1835), author and politician, b. Farnham, Surrey, and worked on his father's farm as a boy, but at the age of 20 became a solicitor's clerk. Finding the life uncongenial, he enlisted and went with the 54th Regiment to New Brunswick. He was soon promoted to the rank of sergeant-major, and secured his discharge in 1791. After a brief stay in France he went to the U.S.A., where he found full play for his talents as a pamphleteer. He became well known, and his fame spread to England, where many of his writings were reprinted. His hatred of shams and dishonesty eventually made him the defendant in a libel action, which, being decided against him, ruined him. He returned to England in 1800, and was taken up by the Tory leaders, Wyndham and Dr Lawrence providing him with funds to start the *Political Register* in 1802, which was pub. weekly until his death. His industry, as he was never tired of pointing out, was prodigious, and his output enormous. Besides writing the greater part of the *Register*, he was the author of many books, mostly of a utilitarian nature, such as *Cobbett's Cottage Economy*, 1822, and *The English Gardener*, 1829. His most characteristic book is *Advice to Young Men*, 1830; his best, *Rural Rides*, 1830. He also wrote *A History of the Protestant Reformation in England and Ireland*, 1824–7. His great merit as an author was his clear, vigorous style. An active politician, he was always on the side of the oppressed. After 1804, when he was prosecuted for an article he had written on Ireland, C. became a violent critic of the administration. He was prosecuted by the gov. in 1810, and imprisoned in Newgate for 2 years; and in 1817, on the suspension of the Habeas Corpus Act, he went to America to escape a second period of imprisonment. He was one of the most strenuous advocates of parl. reform, one of the most valuable of his pubs. the *Register*, reaching a vast public. Appropriately enough, he was returned as a member of the first Reform Parliament, but he was then too old to achieve any marked success in a new sphere of activity. See L. Melville, *The Life and Letters of William Cobbett in England and America*, 1913; G. D. H. Cole, *The Life of William Cobbett* (new ed.), 1947; Margaret Bowen, *Peter Porcupine*, 1935; H. J. Massingham, *The Wisdom of the Fields*, 1945.

Cobbler, The, or **Ben Arthur** (2891 ft), mt. of Argyll, Scotland, some 3 m. WNW. of the head of Loch Long. It has many short rock cliffs.

Cobden, Richard (1804–65), politician, was the fourth of 11 children of a small Sussex farmer, brought up by relations in Yorks. Later he became a clerk, and then a commercial traveller, until in 1832 he set up in business on his own account as a calico merchant in Manchester. The business prospered, and eventually C. became a manufacturer, and found time to remedy some of the defects of his education. Economics was his favourite study, and he became an active advocate

of free trade. He gave expression to his views in pamphlets issued respectively in 1835 and 1836, *England, Ireland, and America*, and *Russia*. He entered Parliament in 1841. He was already a prominent member of the Anti-Corn Law League which had been founded at Manchester in the autumn of 1838, supported by Charles Villiers and John Bright. To obtain the repeal of the laws imposing a duty on the importation of corn was the matter nearest his heart, and it was on this subject that, on 25 Aug. 1841, he made his maiden speech in the House of Commons. The Irish famine of 1846 finally converted both Peel and Russell to C.'s view, and the Corn Laws were at last repealed, Peel acknowledging publicly C.'s share in the campaign against them. C. was hailed as the saviour of the poor. His exertions had, however, left him no time for the conduct of his own affairs, and his business was on the verge of bankruptcy; but ruin was averted, for a grateful nation subscribed £80,000 as a testimonial to him. In 1860 another subscription was started and realised £40,000. Nothing that C. did after the repeal of the corn laws was commensurate in value with his share in securing that measure, but after his prin. object was effected he strove in other directions to further free trade. His next most important achievement was the negotiation of a commercial treaty between France and England, to bring about which he went to Paris in 1859. He went as a private person, but when he had silenced the objections of the Fr. protectionists he was given official powers, and in 1860 he and Lord Cowley were the Eng. signatories to the treaty. C. was a consistent opponent of Palmerston's foreign policy, which he considered amoral and bellicose. See Lord Morley, *Life of Richard Cobden*, 1881, and J. A. Hobson, *Richard Cobden*, 1931.

Cobet, Carel Gabriel (1813–89), Dutch classical scholar and palaeographer, b. Paris. In 1846 was made prof. at Leyden, where he remained until his death. His chief works are *Novae Lectiones*, 1858, *Variae Lectiones*, 1873, *Miscellanea Critica*, 1876, *Observationes Criticae*, 1877, *Collectanea Critica*, 1878, and *Brieven aan Geel*, 1892.

Cobh (pronounced *Cone*; formerly *Queenstown*), 14 m. by rail SE. of Cork, Rep. of Ireland, port of call for transatlantic liners in Cork harbour. St Colman's Cathedral, which has a carillon of 42 bells, stands on the high ground dominating the harbour. The Royal Cobh Yacht Club (1720) is the oldest in the world. Spike Is. is now an army coastal defence station. Pop. 5700.

Cobham, Lord, see **OLDCASTLE, SIR JOHN**.

Cobham, Sir Alan John (1894–), aviator. Commissioned 1917 in the Royal Flying Corps. In 1920 he undertook aerial photography for the Aircraft Manufacturing Co. Joined the De Havilland Aircraft Co., 1921. Same year began series of long flights; flew 5000 m. round Europe. Another tour, 8000 m., round

Europe and N. Africa in 1922; in June flew from Belgrade to London in a day. Flew 12,000 m. over Europe, N. Africa, and Palestine in 1923; also London to Brussels with 6 h.p. engine. In 1924 flew from London to Rangoon and back; in 1925-6 flew London to Cape Town and back; in 1928 England to Australia and back; won Britannia Trophy, 1923, 1925, and 1926; and in last-named year was made K.B.E. He was commander-pilot of a flying-boat expedition which flew completely round Africa, Nov. 1927 to May 1928. He later became the most important pioneer in the technique of refuelling aircraft in flight, a work in which he is still prominent.

Cobham, or Church Cobham, vil. in Surrey, England, situated on R. Mole, 4 m. W. of Esher. Pop. 7248.

Cobitis, genus of carp-like fishes popularly known as loaches, which are natives of Europe and the E. Indies. The spined loach is a European species found in Britain.

Coble, low, flat-bottomed boat with a square stern, of 1 ton burden, 20 ft in length, and 5 ft in breadth, rowed with 3 pairs of oars, and fitted with a lug-sail. It is used chiefly in the cod and turbot fishery. The name is also applied to a smaller boat in use by the salmon fishers.

Coblentz, see KOBLENZ.

Coburn, Charles (1852-1945), musical comedian and singer, b. Milo End, London, son of a ship agent. His true name was Colin Whitton McCallum and he took his stage name at random from C. Road, Bow. He began his professional career at the Alhambra, Sandgate. In 1877 he played the title role in *The Man in the Moon* at the Theatre Royal. He made a name at Oxford as a coster comedian. His outstanding successes were his songs 'The Man who broke the Bank at Monte Carlo,' written and composed by Fred Gilbert, which he sang hundreds of times, and 'Two Lovely Black Eyes.' He did much for the comfort of the music-hall profession by forming, in 1885, the Music Hall Artists' Association. C. reappeared in 1927 in the 'Veterans of Variety,' later in broadcast programmes. In 1928 he pub. a vol. of reminiscences with the title of his Monte Carlo song.

Cobourg, cap. tn of Northumberland co., Ontario, Canada, 77 m. N.E. of Toronto, and situated on the N. shore of Lake Ontario. It possesses various factories, including a foundry and a matting mill. Pop. 7153.

Cobra, Portuguese name for sev. poisonous snakes in the colubrine genus *Naja* common to S. Asia and Africa. The most familiar of these is *N. naja*, or C. da capello, the hooded snake of India. The colours vary from pale brown to dark grey in some specimens, while others are dark brown and bear spectacle-like black and white markings on the neck, a portion of the body which becomes a hood-like expansion when the creature is roused. In habit the C. is usually nocturnal, and unless attacked is not, as a rule, dangerous; its diet consists of small vertebrates, e.g. rats and frogs; its length may

be from 4½ to 6 ft. Although it is terrestrial and conceals itself among stones during the day, it can both swim and climb gracefully and well. The King Cobra (*N. hannah*) reaches a length of over 16 ft.

COBRA

Cobra, King, or Giant, see HAMADRYAD. Coburg (Ger. Koburg), Ger. tn in the Land of Bavaria (q.v.), lying among the foothills of the Thuringian Forest (q.v.), on the Itz, 143 m. N. by W. of Munich (q.v.). Formerly the cap. of Saxe-C. (see SAXE-COBURG-GOTHA). On a hill 520 ft above the tn stands a magnificent old fortress; it sheltered Martin Luther (q.v.) at the time of the Diet of Augsburg, and during the Thirty Years War (q.v.) it was sev. times unsuccessfully besieged. The fortress is now a museum, and includes among its exhibits a collection of 300,000 engravings. The ducal palace of C., *Schloss Ehrenburg*, was originally a Franciscan friary. There are numerous Renaissance buildings, and in the surrounding dists. there are fine castles and mansions: Albert, Prince Consort (q.v.), was b. at *Schloss Rosenau*, near by. There are agric. markets, and manufs. of textiles, baskets, porcelain, furniture, and beer. Pop. 47,000.

Coca, see COCAINE.

Coca Wine (*Vinum cocae*), wine used for stimulating effects, and consisting of one part of C. and 8 parts of wine. It is strongly medicated, and must contain half a grain of alkaloid in the ounce, otherwise it is necessary to have a licence before it can be sold.

Cocaine ($C_{17}H_{21}O_4N$), chief alkaloid found in the leaves of the coca-tree. *Erythroxylon Coca* is a shrub of the family Erythroxylaceae; it attains a height of 6-8 ft. and is met with in many tropical countries, particularly in S. America, where the natives have long been in the habit of chewing the leaves for the stimulating effects produced. When the practice has been long indulged in

the appetite for ordinary food falls, the subject tends to rely on the drug, and eventually collapse occurs. As an occasional tonic, however, coca leaves have considerable value, and are said to enable the Indians to perform remarkable feats of endurance. The properties of the plant were demonstrated in Europe by Christison, and many preparations of value as stimulants have been made with coca leaves extract as an important constituent. Many alkaloids have been found in the leaves, the most important being C. One extract is first made by steeping the coca leaves in hot water. The solution is then treated with lead acetate in order to precipitate tannin, etc., and the lead in the filtrate is precipitated by the addition of sodium sulphate. The solution is then rendered alkaline with soda and the C. extracted with ether and purified by recrystallisation from alcohol. C. forms colourless prisms melting at 98° C. It is soluble with difficulty in water, but forms salts readily. The preparation usually employed in medicine is the hydrochloride ($C_{17}H_{21}O_4N.HCl$), which is readily formed by neutralising the alkaline extract with hydrochloric acid and evaporating the solution to crystallisation. The most important property of C. is its capacity for removing all sensation of pain on local application, and it is used for this purpose in dentistry and other minor surgical operations. Taken by the mouth, it acts first as a stimulant and then as a narcotic. It resembles caffeine in its effect on the nerve centres, and atropine in its effect on the respiratory and circulatory organs. The dose for internal use is from $\frac{1}{4}$ to 2 grains. For injection to produce local anaesthesia a 2-8 per cent solution of the hydrochloride is employed. C. has been found of great use in eye operations. When applied to the conjunctiva it dilates the pupil and abolishes pain. For some time after the application there is paralysis of the function of accommodation, so that the patient does not see clearly. For producing local anaesthesia various methods are employed, according to the nature and seat of the operation and the depth of anaesthesia desired. Simple external application to the skin has little effect, but the effect on mucous membrane is to produce a tingling followed by numbness with partial or total loss of sensibility to pain, according to the idiosyncrasy of the subject. There is usually a blanching of the surface, owing probably to constriction of the blood-vessels. Short operations in the nasal passages may be rendered painless by the application of C., also such operations as the removal of tonsils. A deep local anaesthesia can be produced in a superficial part by hypodermic injection. This is used not only for dental and other small operations, but also on occasions when general anaesthesia is dangerous or undesirable. Its use is avoided when possible, as in certain persons it is liable to cause depression of the heart, with possibly fatal results. Another disadvantage of its use is the impossibility of

sterilising C. by heat as it decomposes. There is therefore some danger of septic germs being introduced, although a fairly strong solution is not a favourable medium for the growth of micro-organisms. It is true that the distressing symptoms consequent upon the use of ether or chloroform are avoided, but C. is not free from painful after-effects, and sometimes the sensibility of the part is increased when the influence of the drug has passed away. C. is sometimes used to produce spinal analgesia, though it has been largely superseded by stovaine, eucaïne, and novocaine. The method employed is the injection of the solution into the sac containing the spinal cord in the lumbar region. The effect produced is insensibility to pain in the lower part of the body. A danger always present in the administration of C. is the possibility of setting up the drug habit. Its employment, for instance, to modify recurrent pains tends to produce a craving for C. which is much more insidiously developed and more difficult to eradicate than the craving for alcohol. The patient simulates pain to procure the drug, even to the point of self-deception. The firm establishment of the habit leads to moral degeneration, sleeplessness, emaciation, and death.

Coccajo, Merlino, see FOLENGO, TEOFILO.

Cocceius (Koch or Kohen), Johannes (1603-69), Dutch Hebraist and one of the leading exponents of the federal or covenant theology, an 'important attempt... to do justice to the historical development of revelation.' His disciples were known as Cocceians. His chief works were *Summa Doctrinae de Foedere et Testamento Dei*, 1648, and *Lexicon et Commentarius Sermonis Hebraici et Chaldaici Veteris Testamenti*, 1669.

Coccej, Heinrich von (1644-1719), Ger. jurist whose *Juris Publici Prudentia* for a long time remained the text-book of Ger. civil law.

Coccej, Samuel (1679-1755), Prussian statesman, who became chancellor to Frederick the Great in 1747 and reorganised the Prussian judicial system.

Coccidiosis, see POULTRY, *Common Diseases*.

Cocoo, Coco, Scratch-coco, Taro, and Eddoes are names given to *Coccoloba antiquorum* and var. *esculenta*, E. Indian species of Araceae. The C. is often used as a foliage plant; the rhizomes contain a poisonous property, but lose this when they are boiled, and form a nutritious food for the natives.

Coccoliths, microscopical organisms (which may be protozoans or algae) with characteristic calcareous plates which are found in deep-sea ooze and sometimes in geological formations such as the chalk.

Coccoloba, genus of Polygonaceae, consists of tropical plants of very handsome appearance, some of which produce edible fruits. There are more than 120 species, restricted to tropical and subtropical America. *C. uvifera*, the seaside grape, is a small tree, the leaves, wood, and bark of which are powerfully astringent

owing to the presence of tannin, and a decoction called Jamaica kino is evaporated from them. The wood is valued for cabinet-making and contains a colouring matter used as a dye; the fruit is edible and is sold in W. Indian markets, but is little valued.

Cocculus, dried berry of *Anamirta cocculus*. *C. indicus* is the commercial name of the drug. The berries contain a poisonous active principle known as picrotoxine, about which great care is exercised when it is used medicinally.

Coccus, genus of hemipterous-homopterous insects typical of the family Coccidae, of which the species are called familiarly scale-insects or mealy bugs. The females are wingless, and of a very degenerate type; when adult they fix themselves to a plant by means of their proboscis, and remain there until they produce their young and die. The males, however, are devoid of mouth parts, and consequently do not live long after fulfilling their one duty, that of fertilising the females. They are unlike their mates in being beautiful and well-developed creatures with anal cerci and a single pair of wings. Some of the coccids are destructive to vegetable life, while others are of value to man. Such are *Dactylopius coccus* which yields cochineal, and *C. (or Gossyparia) mannifera* (*C. manniparus*) which exudes the honey-dew supposed to be the manna of the O.T. This latter occurs on the leaves of *Tamarix gallica* var. *mannifera* a. 'Lac' is produced by an Indian coccid (see SHELLAC).

Coccyx, terminal portion at the lower end of the spinal column below the sacrum, consisting of 4 or 5 vertebrae.

Cocentaina, Sp. tn in the prov. of Alicante, with anct towers and a 15th-cent. palace. Silk and linen are manuf. Pop. 9,500.

Cochabamba, second largest city in Bolivia, cap. of C. dept and Cetado prov., railway terminus and main airport for internal services. The city enjoys an average temp. of 64.4° F. (altitude 8389 ft). The prov. (area 23,030 sq. m.; pop. about 654,000) of which it is the cap. is sometimes called the granary of the rep. There are large herds of cattle and rich forests. The city is the distributing centre for the agric. products of E. Bolivia, and there is a rich mining region. C. has a cathedral and a univ., and is a tourist resort. Pop. 80,300.

Cochin, tn on W. coast of India, formerly in Cochin state, now in the merged state of Travancore-Cochin. It is commonly regarded as the earliest European settlement in India. The Portuguese Cabral was welcomed on a visit here in 1500, and in 1502 Vasco da Gama estab. a factory. He d. at C. in 1524. The Portuguese viceroy in 1510 was Albuquerque. An Eng. factory was estab. in 1635, but in 1663 C. was captured by the Dutch. It was finally taken by the British in 1795. It has a very anct Christian tradition and first conversions are ascribed to the Apostle Thomas (AD 52). There have been many sects and heresies, but Christians from this area are commonly

called Syrian Christians. There is also a colony of Jews, of whom one section claims to have settled on the coast as early as the 3rd or 4th cent. AD. C. is now a fine harbour and port for cargo and passenger liners.

Cochin-China. Modern C.-C. is the southernmost of the 3 regions, Tonking, Annam, and C.-C., into which France divided Viet Nam during the 19th cent. The name C.-C. dates from the 17th cent. About 1600 Viet Nam split into 2 separate kingdoms of which the S., ruled by the Nguyen emperors, was known to the Japanese traders by a name which sounded to European ears like Cochin. The 17th-cent. European traders, in order to avoid confusion with Cochin in India, called the kingdom C.-C., but the C.-C. of that time was little more than the S. part of modern Annam. It is also known to-day as Nam-bô (S. region). C.-C. is bounded by Cambodia and Annam to the N., by the China Sea to the E., and by the Gulf of Siam to the W. A peninsula to the S. ending in Point Ca-mau, it separates the China Sea from the Gulf of Siam. Off the coast are the Poulo Condore Is. and Poulo Obi in the China Sea, and the Phu Quoc group in the Gulf of Siam.

Its area is 20,476 sq. m. C.-C. is mostly a broad, low-lying, alluvial plain, including the deltas of the Mekong and Dongnai R.s, together with the Saigon R. and the Great and Little Valcos. The coast region is swampy, and cane-covered marshes stretch far inland. Two canals connect the Bassac arm of the Mekong with the Gulf of Siam. The climate is subject to monsoons and is found to be somewhat oppressive by Europeans. Towards the N. there is higher land, mt summits rising to about 2000 ft. In the W. are the last outliers of the Elephant Mts of Cambodia. Forests in the NE. contain valuable woods for shipbuilding and cabinet-making. The gamboge-tree abounds. The ter. is covered by a network of roads, many of which are metalled, but much of the rice and other products is carried in junks through a complex system of rivs. and canals which converges on Cholon. C.-C. is an agric. region and its main crop is rice, of which 3 million tons were produced annually before the Second World War. Secondary products are rubber, coffee, tea, areca-nuts, betel-nuts, sugar-cane, coco-nuts, ground-nuts, maize, mulberry, cotton, pepper, palm oil, sweet potatoes, and various fruits. Water-buffaloes are much used for labour, also zebus. Among other animals found there are the elephant, rhinoceros, deer, wild boar, tiger, and many smaller animals. Peacocks, snipe, partridges, pheasants, and woodcocks also abound. Minerals are not very abundant, but phosphate of lime is found at Ha-tien, lignite and granite quarries are worked, and salt is produced on the coast from lagoons and pits at Soctrang, Baolieu, and Baria.

However, the agric. production was badly disorganised and damaged by the 1945-54 war and the subsequent internal disorders. Moreover a million refugees

from the Communist N. Viet Nam have come to C.-C. since 1954. Production figures are still well below those of pre-war days, but ambitious plans are being carried out with U.S. technical and financial aid to clear jungle, to drain swamps, and to improve irrigation. All this, together with the resettlement of the refugee immigrants—C.-C. has always been underpopulated—should raise C.-C.'s production to a new high level in a very few years. Strenuous efforts are also being made by the gov. to introduce new light industries to the area. Trade and commerce have been mainly in the hands of Chinese and Europeans, but the departure of the Fr. colonial administration, and the final departure of the Fr. armed forces in 1956, have led to the withdrawal of much Fr. capital and many Fr. commercial companies. More recently still the gov. issued decrees forbidding Chinese participation in specified branches of trade, closing down Chinese schools, and offering Vietnamese citizenship to all Chinese residents. It is not yet possible to estimate the effects which these events will have on the future trade of C.-C. The main commercial centres are the adjoining cities of Saigon and Cholon (qq.v.), which between them possess extensive docks and wharves, rice mills, distilleries, sugar refineries, tobacco factories, glass factories, and small textile mills. Storms prevail in May and Aug., while in July, the brief dry season, dysentery and fever are most prevalent. The seasons are very regular and the harvests generally good. The pop. of C.-C. is mainly Vietnamese, but there are considerable numbers of Chinese and Cambodians as well as backward Moi tribes in the hills and jungles, and some Europeans mainly found in Saigon. Sev. religions flourish side by side, the greatest, numerically, being Rom. Catholicism with approximately 2 million adherents, Buddhism and Cao-dalism (qq.v.) with over a million each, and unspecified numbers who still follow the traditional religion of Viet Nam, which is ancestor-worship coupled with different forms of animism. The cap. of C.-C. is Saigon, which is also the seat of the gov. of S. Viet Nam (see VIET NAM). This city is to-day very overcrowded because of the influx of people from the erstwhile unsettled countryside, because of the influx of refugees from N. Viet Nam, and because of the adoption of Saigon as the centre of gov. The combined pops. of Saigon and Cholon to-day exceed 2 million people (pre-war approximately 400,000). Education is administered by the gov. of S. Viet Nam (see VIET NAM) and there are numbers of primary and secondary schools as well as a univ. in Saigon. Some Fr. *lycées* continue to operate. The ter. of C.-C. formerly belonged to Cambodia and Champa, but the Vietnamese people pushed southwards for sev. cents., overrunning Champa entirely and completing the capture of C.-C. from Cambodia in 1780. In 1862 the 3 E. provs. of C.-C. were ceded to France and the whole of C.-C. became a Fr. colony in 1867. It was made part of

the Indo-Chinese Union in 1887. Japan occupied C.-C. during the Second World War and, after the capitulation of Japan in 1945, a Brit. force under the command of Gen. Gracey arrived to disarm the Jap. soldiers. Gen. Gracey handed the ter. back to the Fr. authorities, but a Vietnamese nationalist movement, which later fell under Communist control (see VIET MINH), opposed the return of Fr. rule and began a war which lasted until 1954. In 1954 France granted independence to Viet Nam and, at the Geneva Conference on Indo-China held in the summer of that year, agreed to withdraw all Fr. forces. C.-C. to-day forms the largest part of the Rep. of Viet Nam. For bibliography see VIET NAM.

Cochineal, natural dye-stuff employed in dyeing scarlet, crimson, and orange, and in the preparation of the pigments lake and carmine. It consists of the bodies of the female insects of the *Coccus cacti* (family Coccidae, order Hemiptera), so called because the chief food of the species is a variety of cactus, particularly the nopal, found in Mexico and Peru. It is now also cultivated in Algiers, Spain, etc. The insects are collected from the plants into bags, and killed either in an oven or by exposure to the sun or steam. Different kinds of treatment produce the various varieties of C., the best being known as silver, the next as black, and an inferior quality as granilla. The use of C. reached Europe from Mexico in the 16th cent. Formerly widely used as a dye, C. is now only employed for special purposes, e.g. uniforms, hunting coats, etc. See DYE.

Cochlaeus, Johannes (properly Dobneok) (1479–1552), Rom. Catholic controversialist and writer, b. Wendelstein. He sat on the Rom. Catholic side in the first commission at Augsburg, and at the Regensburg Colloquy in 1546. His best-known work is *Commentaria de Actis et Scriptis Lutheri* (1549; Ger. eds. 1580 and 1582). His *Kleine Schriften* were ed. by J. Schweizer in 1920. Other works are *De Matrimonio Regis Angliae*, 1535, and *Scopa in Araneas Ilicardi Morysini Angli*, 1538 (both written strongly against the marriage of Henry VIII of England with Anne Boleyn), and *Historia Hussitorum*, 1549. His life has been written by Spahn, 1898.

Cochlea, see EAR.

Cochlearia, genus of 15 species of herbs, natives of Europe and N. America, family Cruciferae. *C. armoracia* is the perennial Horse-radish, naturalised in Britain; *C. officinalis* the biennial Scurvy Grass, reputed for antiscorbutic properties when fresh, having a tarry flavour.

Cochran, Sir Charles Blake (1872–1951), theatrical manager, b. Brighton, Sussex. Educ. at Brighton, where he was influenced towards the theatre by Aubrey Beardsley. He acted in America from 1890 to 1893. In 1897 he produced *John Gabriel Borkman*. His first London production was *Sporting Simpson*, at the Royalty Theatre in 1902. He produced more than a hundred shows, and made a big success with *The Miracle* at Olympia.

He won fame also as a promoter of large-scale entertainments of all kinds—including boxing and wrestling matches. Probably his greatest period was between 1818 and 1831, when he produced a succession of revues at the London Pavilion. He was associated with Noel Coward in *Bitter Sweet* and *Cavalcade*, and one of his greatest successes, *Bless the Bride*, was running at the Adelphi Theatre shortly before he d. See *Circus*. It was C. who introduced Hackenschmidt (q.v.). Pub. *The Secrets of a Showman*, 1925, *Cock-a-doodle-do*, 1941, *A Showman Looks On*, 1945.

Cochrane, Sir Alexander Forrester Inglis (1758-1832), admiral who took part in the actions off Martinique in the *Montague*, 1780. In 1795 he seized 2 large Fr. store ships out of a squadron of 5. In Lord Keith's expedition to Egypt in 1801 he commanded the *Ajax*, and in 1806 he took a prominent part in the battle off San Domingo, being second in command under Duckworth. He was uncle of the celebrated Adm. Thomas (Lord) C., Earl of Dundonald, and father of Adm. Sir Thomas John C.

Cochrane, Douglas Mackinnon Baillie Hamilton, 12th Earl of Dundonald (1852-1935), soldier. He entered the 2nd Life Guards in 1870; served in the Nile expedition from 1884 to 1885, was in Stewart's march to the relief of Khartoum, and fought at the battles of Abuklea and Gubat. In the Boer War he was present at the battle of Colenso, and at the head of the 2nd Cavalry Brigade was the first to enter Ladysmith at the raising of the siege by Sir Redvers Buller (28 Feb. 1900). Commander of the Brit. forces in Canada, 1902-4, but recalled by the secretary of state for war following differences with the Canadian Gov. He pub. *My Army Life*, 1926.

Cochrane, Robert, Earl of Mar (d. 1482), Scottish architect, and a favourite of King James III. He is said to have been associated in the building of Parliament House at Stirling.

Cochrane, Thomas, 10th Earl of Dundonald (1775-1860), admiral, began his career in the navy when about 18 years old, and in 1801, when he held the post of commander of the *Speedy*, distinguished himself in the service. Some years later he was elected member for Westminster, and endeavoured in that capacity to reform the Admiralty. He saw a good deal of service against France, but at Aix roads in 1809 he was not successful in his attempt to bring about the destruction of the Fr. fleet, and although the fault was the caution of C.'s admiral, C. had to bear the blame. In 1814 he suffered expulsion from the navy on a false charge of fraud, was expelled from Parliament, and was imprisoned. He escaped, and was re-elected for Westminster. He was, however, recaptured, and had to serve one year's imprisonment. He entered the service of Chile and commanded that country's navy during the war of Liberation, winning sev. fights. After this he did brilliant service in defence of the independence of Brazil (1823-5), and

in 1827-8 was in the service of Greece. By the year 1832 he had managed to regain his position in the Eng. Navy, being made an admiral. He also served as commander-in-chief in the N. Amer. and W. Indies station, 1848. It was under C. (then a captain) that Marryat, in 1806, started on his first voyage in H.M.S. *Imperieuse* for the Mediterranean (see autobiographical incidents in Marryat's *Frank Mildmay*). 'Capt. Savage' in *Peter Simple* is generally conceded to be meant for Capt. C. of the *Imperieuse*. C.'s autobiography contains a hist. of the *Imperieuse*. He wrote *The Autobiography of a Seaman*, 1860-1. See life by his son; also J. B. Atlay, *The Trail of Lord Cochrane before Lord Ellenborough*, 1897; C. Lloyd, *Lord Cochrane*, 1947.

Cochrane, Sir Thomas John (1789-1872), admiral, son of Adm. Sir A. F. I. C. While commanding the *Surprise*, 1813, he captured the *Decatur*, an Amer. privateer, afterwards assisting in the attacks on Washington and Baltimore.

Cook, Edward (1805-92), surgeon, b. Tottenham, Middx, apprenticed at the age of 16 to his uncle Sir Astley Cooper, at St Thomas's Hospital. On the separation from St Thomas's of Guy's Hospital in 1825 he was appointed demonstrator of anatomy at the latter hospital. He became assistant surgeon in 1838, surgeon in 1849, and consulting surgeon in 1871. C. was probably the first to perform the operation of pharyngotomy (1856). His chief work was *Practical Anatomy of the Head, Neck, and Chest*, 1835.

Cock-fighting, an ancient and widely practised sport, consisting of the pitting against each other for fighting of specially bred and trained game-cocks. It appears to have been known in India, China, and Persia, and was introduced into Greece from the E. during the time of Themistocles. From here it spread to Asia Minor, Sicily, and Rome, and from Rome northward and westward over the greater part of Europe. In most European countries it is now illegal, but it is still practised in Spain, and is popular in Sp. S. America, China, Siam, and the Malay Peninsula. It was probably introduced to England at a very early date by the Romans, but our first definite knowledge of it comes from a description by Wm FitzStephen, in the reign of Henry II, of the cock-fights at schools on Shrove Tuesday. It reached its highest popularity in the time of Edward III, and though it was prohibited, on account of the gambling it entailed, about 1360, it continued to be a favourite sport for many cents. Henry VIII built the famous royal cockpit at Whitehall, and the pastime was known as 'the royal diversion' during the time of the Stuarts. James I and Charles II were enthusiastic devotees, the former being said to have attended at least 2 fights a week. C. was rigorously opposed by the Puritans, and Cromwell managed to suppress it entirely for a short time. It was finally abolished by law in 1849, having reached its zenith in Regency days, but is still carried on more or less

clandestinely. The sport was introduced into Scotland about 1681, and here partridges were frequently used instead of cocks, while in Wales a special form of combat, known as the Welsh main, was evolved. The cockpits were usually circular, about 20 ft in diameter, consisting of a stage covered with matting and surrounded by a barrier round which the audience stood. Almost every town in the kingdom had one, the larger provincial cities 3 or 4 each, and London a considerable number, of which the best known were in Westminster, Drury Lane, Jewin Street, Birdcage Walk, Pall Mall, the Haymarket, and Covent Garden. The usual form of combat was that in which an agreed number of pairs of birds fought together, the final result being decided by the majority of victories on one side or the other. In the Welsh main, on the other hand, 8 pairs fought, and the 8 victors were paired and fought again, and so on till only 1 bird was left alive. There was also the battle royal, in which a certain number of birds were set upon each other and left to fight till all but one were killed. The game fowl is probably the nearest modern variety to the original Indian jungle-fowl. A cock is fought when 1 or 2 years old, and is trained by diet and exercise for about a month previously. The wings, tail, hackle, rump, and comb are all carefully trimmed, and spurs, from 1 to 2½ in. long, attached to the heels.

Cock Lane Ghost, imposture which agitated London about 1762. A house in Cock Lane, Smithfield, tenanted by a man named Parsons, was said to be haunted by mysterious noises and by the apparition of a Mrs Kent, who had died there 2 years before. Inquiry revealed that the visitation was the work of Parsons's little daughter, aged 11, and was a scheme on the part of Parsons to blackmail Kent by making it appear that he had murdered his wife. Parsons was condemned to stand in the pillory 3 times and to 2 years' imprisonment. The house was visited by large crowds, among them being Dr Johnson.

Cock of the Rock, or *Rupicola*, genus of S. Amer. passeriform birds, the males of which are very handsome, with a purple-crested head and general orange colour, and have the curious characteristic of performing a strange dance before an assembly of their species. The hen bird is dull-coloured, and does not partake of her mate's antics.

Cock of the Wood, see CAPERCAILLIE.

Cock-penny, payment formerly made by the scholars of certain schools, especially in the N. of England, to their master at Shrovetide. It was originally intended to defray the expenses of cock-fighting, a regular institution at the schools.

Cockade (Fr. *cocarde*, probably alluding to cock's comb), modern substitute for the badge worn in olden days on the dress or appointments of the servants of the house. Custom is the only authority for its use, and excepting casual references in the description of military accoutrements, no official recognition of the C. occurs.

Probably the earliest C.s known were those which were worn in Scotland for William of Orange at the time of the revolution. The white C. was that worn by the Jacobites, while a black one was used by the house of Hanover and by the household of the estab. gov. From the hats of the military it passed on to those of the civil servants of the Crown, and as headgear changed in fashion the use of the C. became confined to servants only. Hence the custom of generations was estab. by which the use of the C. is confined to the servants of those who bear commissions from the Crown or its delegates, i.e. justices of the peace, who receive commissions from the lord-lieutenant of the co.

Cockaigne, Land of (O.F. *coquaigne*, modern Fr. *cocagne*, coming through It. *cocagna* and Lat. *coquere*, to cook, and perhaps literally meaning land of cakes), imaginary land familiar in medieval romances, in which it was possible to live a luxurious life of perfect idleness. All the features of the landscape were good to eat or drink; the rivers were of wine, the houses of cakes and sweetmeats, and the streets of pastry, while roasted geese and fowls and buttered larks went about asking to be eaten. There is a 13th-cent. Eng. poem, *The Land of Cockayne*, which ridicules monastic life.

COCKATOO

Cockatoo, bird belonging to the family Psittacidae, of the order Psittaciformes. They are closely related to the true parrots, with which they are commonly considered. True C.s are light in colour, generally white with tinges of red and orange. They are found in Australasia and the E. Indian Is. The term is often extended to include allied genera of dark plumage, such as the black C. In heraldry a C. is a beast with head, shoulders, and legs of a cock, and the body, wings, and tail of a wyvern.

Cockatrice, fabulous monster, believed in ancient and medieval times (see Pliny, *Natural History*, and Aldrovandus, 17th cent.) to come from a cock's egg hatched

by a serpent and to have power to wither plants (except rue) and to kill men and animals (except the weasel) by its glance. A cock's crow killed it—so travellers took the bird with them as a protection. In the Bible C. merely means a venomous reptile. It is sometimes identified with the basilisk.

Cockburn, Sir Alexander James Edmund (1802–80), lord chief justice of England. Came of an old Scottish stock; son of Alexander C. of the diplomatic service. He was educ. at Trinity Hall, Cambridge; became a barrister in the Middle Temple, 1829; recorder of Southampton, 1840–6; Q.C. 1841; M.P. for Southampton, 1847–1856; solicitor-general, 1850. His opening speech in the prosecution of Palmer in the celebrated Rugeley murder case in 1856 is famous as a forensic model of its kind. C. defended (1843) the crazy Scotsman, McNaughton, who shot Sir Robert Peel's secretary, Drummond, and estab. the defence of insanity, initiating the general rule (see McNAUGHTON'S CASE). Briefed against Attorney-General, Thesiger, in the case of *R. v. Newman* (later Cardinal Newman), a libel prosecution launched against Newman who had denounced a profligate Rom. Catholic friar named Achilli, who was lecturing on Rom. Catholicism in England. The verdict against Newman was set aside. C. was knighted in 1850; in 1851 he was made attorney-general; recorder of Bristol, 1854–6; and became lord chief justice of court of common pleas in 1856, of court of queen's bench in 1859, and of England in 1874. C. was presiding judge in the Tichborne trial and an arbitrator in the *Alabama* dispute. A man of brilliant abilities and of high reputation as a judge. See *The Greville Memoirs* (ed. H. Reeve), 1874–87; J. McCarthy, *History of Our Own Times*, 1881–1905; W. Ballantine, *Experiences*, 1890.

Cockburn, Alicia, or **Alison** (1713–94), poetess, b. Fairmile, Selkirkshire, a daughter of Robert Rutherford. A very beautiful girl, she married in 1731 Patrick C., advocate, and was for 60 years a queen of Edinburgh society. Although she wrote verse all her life, she is remembered almost solely by her poem *The Flowers of the Forest*, which begins 'I've seen the smiling of fortune beguiling.' It is commonly assumed to have the same subject as the poem of Jean Elliot (q.v.) with the same title, which is a lament for Flodden, but in fact it was occasioned by a wave of financial ruin which affected many in the Ettrick Forest neighbourhood. Her letters were pub. in 1900.

Cockburn, Catharine, née Trotter (1679–1749), miscellaneous writer. Her works include *Verses on Congreve's 'Mourning Bride'*, 1697; 3 tragedies, *Agnes de Castro*, 1698, *Fatal Friendship*, 1698, and *The Unhappy Penitent*, 1701; a comedy, *Love at a Loss*, 1701; and *Writings in Defence of Locke*, 1702 and 1706.

Cockburn, Sir George (1772–1853), admiral who served under Nelson with the frigate *Minerve* during 1796–1802. From 1803 to 1805 he commanded the *Phaeton* in the E. Indies; and in 1813

took an important part in the capture of Washington; in 1815 became commander-in-chief at St Helena, having conveyed Napoleon there from Plymouth.

Cockburn, Henry Thomas, Lord (1779–1854), jurist and judge, b. near Edinburgh, the son of Archibald C., a baron of the Scottish court of exchequer. In 1831 he became lord rector of the univ. of Glasgow, and in 1834 was promoted to the bench as one of the lords of the court of session, under the title of Lord C. He was appointed a lord commissioner of judiciary in 1837. He pub. *A Life of Lord Jeffrey*, 1852, while *Memorials of his Time*, a book full of humour and interest, was pub. posthumously in 1856.

Cockburn, Sir John Alexander (1850–1929), Anglo-Australian statesman, b. Corsbie, near Duns, Scotland; in 1875 he settled in S. Australia, and in 1884 was elected to the House of Assembly as representative for Burra, and in 1887 for Mt Barker. He was minister of education, 1885–7; premier and chief secretary, 1889–90; chief secretary, 1892; minister of education and agriculture, 1893–8. Made K.C.M.G. in 1900. He represented S. Australia at the Federal conferences and at numerous international congresses, and wrote *Australian Federation*, 1901.

Cockchafer, or *Melolontha vulgaris*, lamellicorn coleopterous insect in the family Scarabaeidae and section Melolonthidae. The larvae are found in dung or in decaying vegetable matter or buried in the ground. The beetle is of a brownish colour, is over an inch in length, and is destructive to crops. When in flight it emits a loud whirring sound. Its life is short, but the larval stage is of very long duration, lasting from 3 to 5 years, most of which time is spent at some depth below the soil. The C. is common to continental Europe, but is not so frequently found in England.

Cockcroft, Sir John Douglas (1897–), b. Todmorden, physicist, formerly Jacksonian prof. of natural philosophy at Cambridge, and, 1946–58, director of the Atomic Energy Research Estab. of the Ministry of Supply. Working under Rutherford at Cambridge he constructed (with Walton) apparatus for accelerating atomic nuclei to very high speeds, and with this was able to produce the first examples of completely artificial transmutation (i.e. the conversion of nuclei of one element to those of a different kind). Rutherford had previously shown that such transformations sometimes occurred when alpha particles from radioactive material collided with atoms, but prior to C.'s experiments no nuclei had been artificially accelerated to speeds sufficient to produce similar changes. He has contributed a number of papers to the Royal Society, amongst which are some reports on his work on high velocity positive ions. In 1936 he was elected F.R.S. and was awarded the Hughes Medal in 1938 and Royal Medal in 1954. He was assistant director of atomic research at the ministry of supply in 1942, and director of the atomic energy div. of the national research council of

Canada 1944-6. He received the Nobel prize in 1951.

Cookenzie and Port Seton, joint burgh and fishing port on NW. coast of E. Lothian, Scotland, on the Firth of Forth, 1 m. E. of Prestonpans, and 4 m. NE. of Musselburgh. The 2 vills. now form 1 small port. Pop. 3180.

Cooker, Edward (1631-76), engraver and teacher. His famous *Cocker's Arithmetick*, pub. posthumously by John Hawkins, 1678 (confined to commercial questions only), was popular for nearly a cent. More than 100 eds. were sold. 'According to Cocker' (meaning, in accordance with strict rule or reckoning) became a proverbial phrase. 'Daniel's Copy-book engraven by Edward Cooker, Philomath, 1684,' is preserved in the Brit. Museum. Other works were *A Guide to Penmanship, Tutor to Arithmetick, and Compleat Arithmetician*. See *Pepys's Diary*, 10, 11 Aug. 1664, and A. De Morgan's *Arithmetical Books from the Invention of Printing to the Present Time*, 1847.

Cooker Spaniel, small breed of dog, of Sp. origin; reared for work with the gun, especially for woodcock shooting. It has a soft, wavy coat, black, red, or cream; short legs, square muzzle, and long, low-set ears. See **SPANIEL**.

Cokerell, Charles Robert, R.A. (1788-1863), architect, b. London, the son of an architect. He was trained by his father, then under R. Smirke (q.v.). Travelled extensively in Greece and Italy, 1810-1817; started independent practice on returning to London, 1817; succeeded his father as surveyor to St Paul's, 1819; and became architect to the Bank of England, 1833. From 1840 to 1867 he was prof. of architecture at the Royal Academy. He was the first recipient of the Royal Gold Medal for Architecture, 1848, and president Royal Institute of British Architects, 1860. His most important building is the Taylorian Institute, Oxford, 1841-5. His book on *The Temples of Aegina and Bassae*, 1860, is notable.

Cokerell, Sir Sydney Carlyle (1867-), palaeographer, educ. at St Paul's School. From 1889 to 1892 he was a coal merchant. Secretary to Wm Morris and the Kelmscott Press, 1892-8 (see **MORRIS, WILLIAM**). Director of the Fitzwilliam Museum (q.v.), 1908-37. Fellow of Jesus College, Cambridge, 1910-18, of Downing College, 1932-7. He was a literary executor of Wm Morris, Wilfrid Scawen Blunt, and Thomas Hardy, and has written various bibliographical monographs, especially on illuminated MSS.

Cookermouth, in Cumberland, England, at the confluence of the Derwent and Cocker Rs., 25 m. from Carlisle. There are Rom. remains near by, and C. has the ruins of an 11th-cent. castle, destroyed by the Parliamentarians in 1648. The poet Wordsworth was b. here in 1770. C. borders on the Lake Dist., and is an agric. centre and mkt. tn. for the surrounding area, with sev. light industries, the largest of which is the manuf. of shoes and slippers. Pop. 5250.

Cookie-lecky, or **Cocky-lecky**, soup,

common in Scotland and the N. of England, made from a fowl boiled with leeks.

Cockle, popular name of members of the Cardidae, a family of eulamellibranchiate molluscs. The species are widely distributed in many seas, especially those of the tropics. The shells are strong, heart-shaped and ribbed, and the foot is long and bent. By means of this foot the C.s burrow in mud and sand and also leap over the sand for a short distance. *Cardium edule* is the edible C. familiarly known in Britain as an article of diet.

Cockney. The etymology is now generally accepted that C. derives from M.E. *cokeu-ey* (apparently from O.E. *coken*, 'of cooks,' and *ey*, 'egg,' from which the meaning extended to children that sucked too long, in other words cockered children, milksoaps). The special application to Londoners appears to have come about through countryfolk regarding Londoners as cockered and squeamish, too fine-bred for country taste, and as such it was in common use in Elizabethan times, and may go back considerably earlier. London at that time being just the City, it followed that a Londoner was one born within the sound of the loud and famous Bow bell (i.e. the bell of St Mary-le-Bow Church, Cheapside). In modern usage the term is applied, sometimes contemptuously or banteringly, and sometimes affectionately, to the uneducated Londoner and his speech and humour.

Cockpen, par. of Midlothian, Scotland, 2½ m. S. of Dalkeith. Dalhousie Castle, formerly the residence of the Marquess of Dalhousie, Governor-General of India 1847-56, is the Dalhousie family seat. The grounds include those of the Laird o' C. of Scottish song. Pop. 5700.

Cockroach, term employed in speaking of either the whole family of orthopterous insects known as Blattidae, or of certain members only of the family. The species are very widely distributed, and the Brit. black-beetle is a true C., bearing little resemblance to a beetle. Some of the species are wingless, but usually the male has 2 well-developed pairs of wings—a stiff front pair called the *tegmina*, and a membranous hind pair—and the female bears rudimentary structures to represent each pair. In habit the insects are omnivorous and nocturnal. The female has a broader abdomen than the male, and her eggs are laid in hard capsules. *Phyllodromia germanica*, the croton bug of America, is common also in Europe, and is a representative species of C.; *Blatta* (or *Periplaneta*) *orientalis* is the pest of Brit. kitchens. *Periplaneta* is also the generic name given by some entomologists to a flying species, *P. americana*, and to the Australian C., *P. australasica*. See L. C. Miall and A. Denny, *The Structure and Life-history of the Cockroach*, 1886.

Cocksoomb, see **CELOSIA**.

Cock's-foot Grass, pasture grass of Europe, Asia, and N. Africa, valued as an excellent yielder producing herbage of high feeding value. It must be grazed when young, for with increasing age it

loses its palatability and if not kept in check becomes very aggressive in the pasture. Sev. commercial and indigenous strains are available, each having a particular use. See also *DACTYLIS GLOMERATA*.

Cocktail: 1. *Alcoholic*, a mixture of strong drinks, cold, short, and spirituous, intended to be 'a bugle call for meals.' The C.'s popularity in the U.S.A. was mainly due to the drinking of iced water at meals instead of wine. The number of possible C.s is unlimited, but perhaps the best known are the Martini (gin and vermouth), the Manhattan (rye whisky and vermouth), the Old Fashioned (rye whisky, bitters, sugar, and water), the Side Car (Cointreau, brandy, and lemon juice). See 'Robert' of the Embassy Club, *Cocktails, How to Make Them*, 1922, and T. E. Carling, *The Complete Book of Drink*, 1953.

2. *Non-alcoholic*. C.s of this type are of Amer. origin, but are now popular in Great Britain. They are prepared from a wide variety of fruits and vegetables. Soft fruits are pulped and sieved, hard fruits and vegetables are processed to extract juice. Juices are mixed and flavoured with herbs, spices, sugar, and ketchup, and chilled before serving. Alternatively fruit is served in carefully prepared portions covered with food liqueur; sometimes a combination of sweet and sour fruit is used to give piquancy.

3. *Fish Cocktails* are made from a basis of shellfish *purée*, flavoured with vinegar, cream, mayonnaise, etc. They are served at the beginning of a meal in place of *hors d'œuvre*.

Cockton, Henry (1807-53), novelist, b. London. He is remembered only for 2 of a number of novels: *The Life and Adventures of Valentine Voz, the Ventriloquist*, 1840, and *Sylvester Sound the Somnambulist*, 1844.

Cocles, Horathus, see *HORATIUS COCLES*.

Coco, riv. of Nicaragua, Central America, formerly known also as Wanks, or Scgoria. (These names are still popularly applied to the first third and second third of its course.) It rises in Honduras and almost immediately enters Nicaragua, forming most of the N. boundary between Nicaragua and Honduras, as arbitrated by the King of Spain in 1906. It flows 300 m. into the Caribbean Sea at Cape Gracias-a-Dios. It is navigable for about 140 m., but large vessels cannot pass the sand-bar at the mouth.

Coco (plant), see *Cocco*.

Coco de Mer, so called from the fact that it was first seen floating on the Indian Ocean, is the fruit of a species of palm. The double coco-nut, as it is sometimes termed, is the largest fruit known, and takes 10 years to attain maturity.

Cocoa and Chocolate are derived from the cocoa bean, seed of the tree *Theobroma Cacao*, member of the family Sterculiaceae, related to mallows and linden. Originally wild in Central America; now cultivated in tropical belt 20° N. and S. of equator, requiring mean shade temp.

80° F. with only occasional variations of 15° above or below, and rainfall of at least 50 in. per annum, without marked seasonal fluctuations. The prin. producing countries are Africa (Ghana, Nigeria, Fr. and Portuguese W. Africa); America (Brazil, Venezuela, Ecuador, etc.; the Dominican Rep., Trinidad, and other W. Indian Is.); also Ceylon, Java, and New Guinea. The possibility of commercial production in Malaya, Brit. Guiana, etc., is being explored.

Cadbury Brothers Ltd

A WEST AFRICAN COCOA FARMER
HARVESTING HIS CROP

The tree is 15-25 ft high, with broad-leaved luxuriant foliage. Flowers are small, pale pink, pale yellow, wax-like texture; the fruit produced in pods; buds, flowers, and fruit at all stages of development are present simultaneously; pods grow on main trunk and branches. A tree produces 6000 flowers, but only 10 to 60 mature. Pods differ in size (6 to 10 in.), shape (gherkin or lemon to melon) and colour (yellow, maroon, crimson-purple). There are 2 main varieties: *Criollo* (lemon-shaped, broad at stalk end, skin soft and furrowed) and *Forastera* (smoother and harder with great variety of shapes). The pod contains 20 to 40 seeds ('beans') in white pulp, sweet and faintly acid to first taste but bitter and astringent on biting. *Criollo* seeds are large, plump, and white; *Forastera* smaller, flatter, and heliotrope; some trees yield both colours. The yield varies, but the typical 1-lb. pod produces 4-oz. seeds = 1½ oz. commercial cured bean. Yield higher in Brit. W. Africa, but average yield of dried cocoa in all growing countries probably 2 lb. per tree (= 1 lb.

commercial cocoa powder) or less. *Criollo* gives a distinctive flavour and moderate yield, *Forastera* a good chocolate flavour and high yield.

Cultivation, harvesting, and marketing. In S. America and the W. Indies cultivation is on plantations, in W. Africa on small native-owned farms. Trees are protected from wind by other plantings and usually from sun, but practice varies; they can be intermingled with 'catch crops,' e.g. yams. The tree bears at 4 to 5 years, reaches maturity at 10 to 15 years, and continues for 30 to 40 years. Ripe pods are present throughout the year, but there are usually 2 harvests. The pods are separated from tree by cutlass (machete) or hooked knife on a long pole (goulet). The pods are then cut open, and the beans and pulp scooped out; these are placed in heaps on ground and covered with leaves, or in 'sweating boxes'; the pulp ferments and drains away. This process develops the chocolate flavour and changes the interior to chocolate brown. This is necessary in order to produce beans of suitable quality. The beans are then dried, usually in the sun.

World production, consumption, and price. The most remarkable feature of world production is the enormous growth of the industry in Ghana (Gold Coast) to which cocoa was introduced about 1879. The export in 1890 was a mere 80 lb., while to-day, with Nigeria, Ghana produces more than half the world yield, and nearly double the whole world production of 1909. In 1939 world production reached a peak of over 700,000 metric tons, of which Brit. W. Africa accounted for nearly 400,000 tons. In the same year world consumption nearly equalled production. During the past 4 years the average ann. world production has been over 800,000 tons, and in the year 1955-1956 it exceeded this. The bulk of raw cocoa comes from Africa, mainly W. Africa, African production now being about 490,000 tons per annum. The ann. production from Central America, with which, for convenience, is included the W. Indies, is from 60,000 to 70,000 tons, and from S. America about 170,000 to 200,000 tons. Asia (5000 to 6000 tons) and Oceania (6000 tons) make up the balance.

Over three-quarters of this production is taken up in 7 countries, a third being consumed by the U.S.A. and the U.K.; Germany, the Netherlands, and France buy 10, 7, and 6 per cent respectively. Europe takes about half of world production, Amer. countries about 45 per cent.

In Ghana and Nigeria gov.-sponsored marketing boards have subsidiary selling companies in London. The buying organisations of the big manufacturers and trading firms have since 1947-8 become licensed buying agents of the marketing boards, which purchase direct from the farmers and fix the price for 12 months ahead. In the Fr. W. African tors. there are no marketing boards, and trading organisations buy direct from local farmers and sell through their representatives

in the cocoa markets of the world. The price of cocoa beans has fluctuated considerably in recent years, reaching £30 per cwt at one stage; at the beginning of 1957 it was £9 10s. per cwt.

Pre-war consumption (estimated) in the U.K. of chocolate and sugar confectionery was 7.1 oz. (representing 5.3d.) per head per week, of which 3.2 oz. (2.9d.) was chocolate. Under rationing, consumption in the U.K. was reduced to 3 oz. During 1956 consumption of chocolate and sugar confectionery amounted to 8½ oz. per head per week (representing 12.7d. on chocolate and 10.1d. on sweets).

Manufacture. The initial processes in manuf. of drinking cocoa (powder) and chocolate for eating and drinking are the same. Mechanical sieves and magnetic separators remove foreign substances from beans, which are roasted in revolving drums heated by coke fires, gas jets, or super-heated steam. This brings out the aroma and facilitates breaking of bean into small pieces ('nib') and winnowing away of shell. Blending takes place at this stage. The nib is then ground. Owing to the high fat ('cocoa butter') content (56 per cent), grinding produces a viscous brown liquid, as fat is melted by heat generated. When cool the liquid solidifies. Hydraulic presses, exerting pressure up to 6000 lb. per sq. in., extract a fixed proportion of cocoa butter, which is refined for chocolate manuf. and other purposes. Cocoa remains as dry, hard cakes, which are broken up, ground and reground to powder, and sifted through silk for drinking cocoa. In a modern factory all stages of production, including tin-making, are embodied in a series of 'linked processes' involving automatic and semi-automatic machinery, gravity being largely used for conveyance of material.

Eating chocolate. While cocoa powder consists of bean minus some of its cocoa butter, chocolate contains full butter content of bean plus extra cocoa butter added to compensate for increased bulk due to inclusion of sugar. Eating chocolate is of 2 main kinds: moulded and couverture (or confectionery). Couverture for covering fruits, nuts, biscuits, preserves, and other 'centres' needs a higher proportion of butter than chocolate for moulding into blocks. Balance in production of C. and C. is therefore important to the manufacturer. He does not want to buy cocoa butter nor, generally speaking, to produce a surplus, though there is a market for this in manuf. of other confectionery and of cosmetics and other pharmaceutical preparations. In chocolate manuf. finely powdered sugar, extra cocoa butter, and cocoa 'mass' are mixed and ground in a *mélangeur*, in which heavy granite rollers rotate on a revolving granite bed. The material is kept warm enough to be plastic and is delivered to a series of refining machines. The first consists of rolls revolving at different speeds and delivers the chocolate in dry, flaky condition. Another process is conching (so called from shape of machine: Fr. *conche*, a shell) in which

semi-liquid mixture is mechanically kneaded for long periods. For confectionery chocolate a fluid product is required. Centres pass on a moving wire mesh under a curtain of chocolate. Decoration is added with a fork or other implement. Hand-covering is also practised, centres being dipped into bowls of liquid chocolate with a decorating fork. Moulded chocolate is less liquid. It is run into moulds, shaken mechanically, and knocked out (in form of blocks, bars, sticks, etc.) when cool and set hard. Fruit (e.g. raisins) and nuts (whole or chopped) can be mixed in before moulding.

Milk chocolate is made with dried powdered milk or with fresh liquid milk. In the latter case, partially evaporated milk is mixed with chocolate mass and sugar. Factories for this purpose have been estab. in dairy dists., and the partially finished product ('crumb') is sent to the parent factory for the final stages of manufacture.

By-products. Apart from cocoa butter, by-products of the industry are cocoa shell, a constituent of some cattle foods, and the drug theobromine, a useful stimulant.

Constituents and food value. Cocoa nib consists typically of 55-58 per cent fats, 25 per cent carbohydrates, 12 per cent proteins, and the balance of salts, iron, etc., yielding 2975 calories per lb. A good brand of plain eating chocolate is composed of 32 per cent fat, 60 per cent carbohydrates, and 5 per cent proteins (= 2500 calories per lb.); milk chocolate made with fresh milk of 37 per cent fat, 54 per cent carbohydrates, and 9 per cent proteins (= 2600 calories per lb.), while cocoa powder has about 28 per cent fat, 34 per cent carbohydrates, 18 per cent proteins, and 20 per cent other constituents (= 2100 calories per lb.).

History. Cocoa beans were first brought to Europe in 1494 by Columbus, but he did not realise their value. Cortez, who conquered Mexico in 1519, noted the use which the Aztecs of Mexico made of cocoa beans, and he introduced chocolate as a beverage into Spain. Cortez found that the Aztecs, believing that it was a gift to man from the gods, consumed large quantities of a preparation made from the roasted and ground bean called *chocolatl*. Montezuma, the Aztec emperor, and his court were said to use 50 jars a day. It was beaten to a paste, flavoured with spices, and taken cold. For a cent. Spain kept secret the recipe for chocolate, but France learned it and knowledge of chocolate spread thence to other countries. In 1657 a Frenchman opened a 'chocolate house' in Bishopsgate, London. During the latter half of the 17th cent. chocolate houses sprang up all over London and became resorts of politicians, wits, gamblers, and literati. At one, White's in St James's Street, a centre for reckless gambling was founded the first club (see CLUBS). High import duties were imposed on cocoa beans. It was not till 1853 that, by imposition of a uniform penny a pound on imported colonial and foreign beans, price was brought within

reach of less well-to-do. Fry's are the oldest C. and C. firm in the world, having developed from a small concern estab. in 1728. When chocolate as a sweetmeat was introduced is not certainly known, but as late as 1842 a leading Eng. manufacturer listed only one 'line' of eating chocolate. Modern drinking cocoa was invented about 1828 by van Houten, the Dutch maker, who expressed part of cocoa butter, but it was not until the 1860's that it was introduced into England by Cadbury's. Hitherto cocoa had been mixed with farinaceous substances in order to counter-balance high fat content. The new process of making cocoa by creating a supply of cocoa butter enabled more palatable eating chocolate to be made. Sir Hans Sloane prepared a milk chocolate for drinking in the late 18th cent. Peter, the Swiss maker, introduced milk chocolate for eating in 1876.

Knapp, *Cocoa and Chocolate: their History from Plantation to Consumer* (with bibliography), 1920; *The Cocoa and Chocolate Industry: the Tree; the Bean; the Beverage*, 1930, and *Cacao Fermentation* (London), 1933; R. Whymper, *Cocoa and Chocolate—their Chemistry and Manufacture*, 1921; H. W. Bywaters, *Modern Methods of Cocoa and Chocolate Manufacture*, 1930; H. C. J. Wynoogst, *Hints for Cocoa and Chocolate Manufacture* (Copenhagen), 1938; C. T. Williams, *Chocolate and Confectionery*, 1950; D. H. Urquhart, *Cocoa*, 1955.

Coconut, fruit of a species of palm (*Cocos nucifera*) found in most tropical regions, and reaching perfection in a sandy soil near the sea. It is found on even the smallest is. of the Pacific, the nuts being admirably adapted for distribution by ocean currents, and germinating readily when cast up on shore. The tree grows to a height of 60-100 ft, and consists of a cylindrical stem 1½-2 ft thick, marked with rings where leaves have formerly grown, and terminating in a crown of from 16 to 20 graceful pinnate leaves, each about 15 ft long. These consist of a strong central rib, on both sides of which are numerous long thin leaflets. The flowers grow in branching spikes, 5-6 ft long, enclosed in a spathe, and each of these produces from 5 to 15 fruits. Each fruit consists of a thick husk of brownish fibres, called coir, with a hard inner shell containing a white kernel, which in turn encloses a 'milky' liquid. The tree begins to bear at 7 or 8 years of age, and continues to produce 4 or 5 crops a year for 70 or 80 years. Its uses to the natives of the regions where it grows are numberless. The nut, in various stages, is a standard article of food, and the milk forms an agreeable drink. The root is sometimes chewed as a narcotic; the young terminal bud, palm cabbage, is a delicious vegetable; the sap, in various stages of fermentation, forms toddy, palm wine, and arrack, and is boiled down to form a sugar known as jaggery. The leaves serve as thatch, and are plaited for mats and baskets; the trunk supplies a valuable timber known as porcupine wood; and the coir, or outer husk, is made

into ropes, cordage, etc. The kernel is by far the most important product, due to the large proportion of oil that it contains and the consequent high demand for it in the country of production and in Europe and N. America. When suitably dried it is termed 'copra'; it is about a quarter of the weight of the original nut without husk and contains up to 70 per cent of oil. Continuous screw presses (expellers) and, to a lesser extent, hydraulic presses are used for expression of the oil, which is used for edible purposes and in the manuf. of soap, while the cake residue, containing about 6 per cent of oil, is used in animal feeding stuffs. World production of copra is almost 3,000,000 tons per year, of which about 80 per cent

COCONUT

is produced in the Philippine Is., Indonesia, Ceylon, India, Malaya, and New Guinea. Approximately half is exported, chiefly to W. Europe. The Philippine Is. are the main exporters, followed by Indonesia, and together they provide over 70 per cent of world copra exports. Almost the whole of production in India (about 180,000 tons) is consumed locally (see COCONUT OIL).

Desiccated coconut is manuf. in Ceylon, America, and Europe by drying the meat of the C. after the rind has been removed; it contains 68-70 per cent of oil.

Coconut Beetle, or *Balocera rubus*, species of Cerambycidae found in the E. The larvae do much damage by eating the young coconut trees, and are themselves eaten by the natives.

Coconut Oil, or **Coconut Butter**, one of the most important of the lauric acid oils, is derived from the fruit of the palm *Cocos nucifera* and constitutes up to 70 per cent of the dried kernel, known as 'copra'. Extraction of the oil is by pressing in continuous screw presses (expellers) and, to a lesser extent, in hydraulic presses (see OILSEEDS, PROCESSING OF). It refines to a colourless oil with neither taste nor odour and sets to a white fat when cooled below about 24° C. Main component fatty acids are

—saturated: Lauric (44-55 per cent), Myristic (13-19 per cent), Palmitic (7-11 per cent), Capric (4-10 per cent); and unsaturated: Oleic (5-8 per cent). C. O. differs from most vegetable oils in that it has a narrow plastic range—it passes from solid to liquid within a temp. range of a relatively few degrees and, due to the low proportion of unsaturated fatty acids, can be changed but little in melting-point and consistency by hydrogenation. These characteristics limit the use of the natural and hardened oils in edible products, but considerable quantities are used in the manuf. of margarine and help to produce a consistency similar to that of butter, which also has a comparatively short melting range. Large quantities of C. O. are separated into 2 fractions—'stearine' and 'oleine'—by hydraulic pressing, and the hard 'stearine' is used in the manuf. of chocolate and special cooking fats, and for pharmaceutical purposes, while the liquid 'oleine' is used as a baking fat for biscuits, cakes, etc., in the production of confectionery such as toffee and caramels, and in salad dressings. The crude oil is also processed for use in solid soaps as a minor constituent to impart foaming, and in liquid soaps and shampoos because of the solubility of the potassium soaps of its acids. A small quantity of the oil or fatty acids obtained from the soap stock resulting from alkali-refining is used to make non-drying alkyds for use as plasticising resins, particularly in the U.S.A.

Cocoon (from Lat. *concha*, shell), pupa-case of many insects, especially of moths and silk-worms. This outer web or ball is spun from the mouth by caterpillars before passing into the chrysalis state. Originally the word was only applied to the C. spun by the silk-worm (*Bombyx*). It is now extended to all similar structures (e.g. silken case spun by spiders to receive their eggs). The pupal stage may last a long or only a short time, the covering splitting when the insect is ready to emerge.

Cocos, genus of tropical palms now botanically of one species, *C. nucifera*, the coco-nut palm. See COCONUT.

Cocos Islands, see KEELING.

Cocteau, Jean (1891-), Fr. dramatist, novelist, and poet. b. Maisons-Laffitte. He possesses an amazing versatility, and has thrown himself into every new movement in the artistic world of France, drawing upon the new artists and musicians like Picasso, Erik Satie, and Darius Milhaud to collaborate with him in the production of ballets like his famous *Le Bœuf sur le toit*, 1920, and *Les Mariés de la Tour Eiffel*, 1921. His dramas include *Orphée*, 1927, *Antigone*, 1928, *La Machine infernale*, 1935, *Les Parents terribles*, 1938, and *L'Angé à deux têtes*, 1946. He has also won success as a novelist with *Le Grand Écart* and *Thomas l'imposteur*, both 1923, *Les Enfants terribles*, 1929, and *Le Journal d'un inconnu*, 1953, and has written and directed sev. well-known films, including *Le Sang d'un poète*, *L'Éternel Retour*, and *Orphée*. Among his verse is *L'Ode à Picasso*, 1919, *Poésies*,

1920 and 1948, *Mythologie*, 1934, and *Clair-Obscur*, 1955. His books of criticism—*Carte blanche*, *Le Coq et l'arlequin*, and *Le Secret professionnel*—have become guide-books for the younger writers. In 1955 C. was elected a member of the Académie Française. He painted the interior of the St Pierre Chapel at Villefranche in 1957. See R. Lannes, *Jean Cocteau*, 1945; C. Mauriac, *Jean Cocteau, ou la vérité du mensonge*, 1945; M. Crossland, *Jean Cocteau*, London, 1955.

French Embassy

JEAN COCTEAU ON THE OCCASION OF HIS ELECTION AS A MEMBER OF THE ACADEMIE FRANÇAISE

Cocumilia, name of a kind of plum found wild in Calabria. It has the reputation of being a powerful febrifuge, and the bark is much used for the cure of intermittent fevers.

Cocx, Gonzales, see COQUES.

Cocytus (modern Vuvo), riv. of Epirus, trib. of the Acheron, which flows into the Ionian Sea, 20 m. N. of the Gulf of Arta. In Gk mythology it was held to be one of the rivs. of Hades, and the name, which means wailing, refers to the cries of the dead. Hence Milton's 'Cocytus named of lamentation loud.'

C.O.D., see CASH ON DELIVERY SYSTEM.

Cod, or *Gadus callarias*, important species of bony fish in the same genus as the haddock, whiting, and pollack. Other representatives of the family Gadidae are

the ling and coal-fish, but the C. surpasses all these in economic importance; as a food it is much valued, and C.-liver oil is of great repute in medicine. The body is generally of a dark grey hue, is elongated in form, and covered with small, soft scales, while a small barbel depends from the chin. It inhabits the neritic parts of the sea, and at the bottom feeds on such animals as crabs, molluscs, worms, herrings, and a few members of its own family. It is the largest of the Gadidae, attaining a length of 4-5 ft and weighing as much as 100 lb. The C. is found in the temperate regions of the N. hemisphere, along the N. European coasts, not farther S. than Gibraltar, and on the Amer. coast, the fisheries off Newfoundland being especially famous. Other C. fisheries are those of the Lofoten Isles off the N. coast of Norway and off Greenland, Spitsbergen, and Bear Is. It spawns in the early part of the year between Feb. and April, and is very prolific, 1 fish producing as many as 8 or 9 million eggs. Of these, however, very few are ever fertilised, and the young C. are quite small, being less than an inch long when first produced. C. fishing was an important industry 5 or 6 cents. ago, and was carried on by people of various nationalities, among them French and English, on the shores of N. Europe and Iceland. The C. are caught principally by trawls and lines and bait, long lines and hand lures both being employed. A large quantity of the C. caught off Newfoundland is dried and salted, and is then exported—a considerable amount—to the countries of S. Europe. In addition to this the fish furnishes other useful products, isinglass being obtained from the air-bladder, and cod-liver oil, as mentioned above, from the liver, this oil being used largely as a medicine for lung complaints. In some parts the heads are used as a food for cattle, and the roe alone is used for human food. See FISHERIES.

Cod, Cape, see CAPE COD.

Cod-liver Oil, marine oil extracted from the liver of the cod-fish (*Gadus morrhua*). It is sometimes, however, adulterated with oil from the ling or turbot, but the latter are not officially recognised. The chief exporting countries are Norway and Newfoundland, the former utilising fish from the N. Sea and the latter those of the Newfoundland banks. The processes of manuf. have improved greatly of recent years, and, in place of the old coloured and disagreeable fluid the best medicinal varieties are almost colourless and tasteless. Healthy and fresh cod livers are taken and placed in barrels and the exuding oil ladled out. Gentle heating brings out more oil. These products, however, are not equal in value to that obtained in the next process, which consists in leaving the livers in rooms with freezing mixtures, when the oil which remains unfrozen is taken off and constitutes the best variety of oil. A coarse variety is next obtained by boiling down the remains of the livers. It is of dark brown colour and is used for treating leather. In the operation of stuffing,

dubbin (a mixture of tallow and C. O.) is rubbed into the leather to make it waterproof and supple. C. O. is valuable as a food and as a source of vitamins A and D (see VITAMINS). For this reason it is given in cases of tuberculosis (q.v.) and as a supplementary food for infants and young children. Attention has recently been called to certain risks attendant upon overdosage with vitamin D, and as a result manufacturers will in future reduce the average content of vitamin D in C. O. from 200 international units per gramme to 100. It is easily digested, especially when in the form of an emulsion—that is, in small globules. This is probably due to the existence of free oleic acid to the extent of about 5 per cent, which is a good emulsive agent. There are also olein (80 per cent) and palmitin and stearine, which are valuable glycerides. Doses should begin in small quantities of a teaspoonful and gradually increase to a tablespoonful.

Code (Lat. *cauda*, a tail, through It.), in music, a term applied to a passage concluding a composition or one movement of it, especially in sonata form. It was developed, notably by Beethoven, into an important and elaborate feature of a composition.

Code, see CODES AND CODIFICATION OF LAW.

Code Napoléon, or the Civil Code of Fr. law. The term C. N. was suppressed in 1814, but re-established in 1832 out of respect for Napoleon's memory. Since 1870 the name Code Civil has come into general use. Before the revolution there existed no unified system of laws, and France was divided between the *droit coutumier* in the N. and the *droit écrit* in the S., based on Rom. law. Under the Fr. constitutions of 1791 and 1793 it was promised to codify the laws, but it was not until Napoleon became First Consul that 5 commissions were set up in 1800–2 to codify the laws under 5 heads, of which the first is the Code Civil or C. N. Three jurists—Tronchet, Portalis, and Bigot—were entrusted with the task of drafting the code, and, being from the N., they drew largely upon the *droit coutumier*, but some sections of Rom. law were incorporated. The first 14 laws were passed by the Assemblies in 1803 and the remaining 22 in 1804. The third and authoritative ed. of the C. N., still in force, appeared in 1816. Napoleon is said to have been prouder of the C. N. than of his many victories. The code is clearly expressed in a straightforward style and is well arranged. It is divided into 3 books preceded by a preface. Book I (articles 7–515) is concerned with persons, and is subdivided into 11 sections, which deal with the distinctions between Frenchmen and foreigners, with civil domicile and with absence, with marriage and divorce, with paternity, adoption, and paternal authority, and with minority and majority. Book II (articles 516–710) is divided into 4 sections, concerned with classification of property, with ownership, usufruct, and easements. Book III (articles 711–2281) details the different ways ownership may be acquired. It has 20 sections,

which come under 7 main heads: successions; gifts *inter vivos* and wills; the theory of contracts or obligations; the marriage contract; other contracts (sale, hire, loan, bail, etc.); priorities and mortgages; and prescriptions. The C. N. has been trans. into English by E. Blackwood Wright and others. See CODES.

Codeine, or Codeine ($C_{17}H_{19}ON(OCH_3) \cdot OH$), alkaloid forming 0.3 per cent of opium. It is identical with *methylmorphine*, and resembles morphine in its hypnotic effects. It is obtained, in orthorhombic colourless crystals, with 1 molecule of water of crystallisation. It is insoluble in alkalis, but dissolves readily in alcohol, ether, and chloroform. In medicine C. is used as a soporific, but, like morphine, it must be employed with caution and only under the supervision of a medical man. It is used to allay the irritation causing cough when a paroxysm is likely to prove dangerous, and has been employed to this end in whooping cough. It is useful also in *diabetes mellitus* where it tends to prevent the excretion of sugar.

Codes and Codification of Law. Code is a term denoting a collection of laws. Codification is the process of classifying laws or reducing them to a system or digest. Various codes have been prepared either as a systematic statement of existing laws in a form available for easy reference or as the basis of study of a legal system. In ancient times the existence of a code indicated a matured stage in the development of a society. Codification does not necessarily mean that a legal system is static; it may be modified from time to time to meet the changing requirements of the society for which it is designed. Justinian, for example, within 30 years, added 165 *novellae* (new laws) to his code of Rom. law. Codes such as the Morale and Islamic laws, which are credited with a divine origin, are compilations of immutable laws. The empiricism of the Eng. common law has not lent itself to codification, which has been largely confined to the tidying of the statute book to make statute law on given topics more easily accessible (see CONSOLIDATION OF STATUTES).

Examples of codes and codification of law. (1) The Theodorian code, which was modelled on the earlier and private collections compiled by the jurists Gregorianus and Hermogenianus, was a digest of the constitutions (decisions) of the emperors from the time of Constantine. (2) Justinian's first code (AD 529) was founded on that of Theodosius, whilst the second was a revision of the first with the addition of a book of 50 decisions (AD 534). (3) Rom. law inspired many codes, e.g. the Romano-Barbarian codes—Edictum Theodorici, the Breviarum Alaricanum (q.v.), and the Lex Burgundionum (Fr. Loi Gombette). The influence of the breviary of Alaric, according to Prof. Muirhead, was so great in Europe that until the 12th cent. it was from it rather than from Justinian's code that W. Europe acquired the knowledge of Rom. law. (4) The Code Frédéric was framed as a common system in place of sev.

systems rather than to restate in exact and exhaustive form the whole of the existing laws. It was intended to make law knowable to all and purported to explain the Rom. law, Saxon law, and other foreign subsidiary laws and statutes. The lack of homogeneity between the various Germanic states is explained by the fact that their prov. laws were left unimpaired. (5) The Code Napoléon (q.v.), 1803-4, despite the hasty compilation, has served as a model in sev. European states. It was largely based on the civil or Rom. law and, according to the 19th-cent. Eng. jurist Austin, was never intended to supersede all other law but to be supplemented by ancient customs and general principles of law and equity. It consisted of the Code Civil, Code de Commerce, Code Penal, Code d'Instruction Criminelle, and various procedural codes. (6) The code of the state of New York purported to be an exhaustive re-statement of laws and affected to provide 'for every possible case, so that when a new case arises it is better that it should be provided for by new legislation.' (7) Comprehensive codes have not been adopted in England. In India, however, Stephen's Indian Evidence Act (see EVIDENCE) and the Penal Code drafted by Macaulay appear to have worked well. The principles underlying these codes are presented in a concrete form by many practical illustrations.

The arguments for and against codification as analysed by the Eng. jurist Austin may be summarised as follows: (1) A code cannot be so comprehensive as to anticipate every conceivable legal situation. This is, however, not the object of codes, which do not preclude the elasticity of laws in order to meet the changing social needs. (2) A code may give rise to inconsistencies in its failure to legislate for every possible contingency. Any statute law is liable to create inconsistencies and the courts are often called upon to decide in favour of one of sev. conflicting principles. (3) In reply to the alleged failure of the Fr. and Prussian codes, Austin states that these were prepared hurriedly and are not fair examples of what codes might be. He explains that the Code Napoléon lacked scientific precision and, like the Rom. codes, contained an unsystematic juxtaposition of principles, maxims, and philosophical speculation. Despite these defects, it is the basis of the legal systems of most Lat. races. (4) Austin favoured codification, which he thought, however, was a question of time and place. Bentham, the great 18th-cent. reformer, suggested codes which were too Utopian to secure support. The only argument in favour of codification among Eng. lawyers is to make the law as coherent and concise as possible. The Ger. code was inspired by a desire for national unity, whereas the Code Napoléon epitomised a hatred of the *ancien régime*.

Codex Argenteus, see ARGENTEUS.

Codex Bezae, see BEZA, THEODORE.

Codex Sinaiticus, see SINAITICUS, CODEX.

Codex Vercellensis, see VERCELLI BOOK.

Codell, writing by way of supplement to a will, and which is to be considered part of it, whether for the purpose of explaining, altering, or adding to the provisions of the will. In the Rom. law C.s were small tablets on which memoranda or letters were written, giving directions to the heir, especially in regard to creating *fidei commissa* or trusts. By the Rom. law a testator could not alter his will unless he made an entirely new one. Hence the utility of C.s, which in Rom. law could be made whether there were a will or not. Such C. differed from the Eng. C., therefore, in that it did not mean a supplement to a will, but obligatory directions by tablets. Where a Rom. C. was confirmed by testament, it was operative to give legacies as well as to create *fidei commissa*. Rom. C.s had to be made in the presence of 5 witnesses. In Eng. law a will when once signed and attested cannot be altered without being re-executed except by a C. The execution of a C. operates as the re-execution of the will, and hence a C., duly executed as a will, will render a will which was not duly executed valid, provided the C. clearly refers to the will. Where a will is revoked by actual destruction, no C. can revive it. A C. forms part of the will, and is incorporated with it in the probate. If in any way inconsistent with the will, the C. prevails. A C. must be executed with the formalities of a will, that is, signed in the presence of 2 witnesses. See WILL.

Codigoro, It. tn in Emilia-Romagna (q.v.), 22 m. E. of Ferrara (q.v.). It is 3 m. from the Adriatic coast, and the dist. formerly marshy, is very productive. Pop. 15,000.

Codogno, It. tn in Lombardy (q.v.), 32 m. SE. of Milan (q.v.). It manufs. silks and the cheese known as Parmesan. Pop. 12,000.

Codreanu, see JORGA and RUMANIA, History.

Codrington, Christopher (1608-1710), Eng. soldier and scholar, commonly called **Codrington of All Souls**, son of Christopher C., a captain-general of the Leeward Is., b. in St John, Barbados, and educ. at Enfield school and at Christ Church, Oxford. He became a fellow of All Souls in 1690; in 1694 he served with William III in Flanders and, fighting with distinction at Huy and Namur, was made captain of the 1st regiment of foot guards by the king. Though C. gained the reputation of a wit and scholar it is as a W. India governor and captain-general that he is remembered. In 1697 the king made him captain-general and commander-in-chief of the Leeward Is. in succession to his father. He resigned after the failure of his Guadeloupe expedition (1703) and lived in retirement, studying Church hist. at his estab. in Barbados. In his will he left a large legacy in cash and books to All Souls College. He left his Barbadian estates to the Society for Propagation of the Gospel for the foundation of a college in Barbados now known as C. College. See V. T. Harlow, *Christopher Codrington, 1668-1710*, 1928.

Codrington, Sir Edward (1770-1851), admiral, b. Dodington, Glos., and entered the navy in 1793. At Trafalgar (1805) he commanded the *Orion*, and subsequently took part in the Walcheren expedition. Rear-admiral in 1814, he led the fleet at Washington and Baltimore in the American war. In 1826 he commanded the combined fleets of Great Britain, France, and Russia at the battle of Navarino, in which he destroyed the Turkish Navy, but was held to have exceeded orders and recalled. He became admiral of the Red in 1837, and in 1839 was appointed commander-in-chief at Portsmouth.

Codrington, Sir William John (1804-1884), general, second son of Sir Edward C. (q.v.). During the Crimean War he distinguished himself at Alma and Inkerman, and in 1855 became commander-in-chief at Sevastopol. M.P., 1857. Governor of Gibraltar, 1859-65.

Codroipo, It. tn. in Friuli-Venezia Giulia (q.v.), 15 m. SW. of Udine (q.v.). Pop. 8000.

Codrus, son of Melanthus, and the last King of Athens. He lived about the 11th cent. BC. When the Dorians had invaded Attica he is supposed to have acted on the advice of the oracle, and to have given his life for his country.

Cody, Samuel Franklin (1862-1913) ('Colonel Cody'), aviator and inventor of a triplane, b. Birdville, Texas. He was a pioneer aviator in England (he became a naturalised Brit. subject) and made the first official powered aeroplane flight in England in 1903 at Farnborough, where he was employed by what is to-day called the Royal Aircraft Estab. He was killed in an aeroplane crash near Aldershot.

Cody, William Frederick (1846-1917), famous all over the world as Buffalo Bill, and one of the last of the picturesque figures of the far W. in the U.S.A. before it became a settled agric. country; b. Scott co., Iowa, U.S.A. In the days before the great transcontinental railways were built across the prairies and through the mts to the Pacific coast, C. became noted in the sixties as one of the chief riders for the famous Pony Express. This was organised by a company which undertook to forward the U.S. mails from St Joseph, Missouri, to Sacramento, California, by means of intrepid men who rode relays of ponies through country often dangerous because of hostile Indians. Upon the outbreak of the Civil war, C. became one of the most skillful scouts and guides for the N. troops operating in the middle W. Upon the close of the war, when Congress gave huge land grants to companies undertaking to construct railway lines to the Pacific coast, C. obtained the contract to supply the railway workmen who were laying the lines with fresh supplies of buffalo meat. The buffalo, or more correctly the bison, then roamed the prairie lands in thousands. It is recorded that C. killed 4320 bison in 18 months. Ever afterwards he was known as Buffalo Bill. After that he again served his country in the wars against various Indian tribes. Then, looking around for fresh fields to conquer,

C. recalled that the youth of 2 continents had been fascinated by tales regarding the Indians, the cowboys, and the trials of settlers who were attacked by the red men. He gathered together a band of cowboys, who were expert riders and lasso-throwers, and also secured a large number of Indians of various tribes through arrangements with the U.S. Gov. This was the beginning of his famous travelling entertainment, Buffalo Bill's Wild West Show. It was an enormous success in the E. states of the U.S.A. C. then took the huge organisation to England and to the leading countries of Europe, and repeated his success, the show being different from anything ever offered in the Old World.

Co-education, education of the 2 sexes together in school or college. The term mixed education should be used to describe schools where boys and girls are taught under the same roof, and occasionally together, purely from motives of convenience, and C. reserved for those schools which offer a genuinely shared upbringing, as far as may be, both in and out of the classroom, from a belief in its value as a training in mutual understanding and help, and as a basis for a right adult relationship between the sexes. This latter method has been practised only rarely in the hist. of European education; though it had the strong support of Plato, it finds little or no mention in the pages of the classical educationists, Quintilian, Elyot, Ascham, Milton, Locke, Rousseau, Pestalozzi, Herbart, Froebel, and Spencer. Yet, historically speaking, segregated education may be held to be an accident: most schools were founded at a time when education was thought unnecessary or even improper for girls. C. was very rare in the ancient world; the spread of Christianity fostered it, and the pioneer court schools of Charlemagne (AD 782) and Alfred the Great (c. AD 900) were co-educational, as was the famous Renaissance school of Vittorina da Feltre at Mantua (1423). The 'new' humane education of the 19th cent., deriving largely from the theories of such writers as Luther, Rabelais, Malcaster, Rousseau, Pestalozzi, and Froebel, and protesting against narrowness of curriculum and brutality of treatment, was theoretically favourable to C., but its development (dating in England from the sixties) has been very gradual. Bedales, founded by J. H. Badley in 1893, was the earliest whole-hearted co-educational boarding school. Statistics of co-educational practice in different countries are apt to be misleading, since much C. is only mixed; broadly speaking, C. is strongest where the prevailing religious obedience is Protestant or the form of gov. democratic (e.g. all the Scandinavian countries, the U.S.A., and—an interesting exception—Portugal), weakest in Catholic or authoritarian countries (e.g. Rep. of Ireland, Spain, France, the U.S.S.R.). In England the proportion of mixed state secondary schools (mixed primary education is everywhere normal) is 27 per cent., and among recognised private secondary

schools 27 per cent also; but almost all the numerous unrecognised private schools are segregational. All branches of univ. education now practise C. in a greater or lesser degree, as did the first univ., Plato's Academy; but the number of women students in the U.K. univs. is very much smaller than the number of men. See B. A. Howard, *The Mixed School*, 1928.

Coefficient, in algebra, denotes the numerical quantity preceding an algebraic term and by which the term is to be multiplied. It is also used to denote the ratio of the increase or decrease of any quantity with a change in a variable quantity which determines its condition. Thus the linear C. of expansion of any material with temp. denotes the increase

teca di Fortificazione, 1810, and Bonomer, *Essai général de Fortification*, 1814.

Coehorn, small bronze mortar invented by Menno van C., the engineer, and named after him.

Coelacanth, group of specialised cross-opterygian fishes (q.v.) characterised by lobate fins which could be used more or less as limbs, a symmetrical diphyccercal tail, and a hollow cartilaginous 'backbone' bearing hollow spines (hence the name). C. occur as fossils in rocks as far back as the Upper Devonian (300 million years old); they were abundant in Triassic times, and were thought to have become extinct in the Cretaceous period, some 50 million years ago. However, in 1938, a 5-ft steely-blue coelacanth

By permission of Prof. J. L. B. Smith and Longmans, Green & Co. Ltd

LATIMERIA, A MODERN COELACANTH

in length per unit length for one degree rise in temp. We may also regard it as the quantity by which the length of the material must be multiplied to give its expansion for one degree rise of temp. Similar C.s are the C. of pressure, viscosity, volume, etc. Of course the value of a C. will depend on the unit employed in the independent variable.

Coehorn, or **Coehoorn**, Menno, Baron van (1641-1704), Dutch engineer. He inherited from his father a taste for military learning. During the Seven Years War his bravery at Maastricht and Senefte, and the works of defence which he had constructed, made him famous. In 1673, at the siege of Grave, he used a mortar of his own invention. After peace had been declared in 1678 C. devoted his time to engineering work, and fortified many towns in Holland. When war began again he was to the front, as before, and met Vauban at the siege of Namur, where he had to surrender—but he was present at its recapture, and later on was made lieutenant-general. He commanded a corps in Marlborough's army, 1701-3. D. suddenly of apoplexy. For a description and critical appraisal of his engineering theories, see Marini, *Biblio-*

weighing 127 lb. was caught off E. London, Cape Province, and named *Latimeria chalumnae*. A second specimen was caught off the Anjouan Is. in the Comoro archipelago, near Madagascar, in 1952, and named *Malania anjouanar*. Both specimens probably belong to the same genus, the former being the valid name. Sev. more C. have subsequently been captured off the Comoro Is., including an egg-bearing female. Their interest is centred on the unexpected survival into modern times of an apparently extinct line, and the valuable information they provide concerning the structure of crossopterygians. See also LATIMERIA. See J. L. B. Smith, *Old Fourlegs, The Story of the Coelacanth*, 1956.

Coelenterata (Gk *kolos*, hollow; *enteron*, alimentary canal), name of a large phylum of invertebrate animals, differing greatly in both structure and habit. All are aquatic, and the great majority are marine. A very general feature is the presence of stinging cells, and nearly all the coelenterates are radially symmetrical. The nervous and vascular systems are absent or rudimentary, and the body wall consists of an inner and outer layer of cells, called respectively the endoderm

and ectoderm. Within the body wall a single cavity (enteron) communicates with the exterior through a single opening. Reproduction is often sexual, but vegetative multiplication by budding and fission is also common. Both medusoid and polypoid types occur in the C., and in the latter a limy skeleton is frequently developed, and thus forms a coral. The group is divided into 3 classes, the Hydrozoa, Scyphozoa, and Anthozoa (or Actinozoa). The first class is represented by many well-known animals, e.g. the freshwater *Hydra* (q.v.), sev. corals and small jellyfishes, and the Portuguese man-of-war. The second contains the large jellyfishes often cast up on Brit. shores or found floating in the water, and dreaded by bathers on account of their stinging powers. The third class includes the sea anemones, dead men's fingers, and other corals. The Ctenophora, e.g. *Beroë* and *Cydinge*, are regarded by many zoologists as a div. of the coelenterates, while others regard them as belonging to a separate phylum. The species are very widely distributed, some are free-swimming, others are sessile, and a few are parasitic. Small organisms constitute the greater part of their diet, and in obtaining their food the stinging organs are frequently called into action.

Coelastinus, see CELESTINE.

Coele-Syria (modern El Bukā'a Beka'a, or Bilka), valley of Lebanon, between the ranges of Lebanon and Anti-Lebanon. Altitude 2600-3000 ft; length about 100 m. Through it flow parts of the Nahr-el-Litani (ancient Leontes) and the Nahr-el-Asi (ancient Orontes). Called Hamath in the O.T.

Coeelho, Francisco Adolfo (1847-1919), Portuguese philologist, noted for his research on Portuguese language, folklore, and onomasticon. He pub. *A Língua Portuguesa*, 1868, *Origem da Língua Portuguesa*, 1870, *Algumas observações acerca do Dicionário Bibliográfico Português*, 1870, *Tratado de pronúncia Francesa*, 1875, *Contos populares Portugueses*, 1879, *Antologia de poetas e prosadores*, 1885, *Noções elementares de gramática Portuguesa*, 1891, *Os ciganos em Portugal*, 1892, *Diferenças fonéticas das línguas*, 1900-1901, *Estudos sobre a influência étnica na transformação das línguas*, 1901, and *Curso de analogia da língua Portuguesa*, 1907.

Coesius Antipater, Lucius (2nd cent. BC), Rom. lawyer and historian. He was the first who introduced an ornamental style into his writings, which were highly rhetorical. He wrote the hist. of the second Punic war, and Livy quotes from him. Surviving fragments are printed in H. Peter's *History of Roman Religion*; I (2nd ed.), 1914.

Coeilo, Claudio (c. 1630-93), Sp. painter, b. Madrid, who became painter to King Charles II. His masterpiece was 'Charles on his knees among the Nobles of his Court' (the altarpiece for the sacristy in the Escorial representing the 'Transfer of the Eucharist'). When Luca Giordano was given a commission by the king, C. fell into a melancholy state, imagining

that his brother artist was preferred. Some of his best works are at Madrid and Salamanca.

Coeln (Köln), Wilhelm von, Ger. painter of the 14th cent. His chief works were mural paintings, the most important being in a chapel of Cologne Cathedral. There are also various other works in different picture galleries which are said to be his.

Coelomata (Gk *koilōma*, cavity), wide term, comprising all animals which possess a coelom, or body cavity lined with tissue derived from the middle germ layer or mesoblast. This tissue also invests the heart, alimentary canal, and other organs which are suspended in the coelom. Annelid worms, echinoderms, protochordates, and vertebrates are groups of animals in the well-developed coelomic cavities. In the arthropods and most molluscs the greater part of the body cavity (haemocoel) is associated with the vascular system.

Coelostat, see SIDEROSTAT.

Coemptio (joint-purchase), in Rom. law, a form of civil marriage, so called from the mutual fictitious sale of the 2 parties. The ceremony took place before 3 witnesses and a *libripens* (holder of the balance).

Coenobites, or Cenobites (Lat. *coenobita*; Gk *koinos*, common; *bios*, life), members of a religious order living a community life as opposed to hermits. See MONASTICISM.

Coenurus, now known to be merely the asexual stage in the life-hist. of certain Cestoda, or tapeworms, was formerly considered to be a distinct animal. This bladder-worm lives in an intermediate host which is eaten by a vertebrate before the parasite matures. *C. cerebralis* is the bladder-worm which is found in the brain of a sheep and gives rise to staggers, a disease which often works great havoc among a flock. *Taenia coenurus* occurs in the dog (see CESTODA).

Coerullignone, see CEDRINET.

Coesfeld, Ger. tn in the Land of N. Rhine-Westphalia (q.v.) near the Dutch border, 52 m. NNE. of Düsseldorf (q.v.). It received its charter in 1197, and it was a member of the Hanseatic League (q.v.). There was severe damage during the Second World War. Textiles and paper are manuf. Pop. 15,000.

Coethen, see KÖTHEN.

Coeur, Jacques (c. 1395-1456), Fr. merchant and financier, b. Bourges. He inaugurated an extensive trade between France and the Levant. He was made the king's master of the mint, and from 1436 was in charge of the Fr. royal finances, advancing large sums to the king for carrying on his wars. C. amassed a huge fortune and founded colleges in Paris, Montpellier, and Bourges, and virtually controlled the trade of the whole country. The king seized the opportunity given by the sudden death of Agnes Sorel, the king's mistress, to accuse C. who had been appointed one of her ex-cutors, of having poisoned her. This and other allegations were without foundation, but C. was condemned to confiscation of his whole fortune. In 1455 he escaped to

Rome. According to some accounts Calixtus III put him in command of a fleet of galleys for the relief of Rhodes, but C. was taken ill at Chios and *d.* there.

Coffee, and Coffee Trade (Turkish *kahveh*, from Arabic *qahveh*, wine, the coffee beverage), beverage made from the roasted seeds of the C.-tree (*Coffea* species). Botanically there are 3 main types of C.: *arabica* (believed to have originated in Ethiopia but now yielding the bulk of the C. in the W. hemisphere), the more hardy *robusta* (a native of the Congo but widely grown elsewhere), and *liberica* (mainly from W. Africa). In international trade only 2 types are recognised: 'Brazils,' i.e. all those grown in Brazil regardless of type, and 'milds,' grown in other parts of the world. *Coffea arabica* has been introduced to very many

in rows. They are pruned to the same height, the ground being kept clear of weeds. Shade is needed, especially at first, and always in hot, dry climates, when irrigation is also necessary. The water supply should be lessened as the fruit ripens. Normally the first crop is yielded in the third year (amounting to as much as 2 lb. of seeds), and the trees live 40 years. In the W. Indies and Brazil 3 ann. gatherings are made. The beans are put on mats, dried by the sun, and often turned. They are passed between rollers to remove the dried pulp, freed from impurities, and put in bags for export. A wet method is also used extensively for *C. arabica*. The quality and price depend largely on the care expended in the process of preparation.

C. was unknown to the ancients and to the medieval world outside Ethiopia. It was not introduced even into Arabia until the 15th cent., and did not reach Europe for another 100 years. Rauwolf made it known to Europeans by an account of his travels, printed 1573. The plant was taken from Mocha to Batavia by Wieser, burgomaster of Amsterdam, in the 17th cent., and thence spread to Martinique (1720, from France), and has flourished in the W. Indies ever since. The chief different kinds of commerce are Mocha (from Arabia, with yellowy-brown beans), Java (with large yellow beans), Jamaica and E. Indian (with large blue-green beans), Surinam (which has the largest beans), and Bourbon (with pale yellowish-white beans). There are numerous ways of preparing C. for the table, the W. idea being to get the liquid free from all sediment by means of strainers of different kinds. The Turks drink their C. thick.

A number of cheaper substitutes are frequently used instead of C., or mixed with the ground berries, notably chicory root, dandelion root, cereal, carrot, yellow iris seeds, etc. The seeds of *Astragalus baticus* are known on the Continent as Swedish C. All these lack the chief constituent, caffeine, and are much inferior (see ADULTERATION). Real C. is very refreshing, stimulating the system and diminishing the waste of tissues (see TEA). It is an antidote to opium or alcohol poisoning. Its 4 chief constituents are caffeine, volatile oil, caffeotannic and caffeic acids. The C. trade is very important, Brazil being by far the chief producer; over half of the world's ann. crop is produced in that country. C. is also largely exported from Mexico, Central America, Java, Sumatra, India, Ceylon, Arabia, Hawaii, and the W. Indies. A great deal of the C. consumed in Britain comes from E. Africa. Receipts from the customs on C. and cocoa are somewhat fluctuating, but show a marked decrease since 1927, the largest return being roughly £908,000. The consumption of C. per head in Great Britain and N. Ireland was over 2 lb. in 1950 and has increased during recent years. See G. C. W. Lock, *Coffee: its Culture and Commerce in all Countries*, 1888; W. H. Ukers, *All About Coffee*,

COFFEE

parts of America and Central Africa, and is now extensively cultivated in a belt about 25° N. and S. of the equator. The *Coffea* (*Coffea*) genus belongs to the family *Cinchonaceae*. When wild the tree is tall and slender with few branches, but the cultivated kind is pruned to a height not exceeding 6-10 ft. and trained in a pyramidal form with horizontal branches. The leaves are evergreen and shiny. They grow opposite, are leathery, and oblong in shape; the flowers are snow-white and small, clustered in the axils of the leaves, and very sweet-smelling. The ripe fruit is a dark scarlet colour, and contains 2 cells, each with a single seed. These seeds, called also C.-beans (from Arabic *bunn*, C.), C.-nibs, or C.-berries, are hard semi-ellipses. The *Coffea mauritiana* has bitter, slightly emetic seeds. The Liberian C.-plant of W. Africa seems more hardy than *C. arabica*, and better able to withstand the ravages of the leaf disease which proves so injurious to C. plantations. It flourishes in well-drained, sandy, or gravel soils, and on highlands, 1000-3000 ft. above sea level. In Peru and Ecuador it is cultivated at a height of 6000 ft. but escapes frosts. C. plantations are usually laid out in quadrangles, 1-year-old trees, 12-16 in. high, being set

1922; J. H. McDonald, *Coffee Growing: with Special Reference to East Africa*, 1930; E. Windle, *Modern Coffee Planting*, 1933; H. E. Jacob, *The Saga of Coffee: the Biography of the Economic Product*, 1935.

Coffee-houses, first known in Cairo, were estab. in Constantinople during the latter part of the 16th cent., and are referred to in the writings of Burton (1621) and Bacon (1627). In the second half of the 17th cent. they were estab. in many European cities: Marseilles (1671), Hamburg (1679), Vienna (1683), Nuremberg (1686), Augsburg (1713). The first Eng. coffee-house was opened in Oxford in 1650 by a Jew named Jacobs, while the first London one dates from 1652, and was opened in St Michael's Alley, Cornhill, by a Ragusan, Pasqua Rosée. They very speedily became extraordinarily popular and were much frequented. In 1675 Charles II attempted to suppress them as being the place of resort of the politically discontented. They served to a great extent as clubs. Among the most famous were Garraway's and Jonathan's, both in Change Alley, the former the scene of many a rash speculation during the time of the S. Sea Bubble, the latter, according to the *Teller*, 'the general mart of stock-jobbers'; Lloyd's; the Jerusalem, which also served as a news-room; Don Saltero's, with its attached museum of curiosities; Will's, which Dryden visited; the St James's, where the members of the Whig party met and Goldsmith originated his *Reliatiion*; Button's, the favourite resort of Addison and Pope; and Tom's, in Birchin Lane, Cornhill, which Garrick frequented. At the present time cafés are merely eating-houses without licence for sale of intoxicants, and exist throughout the Brit. Isles. In France the *café chantant* is a kind of informal music-hall. See also RESTAURANT. See Aytoun Ellis, *The Penny Universities: a History of the Coffee-houses*, 1957.

Coffer, see CHEST.

Cofferdam, temporary structure erected on a river-bed or the bottom of a lake or the sea around an area where foundations for a pier or other structure are to be built. It usually consists of a double wall of piles, the space between being filled with clay puddle. The area surrounded by such a double wall can be kept effectively dry by light pumping to allow of building operations. When no longer required the piles are pulled up. In very calm water at shallow depth the piles may be dispensed with. In rivs. where obstructions must be kept to a minimum, closed grooved and tongued piling is used.

Coffering, in Rom. and Renaissance architecture, the treatment of a ceiling or of the underside of a vault or dome with deeply sunk rectangular panels known as 'coffers.'

Coffee's Still, apparatus for separating substances of different degrees of volatility from a liquid mixture. Different varieties of the C. S. are used in the spirit, ammonia, and coal-tar industries. In whisky distilleries the still consists of 1 or 2 vertical columns separated into chambers by perforated copper plates.

Steam is introduced at the base of one column and passes upwards through the perforations in the copper plates. The wash, or dilute alcohol, is introduced at the top of a column, is prevented from passing through the perforations by the pressure of the steam, and descends from chamber to chamber by means of a pipe, whose mouth stands slightly above the level of the copper plate. By this means the steam is kept in contact with the wash, and the more volatile constituents, including the alcohol, pass with the steam to the base of the cooling column, where they condense at different levels according to their boiling-points. At the level above which the alcohol condenses, the chamber floor is not perforated, so that the alcohol collects and is carried away by a special pipe. The still more volatile constituents are conducted to a water-cooling chamber. The strength and quality of the distillate are controlled by regulating the pressure of the steam and the rate at which the wash is pumped up to the analysing column.

Coffeyville, city of Montgomery co., Kansas, U.S.A., on the Verdigris R., 15 m. S. of Independence. It is the centre of a natural gas area, oil- and coal-fields, and manufs. structural steel and chemicals. Pop. 17,113.

Coffin (Lat. *cophinus*, basket or chest), receptacle in which dead bodies are buried. The earliest known use of C.s is in anct Egypt, where they were made of wood and stone. The Greeks and Romans seem to have used C.s in anct times, but later resorted to cremation. The Gk C.s were of various shapes, and usually made of baked clay; the Rom. *arcae*, or *loculi*, were frequently made of a limestone from the Troad, which was believed to have a corrosive action on the flesh (see SARCOPHAGUS). The early Christians in Rome always buried their dead in C.s, which were either hewn out of the living rock or formed of sculptured stone. C.s appear to have been used by other European nations from prehistoric times. They have been found in Scandinavia, both of hollowed tree-trunks and of stone slabs lining the grave. In mediæval times in England the lower classes seem to have simply buried their dead wrapped in a cloth; but the wealthier people employed tapering stone C.s and occasionally leaden ones. The light wooden C. now used is of recent origin.

Coff's Harbour, seaside tn in New S. Wales, Australia, 377 m. S.E. of Sydney by rail. Situated on the fertile N. coast, C. H. serves dists. growing bananas and timber, and raising dairy cattle. Pop. 6200.

Coggeshall, tn of Essex, England, on the R. Blackwater, 6 m. S.E. of Braintree. Paycooke's House, a fine ornamented house (c. 1500), now belongs to the National Trust. C.'s manufs. include clothing and isinglass, and there is a seed-growing industry. Pop. 3000.

Cognac, Fr. tn, cap. of an arron., in the dept. of Charente, on the Charente. It has many anct buildings, including the castle in which Francis I (q.v.) was b.

C. is famous for its brandy. By Fr. law the name 'cognac' may be applied only to brandy produced within a strictly delimited area around C. Pop. 17,500.

Cognates (Lat. *cognatus*). In Rom. law C. were persons who were sprung from a common marriage, through either male or female antecedents, whereas agnates were persons related through males only. The foundation of C. was thus the legal marriage, while agnates were such persons as were under the same *paterfamilias*, or would be, were he still living. Those who were of the same blood by both parents were sometimes called *germani*; *consanguinei* were those that had a common father only, and *uterini* those that had a common mother only. In reckoning the nearness of C. reference is made to the common ancestor. Each generation is counted up to and including the common ancestor and thence down again along the other line, so that an uncle and a nephew are C. of the third degree, first cousins of the fourth degree, and so on. In Scots law C. are persons related through the mother, and agnates those related through the father.

Cogne, It. vil. in the Valle d'Aosta (q.v.). It is in the Graian Alps (q.v.), in the upper part of the Val di Cogne, and is opposite the Gran Paradiso (13,652 ft). C. is a popular resort (altitude 5032 ft), particularly for winter sports, and there are iron mines near by. Pop. 2000.

Cognisance, see BADGE and CREST.

Cognovit, obsolete plea by a defendant in an action at law which admitted the plaintiff's claim (*cognovit actionem*), thereby enabling him to obtain judgment without the necessity of a trial. At the present day the same result is attained by the simple process of signing judgment by consent.

Cohan, George Michael (1878-1942), Amer. playwright, actor, and songwriter, b. Providence, Rhode Is., son of Jerry John, actor. By his early twenties he was appearing on Broadway and writing plays in which he took the chief part. He acted in his own plays *Little Johnny Jones*, 1904-6, and *George Washington, Junior*, 1906-7. Other plays of his were *Forty-five Minutes from Broadway*, *The Talk of New York*, and *The Song and Dance Man*. He visited London, and among his comedies which were produced there were *Get-rich-quick Wallingford*, at the Queen's in 1913; *Broadway Jones*, at the Prince of Wales's, and *Seven Keys to Baldpate*, at the Apollo, in 1914; and *Baby Cyclone*, at the Lyric, in 1923. But he will probably be best remembered in Britain for the patriotic song *Over There*, which he wrote for the Americans in the First World War. In recognition of his patriotic service in composing that song and also the song *A Grand Old Flag*, Congress voted him a gold medal, which was presented to him by President Roosevelt at the White House in 1940. He wrote and composed hundreds of songs, many of which were known all over America and sung by millions.

Cohen, Ernst Julius (1869-1944), Dutch

(Jewish) chemist, b. Amsterdam. He studied under Arrhenius in Stockholm, Moissan in Paris, and van't Hoff in Amsterdam. In 1898 he was prof. of chem. at Montreal, in 1901 he was at the Amsterdam Univ.; in 1902 he succeeded the famous van't Hoff at Utrecht Univ. In 1899 he discovered that tin exists in 3 allotropic forms, confirming Aristotle. He pursued research into the allotropy of metals, and into piezochemistry. He also wrote *Jacobus Henricus van't Hoff, his Life and Work*, 1912.

Coheser, instrument used in early experiments on radio communication as detector. Loosely packed iron filings cohere, and thus become conducting, on the passage of electromagnetic waves. The C. was included in a battery-operated circuit with a bell or relay, acting as a switch which closed the circuit when waves impinging on the C. made it conducting.

Cohesion, molecular force which keeps the particles of a body together and resists rupture. It is strongest in solids, weaker in liquids, and almost insensible in gases. The forces of C. between atoms or molecules are electrical in origin. They are of various types: (i) Van der Waal's forces, proportional to $1d^7$ and negligible for separations (d) less than 10^{-7} cm.; (ii) ionic or electrostatic, proportional to $1d^2$; (iii) covalent; and (iv) metallic. C. of the particles of a solid body is due to the close contact brought about by the solidification from a liquid state, crystallisation out of solution, electrochemical deposition, etc. Great pressure will cause 2 similarly constituted bodies to cohere; but as it is necessary to force the surfaces to fit each other exactly, more force must be used than that which, exerted in a contrary direction, would cause a rupture. Two smooth surfaces of the same substance, however, can be made to cohere with but little pressure. **Adhesion** usually refers to the attraction existing between the surfaces of dissimilar substances. C. in a liquid means the attraction between the particles in the interior of the substance; the adhesive forces at the surface bounding a liquid and some other substances are dealt with in SURFACE TENSION and CAPILLARITY. See also R. Kronig, *Textbook of Physics*, 1954.

Cohn, Ferdinand Julius (1828-98), Ger. botanist, who improved the microscope, and with it made far-reaching discoveries as to the growth of plant and animal cells. He made a special study of lower algae and fungi. He contributed greatly to the overthrow of the doctrine of abiogenesis or spontaneous generation, and may be justly held to be the founder of bacteriology. He pub. sev. works on insect epidemics, infusoria, and plant diseases.

Cohoes, manufacturing tn with water power from the falls of the Mohawk in the co. of Albany, New York, U.S.A. It is situated on the R. Hudson, on the Barge Canal, and possesses large cotton and woollen mills, and manufs. machines, pulp, and hosiery. Pop. 21,270.

Cohort, term used to denote a portion

of a legion in the Rom. army. Ten C.s made up a legion, which usually consisted of 6000 men. The first C., sometimes numbering 1200, had charge of the standard of the legion. *See also* ROMAN ARMY.

Coif (Fr. *coiffe*, a cap), head covering of linen, in the shape of a close-fitting cap with a string under the chin like a modern baby's bonnet, which was worn by men through most of the 12th, 13th, and 14th cents. Indoors and, beneath their usual headgear, outdoors. It went out of fashion in the 15th cent., but remained a part of the ceremonial dress of the Doge of Venice, and, in England, became a distinctive badge of office, first of councillors and ministers, and later of the serjeant-at-law. Upon wigs becoming commonly worn it was represented by a small black patch with a white border worn on the crown of the wig.

Coil, Electric, *see* ALTERNATING CURRENT; ARC-SUPPRESSION COIL; CHOKING-COIL; ELECTRIC MACHINES; INDUCTANCE; INDUCTION, ELECTRO-MAGNETIC.

Colimbra: 1. Dist. of W. central Portugal, mainly in Beira Litoral prov. (q.v.). It has a coastline on the Atlantic, and is drained by the R. Mondego. The dist. is generally low-lying and fertile, and has fishing, canning, textile, and salt industries. Area 1527 sq. m.; pop. 432,100.

2. City of Portugal, cap. of C. dist. and of Beira Litoral prov., built on a hill on the r. b. of the R. Mondego, 110 m. NNE. of Lisbon (q.v.). It was the cap. of Portugal 1139-1260, and is a bishopric. There is a fine Romanesque church, formerly the cathedral, and a notable 16th-cent. church, which has been the cathedral since 1772. The famous univ. of C. was founded at Lisbon in 1290 and was moved here in 1537. In the *Quinta das Lagrimas* (House of Tears) in the Santa Clara suburb Inez de Castro (q.v.) was murdered. There are textile and pottery manufs., and there is a trade in cereals, wine, and almonds. Pop. 42,650.

Coin, Sp. tn in the prov. of Málaga. It is in a dist. abounding in orchards, has textile and metal manufs., and is near marble quarries. Pop. 17,000.

Coin, pieces of metal stamped with various devices, and intended to circulate as currency. *See* CURRENCY; MINT; MONEY; NUMISMATICS; TRADESMEN'S TOKENS.

Coinage Weight Standards. The king's indenture specified the number of coins to the poundweight, and originally the pound of reference at the mint was the tower pound (5400 grains), but this was changed to the troy pound (5760 grains) by Henry VIII (*see* METROLOGY). The Rom. pound of 288 Rom. scruples weighed 5040 grains, and the Republican denarius c. 187 bc appears to have been struck at 72 to this pound (*Numismatic Circular*, Dec. 1955). For an analysis of the evidence relating to early Gk coin standards, *see* A. E. Berriman, *Historical Metrology*, 1953. *See also* the references under COIN.

Coining in England, as in all civilised states, is a prerogative of the sovereign power, and therefore the crime of counterfeiting the current coinage is severely

punished. Under the old statutes it was made a form of treason. In 1861 the statutes relating to this offence were codified and unified for the whole U.K. by the Coining Offences Act, and this was further amended by the Counterfeit Medals Act of 1883. The Coinage Offences Act, 1936, consolidated without amendments in substance the Acts dealing with coinage offences. The following offences are high crimes, punishable by penal servitude to the extent of life: counterfeiting or making coins to resemble or pass for the current coin of the realm; colouring, casing, or washing over any coins or metals with intent to make them pass for gold or silver coin; buying, selling, receiving, or passing counterfeit coin at a lower rate than its denomination imports; knowingly importing counterfeit coin; making, mending, buying, selling, possessing, or conveying out of the Royal Mint (q.v.) any C. instruments. The clipping or lightening in any other manner of current gold and silver coin is a crime punishable with not more than 14 years' imprisonment. The following offences are punishable with not more than 7 years' imprisonment: unlawful possession of clippings, etc., taken from gold and silver coin; unlawfully making, mending, buying, selling, or possessing instruments for so doing; buying, selling, or bringing into the country counterfeit coin at a lower value than its denomination imports; possessing 3 or more counterfeit gold or silver current coins with intent to utter them. Various minor offences are punishable with imprisonment for varying periods all under 7 years. Such are the exportation of counterfeit current coin, the counterfeiting of foreign coinage, and the knowingly uttering counterfeit current copper coinage. *See also* FORGERY.

Coins (weight), *see* METROLOGY.

Coins, Foreign, *see* METROLOGY.

Coir, fibrous covering of the coco-nut. Stripped off lengthwise, the fibres are manuf. into matting, ropes, cables, etc. It is prepared as follows. After soaking for months in water until soft, the fibres are beaten to remove the superfluous matters, and then are spun into yarn and woven into articles or twisted into cables. Compared with hempen cables these are buoyant and of great strength and elasticity.

Coire (Switzerland), *see* CHUR.

Cojedes, richly forested state of N. Venezuela, formerly part of Falcón, a cattle-grazing region, with some agriculture. Coffee is grown in the N. San Carlos is the cap. (pop. 7200). Area 5710 sq. m.; pop. 52,100.

Cojutepec, mkt tn and cap. of Cuscatlán dept., El Salvador, Central America, 7 m. NE. of San Salvador. It is situated near the shore of Lake Ilopango. It has potteries, weaving, distilling, sugar and cotton milling, and a cigar trade. There is a celebrated ann. cattle fair. Pop. 10,000.

Cokayne (or Cokaln), Sir Aston (1608-1684), poet, b. Derbyshire. He was educ.

at Trinity College, Cambridge. He was a strong Royalist, and stood firm to his religious opinions. There were 4 issues of his poems and plays: *Small Poems of divers Sorts*, embracing, besides poems, a *Masque presented on Twelfth Night, 1634* and *The Obstinate Lady* (a comedy), 1658; a reissue in 1659, entitled *A Chain of Golden Poems*, etc., including *Trappolin Creduto Principe*, or *Trappolin suppos'd a Prince* (an It. tragi-comedy); a third issue in 1662, entitled *Poems*, etc., to which was now added *The Tragedy of Ovid*; and a fourth (reissue) in 1669.

Coke, *see* LEICESTER, 1ST EARL OF.

Coke, Desmond, *see* CHILDREN'S BOOKS.

Coke, Sir Edward (1552-1634), lawyer, b. Mileham in Norfolk. He was educ. at Norwich School and Trinity College, Cambridge, and was called to the Bar in 1578. The following year he distinguished himself in the libel case *Cromwell v. Derby*, and soon after in Shelley's case, having been previously made reader of Lyon's Inn. In 1582 he married Miss Bridget Paston, receiving with her a large fortune. In 1586 he was made recorder of Norwich, in 1592 reader of the Inner Temple and solicitor-general, in 1593 Speaker of the House of Commons, and in 1594 attorney-general, thus succeeding over his rival, Bacon, who wished to be appointed to the last-named office. In 1606 he became chief justice of the common pleas, and in 1613 chief justice of the king's bench. In 1598 C.'s wife d., and he married Lady Hatton, granddaughter of Cecil, Lord Burghley. This was his second success over Bacon, for the latter was refused by Lady Hatton. The marriage proved a very unhappy one for C. Just after this he conducted sev. important trials, among them that of Sir Walter Raleigh, but this one does not redound to his credit, as his treatment of Raleigh was both discourteous and full of injustice. In his office as chief justice of the common pleas C. maintained a vigorous defence of the law, and when the eccles. courts wished to claim more power and King James was inclined to support them C. was on the defensive, and was successful in winning the king over to his side. He was opposed to James on sev. other occasions, as he had no exaggerated notion of the royal prerogative. He firmly estab. the fact that the king could neither make laws without the consent of Parliament nor could declare any action to be an offence unless it were contrary to the law of the land. In the case of Peacham who was accused of high treason, C. found himself in opposition to the king, and again in declining to refer to the king difficult cases in the court of chancery, as also in his contesting James's right to grant commendams, and in refusing to await the king's pleasure with regard to that granted to the Bishop of Lichfield. For these reasons he was dismissed from his office in 1616. He again took up public duties in 1620, when he was returned to Parliament as member for Liskeard. During this part of his career he concerned himself mainly with the reform of abuses. He opposed the

marriage of Charles to the infanta of Spain, and was insistent on freedom of speech for Parliament, thus alienating himself more and more from the king. After the death of James C. vigorously opposed Charles I in his illegal means of

SIR EDWARD COKE

obtaining money. He was also instrumental in drawing up the *Petition of Right*, and at the time of the Grand Remonstrance he pointed out in Parliament the evil caused in the country by the Duke of Buckingham. After this C. spent his time in retirement at Stoke Poges, where he d. *See* Lord Birkenhead, *Fourteen English Judges*, 1926.

Coke, Thomas (1747-1814), Methodist bishop, b. Brecon and studied at Oxford. He made the acquaintance of John Wesley, and commenced a series of open-air services that led to his dismissal from his Somerset curacy. Allied then to the Methodists, he became president of the Eng. conference, and later superintendent (bishop) of the Methodist societies in America, whither he made sev. voyages between 1784 and 1803. He pub. a *History of the West Indies* (1808-11), and, jointly with Henry Moore, a life of Wesley in 1792.

Coke, form of fuel composed of the carbonaceous substance left when coal is heated in a confined space. The volatile constituents of the coal are thus lost, and a hard, brittle, porous substance, with a slight metallic lustre, is left. It does not soil the fingers when touched, and burns with an intense heat and no smoke. These advantages, together with the facts that it is relatively free from sulphurous fumes and does not produce sparks, render it a valuable fuel for use in metallurgy and various industrial operations. C. is produced in the manuf. of coal-gas as a by-product, but this variety is of inferior quality, and the regular method of manuf. is by means of either mounds or ovens. In the former case a caking variety of

coal is stacked in a large heap round an open chimney covered with wet C.-dust, and fired from above. When all smoke has ceased to appear the air-holes are closed, and the mound is extinguished and cooled with water. The same principle is employed in closed ovens, which, however, yield a better quality with a considerable saving of time and expense. See also CARBONISATION.

Col des Nuages, see DEO-VAN.

Cola di Rienzi, see RIENZIL.

Colac, main centre of a wealthy dairying and agric. area known as the W. Dist., 95 m. SW. of Melbourne, Victoria, Australia.

Colard Mansion, first printer at Bruges, formerly a calligrapher; he was in partnership with Caxton, 1475-7. At his press was printed about 1474 the *Recuyell of the Histories of Troye*, the first book printed in English. C. M. printed 24 books, the last being a version of Ovid's *Metamorphoses* in May 1484. He then left Bruges and is thought to have d. soon after.

Colban, Adolphe Marie (1814-84), Norwegian novelist, *née* Schmidt, whose works were very widely read in their day. Best known among them are *Laererinden*, 1869, *Tre nye Noveller*, 1875, *Jeg lever*, 1877, and *Thyra*, 1882.

Colbert, Jean Baptiste (1619-83), Fr. statesman, b. Rhelms. He entered the employment of Cardinal Mazarin in 1651, and was entrusted by him with his most important commissions. In 1661 he succeeded Mazarin as chief adviser to the young king, and in 1668 became minister of marine and also minister of commerce and of the king's household, having previously been made controller-general. He had, in fact, almost supreme power over the financial affairs of the country. C. reformed the whole Fr. financial system by doing away with extortion and unjust taxation, and by revising the method of collection. He next turned his attention to commerce, and did all that he could to increase the manufs. of the country instead of importing manuf. goods from abroad. The protectionist lines on which he worked, however, inevitably discouraged enterprise in the laymen. The inspection as to quality and measure of articles was most rigid, and the protective tariffs hampered the trade considerably. Credit is due to C. for his reconstruction of the Fr. Navy. He not only increased the number of men and ships, but also reconstructed Toulon and Rochefort, and fortified Dunkirk, Brest, and Havre. He turned his attention also to learning and art, and he encouraged scholars and artists from all parts of Europe. He had public buildings and monuments set up in Paris, and added considerably to the Louvre art collection. He experienced great difficulties from Louvois, his rival, who had control of the war dept. Peace was necessary to C. so that his reforms might be effectual, and in his later days he carried on a losing struggle to cut down the king's extravagances to this end. Louis XIV eventually transferred his favour to Louvois, and C.'s influence

gradually declined till he d., stricken with a fever which had attacked him at intervals for sev. years before his death. Within a few years of his death the financial corruption and instability of Fr. finance was to be as bad as ever.

JEAN B. COLBERT

Engraving after a painting by V. Mignard.

Colborne, Sir John, 1st Baron Seaton (1778-1863), soldier, served in the Corunna campaign. He afterwards fought with Wellington, and was wounded at Ciudad Rodrigo. He also took part in the battle of Waterloo, 1815. In 1838 he put down the rebellion in Canada. He was created Baron in 1839; Governor of the Ionian Is., 1843-9; promoted general, 1854, field-marshal, 1860; commander-in-chief of the forces in Ireland, 1855-60. See life by G. C. M. Smith, 1903.

Colburn, Zerah (1804-40), mathematical prodigy, b. Cabot, Vermont, U.S.A. In his earliest years he displayed such extraordinary powers of rapid calculation that from 1810 he was publicly exhibited by his father, and came to Great Britain 1812, and France in 1814. He studied from 1816 to 1819 at Westminster School at the expense of the Earl of Bristol. On the death of his father he returned to America, and was ordained in the Methodist Church. He was never able to explain how the answers came into his mind, but in his early years his calculations were accompanied by certain bodily contortions.

Colby, Frank Moore (1865-1925), Amer. editor, b. Washington. Educ. at Columbia Univ., he held appointments there and at Amherst College, and was prof. of economics at New York Univ., 1895-1900. He ed. the *New International Year Book* and the *New International Encyclopaedia*. His books include *Outlines of General History*, 1900, and many essays, collected as *The Colby Essays*, 1926.

Colby, Thomas Frederick (1784-1852),

major-general, who was connected with the Ordnance Survey (q.v.), of which he became director.

Colchagua, prov. in Chile, extending from the Cordilleras to the Pacific Ocean. Its cap. is San Fernando (pop. 14,420). The prin. crops are cereals; wine is produced, and cattle and sheep are grazed. Area 3255 sq. m.; pop. 136,850.

Colchester, Baron. This title was borne by the family of Abbot from 1817 to 1919, when the third baron d. Charles Abbott, the first baron, was Speaker of the House of Commons from 1802 to 1817.

during this period C. assumed great importance. (See *Camulodunum: First Report of the Excavations at Colchester*, 1930-9, Society of Antiquaries of London, 1948.)

The most important of the modern tn's anc't monuments is the castle, which dates from 1070 and has the largest Norman keep in the country. There are numerous other buildings of historical interest, the best known being the ruins of the 12th-cent. St Botolph's Priory church, and the gateway of the 11th-cent. monastery of St John, on St John's Green. There are

COLCHESTER CASTLE

M. Nichols, Colchester

Colchester, municipal bor., mrkt tn, and riv. port of Essex, England, 52 m. from London. It stands on the R. Colne, which is navigable by vessels of 150 tons to the Hythe, 1 m. SE. and 9 m. from the sea. The recorded hist. of C., which is the oldest recorded tn in Great Britain, goes back to the coins of Cunobelinus (Cymbeline), who reigned from 5 BC until his death in AD 43. These are inscribed C A M V for Camulodunum, the Brit. name for C. (meaning the hill or fort of Camulos, god of war). On the Rom. invasion in the year 43 Camulodunum became the H.Q. of the Romans in Britain. It was burnt and devastated by Boadicea in AD 61, when that queen led a rising of the Trinobantes and Iceni against the Romans. Soon afterwards the Rom. wall was built to protect the tn. The remaining 1½ m. or more of Rom. work can be seen to advantage on Balkerne Hill and at the Balkerne Gate, the old Rom. gateway at the top of the hill; also at the steps leading up to the church of St Mary-at-the-Walls in Balkerne Lane. The Rom. occupation of C. lasted until about the year 367, and

2 museums, that in the castle keep containing chiefly, though not exclusively, Romano-Brit. antiquities, one of the finest collections of its kind in N. Europe. In the Holly Trees mansion, an early Georgian house near the castle, is a collection of domestic interest, also a valuable collection of Peruvian antiquities and various oriental exhibits. The council has recently taken over on lease a redundant C. church, in which it is proposed to estab. a natural hist. museum, with an eccles. section. This museum will be known as All Saints' Museum.

C. is a municipal bor., the earliest charter being that of Richard I (1189), and for parl. purposes is in the C. div. of Essex. Corn and cattle markets are held and the chief industries now carried on are engineering and the manuf. of clothing. The Colne oyster fishery, which produces the Pyefleet oysters, belongs to the council, and C. is also noted for its roses. C. still maintains her position as a military centre, both for the C. Garrison H.Q. and as H.Q. of the E. Anglian Dist., 3rd Infantry Div. and 19th Infantry Brigade. There are

many camps and barracks, extensive married quarters of modern design, and a large military hospital. Among the more modern buildings of the tn should be mentioned the tn hall, the co. hospital, and the new public library, in which is housed a valuable collection of books especially intended for students and presented by the Rev. Dr G. H. Rendall, a former headmaster of Charterhouse. Pop. 57,436.

Colchicum, genus of Liliaceae, containing over 50 plants, which grow wild in Europe, Asia, and Africa. In Britain it is represented by the well-known *C. autumnale*, the meadow saffron or autumn crocus. The large pale purple flowers appear in autumn without the leaves, and with the anthers and stigmas just above the surface of the soil, while the ovary and filaments remain below ground, protected from cold. The ovary becomes mature before the stamens, and pollination is effected by means of bees. In the spring-time the foliage, an erect tuft of broad, oblong, shining, sheathing leaves, appears and the capsular fruit is elevated above the soil by its lengthened footstalk. The corn of the *C.* is irregularly egg-shaped, and covered with a dry, brittle, brown skin; and it consists of a white fleshy succulent substance. When fresh, it has a nauseous, radish-like odour, when dried there is no odour; the taste is sweetish-bitter, leaving an acrid sensation in the throat. Both corns and seeds yield a stimulating, deleterious principle, colchicine; a gastro-intestinal irritant, used in medicine for gout. It is also used in plant genetics for its doubling effect on chromosomes in some plants.

Colchis: 1. In ancient geography a ter. in Asia, situated between the Caucasus on the N., Iberia on the E., Armenia on the S., Pontus on the SW., and the Euxine on the W. It was noted in Greek mythology as a home of sorcery, the land of Medea and the Golden Fleece. Its inhab. were from earliest times engaged in linen manu.

2. Russian **Kolkhida**, swampy lowland area with subtropical climate, situated in W. Georgia (Transcaucasia), along the lower Rioni R. and the Black Sea shore. Citrus fruits and tea are cultivated.

Cold. For physical meaning see HEAT. In medical practice *C.* applied to the body subdues pain, reduces inflammation and feverish temp., arrests bleeding, and stimulates by *C.* bathing. A *C.* (Coryza), term used to indicate a catarrhal inflammation of the mucous membrane of the nose, which frequently involves the throat and may, unless checked, extend to the chest. The name derives from the sensation of chilliness which commonly accompanies its onset. The condition, which may be febrile, is usually caused by bacterial invasion, and is characterised by excessive secretion of mucous fluid ('running of the nose'), hoarseness, sore throat, headache, and, in varying degree, a general feeling of depression and malaise. The condition is infectious.

Cold Cream, or **Rose-water Ointment**, cooling dressing for the skin. It may be prepared by melting together 125 gm.

of spermaceti, 120 gm. of white wax, 560 gm. of expressed oil of almonds, and then mixing in 190 gm. of stronger rose-water. A few grammes of sodium borate are dissolved in the rose-water unless some other metallic salt of remedial properties is desired. The ointment constitutes a soothing application for chapped face and hands, abrasions, etc.

Cold Harbor (Old and New), 2 localities c. 10 m. N. of Richmond, Virginia, U.S.A., 2 m. from Chickahominy R. The battle of Gaines's Mill was fought near by (1862), the Federals, under McClellan, being defeated by the Confederates under Lee. There was another battle fought between Gens. Grant and Lee, 1864, considered indecisive, though the advantage was on Gen. Lee's side. Pop. 3000.

Cold Storage, see REFRIGERATION.

Cold Water Test, or, more usually, **Hydraulic Test**, in engineering, is a pressure test for totally enclosed vessels to determine their power of resistance. The vessel is filled with cold water, and the pressure progressively increased to twice the normal working pressure.

Cold Wave, sudden and general fall of temp., usually following a winter storm and caused by a cool wind blowing towards the equator. It generally lasts only for 2 or 3 days, and is common in U.S.A. In the E. U.S.A. *C. W.*s from the N. plains often cause a fall of 18° F. or more, bringing the temp. below freezing-point. They cross the border between Lake Superior and the Rockies.

Colden, Cadwallader (1688-1776), was a Scot and a member of the medical profession. He went to America and practised medicine there, first in Pennsylvania and later in New York, and in 1761 he was made lieutenant-governor of that city. His chief works are *History of the Five Indian Nations depending on the Province of New York in America*, 1727, and *An Explication of the First Causes of Action in Matter and of the Cause of Gravitation*, 1745.

Coldingham, par. and vil. of Berwickshire, Scotland, 2½ m. from Eyemouth, 1½ m. from C. Bay. It has the remains of a famous priory, founded in 1098 by Edgar of Scotland. East Castle, the Wolf's Crag of Scott's *Bride of Lammermoor*, is about 6 m. off. Pop.: par., 2830; vil., 495.

Coldstream (formerly **Lanell**, **Leinall**), par. and burgh of Berwickshire, Scotland, 13 m. from Berwick, on the R. Tweed. Smooton's 5-arched bridge (1763-6) crosses the riv., and near by is the famous ford of the Tweed, often crossed by Scotch and Eng. armies. It was once, like Gretna Green, a refuge for runaway couples. The ann. 'Olvie Week' is the first week in Aug. Pop. 2000.

Coldstream Guards, second regiment of foot-guards, forming part of the Household Brigade. It is the second regiment in age of the Brit. Army, the oldest being the Royal Scots. The *C. G.* were known first as Monck's Regiment, from Gen. Monck, for whom Cromwell formed it in 1650. The regiment served in Scotland until 1660, when it accompanied Monck on his march to London in that year. The

regiment's name refers to its sojourn in the border vil. of Coldstream in the winter of 1659-60. During the reigns of Charles II and James II detachments of the regiment served in Flanders, at Tangiers, and in Virginia, and under William III it served at the siege of Namur, 1695. Some companies helped to hold Gibraltar in 1704-5 after its capture by Rooke. It served under Marlborough at Oudenarde and Malplaquet, under George II at Dettingen, and under Abercrombie in Egypt in 1801. A series of battle honours for the Peninsula and Waterloo testify to its service under the great Duke of Wellington. It next saw service in the Crimea, 1854-6, this being followed by the Egyptian campaign of 1882 and Suakin in 1885, and then the Boer War of 1899-1902. During the First World War it served with great distinction and gallantly upheld its proud motto, 'Nulli secundus.' 7 V.C.s being won. Five battalions served at various periods in France and Flanders, notably at Mons (1914), Zandvoorde near Ypres (1914), Neuve-Chapelle (1915), and in the later battles of Ypres (1917). In the Second World War the C. G. fought in NW. Europe and in Italy. As part of the Guards Armoured Div. in France in 1944 they were prominent in the passage of the Orne into the Caen plain in the battle of Normandy. Other units were in the Eighth Army (q.v.) which fought in numerous battles up the It. peninsula. The C. G. can be distinguished from other Guards by the white band round their hats and by the buttons on their tunics being grouped in pairs.

Cole, George Douglas Howard (1889-), writer on social studies, b. Ealing; educ. at St Paul's School and Oxford Univ. He is Chichele prof. of social and political theory at Oxford, and a fellow of All Souls and Nuffield colleges. A leading authority on labour questions and economics in relation to industry, he is president of the Fabian Society and of the International Society for Socialist Studies. Pubs. include *A Short History of the British Working-class Movement*, 1925-7, *A Century of British Co-operation*, 1945, *The Intelligent Man's Guide to the Post-war World*, 1947, *Money, Trade, and Investment*, 1954, and *A History of Socialist Thought* (in progress). He collaborates with his wife Margaret Isabel, née Postgate (b. 1893), in detective stories, etc.

Cole, George Vioat (1833-93), landscape painter, especially of Surrey and Thames scenes, b. Portsmouth. From 1853 he contributed frequently to the Royal Academy exhibitions. He was elected R.A. in 1880. 'The Pool of London' is in the Tate Gallery, and he produced a series of the Thames 'From Source to Sea.' See life by Chignell.

Cole, Sir Henry (1808-82), public official, art critic, and editor, b. Bath, and educ. at Christ's Hospital, one of the outstanding public servants of his day. He served first in the Public Record Office, which he helped to found; then he engaged in a variety of successful public projects and activities, some of them stemming from

his prominent position in the Royal Society of Arts. His greatest work was in organising, and remaining the guiding spirit of, the Great Exhibition of 1851. C. also bore the major share in founding what became the Victoria and Albert and Science Museums (qq.v.) of which he was also in charge for many years. He was also the prime mover in founding the Albert Hall, the Royal College of Music, a school of cookery, etc. See *Fifty Years of Public Work*, 1884.

Cole, Thomas (1801-48), noted Amer. landscape painter. He went from England to the U.S.A., 1819; from Ohio to New York, 1825. He travelled to London, Florence, and Rome between 1829 and 1832. He aimed chiefly at historical or allegorical landscapes (for examples see New York Historical Society's rooms). Among his works are 'Views of the Catskills and White Mountains,' 'The Voyage of Life' (4 pictures), 'The Course of Empire,' 'View of Mount Etna taken from Taormina,' and 'Kenilworth Castle.'

Cole, Timothy (1852-1931), Amer. wood engraver, b. London. In 1875 he began to work for the *Century Magazine* (then *Scribner's*). His work attracted widespread attention, and he was sent to Europe to make engravings after the old masters (1883), which met with great success and were the last brilliant effort in a craft soon to be rendered obsolete by photographic reproduction. He received medals at the Paris and St Louis exhibitions.

Cole, see RAPE.

Colebrooke, Henry Thomas (1765-1837), pioneer in Sanskrit studies. His father, who was chairman of the E. India Co., secured his son a post in the company's service. C.'s first paper was *On the Duties of a Faithful Hindu Widow*, 1794. His main work was *A Digest of Hindu Law on Contracts and Successions* (trans. from the original Sanskrit), in 4 folio vols., Calcutta, 1798. In 1805, he became president of the Calcutta Court of Appeal, and prof. of Hindu law and Sanskrit at the recently founded college of Fort William. In his *Grammar of the Sanskrit Language*, 1 vol., 1805, C. summarised the work of the native grammarians. His treatise *On the Vedas*, 1805, is a pioneer work in Vedic studies. *Algebra, with Arithmetic and Mensuration* etc., 1817, is his main work on mathematics. From 1807 to 1814 he was president of the Asiatic Society of Bengal. In 1814 he returned home.

Colectomy, in surgery, the name given to the operation of removal of part of the colon or large intestine, and the consequent reuniting of the severed ends, so as to complete the circuit. This course is rendered necessary in cases of tumour or stricture in the part.

Coleford, par. and mkt tn of Glos., England, 8 m. NW. of Lydney, in the mining dist. of the Forest of Dean. The tn hall was built in 1662. The Speech House, where the Verderers' Court was once held, is now an hotel. The court room possesses a musicians' gallery. Pop. urb. dist. and par. 2800.

Colemanite, hydrated calcium borate. $\text{Ca}_2\text{B}_2\text{O}_7 \cdot 5\text{H}_2\text{O}$, one of the chief sources of borax and boric acid. Important deposits are found in the SW. of California. They are found in hot springs and volcanic lakes.

Coleenso, John William (1814-83), Bishop of Natal and a celebrated mathematician, b. Cornwall. He was educ. at Cambridge, where he was second wrangler in 1836. From 1838 he was assistant master at Harrow, and from 1842 tutor at Cambridge. In 1846 he became rector of Fornett St Mary, Norfolk, and pub. mathematical textbooks on arithmetic, algebra, and plane trigonometry. His *Village Sermons* appeared in 1853, in which year he was appointed Bishop of Natal. He at once studied the Zulu language, and after a while prepared a grammar and dictionary, and trans. part of the Prayer Book and Bible. In 1861 he pub. his *Translation of St Paul's Epistle to the Romans, commented on from a Missionary Point of View*, in which he set forth his objection to the doctrine of eternal punishment. His next work, *The Pentateuch and Book of Joshua critically examined*, 1862-79, made him the apostle of the higher criticism, and provoked a storm of protest. His book was condemned by both Houses of Convocation as heretical (1864), and he was declared (Dec. 1863) deposed from his see by Bishop Gray of Cape Town. The Privy Council, however, declared the deposition null and void. Bishop Gray then publicly excommunicated him, and in 1869 appointed Dr Macrorie Bishop of Maritzburg, with authority over practically the same diocese. Later C. opposed the oppressive measures taken by the Boers and Cape officials against the Zulus, and the policy of Sir Bartle Frere during the Zulu war. He pleaded the cause of the chiefs Langalibalele and Cetewayo, and was regarded by the Zulus as their protector. Other works by him are *Ten Weeks in Natal*, 1855, *The New Bible Commentary Literally Examined*, 1871-1874, *Lectures on the Pentateuch and the Moabite Stone*, 1873, and *Sermons* 1873. See Sir G. W. Cox, *The Church of England and the Teaching of Bishop Coleenso*, 1888.

Coleenso, vil. and railway station, Natal, S. Africa, 70 m. from Pietermaritzburg, on R. Tugela, which is here spanned by a bridge. It was the scene of Buller's unsuccessful attempt to cross the Tugela, Dec. 1899, during the Anglo-Boer war, 1899-1902. The Electric Supply Commission has erected a power station in connection with the electrification of the railway. Pop.: Whites, 766; Bantus, 1005; others, 317.

Coleonso, Bartolomeo, see COLLEONI.

Coleoptera (Gk *koleos*, sheath; *pteron*, wing), order of insects known familiarly to us as beetles. The species have 4 wings; the front pair, the elytra, are hard and leathery, and when at rest they fit together closely over the hind wings, and a straight suture lies between them; the hind pair are used in flight and are membranous. The mouth parts are biting

and have mandibles, the lower lip is not divided along the middle. The metamorphosis is complete, the larva is a grub and develops into a pupa which exhibits the external structure of the perfect insect. There are known to scientists about 180,000 species, of which over 3000 belong to Britain. See BEETLE.

Colepeper, or Colepeper, John, 1st Baron (d. 1660), Eng. Royalist politician. He was a member of the Long Parliament (1640) siding against Strafford, but subsequently supporting episcopacy, and opposing the Scottish demand for religious union. Privy councillor and chancellor of the exchequer in 1642, he became one of Charles I's advisers and fought for him at Edgehill. C. was raised to the peerage, 1644. He accompanied the prince (later Charles II) to France in 1646.

Coleraine, mkt tn of co. Londonderry, N. Ireland, on the R. Bann, 4 m. from the sea. It is noted for its linen manufs., and has shirt and collar factories, and food processing industries. There are also good salmon fisheries. Pop. 10,750.

Coleridge, Derwent (1800-83), author and educationist, b. Keswick, Cumberland, son of Samuel Taylor C. (q.v.). Educ. at Ambleside School and St John's College, Cambridge. He took orders in 1825 and from then till 1841 was master of Helston Grammar School, Cornwall, one of his pupils being Charles Kingsley (q.v.). Here he wrote his largest work, *The Scriptural Character of the English Church*. In 1841 he was appointed the first principal of St Mark's College, Chelsea, and did much to advance elementary education.

Coleridge, Hartley (1796-1849), poet, b. Clevedon, Somerset, eldest son of Samuel Taylor C. He early showed uncommon gifts and a temperament still more remarkable. After the separation of his parents, he was brought up in Southery's family at Greta Hall, being educ. chiefly at Ambleside. Urged by Southery, his well-to-do relatives sent him to Oxford. Intensely sensitive, impatient of control, shy and awkward, of a somewhat bizarre appearance, and infirm of will, Hartley got into trouble with the college authorities, and lost an Oriel fellowship through intemperance. He received a gift of £300 from the college, but the blow was intolerable, and left him for the rest of his life despondent, self-reproachful, and lacking in concentration. After 2 ineffectual years in London, Hartley returned to the Lake country, where he made 2 widely separated attempts at school-teaching. In the interval (c. 1830) he lived for some time at Leeds in the family of F. E. Bingley, a publisher, with whom he produced a biographical work on *Lives of Illustrious Worthies of Yorkshire*, 1835. He is, however, best known for his verse, which, if lacking in power, is singularly fine in mood and happy in expression. His sonnets are among the most perfect in the language. From 1838 Hartley lived at Grasmere, spending his time in study and reverie. His chief literary effort was an ed. of Massinger and Ford 1840, including valuable biographies of the dramatists. He d. of bronchitis, and

was buried in the place chosen for him by Wordsworth, who was laid beside him a year later. Four vols. of his prose and poetry were ed. by his brother Derwent, 1861. As a critic Hartley is delicate and suggestive; as an essayist quaintly humorous, resembling Charles Lamb; and in conversational powers, according to tradition, second only to his father. See *Poems*, with a memoir by his brother, D. Coleridge, 1851; E. L. Griggs, *Hartley Coleridge, his Life and Work*, 1929; E. Blunden, *Coleridge the Less*, 1931.

Coleridge, Herbert (1830-61), philologist, son of Henry Nelson and Sara C., b. Hampstead. In 1853 he began practising as a chancery barrister at Lincoln's Inn. His leisure hours he devoted to philological studies—Sanskrit, the N. tongues, and particularly the Icelandic language and literature. In 1857 he was elected a member of the Philological Society, to which he contributed 2 papers. The society was planning a supplement to the standard dictionaries of Johnson and Richardson, which soon developed into a scheme for a complete new Eng. dictionary. C. was appointed honorary secretary of a special committee 'formed for the purpose of collecting words and idioms hitherto unregistered.' His new duties, for which he was admirably fitted, practically constituted a general editorship of the work; the results of his researches are embodied in his *Glossarial Index to the Printed English Literature of the Thirteenth Century*, 1859, which he describes as the foundation stone of the proposed dictionary. The scheme developed into the *New English Dictionary* (Clarendon Press).

Coleridge, Sir John Duke, 1st Baron Coleridge (1821-94), jurist, son of Sir John Taylor C., b. Ottery St Mary. Among his friends and contemporaries at Balliol were Archbishop Temple, Matthew Arnold, Arthur Clough, and Principal Shairp. He was called to the Bar in 1846, and soon gained practice, thanks to his musical voice, his eloquence (which earned him the nickname of silver-tongued C.), and his powers of persuasion. He became recorder of Portsmouth, Q.C., and M.P. for Exeter, as a Liberal, from 1865 to 1873. He supported the Bill for the abolition of religious tests in the univ., and took part in the debates on the disestablishment of the Irish Church. He became lord chief justice of England in 1880. His chief forensic triumph was in the famous Tichborne case, his speech for the defendant lasting 23 days. See E. H. Coleridge, *Life and Correspondence of Lord Coleridge*, 1904.

Coleridge, Mary Elizabeth (1861-1907), poetess and novelist, b. London, a grandniece of Samuel Taylor C. Educ. at home, partly by W. J. Cory (q.v.). In 1893 she pub. her first novel, *The Seven Sleepers of Ephesus*, and 3 years later a vol. of poems, *Fancy's Following*, but it was her historical romance *The King with the Two Faces*, 1897, that made her name as a writer.

Coleridge, Samuel Taylor (1772-1834), poet and philosopher, the son of the Rev.

John C., vicar of Ottery St Mary, Devon. He was only 9 years old when his father d. A presentation to Christ's Hospital being obtained, he was a scholar there from 1782 to 1790, among his fellow pupils being Charles Lamb, with whom he formed a lifelong friendship. His love of the classics, especially Lat. authors, attracted the notice and esteem of the headmaster, Dr Boyer, but strangely enough, for nearly 2 years (c. 1787-9) he was so engrossed with theological and metaphysical studies that, as he himself says, 'everything else

National Portrait Gallery

SAMUEL TAYLOR COLERIDGE

The painting by Peter Vandyke.

became insipid.' What is still more wonderful, he was relieved from this obsession by reading the sonnets of Wm Lisle Bowles (q.v.), a popular poet of his day. He acquired a considerable knowledge of Greek, and at Jesus College, Cambridge, which he entered in Feb. 1791, he won the Browne gold medal for a Gk ode on the slave trade. But the fatal desultoriness which clouded his after-life showed itself thus early; his studies were irregular, and his rooms were the constant resort of friends who came to enjoy his conversation on all kinds of subjects, especially politics, in which he took intense interest. In 1793, a friend of his being expelled for Unitarianism and sedition, he too left the univ., went to London, and being without resources enlisted in the 15th Dragoons under the name of Silas Tompkins Comberbach, or Comberbacke. His life as a recruit not being happy, he wrote one day on the stable wall: 'Eheu, quam infortunium miserum est fuisse felicem!' (an adaptation from Boethius), which attracting the notice of an officer, led to inquiries. Friends

obtained his discharge, and he returned to college.

Visiting Oxford in June, he made the acquaintance of Southey, and the two evolved a delightful scheme of panti-socracy, suggested by certain visionary Fr. philosophers. An ideal community was to be estab. on the banks of the Susquehanna, where brethren (and sisters) should dwell together in altruistic unity. But the colony was never founded. The 2 friends also collaborated in writing *The Fall of Robespierre*, a drama full of bombastic rhetoric, which was pub. about the time that C. finally left Cambridge, without a degree, towards the end of 1794. He next delivered in Bristol a course of political lectures, very Jacobinistic, and exceedingly virulent in their attacks on Pitt. He also wrote some poems, pub. by his friend Joseph Cottle, the Bristol bookseller to whose reminiscences we owe the account of C. in these years. These poems, while containing some promise of future distinction in style, were often weak, conventional, and, as even their author allowed, turgid. In Oct. 1795 he married Miss Sara Fricker, whose sister Edith soon after became Mrs Southey. He settled at Clevedon for a short time, but returned to Bristol. He was soon tired of Bristol, and went to Nether Stowey, where he met Wordsworth. C.'s marriage was an unfortunate one; his wife, though an excellent woman, was incapable of affording him intellectual and spiritual companionship, or the support which his moral weaknesses unhappily required. Projecting in 1796 a paper to be called the *Watchman*, which was to be a Herald of Truth, and, to avoid the stamp-tax, was to appear every eighth day, C. started off on a tour to canvass for subscribers, preaching Unitarian sermons as he went, probably the strangest canvasser ever seen. His adventures, as told in his *Biographia Literaria*, 1817, are very amusing. The *Watchman* appeared, reached its tenth issue, and died a very natural death. Within the next 2 years he wrote the *Ancient Mariner*, the first part of *Christabel*, *Kubla Khan*, the *Ode to France*, in fact nearly all his finest poems. The first-mentioned was included in the *Lyrical Ballads*, 1798, a vol. planned by the 2 poets in conjunction. C. was to deal with the supernatural, Wordsworth with subjects of everyday life; the *Ballads*, however, contained only a few pieces by the former. The little vol. was very ill received. Among other notices, the *Monthly Review* spoke of the *Ancient Mariner* as 'the strangest story of a cock and a bull that we ever saw on paper.' It may be observed also that nearly 20 years later, when *Christabel* and *Kubla Khan* appeared, the same *Monthly Review* sagely remarked: 'That so much superior genius should be corrupted and debased by so much execrable taste must be a subject of sincere lamentation to every friend of poetry.'

In 1798 Josiah and Thomas Wedgwood allowed him £150 per annum on the implied condition that he should abandon preaching (he had accepted a Unitarian

ministry in Shrewsbury) and devote his time to literature. His revolutionary enthusiasm had been disillusioned by the course of events in France, and, desirous of studying Ger. philosophy, he spent about 8 months at Ratzburg and Göttingen, mastering the language, attending the lectures of Prof. Blumenbach, and enjoying glorious hours of oratory and disputation among his fellow students. Returning to England in 1800, he produced his excellent trans. of *Wallenstein*. This sold so badly that the publishers, Messrs. Longman, disposed of the greater part of the ed. as waste paper. During this year the *Morning Post*, which had already pub. his *Ode to France* and other pieces, engaged him to write a series of political articles. His articles appeared irregularly for 2 years, and then ceased. In the summer of 1800 he removed with his family to Greta Hall, Derwentwater, to be near Wordsworth, who was living there. But he had been a frequent sufferer from rheumatism ever since boyhood, and the Westmorland climate affected him severely. In the spring of 1801 he began to take opium to relieve his pain; the habit rapidly increased, and, as De Quincey says, 'killed him as a poet.' He became restless and miserable, doing little work, but projecting grandiose schemes which all died in thinking, such as that for an immense *Bibliotheca Britannica*, outlined by him in a letter to Southey, Aug. 1803. Friends came to his assistance; Southey took Greta Hall off his hands, Wedgwood, Wordsworth, and others were full of kindness, and in 1804 he received an invitation to Malta, where he had barely arrived when he was invited to become secretary to the governor, Sir Alexander Ball, a position which he filled with the greatest capacity. This appointment he held for 10 months, but his health did not improve, and he went on to Naples and Rome. About midsummer 1806 he was perturbed by a rumour that he was in danger from emissaries of Bonaparte, on account of his anti-Napoleonic essays in the *Morning Post*. This story has been ridiculed, but it so impressed C. that he speedily departed from Leghorn, taking passage in an American ship.

He arrived home safe, but miserably broken in mind and body, and the record of his next 10 years is a painful story of suffering, weakness, and vacillation. Estranged, though not altogether separated from his wife, he moved from place to place, sometimes alone, sometimes with his family. At Bridgewater in 1807 he met for the first time with De Quincey, who was so impressed that, through Cottle, he sent C. an anonymous gift of £300. A series of lectures begun in London, Jan. 1808, on 'Poetry and the Fine Arts,' was a failure, and it is not quite clear how he got through the year, but in 1809 he started a magazine, the *Friend*, under such impossible conditions that its life of 8 months was remarkable for length, yet it contained some of C.'s finest prose. Some lectures on Shakespeare and other poets were, however,

successful, and he wrote regularly for the *Courier* (1811-12), while his play *Remorse* was well received at Drury Lane. Nevertheless he was continually in pecuniary difficulties; opium had wrecked him morally and physically, and at one time his family was left almost entirely on the hands of Southey and a few other friends. It was now recognised that to give money to C. himself was merely to furnish him with the means of self-degradation. In 1814 he was taking 2 to 3 quarts of laudanum per week, or even more, and he had not sufficient will-power to break off the habit. From 1816 to 1819 he lived with his friend Morgan at Calne, and finally was persuaded to put himself under the charge of a medical man, Mr Gillman of Highgate, as a resident patient. He could not possibly have been in better hands; the fatal vice was gradually subdued, a warm attachment grew up between doctor and patient, and Mr Gillman's house was C.'s haven of safety, which he seldom left during the rest of his life. While he was at Calne he prepared for the press *Christabel* and *other Poems*. 1816, written nearly 20 years before, and other works followed at intervals, including *Sibylline Leaves* (a revised reprint of his poems with a few additions), *Lay Sermons*, and the *Biographia Literaria*. 1817. Fourteen literary lectures, delivered in 1818, were successful in every way, and a remarkable account is given by Mr Gillman of an extra one, delivered extemporarily, the subject, 'The Growth of the Individual Mind,' being given to the lecturer at the last moment. The discourse, says Mr Gillman, was 'brilliant, eloquent, and logically consecutive,' a wonderful achievement. Unfortunately few of his lectures have been preserved except in the shape of rough notes, but these and his *Literary Remains* prove him to have been one of the greatest poetical, and especially Shakespearian, critics. *Aids to Reflection* appeared in 1805, *Church and State* in 1830, but his finest prose work, *Confessions of an Inquiring Spirit*, was pub. posthumously in 1840.

He began life as a warm supporter of the revolution, and his first vol. of verse emphatically proclaimed his democratic enthusiasm. But disillusion soon came and, like his friend Wordsworth, he turned, politically, to Conservatism. With Wordsworth, however, a strong interest in concrete humanity outlived the chaos of his early hopes. C., however, while always interested in the general affairs of the nation, lacked Wordsworth's intense sympathy with individual men and women. His tendency was to live among abstractions, a tendency intensified by his application to metaphysics and theology. As a philosopher he founded no school, yet exercised a great energising and spiritualising influence on Eng. thought. As a poet he is *sui generis*. In his theory of poetry he stressed the aesthetic quality as the primary consideration, and regarding the language of poetry, he concurs with Wordsworth's remonstrance in behalf of truth and nature, though he entirely rejects his

special theories. C.'s *Ancient Mariner*, *Christabel*, and *Kubla Khan* stand by themselves, pictures from magic realms, lit with 'the light that never was on sea or land,' while the metrical theory on which *Christabel* is constructed was the beginning of a new era in Eng. poetry, helping perhaps more than any other single agent to break the fetters of 18th-century correctness and monotony. Heartily abused at first, it soon found disciples, among others Scott and Byron. C.'s prose style is brilliant and profound, but diffuse. Hazlitt has well characterised it in the following mischievous paragraph: 'One of his sentences winds its "forlorn way obscure" over the page like a patriarchal procession with camels laden, wreathed turbans, household wealth, the whole riches of the author's mind poured out upon the barren waste of his subject. The palm-tree spreads its sterile branches overhead, and the land of promise is seen in the distance.' As a conversationalist C. was unrivalled, fascinating all who met him. His personal appearance has been described by many of his friends, including Dorothy Wordsworth, De Quincey, and Southey, and mostly their descriptions agree. Southey says that the power of his eye, forehead, and brow was astonishing, but that nothing could be more imbecile than the rest of his face. C. himself says to Thelwall (in 1796): 'My face, unless when animated by immediate eloquence, expresses great sloth, and great, indeed, almost idiotic, good nature. 'Tis a mere carcass of a face, fat, flabby, and expressive chiefly of inexpression. Yet I am told that my eyes, eyebrows, and forehead are physiognomically good' (*Letters*, ed. E. H. Coleridge, No. 64). In 1797, Dorothy Wordsworth in describing him speaks of the plainness of his features, but adds: 'If you hear him speak for five minutes you think no more of them.' And even in his decrepitude Carlyle speaks of him as 'the most surprising talker extant in this world.' See J. D. Campbell, *Samuel Taylor Coleridge*, 1894; Sir A. T. Quiller-Couch, *Coleridge*, 1918; H. I. A. Fausset, *Samuel Taylor Coleridge*, 1926; J. L. Lowes, *The Road to Xanadu*, 1927; J. H. Muirhead, *Coleridge as Philosopher*, 1930; Sir E. K. Chambers, *Samuel Taylor Coleridge*, 1933; H. House, *Coleridge*, 1953.

Coleridge, Sara (1802-52), b. Greta Hall, near Keswick. A daughter of Samuel Taylor C., she lived under the care of Southey and in the frequent society of Wordsworth. She pub. (1821) an excellent trans. of Dobrizhoffer's Lat. *Account of the Achipones*, an equestrian people of Paraguay, and also trans. the *Memoirs of the Chevalier Bayard*, 1825. Her *Pretty Lessons in Verse for Good Children* appeared in 1834, and *Phantasmion*, an imaginative fairy-tale, in 1837. In 1843 her husband, Henry Nelson C., d. and she continued his task of editing and annotating her father's works. She left a son and a daughter who pub. *Memoir and Letters of Sara Coleridge*, 1873. See also E. L. Griggs, *Coleridge Fille*, 1940.

Coleridge-Taylor, Samuel (1875-1912),

musical composer of Anglo-African descent, *b.* London. His father was a native of Sierra Leone, his mother an Englishwoman, and he was brought up under Eng. influences. He won the composition scholarship at the Royal College of Music in 1893, and studied under Stanford till 1896. He organised a series of successful orchestral concerts at Croydon, and wrote for the Three Choirs festivals and the Birmingham and Leeds festivals. In 1898 his choral-orchestral *Hiawatha's Wedding Feast* was performed at a concert of the Royal College of Music. After this his reputation was estab. with the remainder of his trilogy, namely *The Death of Minnehaha*, 1899, and *Hiawatha's Departure*, 1900. Other works include *The Blind Girl of Castel-Cuillé* and *Meg Blane*; *A Tale of Old Japan*, 1911, a cantata; *The Atonement*, sacred cantata; works for orchestra, for chamber combinations; Negro melodies for piano; incidental music for plays; and songs.

Coles, Cowper Phipps (1819-70), naval architect and officer, who served at Sebastopol with distinction, 1854, becoming captain, 1856. He invented shot-proof rafts of floating batteries, and was keenly interested in the construction of turreted ships. His claim to be the originator of the *Monitor* type of ironclads must be yielded to Ericsson and others. C. was drowned in the capsizing of the *Captain* in a gale off Finisterre.

Colesburg: 1. Dist. of N. Cape Colony. 2. Also cap. of above, 57 m. from Middleburg, 142 m. from Bloemfontein, with 8 churches and synagogues. It is high, dry, and a health resort, and has sulphur springs. It was the scene of active operations in the Anglo-Boer war, 1899-1902. Pop.: white, 1064; Bantu, 1184; Coloureds, 1064.

Coleseed, *see* RAPE.

Coleshill, mkt tn and par. of Warwickshire, England, Sutton Coldfield div., 8 m. from Birmingham, on the R. Cole. Pop. 6000.

Colet, John (c. 1467-1519), priest and scholar, *b.* London, son of Sir Henry C., and educ. at Oxford. About 1493 he made a tour on the Continent, where he studied law and the humanities. In 1496 he returned to England, living for the next few years in Oxford, where he lectured on St Paul's epistles. C. became great friends with Erasmus (q.v.) and in 1503 he was made dean of St Paul's, and soon came to know Sir Thomas More (q.v.). In the same year he inherited a fortune from his father, and with some of this money he founded St Paul's School (1509). In 1514 he made a pilgrimage with Erasmus to Canterbury, and the next year preached in Westminster Abbey when Wolsey was installed as cardinal. He *d.* 4 years later, and was buried in St Paul's. It is rather for his learning and attitude to the advancement of knowledge than for his own writings that C. is remembered. The 'New Learning' or Humanism, as it was called to distinguish it from the old scholasticism, reached its zenith in the closing years of the 14th, and early years of the 16th, cents., its supreme

exponent, Erasmus, being the friend of the Eng. humanists, chief of whom were More, C., and Fisher. C., like More, was well grounded in Greek, and it is said to have been through his influence and that of More and Linacre that Erasmus applied himself to Greek. C. preached also against abuses in the Church, although he questioned no dogmas, being only anxious for reform from within the estab. framework of Catholicism. *See* life by Sir J. Marriott, 1933.

Colet, Louise (née Revoll) (1810-76), Fr. writer, *b.* Aix. In 1834 she married the musician, Hippolyte C. Her first vol. of poems, *Fièvres du Midi*, appeared in 1836 and attracted considerable attention. On sev. occasions her poems were crowned by the Fr. Academy. Mme C. was intimate with Cousin, de Musset, Villemain, and Flaubert. Among her poems are *Les Chants des vaincus*, 1840, *Charlotte Corday et Madame Roland*, 1842, *La Religieuse*, 1856. Her prose works include *La Jeunesse de Mirabeau*, 1841, *Lui, Roman contemporain* (biography disguised as fiction), 1859, *Les Derniers Abbés*, 1868. She also gained notoriety by being involved in various public controversies.

Colette, pseudonym of Sidonie Gabrielle Claudine Colette (Mme Henri de Jouvenel) (1873-1954), Fr. writer. Her earliest works include a series of stories of a semi-autobiographical character, entitled *Claudine à l'Ecole*, 1900, *Claudine à Paris*, 1901, *Claudine en ménage*, 1902, and *Claudine s'en va* (in collaboration with M. Willy, 1903). Among her novels, which reveal an exquisite sensitiveness, are *L'Ingénue libertine*, 1905, *La Retraite sentimentale*, 1907, *La Vagabonde*, 1910, *L'Entrée*, 1914, *Chéri*, 1920, *La Fin de Chéri*, 1926, and *La Châtelaine*, 1933. She has also written short stories, essays, and some plays. She was a member of the *Académie Goncourt* (1945), and Chevalier of the Legion of Honour. *See* M. Crosland, *Mme Colette*, 1953.

Colgate University, for men, was founded by Baptists in 1820 at Hamilton, New York, as Hamilton Literary and Theological Institution. It bore the name Madison Univ. from 1846 to 1890, when it assumed its present name, honouring a family that had long played an important part in it. The theological dept was merged in 1928 with the seminary at Rochester, New York, as Colgate-Rochester Divinity School. The library contained 216,000 vols. in 1956. Teaching staff, 127; students, 1300.

Colic, spasmodic, painful contractions of the muscle of the wall of the bowel or other hollow abdominal viscus. It is a state of exaggerated peristalsis (q.v.). *Renal C.*, C. of the pelvis of the kidney and of the ureter (q.v.). *Biliary C.*, C. of the gall bladder or bile ducts (q.v.). *Vesicular C.*, C. of the bladder.

Colligny, Gaspard de (1519-72), Fr. soldier, *b.* of noble family at Châtillon. He served with distinction in the campaign of Francis I and Henry II, and in 1552 was made admiral of France. In 1557 he was captured at St Quentin—which was besieged by the Spaniards—

and was imprisoned in the fortress of L'Écluse, but subsequently ransomed. It was at about this time that he became a Protestant. C. fought reluctantly against the Crown at Dreux, St Denis, Jarnac, and Montcontour, in most of which battles he was defeated. In 1570 peace was signed at St Germain, and C. returned to court, where he soon became a favourite of Charles IX. Catherine de' Medici, however, saw her own influence dwindling, and on 22 Aug. 1572 an unsuccessful attempt was made on C.'s life. He was then only slightly injured, but 2 days later, during the massacre of St Bartholomew, C. was murdered in his own house. See L. J. Delaborde, *Gaspard de Coligny, Admiral of France*, 1879-82.

Coligny, Odet de (c. 1517-71), Fr. Protestant leader, brother of Gaspard de C. (q.v.). He was created cardinal, 1533; Archbishop of Toulouse, 1534; and Bishop of Beauvais, 1535. He did not openly profess Protestant views till 1560, and even afterwards was still known as Le Cardinal de Châtillon. In 1561 he publicly renounced Catholicism, and was excommunicated by the Pope, 1563. C. was plenipotentiary of the Huguenots during the civil war of 1567-8, and went to England to escape from Catherine de' Medici, and to try to obtain Eng. help for the Protestant cause. He was poisoned, probably at her command, at Hampton Court, when intending to return to France, after the declaration of peace (St Germain, 1570).

Colima: 1. State of Mexico, bounded by Jalisco on the N., the Pacific Ocean on the SW., and Michoacan on the E. The surface is mostly mountainous. Among its products are coffee, sugar, maize, pulse, rice, tobacco, palm-oil, corn, cotton, and rich fruits. It exports much coffee, hides, and palm-leaf hats. There are salt deposits in the coast region, and ore deposits in the mts. Area 2010 sq. m.; pop. 112,300.

2. Cap. of above, 45 m. from Manzanillo, the chief port in the valley watered by C. R. It is a great commercial and agric. centre. Pop. 22,600. Also a volcano near by, 12,800 ft (in eruption in 1869), and a snow mt., 14,250 ft.

Colin, Alexander (1526-1612), Flem. sculptor, b. Malines. Ferdinand I commissioned him to help with the monument erected to Maximilian I at Innsbruck, and the greater part of the work on this tomb was done by him. C. held the post of sculptor to the emperor, and in the church where Maximilian's tomb is are those of the Archduke Ferdinand and Bishop Jean Nas, both the work of this sculptor.

Coliseum, see COLLOSSEUM.

Colitis, inflammation of the mucous membrane of the colon, which is that part of the large intestine extending from the caecum to the rectum.

Coll, is. in Argyll, Scotland, one of the Inner Hebrides on the W. coast of Mull, 10 m. from Ardnamurchan Point. Length 12 m., breadth 1-4 m. It has sev. small bays and a harbour at Arinagour. The is. has a wide reputation for its cheese. Pop. 210.

Colladon, Jean Daniel (1802-92), Swiss engineer, b. Geneva. He won the Grand Prix at the Academy of Science in Paris in 1827 with *Mémoire sur la compression des liquides et la vitesse du son dans l'eau*, and 2 years later received the professorship of mechanics at the School of Arts and Manufs. in that city. He invented a dynamometer which was adopted by the Brit. Admiralty, and developed the use of the energy stored in compressed air in tunnelling operations in 1852. His most important work is *Mémoires des savants étrangers*, 1838.

Collagen, main fibrous protein of animal connective tissues, skin, tendon, and bone, precursor of gelatine (q.v.).

Collapsus, see SHOCK.

Collapse, Pulmonary, or Apneumotosis, term used to signify that condition when a portion of a lung ceases to expand and contain air with inspiration. It may be caused in 2 ways, either, as in the case of an effusion of fluid in pleurisy, or air in the pleural space as in pneumothorax (q.v.), by pressure being exerted on the outside of the lung, or, as in the case of a blocking of the bronchial tube by a tumour or inflammatory exudate, by an obstruction preventing the access of air to the lung. When the C. is extensive or involves the whole lung, respiratory embarrassment is severe. Total C. of both lungs is fatal. Another name for C. is *atelectasis* and this term is often applied to a condition in which the lungs of a newborn baby fail to expand at birth.

Collatio, or Mosaicarum et Romanarum Legum Collatio, or Lex Dei, compilation comparing the law of Moses and Rom. law in 16 titles, probably dating from the 6th cent AD. Each title is headed thus by legal rules from the law of Moses, 'Moses dicit.' There follow, by way of comparison, rules of Rom. law from the 5 Rom. jurists, Papinian, Paulus, Gaius, Ulpian, and Modestinus (3rd cent. AD), and from the 3 compilations which preceded Justinian's *Corpus Juris Civilis* (6th cent. AD), *Gregorianus Codex*, *Hermogenianus Codex*, and *Theodosianus Codex* from the time of Constantine to that of Theodorius II, first pub. AD 438). The C. is valuable for its extracts from the above sources. It is printed in Schulting's *Jurisprudentia Velus Ante-Justiniana*, 1717. An ed. by Blume appeared in the Bonn ed. of the *Corpus Juris Ante-Justinianei*, and a separate ed. in 1833.

Collcutt, Thomas Edward (1840-1924), architect, b. Oxford; trained in London; president Royal Institute of British Architects, 1906-8. Designed the Imperial Institute, 1893; also the Palace Theatre, and extensions to the Savoy Hotel—all in London; Blackburn public library, 1872; Wakefield tn hall, 1880, etc.

Colle, Raffaellino dal, It. painter, b. Colle, near Borgo San Sepolcro, c. 1490. He was a pupil of Raphael and then of Giulio Romano. He assisted Raphael in the decoration of the Vatican. He was a minor but meritorious member of the Rom. school.

Colle Salvetti, It. tn in Tuscany (q.v.).

9 m. ENE. of Leghorn (q.v.). Pop. 10,000.

Colle val D'Elsa, It. tn in Tuscany (q.v.), on the Elsa, 12 m. NW. of Siena (q.v.). It is 2 parts, Colle Alto and Colle Basso, and has a medieval cathedral, other fine churches, and anct palaces. Paper and glass are manuf. Pop. (com.) 10,000.

Collect, brief prayer appointed as the prin. prayer in the first part of the Mass before the Epistle, and also in the Offices of the Church, and offered up for some special purpose or on some special day. The etymology of the word is uncertain, though it is evidently derived from Lat. *colligere*, to collect. The prayer collects or gathers up in a comprehensive form the petition of all the people assembled. Thus it was offered up before the whole congregation, *ad collectam*, and was distinguished from prayers offered up in the main part of the mass, *ad missam*. Some argue, however, that the prayer was so called because it collected or gave a brief paraphrase of the teaching of the epistle and gospel, which it immediately precedes. The form of the C. is very simple. It begins with an invocation to God, contains 1 single petition, with special reference to the day or event celebrated, and closes in praise to Jesus Christ. The C.s of the Common Prayer Book are trans., for the most part, of the C.s of the Lat. Missal, which were composed at a very early date. Many are derived from the sacramentaries of St. Leo (AD 440-61), of St. Gelasius (492-6), and of Pope Gregory (590-604). See F. Procter and W. H. Frere, *A New History of the Book of Common Prayer*, 1903.

Collective Bargaining. In the early days of trade unionism the outlook of the unions reflected both industrial aspirations and political ideas; but by about 1850 they were concentrating much more on the improvement of working conditions. The next stage was the estab. of some agreed relationship with employers' and employees' organisations. Conciliation Boards, with a form of procedure confined to the treatment of disputes, were set up in many industries; but with the development of industry the scope of this arrangement was widened and, by 1900, a number of the staple industries had adopted the practice of C. B. The term 'collective bargaining' is applied to those arrangements under which the wages and conditions of employment are settled by a bargain in the form of an agreement between employers or associations of employers and work-peoples' organisations; but in unorganised trades the individual workman accepts or refuses the terms offered by the employer without reference to anyone else's interests than his own. For many years collective agreements have played a most important part in the regulation of working conditions in Britain, embracing a great variety of matters including not only wage rates but also hours of work, piece-work arrangements, holidays, etc. The terms and conditions laid down in the

agreement are applied not only to members of trade unions but also to non-unionists. Trade agreements are also largely observed by employers who are not party to them. This system of C. B. includes also agreements regarding the procedure for settling questions as they arise, and in no other country has so much been achieved towards evolving machinery for the avoidance of strikes and lock-outs. The whole of this collective system rests on the principle of mutual consent. This acceptance is purely voluntary depending solely on the sense of moral obligation. Loyal acceptance has in fact been the rule in all the trades concerned. Certain steps have, however, been taken in the interests of the community to encourage joint voluntary machinery where such does not exist and to assist where necessary in the settlement of disputes. There are 2 main legislative measures: the Conciliation Act, 1896, which was passed as a result of the recommendations of a Royal Commission of 1891, and the Industrial Courts Act, 1919. In addition, however, much has been done through the conciliation officers of the Ministry of Labour to strengthen and support existing joint machinery and to promote new voluntary machinery as organisation developed in industry (for details see under **ARBITRATION** and **CONCILIATION IN INDUSTRY**). The first modification of the voluntary principle was made by the Trade Boards Act, 1909, which set up Trade Boards empowered to fix minimum wage rates. This Act was confined to certain unorganised trades where 'sweated' conditions obtained, but the Act was extended in operation in 1918 by the Trade Boards Act of that year. Again, during the First World War, the Munitions of War Act, 1915, made strikes and lock-outs illegal so far as munitions work was concerned, unless the dispute had been referred to the Board of Trade which dept. could, in general, enforce arbitration, though it was understood that arbitration was merely supplementary to the agreements in various industries. Generally speaking, however, as the war progressed, arbitration became the practice, and this war-time national arbitration gave encouragement to the regulation of wages on a national basis during and after the war. But despite the legal prohibition of stoppages of work and the acceptance of compulsory arbitration, there developed industrial unrest throughout the country which seems to have had its origin in the shop stewards' movement and the theory of industrial unionism, notably on the Clyde and in Sheffield. The essence of this theory was devolution of authority to the workshop and the estab. of workers' control therein on militant lines with the ultimate object of securing control of industry generally. As a result of the recommendations of the Whitley Committee's Report there was an extension of the trade board system and the development of statutory machinery for the prevention and settlement of industrial disputes. The Committee laid down as an over-riding consideration 'the advisability of a continuance, as far as

possible, of the present system whereby industries make their own agreements and settle their differences themselves,' and this is still the deciding factor of state policy in regard to intervention in industrial disputes (see WHITLEYISM or WHITLEY COUNCILS).

During the Second World War the emphasis on the voluntary principle was maintained as far as possible in the Conditions of Employment and National Arbitration Order, 1940. This order prohibited strikes or lock-outs unless the dispute had been reported to the Ministry of Labour and had not been referred by him for settlement, and it also provided for the estab. of a National Arbitration Tribunal for dealing with disputes while laying down that if suitable collective joint machinery exists, the minister would refer the dispute to that machinery for settlement and that the settlement should have the legal force of an arbitration award.

The voluntary joint machinery for the regulation of terms and conditions of employment has evolved according to the varying needs and circumstances of the different trades and industries, but the better the industrial organisation the more effective and simple is the machinery of C. B. In the early days of C. B. negotiation was generally confined to localities, but in most industries the scope of the machinery has been continually extended until national negotiations have largely replaced local interchanges on industrial questions. National negotiating machinery, however, varies considerably in form and in degree of authority over the local machinery and, moreover, the trend towards national negotiation does not necessarily mean that a national uniformity has been estab. in regard to wage rates and conditions. Variety in the methods of C. B. as well as in wages structure is most to be found in industries where the principle of joint negotiation between organisations was well estab. before 1918. There is greater uniformity in industries where joint organisation is a more recent development and has been founded on the basis of the Joint Industrial Councils recommended by the Whitley Committee. C. B. between employers and workers' organisations may overstandardise the remuneration of workpeople who do work of varying importance and who are themselves of varying degrees of conscientiousness and ability. Particularly in a state of full employment, in which the bargaining power of workers' organisations is strong, C. B. may produce excessively high rates of pay (or other favourable conditions) for workers who, in the public interest, should be employed elsewhere. Particularly also in state-controlled industries or services, such as railways, C. B. may produce agreement that satisfies the workpeople at the expense of the user of the services and the taxpayer. See INDUSTRIAL RELATIONS, WHITLEYISM. See also *Industrial Relations Handbook*, H.M.S.O.; W. H. Hutt, *The Theory of Collective Bargaining*, 1930; *The Theory*

of Idle Resources, 1939; A. Beacham, *Economics of Industrial Organisations*, 1948.

Collective Security, concept which grew out of the Geneva conferences on disarmament after the First World War (see DISARMAMENT) and acquired an added emphasis during the Italo-Ethiopian war. Literally C. S. meant that, under the covenant of the League of Nations (see COVENANT OF THE LEAGUE OF NATIONS), the member states of the League should together guarantee the security of each individual member. When Mussolini threatened Abyssinia, a special committee on C. S. was formed with a view to curbing not only his aggressive designs but also to check the menace implicit in Ger. rearmament. Fundamental difficulties which had, however, previously arisen over the concept culminated in the fiasco of the League's vain efforts to prevent Italy from making war upon Abyssinia. For it now became evident that, even if the League could ensure resistance to a war of territorial aggression—and experience in 1939–40 was to show that it could not—it could not compel nations to compromise on issues which they felt to be vital to their national interests, and, generally speaking, no other issues really mattered. A further effort to construct a new system of C. S. through a series of multilateral politico-military alliances, all aimed against Hitler's policy of naked aggression, proved equally futile. On the constitution, functions, and powers of the Security Council of U.N.O., which has replaced the machinery of the covenant of the League, see UNITED NATIONS CHARTER.

Collectivisation of Agriculture in Soviet Russia, a process by which individual peasant holdings were fused into collective farms (see KOLKHOZ). The policy of C. of A. was embarked upon by the Communist party for a number of ideological, political, and economic reasons; the operation itself was described by Stalin as a 'revolution from above.' The collectivisation drive began in 1929 and encountered stiff opposition from the peasants, ranging from refusal to join the *kolkhoz* to uprisings, some of them extensive and protracted (e.g. in the Altay region of Siberia). The opposition was ascribed by Communists to the influence of the *kulaks* (see KULAK), and was overcome by combined administrative (confiscation of property, banishment), military, and economic measures (including the artificial famine of 1932–3). Seventy-one per cent of all peasant holdings were collectivised by 1934, and 93·5 per cent by 1938; instead of 26 million individual holdings (1929) there were 235,000 *kolkhozes* in 1937. The C. of A. finally estab. the power of the Communist party in the countryside and integrated agriculture with the rest of the socialised economy, but the cost in terms of human suffering and material losses was extremely high. The number of peasant households fell by 7 million to 19 million in 1937. More than a half of all horses (18·5 million) and cattle (36·7 million), and an even higher proportion of other livestock, disappeared

1928-33. Agric. output declined by 30 per cent and did not recover till 1938. Millions of peasants died of starvation or were deported and sent to forced labour camps. See also M.T.S. and NEO-POPULISM. See W. H. Chamberlin, *Russia's Iron Age*, Boston, 1934; N. de Basily, *Russia Under Soviet Rule*, London, 1938; A. Baykov, *The Development of the Soviet Economic System*, Cambridge, 1946; N. Jasny, *The Socialised Agriculture of the U.S.S.R.*, Stanford, 1949; D. Mitran, *Marx Against the Peasant*, London, 1951.

Collectivism, word of modern origin, first used apparently by Bakunin to express the distinction between his tenets and those of Karl Marx, has since come to convey the same idea as Socialism, and is the theory that industry should be carried on with collective capital under the control of the community. See ANARCHISM; SOCIALISM; and INDIVIDUALISM; on the collectivisation of farms in Russia see COLLECTIVISATION OF AGRICULTURE.

College, in Rom. law, an association of persons for a specific purpose, a body of colleagues. The C. corresponded roughly with our corporation; it had to be incorporated by some public authority, springing from either senate or emperor. Collegia might exist for purposes of trade (cf. guilds), for religious purposes (e.g. C.s of augurs, pontifices, etc.), or for political purposes (e.g. *tribunorum plebis collegia*). By Rom. law a C. must have at least 3 members. With us a C. is an incorporation or society of persons joined together generally for educational, literary, or scientific purposes, and frequently possessing peculiar privileges. Such are the C.s of Oxford and Cambridge (see UNIVERSITIES), C. of Physicians, C. of Surgeons, Honalds' C., etc. Educational C.s seem to have grown out of the voluntary association of teachers and students at the univ. They seem to have been more numerous and flourishing than anything we know now; we hear of 300 halls or societies at Oxford, and 30,000 students. Men of wealth and culture, especially the political bishops and chancellors of England, obtained charters from the Crown for the incorporation of societies of scholars, and these gradually became the places of abode for students attending the univ. Later the univ. and the C. became co-extensive; every member of the univ. had to belong to some C. or hall, and was obliged to matriculate in the univ. The corporation consists of a head or master, fellows, and scholars. The governing body is the head and fellows. All eccles. or educational corporations have a visitor, whose duty it is to see that the founder's statutes are obeyed, and to decide disputed cases, provided they do not come under the common laws of the country or have to do with trusts attached to the C. The visitorship usually resides in the founder and his heirs or in the Crown. The fellowships, scholarships, etc., of C.s are subject to various restrictions, which are gradually being abolished. Some of the public schools are C.s, and many secondary schools are so called. In Scotland and in the U.S.A. the C. is not

distinguished from the univ., and we hear of C.s granting degrees. Many teacher training institutions throughout the world are called C.s. In the U.S.A. teachers' C.s award degrees.

Collège de France, founded in Paris by Francis I, about 1530, in opposition to the scholasticism of the univs. Erasmus was asked to be its principal, but he refused. It was first known as the Collège de Trois Langues, because originally the teaching embraced only 3 languages—Greek, Hebrew, and Latin. The univ. of Paris has frequently tried to obtain control, but without success. Until the time of the revolution it was regarded as a royal college. It is now under the control of the minister of public instruction, but is autonomous. There are no fees, no examinations, and no degrees or diplomas. Scientific research work is particularly encouraged. Its famous profs. have numbered Rollin, Saint-Hilaire, Laboulaye, and Gaston. At the present day there are over 40 chairs, and every branch of learning is taught. See C. P. Goujet, *Le Collège royal de France*, 1758, and Bouchon-Brandely, *Le Collège de France*, 1873.

College of General Practitioners. Founded in 1952 to help and encourage general medical practitioners in Great Britain to maintain a high standard of professional efficiency. It assists in the training of final-year students in general practice, and works in close collaboration with the Brit. Postgraduate Medical Federation to promote the further education of the general practitioner. The 22 faculties of the college in London and the provs., and the 5 others in the Commonwealth, arrange courses, symposia, lectures, ward-rounds, etc., for general practitioners. Another aim is the encouragement of research in problems of general practice. It is governed by a council; its constitution provides for members and associates. At present the college is administered from 14 Black Friars Lane, London, E.C.4; it is planned to erect a new building for the college in Lincoln's Inn Fields, London, W.C.2, by 1962.

College of the Sea, see SEAFARERS' EDUCATION SERVICE.

Colleges, Training, see TRAINING COLLEGES.

Collegiate Church (from Lat. *collegium*, assembly), one to which is attached a body of clergy, differing from a cathedral in that it is not the seat of a bishop. There were many on the Continent before the Reformation, the most famous one being that of Aix-la-Chapelle. After the Reformation nearly all of those in England were suppressed by Edward VI. Ripon and Manchester have since been constituted cathedrals for new dioceses. In Scotland the term is applied to a church which has 2 incumbents in the par.

Collembola, name given by Sir John Lubbock to the minute wingless insects known as spring-tails. Their chief characteristic is the power possessed by most of them of taking sudden leaps when alarmed, made possible by a curious apparatus on

the under part of the body. See Sir J. Lubbock, *Monograph of the Collembola and Thysanura*, 1873.

Colleoni, or Coleone, Bartolommeo (1400-1475), It. soldier, b. Solza, near Bergamo. In the war between the Milanese and Venetians his services were in great request by either side, and he fought for both. In 1446 he was imprisoned as a spy by Philip Visconti, Duke of Milan. In 1451 he definitely joined the Venetian army and became generalissimo of the Venetian state, when he showed his brilliant military talents. Near the church of SS. Giovanni e Paolo in Venice there stands an equestrian statue to his memory, executed by Andrea del Verrochio.

Colles, Abraham (1773-1843), Irish surgeon, b. Milmount, near Kilkenny. He qualified M.D. at Edinburgh in 1797. He was prof. of anatomy and surgery at the College of Surgeons, Dublin, 1804-36, and played an important part in establishing the reputation of the Irish school. His description (1814) of fracture of the carpal end of the radius led it to be called C.'s fracture. In his *Practical Observations on the Venereal Disease*, 1837, he stated that a child affected with congenital syphilis whose mother shows no signs of the disease will not infect her—a statement now known as C.'s law.

Colles, Henry Cope (1879-1943), musical critic; educ. at Royal College of Music and Worcester College, Oxford. He became assistant music critic to *The Times* in 1906, and chief critic in 1911. Wrote a number of valuable books on music and ed. the third and fourth eds. of Grove's *Dictionary of Music*.

Collesano, tn in Sicily (q.v.), 35 m. ESE. of Palermo (q.v.). Jasper and agate are quarried. Pop. 8000.

Collett, Jakobine Camilla (née Wergeland) (1813-95), Norwegian novelist, sister of the poet Henrik Wergeland. She was the chief exponent in Norway of the emancipation of women, and her writings deal largely with the suppression of a woman's personality in married life. Her novels give a realistic picture of Norwegian domestic life. Her first, *Amtmandens Døttre*, 1885, is perhaps the best. Others are *Fortællinger*, 1881, *I de lange Nætter*, 1863, *Sidste Blad*, 1868-72, and *Mod Strømmen*, 1879, 1885. See A. Ben-terud, C. Collett, *En skjebne og et livsverk*, 1947.

Colletta, Pietro (1775-1831), It. statesman and historian, b. Naples. He entered the Neapolitan army in 1796, and later served with distinction in the army of Joseph Bonaparte. He was minister of war in the short-lived constitutional gov. of 1820, was subsequently imprisoned, but released, 1823. His great historical work, *Storia del Reame di Napoli dal 1734 sino al 1825*, 1834, was trans. into English in 1853 by S. Horner.

Colley, Richard, see WELLESLEY, MARQUESS.

Colli Euganei, see EUGANEAN HILLS.

Collie, tn in coal-fields, 122 m. from Perth, W. Australia. Pop. 8668.

Collie, sheep-dog used to protect and

control flocks. The Scottish C. is one of the most popular breeds, on account of the affectionate faithfulness it exhibits towards its owner. Renowned for its sagacity and intelligence, and with a snappy temper, it was formerly used chiefly in Scotland and N. England purely as a sheep-dog. During the middle of the last cent., and until the 1920's, it was popular as a domestic companion, and was seen in tns as frequently as on the mt side. Its popularity as a pet or show dog, however, has declined in recent years. There are 2 kinds of Scottish C.s. rough and smooth haired. The chief points to be looked for

T. Fall

ROUGH-COATED COLLIE

are a long head with a sharp nose; ears small, and folded back at the tips when in repose; eyes bright and dark, set obliquely somewhat close together; fore-legs straight; hocks bent; feet strong and round. The rough-coated variety should have a very thick, soft under-coat, hanging from which a long and wiry outercoat; a full mane and deep frill round the neck; fore-legs a little feathered; hind-legs smooth below the hocks; a long and bushy tail. The smooth-coated C. has no feathering on tail, ears, and legs; its coat is flat but thick. The average height for dogs is 22 to 24 in., for bitches, 21 in.; the average weight for dogs is from 50 to 65 lb., for bitches from 40 to 50 lb. The colour varies considerably, from black and tan, tan and white, sable and white, to pure white. The Welsh bob-tailed C. has a long, shaggy, blue-grey coat, and stands 25 in. high. Its tail is cropped when young. C.s are often crossed with black-and-tan setters.

Collier, Arthur (1680-1732), metaphysician, who wrote *Clavis Universalis*, or *A New Inquiry after Truth, being a demonstration of the Non-Existence and Impossibility of the External World*, 1713; *A Specimen of True Philosophy*, 1730, and *Logology, or a Treatise on the Logos*, 1732.

Collier, Sir George (1738-95), vice-admiral, b. London. He entered the navy in 1751, and in 10 years was promoted to the rank of commander. He was appointed senior officer at Halifax, Nova Scotia (1776-8), and, when commanding the *Rainbow*, captured the Amer. frigate, the *Hancock* (1777). In 1797 he relieved

Penobscot and did much damage to the Amer. ships. He took part in the relief of Gibraltar, when he was successful in capturing the Sp. frigate, the *Leocadia* (1811).

Collier, Jeremy (1650-1726), divine, b. Stow-cum-Quy, Cambs, educ. at Caius College, Cambridge, and took holy orders in 1677. On leaving college he became rector of Ampton in Suffolk, and afterwards lecturer at Gray's Inn and preacher of the Rolls. He was an extreme high churchman, and at the revolution of 1688 refused to take the oaths to gov. For writing a pamphlet in defence of the de-throned monarch he was committed to prison, and again in 1692 for a series of pamphlets against William. In 1696 he pronounced absolutism without confession on the scaffold at Tyburn to Friend and Parkyn, executed for plotting the murder of the king. For this he was outlawed, and he remained under the ban for the rest of his life. He now gave himself up principally to literary work. He issued essays upon many moral, religious, and political subjects, a vol. of practical discourses, and *An Ecclesiastical History of Great Britain, chiefly of England, 1708-14*. His famous treatise, *A Short View of the Profaneness and Immorality of the English Stage*, 1698, roused against him the violent opposition of the theatrical world, and led him into a long and triumphant controversy with Congreve and Vanbrugh.

Collier, John (1708-86), poet and painter, b. Urmston, near Manchester. In early life he was apprenticed to a Dutch weaver, but in 1729 obtained a position in a free school at Millnrow, near Rochdale, which he held till his death. He excelled in caricature-drawing and in rhyming satire. Under the name of 'Tim Bobbin,' he pub. *The Blackbird*, 1739, *View of the Lancashire Dialect*, 1748, *Truth in a Mask*, 1757, *The Fortune-Teller*, 1771, 2 skits on John Whitaker's *History of Manchester*, in collaboration with Col. Townley, 1771, 1773, and a vol. of 26 humorous engravings, with rhyming descriptions, entitled *The Human Passions delineated*, 1772-3. See life by H. Fishwick, prefaced to his works, 1895.

Collier, John (1850-1934), painter, b. London. He was the second son of Sir Robert Porret C., afterwards Lord Monks-well, and was educ. at Eton and Heidelberg. He studied art at the Slade School and at Paris and Munich, and had some hints from Alma-Tadema and Millais. He exhibited at the Academy from 1877, and obtained considerable fame and popularity through his 'story-telling' pictures—e.g.: 'The Last Voyage of Henry Hudson,' 1881; 'A Glass of Wine with Caesar Borgia,' 1893; 'Urban VI' (under the torture-chamber window), 1896; 'A Confession,' 1902; 'The Prodigal Daughter,' 1903; 'Mariage de Convenience,' 1907; 'A Fallen Idol,' 1913. But his best work is in portraiture—e.g.: Rudyard Kipling, 1891; Prof. Huxley, 1891; Prof. Burdon Sanderson, 1894; The Duke of York (i.e. George V), 1901; Prof. E. Ray Lankester, 1904; Lord

Alverstone, 1912. He pub. works on the art of painting, including *A Manual of Oil Painting*, 1903, and *The Art of Portrait Painting*, 1905.

Collier, John Payne (1789-1883), Shakespearean critic, b. London. He was called to the Bar in 1829. His first pub. *The Poetical Decameron*, appeared in 1820; in 1825-7 he prepared a new ed. of Dodsley's *Old Plays*, to which he added 6 which had not hitherto been in print. Henceforward he devoted his life to the study of Elizabethan literature, but gave most of his time to the plays of Shakespeare. He issued *The History of English Dramatic Poetry to the Time of Shakespeare*, and *Annals of the Stage to the Restoration*, 1831; *New Facts; New Particulars; and Further Particulars on Shakespeare*, in 3 vols., 1835-9; an ed. of the poet in 8 vols., 1842-1844; and *Memoirs of Actors in the Plays of Shakespeare*, 1846. C. was one of the founders of the Shakespeare and Camden Societies, for which he ed. many old texts. In 1852 he pub. *Notes and Emendations to the Text of Shakespeare's Plays*, which caused a great sensation among Eng. and Ger. scholars. He possessed a copy of the 1632 folio, since known as the Perkins folio, because on it is inscribed 'Tho. Perkins his Booke.' C. asserted that the notes written in the margin of his folio dated from the middle of the 17th cent., and adopted them as emendations of the text. It was afterwards proved that the marginal notes were forgeries. These and other forgeries of his are carefully enumerated in Sir Sidney Lee's *Life of Shakespeare* (appendix 1). C. also wrote a *Bibliographical and Critical Account of the Rarest Books in the English Language*, 1865, *An Old Man's Diary, Forty Years Ago, 1871-2*, and ed. 17th- and 18th-cent. reprints, and the works of Thomas Heywood and Edmund Spenser. See H. B. Wheatley, *Notes on the Life of John Payne Collier*, 1884.

Collier, Robert Porrett, see MONKSWELL. 'Collier's,' popular illustrated Amer. magazine, issued fortnightly, featuring articles and fiction, which was pub. at New York from 1888 until 4 Jan. 1957.

Colliery, see COAL MINING and COAL SUPPLIES.

Collimation, adjustment of a telescope in such a manner that the line of sight (optical axis) is exactly perpendicular to the axis of movement. One common method of obtaining C. is by adjusting the telescope in its ordinary position, and when it is reversed in the bearings the angular discrepancy is noted, one-half of which gives the error of collimation. A collimator is an auxiliary telescope used to detect and correct errors in C.

Collings, Jesse (1831-1920), politician, b. Devon, was until 1879 head of the firm of Collings & Wallis, merchants, Birmingham. He became Liberal M.P. for Ipswich, 1880. It was C.'s Small Holdings amendment to the Address—an amendment involving the Radical scheme for 'three acres and a cow,' which secured in 1886 the downfall of Lord Salisbury's Ministry. Besides founding the Rural Labourers' League, and the National

Education League he played an active part in the municipal life of Birmingham.

Collingswood, bor. SE. of Camden, New Jersey, U.S.A., a residential tn. It manufs. leather products and thermometers. It was settled in 1862 by Quakers, and incorporated in 1885. Pop. 15,800.

Collingwood, Cuthbert, Admiral Lord (1750-1810), b. Newcastle. He went to sea when 11 years old, became lieutenant in 1774, was appointed commander of the *Badger* in 1779, and soon after post-captain of the *Hinchinbrook*. He served under his friend Lord Nelson in the Sp. main in 1780, and again in the W. Indies in 1783-6. In 1793 he was captain of Rear-Adm. Bowyer's flagship, the *Prince*. He was actively engaged under Howe at the great battle of 1 June 1794, and under Jervis off Cape St Vincent on 14 Feb. 1797. His extraordinary valour and judgment in these 2 engagements caused him to be held in great honour by the whole fleet. In 1799 he was made vice-admiral, and from 1803 he was constantly on active service. At Trafalgar he was second in command, his vessel, the *Royal Sovereign*, was the first engaged, and to him much of the honour of the victory was due. On Nelson's death he took supreme command of the fleet and was raised to the peerage. For 3 years his fleet maintained a blockade of Cadiz, the Straits of Gibraltar, and the adjoining coast. To the end of his noble life he remained, although worn out, at his post, his country refusing to release him.

Collingwood: 1. City in Bourke co., Victoria, Australia, situated on the R. Yarra-Yarra, and forming a NE. suburb of Melbourne. Pop. 35,000.

2. Lake port of Ontario, Canada, situated in Simcoe co., on the S. shore of the Georgian Bay, Lake Huron, 72 m. NW. of Toronto. It is a terminus for 2 lines of steamers from Huron to Lake Superior ports, and possesses a large dry-dock and shipyard. An important trade in grain and lumber is carried on, and there are numerous factories. Pop. 7646.

Collins, Arthur Pelham (1863-1932), theatrical manager, b. London, son of H. H. C., a city architect. Educ. at City of London School, and in Hanover. In 1881 he was apprenticed to Henry Emden, scenic artist at Drury Lane Theatre. He became stage-manager, and produced the dramas and pantomimes there, 1887-96. On the death of Sir Augustus Harris he obtained lease of the theatre, and became managing director of the limited company formed to work it. He produced all the dramas and pantomimes, 1897-1924.

Collins, Charles Allston (1828-73), painter and author, second son of Wm C. painter (q.v.). He married Kate, the younger daughter of the novelist Dickens, in 1860. In early life he showed much talent in his painting on pre-Raphaelite principles. In 1860 he pub. *The Eye-witness*. In 1862 *A Cruise on Wheels*, and various other works.

Collins, Cuthbert Dale (1897-), Australian novelist, b. Sydney. At the age of 14 he was general writer for a suburban paper

and later became dramatic critic of the *Sydney Bulletin*. Joining in a motor-yacht voyage round the world he wrote it up in *Sea-Tracks of the Speejacks*, 1923. He followed this with a series of novels, including *The Haven*, 1925, *Idolater*, 1929, and *The Mutiny of Madam Yes*, 1934. In the Second World War he was a press censor. After it he pub. *Winds of Chance*, 1947, *The Happy Emigrants*, 1948, and an autobiography, *Bright Vista*, 1946.

Collins, John (1625-83), mathematician, son of a nonconformist divine, b. near Oxford and apprenticed to a bookseller there. He obtained a clerkship in the employment of John Marr, clerk of the kitchen to the Prince of Wales, where his immediate employer taught him mathematics. The outbreak of the civil war drove him out of the country in the service of the Venetian rep. Later he set up in London as a teacher, writing sev. works on merchants' accounts, the use of quadrants, geometrical dialling and mariners' plain scales. After the Restoration he was appointed successively accountant to the excise, accountant in chancery, and secretary to the council of plantations. He had a large family by one of the daughters of Wm Austen, head cook to Charles II and his means of subsistence became precarious; he d. in 1683 of asthma and consumption. An enlarged ed. of his *Doctrine of Decimal Arithmetick* had occupied his attention a year before his death. His *Arithmetick in whole Numbers and Fractions, both Vulgar and Decimal* was pub. by Thomas Plant in 1688. For his zeal in collecting and diffusing scientific information he was styled the 'English Mersenne' (q.v.).

Collins, John (1742-1808), actor and writer; he was a staymaker, but took to the stage, in which he was fairly successful. He pub. *Scriptserapologia*, 1804, a book of verses. He is worthy of mention for the little piece, *To-morrow*, beginning 'In the downhill of life when I find I'm declining,' characterised by Palgrave as 'a truly noble poem.'

Collins, John Churton (1848-1908), literary critic, b. Bourton-on-the-Water, Glos. Educ. at King Edward's School, Birmingham, and Oxford, for many years he was a prominent univ. extension lecturer, and contributed regularly to the prin. reviews. His first book was a study of Sir Joshua Reynolds (1874) and later works included *Bolingbroke, a Historical Study: and Voltaire in England*, 1886, *The Study of English Literature*, 1891, *Illustrations of Tennyson*, 1891, *Jonathan Swift*, 1893, *Ephemeris Critica*, 1901, and *Studies in Shakespeare*, 1904. In 1901 he ed. *Dryden's Satires*, and he also pub. eds. of *Cyril Tournier's Plays and Poems*, 1874, etc. See L. C. Collins, *Life and Memoirs of John Churton Collins*, 1912.

Collins, Michael (1890-1922), Irish revolutionary general, b. Woodfield, Clonsilla, co. Cork. He was the youngest son of a family of 8 of a farmer, John C., whose wife was 40 years his junior. He was educ. at a national school, and was employed in London in the post office and

afterwards in an accountant's office. In Easter week, 1916, he took part in the seizure of the Dublin G.P.O. (see SINN FEIN); after the failure of the 'rising' he was imprisoned in Stafford jail and in Frongoch camp, Merioneth, from which he was released before Christmas, 1916. In 1918 he was imprisoned in Sligo jail for sedition; in the same year he was elected parliamentary representative for co. Cork, and took his seat in the republican Dail Eireann. He assisted the escape of Eamon De Valera (q.v.) from Lincoln jail in 1919. C. was minister for finance in the gov. set up by the republicans, and also head of the intelligence dept. of the revolutionary army. By 1920 a reward of £10,000 was offered for his arrest, but he was noted for the fearlessness with which he went about and evaded capture. It was chiefly through the influence of C. that the Brit. treaty terms, which led to the setting up of the Irish Free State, were accepted by Dail Eireann. On the death of Arthur Griffith (q.v.) in 1922 C. became head of the Irish Gov. He entered into discussions with the N. Irish Unionists while at the same time fighting the republican irreconcilables in the Free State. He was ambushed by republicans and shot dead while motorcycling from Skibbereen to Cork on 22 Aug. 1922.

Collins, Mortimer (1827-76), novelist, b. Plymouth. For a time he taught mathematics in Guernsey. He settled in Berks to adopt a literary life, writing chiefly for periodicals, and also wrote occasional and humorous verse. His chief novels are *Sweet Anne Page*, 1868, *Two Plunges for a Pearl*, 1872, *Mr Carrington*, 1873, under the pseudonym of 'Robert Turner Cotton,' and *A Fight with Fortune*, 1876.

'**Collins, Tom**' (Joseph Furphy) (1843-1912), Australian novelist, b. Yarra Glen, Victoria. His parents were sturdy settlers of N. Irish stock who valued books and education. Taught first by his mother, he later attended Kyneton State School; he had a scholarly mind and read widely. By turns he was farm hand, prospector, engine expert, road contractor, and bullock driver. In his middle forties, he became a clerk in his brother's foundry at Shepparton where he began to write for the *Sydney Bulletin*, and to work on his novel *Such is Life*. This was finished in 1897 and pub. by the *Bulletin* in 1903 after a large section had been taken out. The discarded chapters, entitled *Rigby's Romance*, appeared serially in the *Broken Hill Barrier Truth*, 1905-6, and were pub. posthumously in revised form as a separate book in 1921. *Such is Life* is a novel about the human comedy as Furphy saw it when driving his bullock team up and down the country. Furphy writes with originality, vigour, and dry humour, his style is discursive, and he deliberately avoids any suggestion of conventional plot. In this book, the 2 streams of Australian writing, the Eng. literary tradition and the folklore of the Australian outback, enrich each other. *Such is Life* is an Australian classic which takes its place beside the great picaresque novels.

See Miles Franklin in association with Kate Baker, *Joseph Furphy*, 1944. See also AUSTRALIAN LITERATURE.

Collins, William (1721-59), poet, b. Chichester, son of a prosperous hatter. He became a scholar of Winchester, and there formed a close friendship with Joseph Warton. In 1740 he went to Oxford, matriculating from Queen's College, shortly before Warton went to Oriel, and the following year he obtained a demyship at Magdalen. He graduated in 1743 and then went to London in pursuit of a literary career. There he endured much privation and even suffered imprisonment for debt. Johnson befriended him, and he was intimate with Thomson. In 1749 he was relieved by an uncle's legacy, but it was too late, for he was too broken in health and spirits, and from despondency he fell into insanity and d. a physical and mental wreck at Chichester, in the home of his sister. The beginning of his melancholy began with disappointment over the reception of his poems, especially his *Odes*. Posterity has signally reversed the judgment of his contemporaries and has placed him at the head of the lyrists of his age. He did not write much, but all that he wrote is the precious outcome of a warm heart allied to a pure sense of beauty. His first pub. work was a small vol. of poems, including the *Persian* (afterwards called *Oriental*) *Eclogues*, 1742; but his prin. work was his *Odes*, 1746 (dated 1747), including those to Evening and The Passions, which will live as long as the language. His other works are *Verses addressed to Sir Thomas Hammer*, 1743, *Ode on the Death of Thomson*, 1749, *Dirge in Cymbeline*, 1749, and the unfinished *Superstitions of the Scottish Highlands* (written 1749; printed 1788, after discovery by Dr Alexander Carlyle). In poetical taste C. was in full sympathy with Warton, but so far outshines him that it may be assumed that Warton's critical work owes everything to C. and, if that be so, C. was the real innovator in literary criticism and the chief herald of the Romantic school. C.'s poetry is distinguished by high imaginative quality, and by exquisitely felicitous descriptive phrases. C.'s revival of obsolete words such as 'Jorn,' 'westering,' and others came naturally to him, were a genuine part of the dialect in which C. thought, and were a necessary revival if the language was to regain its power of true poetic expression. Historically, perhaps, the most remarkable of all C.'s poems is the *Ode on the Superstitions of the Highlands*, a most important poem in the early Romantic movement and the return of imagination to Eng. poetry. See memoirs prefixed to A. Dyce's ed. of the *Poetical Works*, 1827; M. Thomas's *Aldine ed.*, 1858, 1894; H. W. Garrod, *Collins*, 1928.

Collins, William (1788-1847), landscape and figure painter, b. London. In 1807 he became a student at the Royal Academy, and in 1820 was elected R.A. He exhibited 121 pictures in 40 years at the Royal Academy, mainly incidents of everyday life with landscapes. 'As

Happy as a King' (Tate Gallery) is representative.

Collins, William Wilde (1824-89), novelist, b. London. He was the son of a well-known artist who named him after Sir David Wilde, the R.A. Educ. privately, he was entered at Lincoln's Inn and called to the Bar in 1851. In 1848 he wrote a life of his father, and in 1850 pub. his first novel, *Antonina*. In 1851 he formed a friendship with Charles Dickens, with whom he collaborated in a number of works. He is best remembered for *The Woman in White*, 1860, a mystery story, and *The Moonstone*, 1868, which T. S. Elliot once termed 'the first, the longest, and the best of detective novels.' C.'s power to create and maintain suspense places him with Poe as a pioneer of the thriller. Others of his novels are *Hide and Seek*, 1854, *No Name*, 1862, and *Armada*, 1866. His plays include *A Message from the Sea*, 1861, written with Dickens, and *The New Magdalen*, 1873. See life by K. Robinson, 1951.

Collinson, Sir Richard (1811-83), admiral, who sailed in the *Enterprise* for the relief of Sir John Franklin. He was not successful, but in spite of this fact his addition to geographical knowledge was considerable. See his *Journal of H.M.S. 'Enterprise', 1850-5*, 1889.

Collo, It. in Lombardy (q.v.), 19 m. NNE. of Brescia (q.v.). There are iron mines in the vicinity. Pop. 3000.

Collioure, Fr. fishing-port in the dept. of Pyrénées-Orientales, on the Mediterranean. It is a popular bathing resort. Pop. 2400.

Collision of Ships. Owing to the danger of collision at sea, 'rules of the road' covering the conduct of neighbouring vessels, have been adopted by all civilised nations. The most important are as follows: Any vessel overtaking another must keep out of its way. A steamship must always keep out of the way of a sailing vessel (except when being overtaken by the sailing vessel). In the case of 2 sailing vessels, the one running free keeps out of the way of the one close hauled; or, if both are close hauled, the one on the port tack keeps out of the way of the one on the starboard tack; the one with the wind free on the port side keeps out of the way of the one with the wind free on the starboard side, or, if both have the wind free on the same side, the one to windward keeps out of the way of the one to leeward, while the one with the wind aft keeps out of the way of the other. In the case of 2 steamships, when meeting end on both turn to starboard; when crossing, the one having the other on its starboard side keeps out of the way of the other. An elaborate system of lights and signals exists to minimise danger of collision at night, and sirens and hooters are employed in fogs, when the chances of collision are greatly increased. The increasing use of radar (q.v.) navigational guides on vessels and in harbours is permitting the attainment of a high degree of safety under such conditions. Of recent years the lane system, of Amer. origin, by which each line of vessels is required to

keep to a definite track, has come into vogue, particularly among the transatlantic steamers. Notwithstanding all the precautions, however, the proportion of casualties due to collision, especially in the fairways leading to crowded harbours, etc., is high. With regard to the legal aspect of collisions, when the fault cannot be brought home to either party, the cost of the damage done is usually shared between them. When the collision is clearly the fault of one party, that one bears its own loss, and pays for the damage done to the other. Collision comes within the scope of marine insurance.

Colloidon, thick colourless liquid, obtained by dissolving pyroxylin in a mixture of ether and alcohol. This liquid evaporates quickly on exposure to air, leaving a film of pyroxylin, which is colourless and rough. It is used in photography (q.v.). There are sev. forms of C., each with its particular use in medicine. If a little castor oil and Canada balsam be added to the solution, a flexile or flexible C. is obtained which is used for protecting wounds from the air, etc. Again, salicylic acid and Indian hemp added to the ordinary C. give salicylic C., which is used as a corn cure.

Colloids, name originally given by Thomas Graham in the middle of the 19th cent. to certain substances which, in apparent solution, do not possess the power of passing through a parchment membrane. Glue is a typical example; hence the name colloid (Gk. *kolla*, glue). Other C. are gum, starch, caramel, and white of egg, as well as protoplasm, the actual seat of life in all living organisms. More recent work has shown that any substance can be obtained in the colloidal state under suitable conditions; thus water, alcohol, and various metals have all been made to behave as C. In a colloidal solution it is believed that the particles of the colloid, which are electrically charged, are so small as to be kept in suspension by molecular bombardment from the liquid. The colloid is easily coagulated or precipitated from its solution, e.g. by the addition of electrolytes, though coagulation can be rendered more difficult, if stability is desired, by the addition of certain protective substances such as tannin or gelatine. Coagulation may also be effected in many cases by the action of heat, as, for example, when white of egg is heated to about 70° C. A colloidal solution that retains the liquid form is known as a *sol*, but many C. can retain the colloidal state even when the solutions set to a jelly or *gel*. Ordinary cooking gelatine represents such a gel; although it appears to be dry it nevertheless contains a large quantity of water—about one-seventh of the total weight. A study of C. has thrown much light on the mechanism of life processes and has also proved of great assistance in sev. industries, notably the rubber industry and the manuf. of viscose rayon.

Collet d'Herbois, Jean Marie (1750-96), Fr. revolutionary, b. Paris. He was an actor. When the revolution broke out he

was at first a moderate supporter of it, but soon adopted extremist views. He became a Jacobin, a member of the national convention, and of the Committee of Public Safety. He was sent to crush the Girondist revolt at Lyons, and gained notoriety for his cruelties by his blood-thirsty proceedings there. In 1794 an attempt was made to assassinate C., but this only increased his popularity. Later he was denounced and banished to Cayenne in 1795, where he d. the following year.

Collotype, planographic printing process used for fine art reproductions and book illustrations. The process uses no screen, which enables it to print very fine lines and simultaneously a continuous gradation from solid to lightest tones. The printing plate, coated with bichromate-sensitised gelatine emulsion, is exposed in contact with a laterally reversed negative. Exposure to light hardens the emulsion in proportion to the transparency of the negative. After exposure the bichromate is removed by washing and the plate is left to dry. Prior to printing the plate is covered with a mixture of glycerine and water, which it absorbs in inverse ratio to its hardening. The hardest parts absorb little, the softest a maximum of moisture. The ink rolled over the plate is accepted in proportion to its hardening and rejected in proportion to its moisture content. The result is a positive image of the negative printed down. Printing is slow, plates do not yield more than 1000 to 1500 impressions, but the best results are unsurpassed for rendering of fine detail and accurate colour.

Collusion, in a wide sense, connotes any agreement between 2 or more persons to defraud another person of his rights, or to attain an object forbidden by law. In a narrower sense it denotes the particular fraud of a secret bargain between 2 or more persons whereby 1 person agrees to bring a bogus action against the other or others, so as to obtain a judgment, verdict, or decision which could not be obtained if the court knew all the facts. A judgment obtained by C. is void, but in the former state of Eng. real property law, and in most ant. systems of law, collusive or fictitious suits to obtain a result not obtainable by existing principles of law were effectual under certain conditions. In divorce law, C. denotes an agreement between husband and wife whereby one of them will commit a matrimonial offence (i.e. desertion or adultery) in order to obtain a divorce or judicial separation. Petitions for divorce or judicial separation must specifically state that there has been no C. If C. is suspected, the queen's proctor will intervene to oppose the granting of a decree.

Colm, see COLUMBA, St.

Colman, George, the Elder (1732-94), b. Florence, son of the Brit. envoy at the Tuscan court. Educ. at Westminster and Oxford, he was called to the Bar in 1757. He did not practise, however, having succumbed to the glamour of the stage, being determined to take up playwriting. A

friend of Garrick, he had no difficulty in inducing him to produce *Polly Honeycombe* at Drury Lane Theatre in 1760. The success of this piece confirmed him in his intention to devote himself to the composition of dramatic literature, and during his life he wrote a great number of plays, the best of which are, perhaps, *The Jealous Wife*, 1781, and (in collaboration with Garrick) *The Clandestine Marriage*, 1768. Possessed of considerable private means, he led a very pleasant existence, finding his greatest delight in the company of Johnson, Goldsmith, and other members of the Literary Club, of which he was a member. For many years he had a *déjà* with Miss Ford, a minor actress, whom eventually he married, and by her he had a son, *George C. the Younger* (1762-1836), who was educ. at a private school, and afterwards at Oxford and Aberdeen. Like his father he was destined for the Bar, but he too abandoned his legal studies and wrote for the stage. His first production, in 1782, was *The Female Dramatist*. The list of his plays and other works is very long. They include the opera *Inkle and Yarico*, 1787, founded on Steele's story in the *Spectator*, *The Heir at Law*, 1797, and *John Bull*, 1803. The father had at one time had a share in Covent Garden; the son in 1794 purchased the patent of the Haymarket Theatre: both were most unfortunate in their managerial ventures. In 1820 George IV appointed the younger C. Lieutenant of the yeomen of the guard, but allowed him subsequently to sell this post. He was appointed examiner of plays in 1824, which office he held until his death 12 years later. He pub. his *Random Recollections* in 1830. See J. Genest, *Some Account of the English Stage from 1660 to 1830*, 1832; R. B. Peake, *Memoirs of the Colman Family*, 1841; E. R. Page, *George Colman the Elder*, 1732-94, 1935.

Colman, Samuel (1832-1920), Amer. landscape painter, b. Portland, Maine. He came to Europe and studied at Paris, Rome, and Dresden. He was the founder of the Amer. Society of Painters in Water Colours in 1866. Nearly all his works are seascapes, such as his 'Venetian Fishing Boat,' 'Two Boats on the Hudson,' and 'Sunny Afternoon in the Harbour of Algiers.'

Colmar (Ger. *Kolmar*), Fr. tn, cap. of the dept of Haut-Rhin, on the Lauch. It was made a free imperial city in 1226, and was formally ceded to France in 1697. There was fierce fighting here in the Second World War. C. is the most beautiful tn in Alsace after Strasburg, and has many ant. houses, convents, and churches. It manufs. cottons, woollens, silks, and jute, and has breweries and tanneries. Bartholdi (q.v.) was b. here. Pop. 46,100.

Colne, tn of Lancashire, England, situated on a trib. of the Calder, 26 m. N. of Manchester. There are manufs. of the highest class of woven coloured textiles and fancies, and engineering and light leather factories. In the 14th cent. a woollen industry flourished there. In

the vicinity are stone quarries and brick works. Pop. 21,000.

Colne, riv. of England, rising in Essex near Haverhill, and flowing in a S.E. direction, passing Halstead, Colchester, and Wivenhoe, to join the N. Sea at Mersea Is. Length 35 m.

Colne Valley, urban dist. of the W. Riding of Yorks, England, on the R. Colne, 5 m. from Huddersfield. Two reservoirs of the Huddersfield water supply are at Marsden, which with Golcar, Linthwaite, and Slaithwaite makes up the dist., and a canal tunnel is in the neighbourhood. Silk, wool, and cotton milling are carried on. Pop. 22,184.

Colney Hatch, former name of a hamlet in Middx, now in the urb. dist. of Friern Barnet (q.v.). C. H. Asylum (opened in 1851) was formerly the name of Friern Hospital, now a mental hospital with accommodation for over 2300 patients.

Colobus (Gk *kolobos*, docked, stunted), genus of monkeys (guercas), differing from other monkeys by the more or less complete suppression of the thumb. The C. inhabits the mt forests of central Africa, and is sought chiefly for the beauty of its skin which is jet-black, though the tail is white and the face brown.

Colocyth, or **Coloquintida**, see BITTER APPLE.

Cologna, It. tn in Veneto (q.v.), 21 m. S.E. of Verona (q.v.). It has a trade in cereals, wine, and hemp. Pop. 10,000.

Cologne (Ger. Köln; Rom. *Colonia Agrippina*), city and riv. port of Germany, in the *Land* of N. Rhine-Westphalia (q.v.), on the Rhine (q.v.), 20 m. S.S.E. of Düsseldorf. The main part of the city lies on the l. b. of the riv.

C. has been the chief tn of the Rhineland since early times, and although much of it was reduced to ruins during the Second World War it still retains many buildings of historic interest. Greatest of these is the famous archiepiscopal Gothic cathedral, one of the most splendid buildings in Europe. The corner-stone of the cathedral was laid by Archbishop Conrad of Hochstaden in 1248 on the site of an earlier church; the sanctuary was dedicated in 1322, the nave was ready for use in 1388, and the S. tower had reached a height of about 180 ft in 1447. The work was then interrupted for some 400 years. In the 19th cent. it was resumed, chiefly through the efforts of Sulpice Boisserée (q.v.) who prevailed upon the crown prince, afterwards Frederick William IV, to use his influence to have the building completed. Great popular interest was aroused, and all—Catholic and Protestant alike—contributed to the fund for carrying out the work, which was directed successively by the architects Zwirner (*d.* 1861) and Voigtel. The cathedral was finished in 1880, and the opening ceremony took place in the presence of William I and the reigning princes of Germany. The edifice covers an area of nearly 7400 sq. yds; its nave of 5 aisles is 445 ft long, and its transept, with 3 aisles, is 282 ft wide. The height of the nave is about 200 ft, and that of the 2 towers 515 ft. The imperial bell—the *Kaiserglocke*—which

weighed 543 cwt. and was cast from the bronze of 32 cannons taken from the French, was dismantled during the First World War, and was replaced by another bell weighing some 400 cwt. Among the treasures of the cathedral are the medieval gold reliquary of the 3 Magi (whose bones are supposed to have been brought here by the Emperor Frederick I in 1162), the 15th-cent. painting, 'The Adoration of the Magi,' by Stefan Lochner, and the 14th-cent. stained glass of the choir windows. The cathedral suffered considerable war damage, but the main structure survived, and the important contents, including the archives and library, were preserved.

Before the Second World War C. had more than 100 churches. Some of these were destroyed by bombing; others were badly damaged but were capable of restoration. Among the anct churches which still exist are St Pantaleon, a Romanesque basilica which contains the tomb of Bruno the Great (q.v.); St Gereon, which has a 10-sided nave, and which contains relics of St Gereon and of the 350 martyrs slain under Diocletian's persecution; St Ursula, in which are said to rest the bones of St Ursula (q.v.) and her companions; St Andreas, in which is buried Albertus Magnus (q.v.); and the Minorite church, where is the tomb of Duns Scotus (q.v.). The *Festhaus* of the Merchants of C., which was severely damaged by bombing, has been rebuilt, and it was decided also to reconstruct the Gothic *Rathaus*, of which only the Renaissance portico had escaped ruin.

The medieval limits of the city can still be detected in the semicircular avenues which mark the line of the old walls, and 3 of the anct city gates still stand. Among relics of Rom. times are a 1st-3rd-cent. tower and the so-called 'Dionysius Mosaic'—the mosaic floor of a villa—which was discovered during excavations near the cathedral in 1941. In recent years whole streets of new buildings have been erected to replace those destroyed. Some of these modern buildings, in particular the commercial structures, are very fine. The Adenauer Hills, huge mounds of rubble covered with earth and planted with shrubs, are a feature of the city. C. is a cultural centre of great importance. Its univ., founded in 1388 and closed in 1798 by Napoleon, was refounded in 1919. There are also numerous academies giving instruction in the arts and in scientific subjects, and there are notable museums and botanical and zoological gardens. A famous folk festival is held each year before the beginning of Lent, and a trade fair is also held. The commercial importance of the city in modern times is largely due to its situation in a lignite-mining area and to its position as a centre of riv., road, and rail communications. Its chief industries are the manuf. of metals, machinery, textiles, beer, chemicals, and foodstuffs. Pop. 701,000.

History to 1919. C. was founded c. 37 bc by the Ubii, who were compelled by Agrippa (q.v.) to migrate from the r. b. to the l. b. of the Rhine. In AD 51 a colony of Rom. veterans was estab. on the spot by

Agrippina the Younger (q.v.), after whom it was named. In 308 a stone bridge across the riv. was begun by Constantinus I; this was later destroyed by the Normans. It was the seat of a bishop from very early times, and was made an archbishopric by Charlemagne (q.v.) in 785. For a long period the archbishop and the citizens were at variance, but municipal independence was finally estab. at the battle of Worringen in 1299. C. entered the Hanseatic League (q.v.) in 1201, and contended with Lübeck for pre-eminence. Until the 16th cent. it maintained a great

1918, and Sir Charles Fergusson made his formal entry on 11 Dec., and on 12 Dec. the Brit. troops took possession of the Rhine bridgeheads. Later, on the estab. of the commission, the regime of the governor was replaced by that of a general officer commanding-in-chief, with H.Q. in the famous Dom Gen. (later Field Marshal) Sir Wm Robertson being the first commander-in-chief of the Rhine Army. The area of the Brit. occupation was about 1034 sq. m. and the civil administration was under the C. sub-commissioner of the Inter-Allied Rhineland

COLOGNE, THE RHINE AND HOHENZOLLERN BRIDGE

commercial prosperity, but its fortunes then declined. It was incorporated with France at the peace of Campo Formio (q.v.) in 1797, but was assigned to Prussia in 1815 by the Congress of Vienna (q.v.). In the industrial revolution of the 19th cent. its prosperity again returned; large areas of the city were rebuilt and its boundaries were extended. The commercial importance of the city continued to increase throughout the cent.

History (1919-45). C. was garrisoned, after the armistice of 1918, by the Brit. Rhine Army of Occupation, and this occupation continued until 1925, when the forces were transferred to Wiesbaden. Previous to the setting up of the Inter-Allied Rhineland High Commission, the C. zone was placed under Sir Charles Fergusson as military governor. The Brit. cavalry patrols entered C. on 6 Dec.

High Commission, who was assisted by a number of Kreis officers. The civil administration was grafted on to the Ger. system, of which the Kreis, or dist., was the unit. Civil order was maintained partly by the Brit. military police and partly by the C. civil police. By the terms of the Rhineland agreement (which the high commission was called into being to administer) 75 per cent of the police had, for military reasons, to be recruited from the Rhineland area itself. The occupation of C. was, throughout, of a peaceful nature, and the Brit. regime was marked by a spirit of moderation. The Brit. military governor's first difficulty was in dealing with a series of strikes. The governor estab. arbitration courts, equitable solutions of labour troubles were found, and the time came when the Ger. workmen appealed to the Brit. authorities

as a matter of course, for the care of the commission throughout its existence was the ever-recurrent strike. Later, under the regime of the commander-in-chief, Brit. military courts were also set up, to try all offences committed within the occupied zone. These courts gave satisfaction, and a high tribute was paid to their sense of justice at the close of the occupation, and also to the orderliness of the occupation generally, by Dr Adenauer, the Oberbürgermeister of C., and Graf Adelmann, the Regierungspräsident, the high official responsible for the Ger. administration in the Brit. zone. A delicate period supervened when the Fr. and Belgian troops entered the Ruhr (see RUHR). The military and civil authorities in the C. area had to keep their zone free from incidents which were daily occurring in the Ruhr and in other parts of the Rhineland, as a result of the Ger. policy of passive resistance. The relations between the Brit. Army and the people of C. were always correct, and if there was no attempt by authority to promote social relations between the army and the inhab., it was because a service order was implicitly obeyed; but none the less as between the Brit. soldier and the *Hausfrau* of his billet in C. relations were cordial. One beneficial effect of this sequel to the war on C. was that, for the first time in its hist., the city was free from the fetters of fortress works. For, by the peace treaty, fortification of C. was prohibited, and the fortress works existing were accordingly razed. This gave the city municipal authorities a golden chance of getting clear of C.'s encircling bonds and so extending its developments laterally with the Rhine. This opportunity they were not slow to seize, as has been evidenced by the in-planning and riv.-harbour schemes.

Bombing and capture of Cologne in the Second World War. C. was frequently bombed in the Second World War by the R.A.F., beginning with a heavy assault on the night of 13 Mar. 1942. On the night of 30 May 1942 over 1100 planes of all types were concentrated in a mass attack against the city lasting 90 min. It was a blow which devastated nearly one-tenth of the entire metropolitan area, practically destroying the old tn, and wrecking whole industrial areas. This raid cost the R.A.F. some 44 planes. There were 3 more devastating raids beginning 28 June 1942, in which the R.A.F. destroyed over 80 per cent of the central city area and 75 per cent of the other fully built-up dists. on the W. bank of the Rhine. In all about 80 factories were hit in the 3 raids. Railway communications also suffered, over 1000 wagons and 300 coaches being damaged. Cable works, shell-fuse factories, chemical works, and an aluminium foundry were hit. The factories of 3 well-known firms—Humboldt-Deutz, makers of internal combustion engines, lorries, and tractors; Gottfried Hagen, makers of accumulators and submarine batteries; and Felten & Guillaume, cable and wire hawser makers—were all badly damaged. Some 18 air-

craft were lost in a further night attack on 15 Oct. 1942. In the first 3 months of 1943 C., with its U-boat equipment plants, was raided sev. times. There was a higher proportion of heavy bombers in use than in the big raid of 30 May 1942, which meant that a greater weight of bombs could be dropped by fewer planes and with proportionally smaller losses. By the summer of 1943 there had been 116 raids on C., this being more than the number on any other tn in the Ruhr (Duisburg being next with 60 raids). There were yet more attacks in 1944, and by 1945 C. was over 60 per cent destroyed, with more than 2000 ac. laid in ruins.

Amer. forces began to advance towards C. in Nov. 1944, but were held up by Rundstedt's counter-offensive in the Ardennes. When this attack was checked the Allies launched a counter-offensive in the general direction of Bastogne-C. In Mar. (1945), while the Amer. Ninth Army was pushing to the Rhine in its sector, the First Amer. Army was exploiting its successful crossing of the Roer and thrusting towards C. In the First Army drive towards the city heavy opposition was for a time encountered E. of the Ert Canal, but the 3 Ger. armoured formations blocking the allied advance were dispersed by strong allied air attacks, and on 5 Mar. the advance elements of 1th Corps were entering C. By the afternoon of 7 Mar. the city was entirely in Amer. hands, the Ger. resistance having collapsed once the allied forces had reached the outskirts. This success had a profound effect on subsequent operations, as the divs. which would have been used to invest C. became available to assist in exploiting the great opportunity dramatically offered by reason of the Remagen crossing. (See further under WESTERN FRONT IN SECOND WORLD WAR; WORLD WAR, FIRST; WORLD WAR, SECOND.)

'Cologne Post,' see ARMY NEWS SERVICES.

Colomb, Philip Howard (1831-89), vice-admiral, inventor, and biographer, b. Scotland. In 1852 he saw active service in the Burmese war. He was the inventor of the system known as C.'s flashing signals, which has been adopted all over the world. He wrote *Essays on Naval Defence*, 1893, and other works.

Colombes, Fr. tn in the dept of Seine, a NW. suburb of Paris. It has the remains of a château where Queen Henrietta Maria (q.v.) d. There is a large sports stadium. It has chemical, oil, and food-processing industries. Pop. 61,000.

Colombia, NW. rep. of S. America. It is situated between 2° 40' S. and 12° 25' N. lat. and 68° and 79° W. long. It is bounded on the N. by the Caribbean Sea, on the E. by Venezuela, on the S. by Brazil and Peru, on the SW. by Ecuador, on the W. by the Pacific Ocean, and on the NW. by the Gulf of Darien. It is divided into 16 depts, 5 intendencias, and 3 commissaries. Its area is estimated at some 430,828 sq. m., and there are 1100 m. of coast on the Caribbean Sea and 1040 m. on the Pacific.

History. The earliest records of C. go back to about the year 1500, when the Sp. navigator, Alonso de Ojeda, settled on the coast near the snow-covered range of Santa Marta, which had already been discovered by another Spaniard, Rodrigo de Bastidas. But the coast is generally said to have been visited in 1502 by Christopher Columbus—whence its name. This ter. was granted to Ojeda by the Sp. Crown, and soon after the portion adjoining was bestowed upon another explorer, Nicuesa. These 2 ters., called respectively Nueva Andalucia and Castilla de Oro, became united in 1514 into the prov. of Tierra-firma, with Pedro Arias

1811, when the revolution became formal, till 1821, when New Granada, Venezuela, and Ecuador became united under the name of C., incessant war was waged with that country. Union was effected by Simón Bolívar, but at his death in 1830 Venezuela and Ecuador seceded, and in 1831 C. called itself the Rep. of New Granada. It has remained much the same since then territorially, but with different constitutions and names.

Like all the reps. of S. America it is divided into 2 factions, the Conservatives, whose object is centralisation, and the Democrats, whose aim is decentralisation, with complete autonomy for each

De Wilson Popenoe

A TYPICAL ANDEAN ROAD NEAR FACATATIVA, COLOMBIA

de Avila as its governor. With the estab. of these colonies and the discovery of the South Sea by Balboa, a direction was given to the exploration of C. The large Rs. Atrato, Cauca, and Magdalena were explored and conquered in 1536-7. Quesada penetrated along the Magdalena as far as Bogotá, the chief tn then, and still the cap. To this part of the country the name of New Granada was given, and this continued to be the official name until C. won its independence. Next followed expeditions to the E. and SE. in search of the 'Gilded Man'—'El Dorado'; from these an extension of geographical knowledge was the only result. By the middle of the cent. Sp. power was fairly estab., and flourishing coastal tns were springing up. In 1563 New Granada formed part of the Sp. viceroyalty of Peru, but after many vicissitudes it was constituted a separate viceroyalty in 1751. Extreme measures of taxation and exorbitant duties provoked a revolt against Spain, and from

state. Up to 1886 its constitution was that of a federal rep.; at that date its states became depts. From 1889 to 1902 civil war was waged intermittently, and resulted in the triumph of the centralist forces over the revolutionaries. At the present day the executive authority is vested in a president elected for 4 years, assisted by a Cabinet of 6 ministers. Dr Laureano Gomez, the Conservative leader, was elected unopposed in Nov. 1949 and installed in Aug. 1950. He asked for sick leave in Nov. 1951. Lt.-Gen. Gustavo Rojas Pinilla took over after a bloodless coup in June 1953, and exercised an authoritarian control over the gov. A rigorous gov. censorship on Colombian newspapers and news broadcasts was introduced, which was abolished when Gen. Rojas's dictatorship was suddenly overthrown in May 1957. A military junta took over the gov.

Topography. The surface of C. is varied. In the W. there are lofty mts; in the E. there are vast llanos and forest plains,

watered by tribs. of the Amazon and Orinoco. The mt system of the country consists of the 3 spurs of the Andes, which spring out fan-like from the plateau of Pasto in the SW.; these are the W., Central, and E. Cordilleras. Besides these chief ranges there are, in the N., the Sierra Nevada de Santa Marta and the low Bando range along the NW. coast and extending into Panama. The prin. rvs. are the Magdalena and its trib. the Cauca, rising in the Central Cordillera and flowing into the Caribbean Sea; sev. tribs. of the Amazon in the E.; and the Patia, flowing into the Pacific, after making its way through a gorge 10,000 to 12,000 ft high in the cliffs. One of the tribs. of the Patia, the Carchi or Upper Guaitara, is spanned by the Rumichaca Arch or Inca's Bridge of natural stone. On the Rio Bogotá is the great fall of Tequendama, 480 ft high. Other rvs. are the Caquetá and the Putumayo. The climate of C. is determined by the double influence of lat. and altitude. Situated entirely in the tropical zone, its days and nights are of equal length, and it has 2 seasons—the wet and the dry. The country includes every altitude from sea level to upwards of 18,000 ft in the region of perpetual snow; it has therefore every temp., from that of the torrid zone to that of the frigid. The lowland portions, covered with dense forest, have an intensely hot climate; the inland mt region is comparatively cool. The wide-stretching plateaux of the E. Cordilleras have a cool and healthy climate. This region is the most thickly populated of the rep.; in it is Bogotá, the cap., 8694 ft above the sea. The climate of the ter. of Panama is exceedingly unwholesome, and in parts of the depts of Bolívar and Magdalena marsh fevers are rife. Sanitation is now being satisfactorily developed.

Government. In normal times Congress is composed of 2 chambers, a House of Representatives, elected by direct vote, and a Senate, elected (before 1945) by indirect vote, but, by an Act of 1945, the senators are now elected by direct vote of the electorate instead of indirectly by the departmental assemblies. Congress meets annually at Bogotá in July. Women, though conceded citizenship, are expressly debarred from voting (as are members of the army and the police) and from elective office.

The prolonged Panama dispute between C. and the U.S.A. was at last concluded in 1922. Panama had seceded in 1856, rejoined the rep. again, and again seceded in 1903. The U.S.A. recognised the independence of Panama, but it was not until 1922 that a treaty was ratified whereby the independence of Panama was estab., while C. received an indemnity of \$50,000,000 as compensation. There was another dispute in 1925, with Ecuador, arising out of a treaty recognising Peru's claim to sev. thousand sq. m. of ter. in the Amazon valley which Ecuador had ceded to C. In 1931 a boundary commission began the work of delimiting C.'s boundaries with Brazil and Venezuela as agreed by treaties, thus terminating

disputes of more than a cent.'s standing. In 1928 C. was elected to membership of the council of the League of Nations and is now a member of U.N.O.

Population, education, and religion. The pop. of C. is estimated at 12,600,000, of which only 160,000 are Indians. More than nine-tenths are whites and half-castes, and the chief centres of pop. are the upper valleys of the Magdalena and Cauca, where the climate is delightful and grain grows. The white pop. is of Sp. descent, and there are besides those the mestizos, of mixed Sp. and Indian blood, and the few Indians. Slavery was finally abolished in 1852. Primary education is, and has since 1870 been, free, but is not compulsory; and there are nearly 12,500 public elementary schools, with upwards of 650,000 pupils. There are 637 high schools with 26,500 pupils, and a number of vocational, agric., art, and religious schools; besides 63 colleges and 28 institutions of univ. rank, with 12,000 students. The National Univ. in Bogotá was founded in 1573; in the depts are 14 other univs., including Atlántico at Barranquilla, Antioquia and Pontificia Universidad Católica Boliviana at Medellín, Cartagena Univ. at Cartagena, Cauca at Popayan, and Narino at Pasto. The chief tns are Bogotá, Medellín, Barranquilla, Cali, Cartagena, Manizales, Cúcuta, Bucaramanga, and Santa Marta. The state religion is Rom. Catholic. There are 4 archbishops.

Industries, minerals, etc. Chief industries are petroleum, agriculture, mining. The forests are extensive; there are mahogany, cedar, fustic, and other dyewoods, and there are medicinal plants. The prin. products are coffee, cotton, plantains and bananas, and, in some parts, tobacco, wheat, and other cereals. Banana exports in 1941 were over 2,250,000 stems, but owing to disease exports ceased in the following year, but in 1946 reached a total of 40,000 tons, and in 1954 reached a new record of nearly 8 million. C. is the largest producer of mild coffee, the demand for which is not affected by over-production in Brazil. Nearly two-thirds of the coffee goes to the U.S.A. Oil was discovered in 1922 and the chief wells are at Barrancabermeja on the Magdalena R., whence a pipe line runs to Cartagena, 360 m. away. The output in 1954 was over 39,900,000 barrels. The mineral wealth is great. There is a large ann. output of gold and silver, and rich deposits of copper, lead, mercury, iron, platinum, and salt (from the mines in Zipaquirá covering hundreds of sq. m.) are found. The famous emerald mines of Muzo and Cósquez are a gov. monopoly. The manufacturing industry is relatively unimportant, but in the larger tns many articles in common use are produced; among these are cotton textiles, shoes, hosiery, matches, sugar, liquors, flour, and bricks. The exports, in addition to gold, are coffee, petroleum, bananas, hides and skins, and platinum. The imports are textiles, machinery, metal manufs., cars and lorries, and chemical manufs. The value of trade in 1954

was: Imports, \$240,000,000; Exports, \$238,000,000.

Communications. In C. there are 1914 m. of railways, and some 15,000 m. of motor highways, but though some improvement has been made in recent years in railroad and wagon road communication and riv. navigation, railways and roads are still in their infancy owing to the mountainous terrain, which makes construction costly and difficult. There is a daily passenger and mail service between Bogotá and Barranquilla and extensive inland and foreign air connections. New

with 420,000 inhab. The harbour, which has an area of 1 sq. m., and is protected by 4 magnificent break-waters, affords shelter for 45 ocean-going steamers during the SW. monsoon and 39 during the NE. There are a graving-dock and a coaling depot. C. has broad streets with fine buildings and hotels. The business quarter, called Pettah, which is in the form of a bazaar, lies to the E. To the N. extends the quarter of St Paul, with extensive Catholic and Anglican colleges. Wolfendahl church, built in 1749, is the most interesting and complete of the few

Galbraith, *Colombia*, 1953.

Colombo, one of the finest and largest sea-ports of Asia, and the cap. of Ceylon,

relies of the Dutch occupation. A tortoise said to have lived for 200 years is preserved in the museum in the Victoria Park, and a colossal stone lion on which the king sat to administer justice. The univ. in its various depts now caters for some 2400 students. C. is mentioned in 1346; the Portuguese took it in 1517 and named it C. in honour of Christopher Columbus. The Dutch took it from them in 1656 and surrendered it to the Brit. in 1796. C. is a port of call for all vessels bound for Australia, the Bay of Bengal, and the Far E. C. was raided by 75 Jap. planes, operating from carriers, on 5 April 1942. Low-level and dive-bombing attacks were made on the harbour and in the Rotnamada area.

Colombo Plan, plan for co-operative economic development in S. and SE. Asia, pub. 28 Nov. 1950, which came into effect 1 July 1951. Each member is free to revise its development programme as it

desires. Among its members are Britain, Australia, India, Canada, Ceylon, New Zealand, Pakistan, Burma, Indonesia, Japan, and the Philippines, and the U.S.A. is closely associated with it, attending meetings as a full member.

Colón, tn in Matanzas prov., Cuba, 45 m. ESE. of the tn of Matanzas. The chief industries are sugar, fruit, and tobacco processing. Pop. 11,550.

Colón, earlier Aspinwall, city, cap. of Colón prov., Panama, at the N. or Caribbean entrance of the Panama Canal. It is Panama's second largest city, built on Manzanilla Is. at the canal entrance, and a great commercial centre. Fruit and timber are exported. Its port is its twin city Cristóbal, which lies to the S. in the canal zone. It forms an enclave in the canal zone, but is linked to the rep. proper by a highway under Panamanian control. Pop. 52,000.

Colón, see COLITIS and INTESTINES.

Colón Archipelago, official designation of the Galápagos Is. (q.v.).

Colonel (lt. *colonello*, leader of a column), in the Brit. Army, the chief commander of a regiment. In 1588 the title of C. was substituted for that of captain to designate the chief officer of a regiment. In the artillery and engineers the C. is always the acting commander, but his duties are performed by the lieutenant-C. in an infantry battalion or a cavalry regiment. In the latter cases the office of C. is a sinecure, but it is to be noted that this applies only to a regimental C. as distinct from a C. on the staff. A regimental colonelcy carried with it the pay of £1000 a year, and was given to a general on his retirement and as a reward for long service. But, as the result of a decision of 1888, this rule died out and only those having at that date a vested right to such an appointment came under the old order of things. Henceforth those officers only may become Cs who have received a brevet for distinguished conduct. There are besides certain appointments which carry with them the rank of C.: those of aide-de-camp to the sovereign, of assistant adjutant-general, and of commander of a regimental dist. being the chief. After the First World War the rank of C.-commandant displaced that of brigadier-general in the Brit. service, but in 1923 brigadier replaced C.-commandant. Cs of regiments are now selected from any officer of the rank of full C. and upwards who has served with distinction in the particular regiment. They retire on attaining the age of 70 years. At present C.-commandant of the Royal Artillery, Royal Engineers, etc., correspond somewhat to the C. of a regiment. In substantive rank they are general officers with distinguished service records. In the King's Royal Rifle Corps and Rifle Brigade they are equivalent to Cs of regiments. The rank of C.-in-chief of a regiment is an honorary office, and is held in various regiments by the sovereign and other members of the royal family, by foreign royalty and other persons.

Colonia, dept in Uruguay, on the Plata. There are fertile plains and valleys, which

are under cultivation. European colonists have settled there, and are engaged in stock-raising and agriculture. Area 2194 sq. m.; pop. 137,000. C. del Sacramento, on the Plata, opposite Buenos Aires, with which it is connected by a 35-m. ferry, is the cap., and possesses a fine harbour and an airport. Pop. 10,000.

Colonia Agrippina, see COLOGNE.

Colonial Agents, agents in England who act on behalf of Brit. colonies (see CROWN AGENTS FOR THE COLONIES). The agent-general represents a Canadian prov. or Australian state in London, and acts for the crown colonies. Most of the N. Amer. colonies before their separation had special salaried agents in England to superintend their affairs.

Colonial Civil Service. Service in the crown colonies, protectorates, and mandated ters. is by selection by the secretary of state for the colonies through the appointments dept of the Colonial Office. The service includes specialists in tropical medicine, agriculture, geology, law, entomology, engineering, forestry, etc. Some 20 per cent of appointments are made from Whitehall, the remaining 80 per cent, which includes most of the minor posts, by the local or colonial gov. concerned. The service is now unified with pay and conditions assimilated so that transfers from one colony to another may be made without loss of emoluments or pension rights.

Colonial Conference, African, first gathering ever held of the political leaders of Brit. colonial Africa, met at Lancaster House, London, in Oct. 1948. In all there were some 70 delegates, including chiefs from the 4 W. African colonies, emirs from Nigeria, tribal leaders from E. African ters. (including Tanganyika), Europeans representing the interests of trade and mines, and Arabs and Indians settled permanently in Brit. African colonies. The conference had 3 objectives: to give the delegates from different countries an opportunity to know each other, this being the first occasion on which W., E., and Central Africans, white and black together, had ever met in formal conclave; to enable African delegates to hear at first hand something of the problems, hopes, and expectations of the metropolitan power; and to discuss policies for education, improvement of agriculture, health, public relations, and economic development. The main purpose of the conference was achieved by enabling the delegates to return to their countries with a clearer idea of the difficulties, the knowledge that others shared their problems, and with the conviction that they were part of a greater community and had behind them the goodwill and the practical resolution of the Brit. nation.

Colonial Development Corporation (C.D.C.), public corporation estab. by Parliament under the Overseas Resources Development Acts, 1948 and 1956, for the purpose of assisting Brit. colonial ters. in the development of their economies. Members of the board of the C.D.C., consisting of chairman, deputy-chairman, and

from 4 to 10 other members, are appointed by the secretary of state for the colonies on a part-time basis. The general manager is chief full-time executive officer. The corporation is a commercial organisation and is required by the Acts to pay its way. It has powers to borrow its capital so that there shall not be outstanding at any one time more than £100 million on long-term and £10 million on short-term. There is no share capital and

The Corporation's head office is in London, with regional offices in Barbados for the Brit. W. Indies; Singapore for the Far E.; Nairobi for E. Africa; Salisbury, S. Rhodesia, for Central Africa; Lagos for W. Africa; and Johannesburg for the High Commission Territories.

Colonial Development and Welfare. policy of the Brit. Colonial Office in handling the economic and social problems of the dependent empire. In the

the loan money has been obtained from the Treasury; interest has to be paid over the life of each loan at the rate current at the time of each advance. On long-term loans interest payments are postponed for the first 7 years; loans and interest are repayable by 33 annuities starting in the eighth year. At the end of 1956 the Corporation had 66 development projects in hand for which the total capital approved was £75 million. Projects cover all forms of economic development, including agriculture, animal products, factories, fisheries, forestry, hotels, minerals, housing, power, transport, and communications. They are situated in 22 different colonies.

last decades of the 19th cent. the issue appeared to be simple, for in every country, Burma, Malaya, W. or E. Africa, the Pacific Is., bloodshed and slavery had been replaced by peace, freedom, order, and justice. But early in the 20th cent. an expanding electorate began to demand drastic measures to cure the economic and social dislocations accompanying their industrial revolutions. That demand has, in course of recent years, been voiced on behalf of colonial peoples in accordance with the Brit. conception of trusteeship in relation to native people (see COLONIAL TRUSTESHIP). The colonies suffered from lack of capital. With few exceptions Brit. capital has avoided the colonial empire

and favoured more lucrative investment in foreign countries. Of public loans raised by colonial govts. some 75 per cent has been devoted to railway and port developments, and the colonies have had the benefit of rates of interest only slightly higher than internal U.K. loans. The colonies need more capital for development and social services. The ters, which can attract capital by rich mineral and other natural resources are few. The rest are poor countries struggling under a burden of tropical diseases, malaria, yaws, leprosy, beriberi, and so forth; crop pests, leaf spot, the ruin of banana crops, and locusts; malnutrition, isolation, and ignorance. In these areas an adequate standard of living—reasonable immunity from disease, a wholesome diet, improved education, housing, and transport—has not yet been achieved. Such ters. could make little headway within the limits of their own revenue resources. In 1929 a Colonial Development Advisory Committee was appointed by the secretary of state for the colonies, under the authority of the Colonial Development Act, 1929. Its function was to consider and report on applications for assistance from the Colonial Development Fund, in furtherance of schemes likely to aid and develop agriculture and industry in the colonies, protectorates, and mandated ters. Assistance was given for deep-water harbours; afforestation; hospitals and hospital equipment; improved medical services; schools for European and native children; malarial research units; public health schemes; railway development; housing schemes for natives; stations for coffee and sisal research and research into plant ecology; factories; new telegraph and telephone units. But the amounts obtainable under this Act were restricted. Early in 1940 the Brit. Gov., which had made special grants for technical research and grants in aid to help hard-pressed colonies to balance their budgets, passed the Colonial Development and Welfare Act, which authorised expenditure up to £5 million a year for 10 years, and an additional grant up to £500,000 a year for research. At the same time some £10 million worth of loans previously advanced to the colonies was cancelled. In 1943 a Colonial Products Research Council was set up to deal with research for which the £500,000 a year had been allocated. An Act passed in 1945 extended the grant period from 1951 to 1956, more than doubled the rate of expenditure, and abolished the practice of surrendering the unexpended portion of the ann. grant to the Brit. Treasury. Later Acts in 1949, 1950, and 1955 further extended the provision. Grants under the 1940 Act totalled £10.4 million. Grants and loans approved under the subsequent Acts had by 31 Mar. 1956 reached the total of £162 million, of which nearly £118 million had actually been issued. Aid to education totalled nearly £30 million; over £20 million had been allocated to agriculture and veterinary services and to roads, £18 million to medical and health services, £14 million to

water supplies and sanitation. Research schemes of various kinds received 14.7 million. Nigeria, with allocations of £35 million, was the largest benefiting ter. The present provision of money for C. D. and W. remains in force until 1960. Ghana (Gold Coast) and the Federation of Malaya on becoming independent ceased to be eligible for aid under the Acts. See COLONIAL CONFERENCE, AFRICAN. See Lucy Mair, *Welfare in the British Colonies*, 1944; *Social Policy in Dependent Territories* (International Labour Office); Sir Keith Hancock, *Wealth of Colonies*, 1950, and *Colonial Self-Government*, 1952; Roy Lewis, *Ten Years of Development and Welfare*, 1956; Sir Ivor Jennings, *The Approach to Self-Government*, 1956; P. T. Bauer and B. S. Yamey, *The Economics of Undeveloped Countries*, 1957.

Colonial Law. The law to which a colony becomes subject depends on whether it was acquired by settlement, conquest, or cession. Eng. subjects have normally carried no more of the Eng. law than was adapted to the circumstances of the infant colony, e.g. the Mortmain Acts (q.v.) were held inapplicable to New S. Wales, the Marriage Acts to India; but the Bankruptcy Act, 1882, has been held to be of universal application. The Eng. eccles. law applies to settled colonies because they have no estab. church. The sovereign has power by Order in Council, or by charter of justice under the Great Seal, to make new laws. But having once granted legislative powers to a colony, he ceases to have legislative power in regard to local matters. By the Colonial Laws Validity Act, 1865, every colonial legislature had power to establish courts of judicature, and to make laws respecting the constitution, powers, and procedure of such legislature. A change in the operation of dominion legislation, especially in the direction of giving such legislation extraterritorial effect, was foreshadowed by the decisions of the Imperial Conferences, 1926 and 1930. The sequel was the Statute of Westminster, 1931. The Colonial Laws Validity Act, 1865, no longer applies to any law made after 1931 by a dominion Parliament. A dominion Parliament now has power to repeal or amend any Act in so far as it is part of the law of the dominion. No Act passed after 1931 will apply to a dominion unless it is expressly declared in the Act that the dominion consented to its enactment. Australia delayed adoption until 1942, when by an Act of that year it adopted the material sections with effect from 3 Sept. 1939. New Zealand, in 1946, set up a committee to consider the question and the effect on the laws of New Zealand. Newfoundland (q.v.) has joined the Confederation of Canada. The report of the conference of 1929 on the operation of dominion legislation also considered the advantages of a commonwealth tribunal as a means of determining differences between members of the Brit. Commonwealth; and the Imperial Conference agreed that the tribunal should be constituted *ad hoc* in the case of each dispute

to be settled. No such tribunal, however, has yet been convened, though the Brit. Gov. offered to refer the Irish land annuities dispute to such a body (see DE VALERA, EAMON; IRELAND, REPUBLIC OF). The states which have most readily availed themselves of the Act are those like the Union of S. Africa and Ireland, in which there is a strong republican or nationalist element hostile to continued membership of the Commonwealth.

Colonial Office. In England the earliest separate organisation for the administration of colonial affairs was a committee of the Privy Council appointed by the king in council in 1660 'for the Plantations'. By 1695 certain limited powers in regard to the colonies were vested in a commission known as the Board of Trade and Plantations, but the executive work was done by the secretary of state for the S. dept. In 1794 the secretary of state for war had assumed control, but in 1854 the outbreak of the Crimean War led to the appointment of a secretary of state for the colonies to relieve the war secretary of colonial business, and the secretariat for the colonies has continued a distinct dept ever since. The importance of the office was greatly enhanced under the secretaryship of Joseph Chamberlain at the end of the last cent. After the First World War a Middle E. dept was set up to deal with business relating to the mandated ters. of Palestine and Mesopotamia (renamed Iraq, q.v.). In 1925 a new secretaryship of state for dominion affairs was created, and as a result the Dominions Office (now Commonwealth Relations Office) was formed to take over from the C. O. business connected with the self-governing dominions, the Irish Free State (now Rep. of Ireland), the self-governing colony of S. Rhodesia and the S. African ters., Basutoland, Bechuanaland, and Swaziland, and business relating to the imperial conferences (see IMPERIAL CONFERENCE). For some years both secretaryships were held by one minister, but in 1930 a separate minister was appointed to the dominions secretariat, with a separate parl. under-secretary. The administrative powers of the colonial and commonwealth relations secretaries do not embrace the Channel Is. and the Isle of Man, which are under the Home Office. But with these exceptions the 2 secretaries of state are responsible for U.K. relations with the whole of the Brit. oversea dominions, colonies, protectorates, etc. Colonial governors are appointed by the Crown on the recommendation of the secretary of state for the colonies, while some other executive and all judicial appointments are made directly by the secretary of state. In recent years, especially since the close of the Second World War, the staff of the C. O., consistently with the advance of public opinion on the economic development and social welfare of the colonies, has been considerably expanded, especially in the number of its specialist advisers on development planning, agriculture, animal health, education, engineering appointments, fisheries, forestry, and labour. The enhanced importance of

economics and sociology in the administration of the colonial empire is reflected by the new depts—commercial relations and supplies, finance and development, research, social service, and welfare. See COLONIAL DEVELOPMENT AND WELFARE. See Sir Charles Jeffries, *The Colonial Office*, 1956.

Colonial Trusteeship. In the broader sense the concept of C. T. originates in Burke's famous declaration, in his speech on the India Bill, 1785, that Britain had become directly responsible for the welfare of the Indian peoples 'as a sacred trust.' Acceptance of that principle laid the foundations for the 19th-cent. Brit. doctrine of C. T. With varying degrees of success it led to self-gov. for India and elsewhere. In the Brit. colonial empire proper (i.e. as opposed to the dominions) the principle was implicit in the long political campaign for the abolition of the slave trade and, later, of slavery in the Brit. W. Indies and, under Sir John Kirk's influence, in E. Africa, where the Arab slave trade was the chief factor in directing Britain's attention to that region (consult R. Coupland, *The Exploitation of East Africa*, 1939, and also *The British Anti-Slavery Movement*, 1933). Sierra Leone illustrates the principle, for the original settlement was formed for the benefit of liberated African slaves in 1792. Reinforced by a growing interest in Christian missionary effort, the movement for the abolition of slavery led the nation as a whole to accept a new standard of conduct towards subject peoples. In the Brit. tropical dependencies in Africa the doctrine gained fresh impetus from the classic work, *The Dual Mandate*, by Frederick (later Lord) Lugard (1929), which urged that the white man's trust had a dual purpose: the development of indigenous resources for the benefit of all nations, and the promotion of native welfare. Trusteeship is also implied in the principle of 'indirect rule,' which owes much to Lord Lugard (see INDIRECT RULE). C. T. is also illustrated in the administration of Kenya in the principle of the 'paramountcy of native interests' as enunciated by the Devonshire White Paper of 1923, which stated that 'if and when the interests of the African natives and the interests of the immigrant races (i.e. the British, Indians, Arabs, and others) should conflict, the former must prevail. . . . But it has always been made clear that the paramountcy of native interests is not to be interpreted as justifying neglect of the vital interests of the European community, and that the ultimate trusteeship of the imperial gov. does not preclude the grant to that community of a share in the gov. of ters. which they have made their home. The Churchill White Paper of 1927 dealt with these 2 points by enunciating the principle of the 'dual policy' of economic development—increasing native production in the native reserves *pari passu* with that of European plantations—and the imperial gov.'s 'desire to associate more closely in the high and honourable task (of trusteeship) those who, as colonists or residents,

have identified their interests with the prosperity of the country.' The principles implicit in the concept of C. T. have received practical application in recent years in the form of extended social services and colonial welfare generally, through the operation of the provisions of the Colonial Welfare and Development Act, 1940. Trusteeship, on the political side, and the dual mandate on the economic, have in these days been merged in the more constructive relationship of senior and junior partners. The principle of C. T. is also implicit in the concept of mandates (*see* MANDATE SYSTEM).

United Nations' Declaration on Colonial Policy and the International Trusteeship System. During the 1930's when the possession of colonies was one of the causes of international friction, some publicists and politicians thought the solution of what was known as 'the colonial question' lay in bringing all colonies alike under some form of international control, so as to ensure that the non-colonial powers could enjoy the same range of economic opportunities as the colony-owning powers. But in the preoccupations of the Second World War the matter ceased to excite any special interest, though interest revived to some extent through American criticisms of British 'imperialism.' The more dispassionate section of American public opinion, however, could not accept the British conception of C. T. where the trustee was not accountable to some third party's judgment, i.e. some international body after the manner of the Permanent Mandates Commission. As confidence in victory deepened towards the later stages of the war, the opinion in Britain strengthened that no form of international intervention in the administration of the colonies could be tolerated.

The San Francisco decisions of 1945 (*see* SAN FRANCISCO CONFERENCE) respecting colonies were a compromise between the more extreme points of view. The conference drew a clear line between the treatment of the colonies proper and of those areas which were held under mandate or which might at any time be brought under a similar regime. The conference (*see* UNITED NATIONS CHARTER) did not propose to subject colonies to any system of control—probably it bore in mind Churchill's declaration that what Britain had it held, and that he did not think he had been called upon to be Prime Minister in order to preside over the liquidation of the empire. The U.N. Charter restricted itself to an agreed declaration on colonial policy, which recognised that the interests of the colonial peoples are paramount and commits the colonial powers to promote self-governance. This declaration contains nothing new to British colonial policy and would seem almost to be modelled upon that policy, especially as the charter concedes the principle that progress in free institutions must evolve in harmony with social and economic advance. The charter does, however, require that colonial powers should regularly transmit to U.N.O. statistical and other information

regarding colonial conditions. The element of third-party control is limited to terms to be brought under the international trusteeship system, i.e. terms then held under mandate; those which might be taken from enemy states after the war; and those which might be voluntarily put under the system by the states then controlling them. Assuming that Britain would decline to offer any part of her colonial empire for inclusion in this system, the areas which would come under it would in terms of population be under one-tenth of the whole British colonial empire.

The international trusteeship system differs from the mandatory regime. The Trusteeship Council, which replaces the Permanent Mandates Commission, is composed of member states administering trust territories, major signatories not holding such territories (at that date these were U.S.A., U.S.S.R., and China), and such number of elected member nations as would ensure that trust-administering nations were not in the majority. Each member nation nominates one qualified person to be its representative; whereas in the old mandatory system there was no rule prescribing the countries which should nominate members, and it was a recognised convention that the commission's members should be regarded as individuals exercising an independent judgment, not as national representatives.

The council's stated functions on receiving petitions and information are not wider than those of the old commission, save that the council has formal authority to provide for periodic visits to the trust territories. But there is a change in the way in which territories may be brought under the new system: each is to be the subject of a separate agreement, which is to be made by 'the states directly concerned,' including a mandatory power, and approved by the U.N. The object of this arrangement is to secure flexibility in the terms of the trusts over ex-enemy territories, but it may cause difficulties in securing agreements between a mandatory and the 'states directly concerned,' whose identity is obscure. These agreements, however, are to be made within the framework of the declared objectives of the trust system, which indeed are similar to those of the colonial charter or declaration. But 2 points of practical significance arise in relation to certain limitations on the old mandates, viz. the prescription of the obligatory open door in A and B mandates—applicable to tariffs, investment of private capital, and immigration—and the prohibition against raising forces locally or constructing fortifications or bases except for purely local defence. The trust system maintains the open-door principle, though it does so in such terms as imply a possible departure in the interests of the people of the territory; but the restriction on fortification is discarded. Despite all that the charter may be designed to achieve, it is probable that experience will show that, as in the past, 'the sure guarantee of the interests of the peoples of mandated territories lies in the character and conscience of the administering

authority.' See COLONY; INDIRECT RULE; MANDATE SYSTEM.

Colonies, Zoological, are formed when an organism gives rise to sev. buds which adhere to the parent and continue to reproduce after this manner. Such colonies, occasionally found among the Protozoa, are very usual among the Porifera or sponges, and among the Coelenterata the fresh-water *Hydra* forms such an aggregate of individuals temporarily, while many other forms, e.g. dead men's fingers, or *Alcyonium digitatum*, and most corals, are permanently colonial. In many cases the individuals which make up a colony perform identical

condottiere. After having been a soldier in his youth, Pompeo C. entered the Church, and was made Bishop of Rieti in 1508. For inciting the people to revolt against Pope Julius II he was deprived of his office, but was pardoned by Pope Leo X. and created cardinal in 1517. Later he helped the emperor in his attack on Rome in 1526, but was subsequently pardoned by Clement VII and made viceroy of Naples.

Colonna, Prospero (1452-1523), It. condottiere who offered to help Charles XIII of France when that king invaded Italy in 1494-5. He was an extremely able general, and later on entered the

E.N.A.

A COLONNADE: THE FORUM, JERASH, JORDAN

functions, but in the condition known as polymorphism the functions are specialised and allotted to various persons. Thus the individuality of the members is frequently lost, and they become almost like organs instead of whole living creatures.

Colonna, name of one of the oldest and most illustrious families of Italy, which has produced popes, cardinals, princes, and generals, and belonged to the Ghibelline party.

Colonna, Fra Francesco, Dominican. b. Venice. He is famous chiefly as the writer of a mysterious allegorical romance, *Hyperbolomachia Poliphili* (q.v.), which would probably have been forgotten but for a rare ed. with engravings by Giovanni Bellini and for Paul de Saint Victor's illustrations. An abbreviated version of this romance was pub. by Sir Richard Dallington in 1592 under the title of *The Strife of Love in a Dream*. See also Linda Fierz-David, *Der Liebesraum des Poliphilo: ein Beitrag zur Psychologie der Renaissance und der Moderne*, Zürich, 1948.

Colonna, Giovanni Paolo (1637-95), It. composer, b. and d. Bologna. He composed church music, oratorios, and operas. On 4 occasions he was elected principal of the school of music at Bologna. Some of his compositions are still in MS. at Bologna and some at Vienna, but a fair number of them were printed in 1681-94.

Colonna, Pompeo (c. 1479-1532), It. cardinal, nephew of Prospero C., It.

service of the Pope, and among his many victories he won the battle of Vicenza in 1513 against the Venetians, and the battle of Bicocca in 1522 against the Franco-Ger. forces under Lautrec.

Colonna, Vittoria (1492-1547), Marchioness of Pescara, daughter of Fabrizio C. She was betrothed at the age of 4 to Francisco d'Avalos and was brought up in the mansion of Costanza d'Avalos, Francisco's aunt, where Tasso and most of the intellectual men of the time were constant guests. She was remarkably beautiful, highly intellectual, and well educ.; her first poetry was written at an early age. From 1512 she led a very lonely life, her husband being absent with the fighting army; he is the one subject of her verse during this time. After his death she lived in retirement, often in convents. Michelangelo, between whom, in his later years, and C. existed a warm friendship, wrote some of his finest sonnets to her. The *Rime spirituali* are her most characteristic poems, many of them idolising her dead husband.

Colonna, Cape, see COLONNES.

Colonnade, one or more ranges of columns symmetrically disposed, in front of, surrounding, or inside, a building.

Colonne, Guido delle, Gilles, or Gilles de Colonne, Egidio Colonna, or Aegidius Romanus (d. 1316), It. theologian and writer, b. Rome. He became tutor to the dauphin of France, Philippe le Bel, for whose use he wrote a treatise entitled

De Regimine Principum (pub. in folio at Rome in 1492). In 1292 he was elected general of the Augustinian order, and later became Bishop of Bourges. He was an exceedingly learned man, and was called by his contemporaries 'the well-founded doctor.' He wrote sev. books on philosophy and divinity. A life of him by Angelo Roccha is prefixed to an ed. of his work, *Defensorium*, pub. at Naples in 1644.

Colonne, Capo Delle, see LACINIUM.

Colonnae (Colonna), Cape (It. 'column'; formerly Sunium), most southerly point of Attica, Greece. At the cape's extremity are ruins of a temple (269 ft above sea level) dedicated to Poseidon, of which 12 marble columns still stand, and from these the tn derives its name.

Colonsay and Oronsay, 2 Inner Hebridean is., off Argyll, Scotland. C. is 8 m. by 3 m., and has a college founded by St Columba who landed at Oronsay from Ireland in 563 and afterwards removed to Iona. There are extensive remains of a priory founded in the 14th cent. Pop. 230.

Colonus, or Kolonos Hippios, site in Attica, Greece, about 2 m. NW. of Athens. Sophocles was b. there, and immortalised it by the description which he gave of it in the *Oedipus at Colonus*. Two most famous archaeologists, Charles Lenormant and Ottfried Müller, are buried in the cemetery upon the hill-top.

Colony (Lat. *colonia*, from *colere*, to till), name applied to a country which is peopled by immigrants, who remain subject to or connected with their parent state. The anc. Greeks colonised extensively along the coast of Asia Minor, Thrace, S. Italy, N. Africa, Sicily, and the Crimea; a Gk C. was called *apoikia*, and the colonists *apoikoi*, i.e. literally 'people from home.' The cause of emigration from Athens was usually political dissension. The band consulted the oracle and chose a leader, called *oikistês*, who took sacred fire from the Prytaneum, that the new city might be patterned after the *metropolis*. The city thus founded was entirely self-governing and independent, and was connected with Athens only by ties of sentiment and religion. The *klêroukia*, literally 'allotment,' on the other hand, though it had a certain amount of internal self-gov., remained in close connection with the mother city, the citizens being recognised as Athenian citizens. The Romans, who were a great colonising race (strictly speaking a *colonia* is a farm, or cultivated land, but the meaning was extended to embrace any public settlement of Rom. citizens, and later it acquired a military sense), began their C.s in the neighbouring cities. Whenever Rome conquered or acquired new ter., she left behind her a handful of citizens to act as a garrison. These citizens were frequently veteran soldiers. They were given the land as a reward for past services, and had to answer to Rome for the loyalty and good behaviour of the *colonia*. The Romans had a genius for organisation and administration. Some C.s were rewarded with the high privilege

of Rom. citizenship, while others remained dependencies, and still others grew into large Rom. provs. The gov. was modelled on the republican gov. of Rome, and the C.s were governed by the same kind of officials. The highest men in the state were rewarded with the governorship of a prov. or C.

After the fall of Rome, C.s were not heard of again till early in the 16th cent., when Spain and Portugal took the lead in establishing C.s, followed closely by England, Holland, and France. During the Renaissance men were inspired by a high, adventurous spirit. Those who came back across the Atlantic filled the minds of their fellow countrymen with stories of a wonderful land, where great quantities of gold might be found. The possibilities of the New World seemed to be unlimited, and every country which had any maritime power wished to be there first and possess the best of everything. Portugal had, as early as the 15th cent., placed trading factories along the W. coast of Africa, which she later extended as far as India. Portugal now developed her empire in S. America, as well as in Africa, her great rival in the former country being Spain. The C.s of Spain and Portugal were directly subject to the gov. at home; they were ruled by highly paid, self-seeking officials, whose one ambition was to make so much out of the new country that they might return home enriched with their gains. The Sp. colonists were chiefly engaged in mining. The Portuguese aimed at placing factories at convenient ports for trading purposes. Neither country aimed at cultivating the land it had seized, and neither was successful at ruling the natives or at settling down and making a home in the new conditions. By the end of the 18th cent. Portugal had lost everything except a few tns of little note in India, a strip along the coast of Africa, Brazil (q.v.), which later asserted its independence and became a rep. (1822), and Macao (q.v.). Spain eventually lost her possessions in S. and Central America during the 19th cent., and her other C.s she ceded to the U.S.A. after the war of 1898-9.

The earliest Brit. C. was Newfoundland, annexed by Sir Humphrey Gilbert in 1583. During the 16th and 17th cents. Great Britain was urged to send her sons across the seas by a spirit of rivalry with other European states. But other causes sent them to the New World. Religious differences led to the sailing of the *Mayflower* from Plymouth to New England in 1620. The settlers in N. America were organised as chartered companies, with royal letters patent. They remained under the supervision of the gov. at home, but developed according to their own needs. They traded almost entirely with Great Britain, to whom they sent raw materials, receiving in return manuf. products. The Brit. empire in India (see INDIAN SUBCONTINENT), which was not technically a C., having a secretary of state of its own, began through the commercial industry of the E. India Co., which

was incorporated in 1800. The new possessions which accrued to Great Britain during the 18th cent. were, chiefly, trophies of war. Gibraltar (q.v.), the gate to the Mediterranean, and as such of invaluable importance to a maritime country, was captured in 1704. Through the victories of Clive and Wolfe, before the end of the cent. Great Britain reigned supreme over India and Canada (q.v.), which did much to compensate for the loss of North America. The 19th cent. was a period of development and consolidation. Australia, first used as a dumping-ground for convicts, had grown greatly in prosperity, and its different provs. were united into an autonomous commonwealth in 1901. After the rebellion of 1837-8, responsible self-gov. was given to the C.s of Brit. N. America, the last to receive it being Brit. Columbia in 1863. In Africa, after the Transvaal War (1899-1902), the C.s in the S. were united under the name of the Union of S. Africa (q.v.), with a representative gov. of its own. Other Brit. C.s which have (or have had) self-gov. are New Zealand and Newfoundland (qq.v.). Newfoundland's administration was vested in 1934 in a Commission of Gov. under the supervisory control of the Imperial gov., but in 1949 the is. joined the Canadian Confederation.

The term C. no longer applies to Australia, Canada, New Zealand, S. Africa, Ceylon, and Ghana (formerly Gold Coast), which are styled dominions (see DOMINION STATUS). The Statute of Westminster, 1931, provides that the expression 'colony' shall not, in any Act of the U.K. Parliament passed after 1931, include a dominion or any prov. or state of a dominion. The Brit. Parliament has no veto over the legislation made in the dominions or in self-governing C.s, but the Crown appoints the governor or governor-general, who is responsible to the imperial gov. A dominion gov. may make recommendations as to the appointment of a governor-general, as was done in the case of Sir Isaac Isaacs, who was made Governor-General of Australia in 1931, and, a few years later, in the case of Sir Patrick Duncan, the Governor-General of the Union of S. Africa, and his successor Maj. G. B. van Zyl. The term C.s is used loosely to describe all Brit. ters. that have now become self-governing, though strictly they comprise C.s, protectorates, protected states, and trust ters. Few are now without some popular element in the legislature, and in many elected members form almost the whole of the legislative assembly and a majority in the executive council. Some, such as Jamaica and the regions of Nigeria, are already not far from internal self-gov., which they will achieve in due course as Ghana achieved it in 1957. See COLONIAL LAW; EMIGRATION; and COMMONWEALTH AND EMPIRE SETTLEMENTS ACTS. For detailed accounts of the hist. of C.s see articles on the chief colonising countries, Great Britain, Spain, etc.; see also the entries on the various dominions or C.s mentioned in this article. See also bibliographies for BRITISH

COMMONWEALTH and COLONIAL DEVELOPMENT AND WELFARE, and Lord Hailey, *An African Survey*, 1938; E. Walker, *Colonies*, 1944; P. T. Bauer and B. S. Yamey, *The Economics of Undeveloped Countries*, 1957.

Colophon, final paragraph found in some MSS. and in printed books before the introduction of title-pages, giving the name of the author, the date and place of production, and the name of the copyist or printer, pious remarks being frequently added in the case of old MSS.

Colophon, anct Ionian city in Asia Minor, near the coast, between Lebedus and Ephesus, the bp. of the poet Mimnermus.

Colophony, **Common Resin**, or **Resin**, exudes from certain species of pine in a semi-liquid state. This is the crude article, and consists of the resin proper and turpentine. On distillation the turpentine is obtained and the resin left behind. This is a brittle, solid, and semi-transparent substance, varying from pale yellow to dark brown in colour. It is insoluble in water, but dissolves in alcohol, chloroform, etc. It burns with a smoky flame and melts easily, decomposing if heated much, giving resin-oil as a chief product. It is used extensively in soap manuf., the sizing of paper, and as a protective in soldering.

Coloquintida, see BITTER APPLE.

Colorado, one of the states in the Mt. Div. of the U.S.A. It is bounded on the N. by Wyoming and Nebraska, on the E. by Nebraska and Kansas, on the S. by Oklahoma and New Mexico, on the W. by Utah; its lat. is 37-41° N. and its long. 102-109° W., its area is 103,967 sq. m. and its pop. in 1950 was 1,123,296. C. is crossed from N. to S. by ranges of the Rocky Mts, having close upon 50 peaks upwards of 14,000 ft in altitude; Elbert, the highest, is 14,431 ft, the next highest, Blanca, being 14,363 ft; and at least 300 peaks are estimated to exceed 13,000 ft. Six of the many passes which cross the ranges are at an altitude of upwards of 12,000 ft: the Argentine Pass is at a point 13,132 ft high. Railways cross many of the passes, traversing valleys and canyons in their course and presenting examples of great engineering skill. The Denver and Rio Grande W. railway crosses Marshall Pass at 10,856 ft, and in 1928 the Moffat Tunnel, 6.4 m. long, was opened under James Peak. In the central mt region are the superb parks or rich mt valleys, the canyons, and the hot springs which have often been described. The E. rivs. of the state belong to the Mississippi valley, the W. to the C. R. Of the former the most important are the S. Platte, the Arkansas, and the Rio Grande del Norte, draining the Atlantic slope; while to the latter belong the Bear and the Gunnison or Grand rivs., which drain the Pacific slope. The climate of C. is very salubrious and regular; its atmosphere is remarkably dry, rendering sojourn there most beneficial to consumptives and asthmatics. Its many medicinal (chalybeate, sulphur, and soda) and thermal springs, also contribute to make the

state a very valuable health resort. Of C.'s 86,500,000 ac. some 26,000,000 are grazing lands, while c. 20,000,000 ac. are forest land. About 3,000,000 ac. are under irrigation. The prin. irrigated crop is alfalfa; others are hay, sugar-beet, vegetables, and grain. The chief minerals are bituminous coal and petroleum, and C. is the chief U.S. producer of uranium, radium, molybdenum, and vanadium; there are also gold, silver, lead, zinc, tungsten, lithium, and feldspar. Agriculture is the prin. industry, mining and cattle raising coming next in order. Until 1910 C. was the leading state for the production of gold; then, however, it was outstripped by California. Montana, Utah, and Nevada alone surpassed it in output of silver. The locust and the C. potato-beetle have hitherto been very inimical to the labours of the agriculturist, but headway is being made against these pests. Stock-raising is mostly confined to sheep and cattle, and the export of dead meat is an important industry. Part of C. was acquired by the U.S.A. from France in 1803 and part from Mexico in 1848. In 1858 the discovery of gold brought settlements of Eng.-speaking people to the dist.; these pioneers came from Kansas, Nebraska, and Missouri. Immigration went on in a continuous stream during 1860-2, when it was checked for some years by the warlike attitude of the native Indians, to be resumed again in 1865. C. was admitted as a state in 1876. The pop. is of mixed origin, but is largely made up of immigrants from the older Amer. states; there is a small Sp.-speaking colony in the S. The chief tns are Denver, state cap., pop. 415,786; Pueblo, 90,188; C. Springs, 45,472; Boulder, 20,000.

Colorado, University of, state institution for the higher education of both sexes at Boulder, Colorado, opened in 1877. It has colleges of arts and sciences, education, journalism, engineering, pharmacy, and music, a graduate school, schools of medicine, nursing, law, and business, and an institute of arctic and Alpine research. The enrolment in 1955 was 8900, and the teaching staff 715. The library had 756,000 vols.

Colorado Beetle, or Potato Beetle, N. Amer. member of the family Chrysomelidae. The chief characteristics of the beetle are the longitudinal stripes of black and yellow, i.e. stripes running from the front to the tail and *not across* the insect. The bright pink or red colour of the grubs will serve to identify them, provided they are found eating potato leaves, since there is no similar insect in the country that feeds on potato leaves. A further characteristic sign of both beetles and grubs is the black and rather messy excrement (frass) which is left on the potato leaves. The C. B. spends the winter buried deeply in the soil—10-12 in. in average soils. In late spring or early summer it works its way to the surface and flies in search of potato crops, travelling distances of sev. m. if necessary. On reaching a crop the beetles feed upon the potato leaves, and the females lay clusters

of eggs on the leaves, the majority being attached to the under-side. In a few days the eggs hatch into grubs, which also feed upon the potato leaves. After about three weeks the grubs are fully grown, and descend into the soil, where they turn into pupae. Ten to fifteen days later they undergo a further and final change into adult beetles. Towards the end of July and during Aug. these beetles come up to the surface, feed, and, if the weather is warm, lay eggs that produce a further generation of beetles before the haulm dies off in the autumn. With the end of summer the beetles burrow down into the

COLORADO BEETLE AND GRUB

soil again, and stay there for the winter. The effect upon the potato crop depends upon the number of beetles and grubs present. When there are many the haulm is completely stripped of leaves, and no tubers worth digging are formed. It is by the destruction of the haulm that the pests do damage; they do not burrow into the tubers themselves. The C. B. is notable for its ability to adapt itself to different climatic conditions, and for the way in which it can spread rapidly, both by flight and by making use of trains, boats, or other forms of transport. These two characteristics explain how it is that an insect formerly restricted to a semi-desert region of the W. U.S.A. has already occupied most of the N. Amer. continent, and has now colonised many European countries, including France, Belgium, Holland, Germany, and Switzerland. Since 1933 there have been a number of outbreaks in England, but by the exercise of drastic measures the pest has so far been prevented from establishing itself. The kinds of insect most frequently

confused with the C. B. are the useful lady-bird beetles (marked with black spots on an orange or red ground colour), and their grubs and pupae; the burying or sexton beetles (much larger than the C. B., and marked on the back with orange-red and black bands from side to side); and the cockchafer (q.v.) (yellowish-buff in colour).

Colorado Desert, immense desert in the S. of California, U.S.A., situated to the W. of the Colorado R. It contains the Coachella Valley, the lowest part of which once formed the San Felipe Sink, about 300 ft below the level of the sea. In 1891 the flooding of the Colorado R. formed a lake of 8000 sq. m. in the Coachella Valley. This to some extent dried up afterwards.

Colorado River: 1. Large and remarkable riv. of SW. U.S.A. It rises in the Continental Divide in the NW. corner of Rocky Mt National Park, Grand co., Colorado. It receives Dolores R. and Gunnison R. in Colorado, Green R. and San Juan R. in Utah, Little Colorado and Gila R. in Arizona. From a generally southerly direction the riv. turns due W. to cut through the mt ranges, then again due S., entering the gulf of California after a course of about 1400 m. The C. R. is unique in the world by reason of the wonderful channel it has carved out for itself. It flows for miles at a time at the bottom of a deep trench, or canyon, which it has cut out through stratum upon stratum of rock. The walls of these canyons are often from 4000 to 7000 ft high, sometimes rising sheer from the stream; sometimes there has been a fall of rock which breaks up the perpendicularity, and which now and then gives rise to a strip of fertile ground. The most remarkable of these ravines is the Grand Canyon (q.v.), the most extensive not only of the Colorado canyons but of any in the world. This occurs after the junction of the Colorado Chiquito with the main stream. The riv. makes its way for about 200 m. through a great plateau, and the Grand Canyon is the result. Further down is the Black Canyon, whose height is about 1000-1500 ft, and whose length is 25 m. In this dist. are to be found numbers of abandoned prehistoric dwellings, some on cliffs in the canyons, others on high ridges. This seems to indicate that at some distant time it was more adapted for the support of human life than it is now. Navigation of the C. R. is possible only for about 600 m. The riv. is used extensively for irrigation and power. The Colorado-Big Thompson project provides for diversion of water from the riv. on the W. slope of the Continental Divide, through Alva B. Adams Tunnel to Big Thompson R. on the E. slope, where dams divert water for the irrigation of 615,000 ac. in the basin of South Platte R. in NE. Colorado. There are hydro-electric plants at Olympus Dam on Big Thompson R. and at Green Mountain Dam on Blue R. Hoover (Boulder) Dam, between Nevada and Arizona, is the chief unit in a programme of flood control, power, and irrigation for the basin of the lower Colorado R. Other units are Parker Dam and Davis Dam, N. of Yuma.

The Imperial Dam diverts water into the All-American Canal for irrigation of the Imperial Valley.

2. Texas, U.S.A.; rises in the tablelands in the NW. by many heads, the chief being N. Fork and Salt Fork; flows SE. for about 715 m., entering the bay of Matagorda just SW. of Matagorda. Chief towns on its banks: Austin (state cap., at the head of steamboat navigation), Bastrop, and La Grange.

Colorado Springs, cap. of El Paso co., Colorado, U.S.A., 65 m. SE. of Denver. It is a favourite summer and health resort, standing in lovely scenery at an altitude of 6000 ft, and sheltered by mts on the N. and NW. It produces film, wood, granite, concrete, and dairy products, vaccines, chemicals, motor trucks, and mechanical appliances. Gold refining and meat packing are also important industries. Ent Air Force Base is H. Q. of Air Defence Command Pop. 45,472.

Colorno, lt. tn, in Emilia-Romagna (q.v.), on the R. Parma, 10 m. N. of Parma (q.v.). It has a fine palace of the Farnese (q.v.) family. Pop. 2500.

Colosseum, name of a celebrated amphitheatre in Rome (see next page), one of the most important monuments of Rom. antiquity. It was begun by Vespasian, finished in AD 80 by Titus (qq.v.), and was known originally as the Flavian amphitheatre, Flavius being the family name of these two emperors. The name C. was first employed by Bede (q.v.) in the 8th cent., in reference, no doubt, to its colossal size; it was the colossal building *par excellence*. The C. was used for combats of gladiators and wild beasts; after the shows the arena was often filled with water and used for nautical displays. It is now in ruins—a gigantic stone carcass. Sev. times ravaged by fire and always restored, it served the barbaric pleasures of the Romans until the end of the 6th cent. Since then it has suffered pillage at the hands of the barbarians, has been used as a fortress by brigands of noble Rom. families, has been transformed into a huge quarry, marble for the forum being calcined there in lime-kilns, and its own stones have been carried away for building purposes. Pope Benedict VIII saved it from further devastation by consecrating it to the memory of the Christian martyrs and by erecting crosses and oratories within its walls. Popes Pius VII, Leo XII, and Pius VIII further preserved it by buttressing the walls, etc. In form the C. is an ellipse whose axes measure 615 ft and 510 ft; its height is 160 ft to 180 ft, and the arena about 281 ft by 177 ft. It is estimated to have held seats for 87,000 persons and standing room for 20,000 more.

Colossians, Epistle to the Colossae was a town of NW. Phrygia, in the valley of the Lycus. This epistle, one of the four captivity letters, was written by St Paul in Rome about AD 62, on the occasion of the springing up in the church at Colossae of a Judaeo-Gnostic heresy. The chief features of this heresy were the worship of angelic mediators and asceticism. The Colossian church was mainly Gentile, and this doctrine was taught by converts from

Judaism, who tried to impose its ceremonial observances upon their Gentile brethren. Epaphras, the founder of the church at Colossae, informed St Paul of this, and the Apostle wrote to combat this invading 'philosophy' and earnestly contend for the supreme dignity of Christ. The epistle contains a remarkable statement of the cosmic significance of Christ, pre-existent, divine, and the goal of all creation. The epistle was dispatched by the hands of Tychicus, who carried the Epistle to the Ephesians at the same time. The latter, being a circular letter to other

easily digested and is essential for early health.

Colotomy, that operation which involves opening into the colon.

Colour, sensation excited by the action of rays of light on the retina of the eye. Light consists of electro-magnetic waves, and its properties depend upon the wave-length of the waves. Of the whole group of radiations of the same nature, ranging from long wireless waves on the one hand to X-rays and gamma-rays on the other, the eye is sensitive to only a narrow band of wave-lengths. In this band the longest

THE COLOSSEUM, ROME

Anderson

churches besides Ephesus, is probably that described in iv. 16 as coming from Laodicea to Colossae. See L. B. Radford, 1931; also commentaries by J. B. Lightfoot, 1876; T. K. Abbott, 1897.

Colossus, word originally used by the Greeks, and afterwards adopted by the Romans, to designate statues that were more than life size, and particularly those of gigantic proportions. The name was especially used to signify the celebrated enormous statue known as C. of Rhodes, (see APOLLO OF RHODES). Other famous colossi of the ancient world were the statue of Athena in the Parthenon (by Phidias) and that of Nero in his Golden House.

Colostrum, or **Beastings**, is the first milk taken from a cow or other animal following parturition. It is usually rather yellow and thicker than ordinary milk and contains more protein. The extra protein is in the form of globulin which is very

waves excite the sensation of red and the shortest that of violet. Ordinary white light from the sun or from an incandescent solid or liquid can be resolved into its components (by a prism, for example) to form a spectrum in which the radiations of each particular wave-length are concentrated at one point. In this way it is shown that the radiation that excites in the eye the sensation of white consists of a mixture of radiations which separately produce sensations of C. Seven different C.s (red, orange, yellow, green, blue, indigo, and violet) are conventionally distinguished in the spectrum, but as each shades off gradually into its neighbours there is no sharp demarcation between them, and most observers find difficulty in accepting all these C.s as distinct, preferring to regard the blue, indigo, and violet, for example, as shades rather than as separate C.s. Certain C.s such as brown

and purple are not found in the spectrum, and are not induced as sensations when light of any one wave-length falls on the eye.

Although ordinary white light consists of a mixture of all the spectral C.s, the sensation of white can also be produced by other mixtures such as that of blue and yellow lights of appropriate intensities, or by red, blue, and green. This fact may be used in the production of white light by electric discharge lamps, the light from which appears to the eye to be indistinguishable from ordinary white light, although the intensities of the various C.s present are not necessarily the same in the two cases. In the same way lights of such wave-lengths as separately produce the sensations of pure spectral C.s may give, when mixed, a sensation indistinguishable from that of another spectrum C., or of a C. not found in the spectrum. A mixture of green and red lights, for example, produces the sensation of yellow. The C.s of non-luminescent objects therefore depend upon the nature of the light falling on them, upon their action on this light, and upon the reaction of the eye to the light transmitted to it from the objects. With few exceptions the action of a coloured object upon the light falling on it is merely one of subtraction of one or more spectral C.s. Thus when white light falls on a red glass the glass appears red when viewed by transmitted light, because the light passing through it has the wave-lengths associated with the sensation of red. This light may be either radiation of a narrow band of wave-lengths at the red end of the spectrum, or a wider band in which red is the predominant C., because the red light is of a higher intensity than the orange and yellow. Similarly a blue glass appears blue because it absorbs all the rays except those at the blue end of the spectrum, while if the red and blue glasses are superimposed any radiation transmitted by the one is absorbed by the other, with the result that the combination looks black. Opaque objects act in a similar way. The light reflected to the eye penetrates the surface of the object for a short distance while undergoing reflection, and in doing so some of its C.s may be absorbed. If there is no preferential absorption the object appears white when viewed in white light, and when viewed in coloured light appears to be the C. of the light. A blue object on the other hand appears blue in white light because it absorbs light of the red end of the spectrum, and reflects only that from the blue end. If viewed in blue light the light is reflected and the object still appears blue, but if only yellow light falls on it none is reflected, and it appears black. Most blue objects, however, reflect appreciable amounts of green light as well as blue, and therefore appear green in a pure green light. When two pigments are mixed both may continue to absorb the same C.s as before. Thus when white light falls on a mixture of blue and yellow pigments the blue particles absorb all but the blue and green light,

and the yellow all but the orange, yellow, and green. The only light not absorbed by either is therefore green, so this is the C. seen by the eye. It is very important to distinguish carefully between the effects produced by the mixing of coloured lights and of pigments.

C. has three varying properties: it may be said to possess *hue*, *purity*, and *luminosity*. Its hue or tint gives it its name, as, for example, ultramarine and indigo blues. The purity or richness of a C. is determined by the amount of white light which is diluting the tint, and according to its purity we talk of the paleness or deepness of a given C. Again, the luminosity determines the shade of a C. and gives it its quality of darkness or brightness. Various theories as to the mode of C. perception have been put forward, but all meet with difficulties. Young (1807) and Helmholtz (1853) believed that the retina contains three kinds of colour sensitive cells. Each of these is excited by only one C., and it is supposed that there are three physiologically primary C.s. Opinions differ as to what these C.s are, but we may take them as being red, green, and violet. According to this theory, if the cells sensitive to all three C.s be simultaneously excited, according to the proportion of excitation of each set of cells then the resultant impression may be either a simple C. or white. Similarly, simultaneous excitation of the cells sensitive to green and violet would result in some C. in the spectrum, ranging between green and violet, according to the proportion of the excitation of the two cells. This theory will account for the appearance of consecutive coloured images. For example, if a red object be viewed for a long while, the eye becomes fatigued to red, and in darkness an image composed of green and violet will result in an after image of a pale greenish-blue hue. Viewing an object in white light with the eye fatigued to red, then, causes one to see an intense complementary image coloured by a blend of green and violet. *See also INTERFERENCE; LIGHT; SPECTRUM; VISION, DEFECTS OF.* *See A. H. Church, Colour, 1901; W. de W. Abney, Researches in Colour-vision, 1913; E. R. Watson, Colour in Relation to Chemical Constitution, 1918; W. H. Bragg, Universe of Light, 1933.*

Colour, in Art. Primary C.s are red, yellow, and blue in practice, in contrast to the red, orange, yellow, green, blue, indigo, and violet in pure physics. Secondary C.s are produced by a mixture of pigments, representing the primaries. These are orange (a mixture of red and yellow), green (blue and yellow), and violet or purple (red and blue). Tertiary C.s are produced by a mixture of two or more of the secondaries; generally dark and tending to greys or browns, they are in practice lightened or darkened by the addition of white or black pigment. *See also PIGMENT.*

Colour Bar (*see also APARTHEID*), discriminatory legislation or regulations, or a spontaneous prejudice and sentiment, against coloured races. It is of great

antiquity, and, in its wider implications, is a corollary of slavery. The white man's more efficient technical equipment and more advanced intellectual achievements tended to make him contemptuous of native, and especially African native, manners and customs and culture generally. This attitude of 'superiority' does not, however, explain the discrimination, which is motivated by the white man's determination to retain his privileged position. In this article the phrase C. B. will be used in the technical sense of formal discriminatory legislation rather than in the sense of discrimination social, religious, economic, and educational, both official and unofficial, which sometimes characterises the general relationship between the white man and the coloured.

Discriminatory or differential laws and regulations are mainly found in Africa—in the Union of S. Africa, S. Rhodesia, and to a limited extent in the Brit. dependencies in E. Africa—and in the S. states of the U.S.A. In the Brit. W. Indies or other parts of the world under Brit. dominion the C. B. is almost non-existent. To a much smaller extent W. Africa, not being suitable for white settlement, also is markedly free from colour restrictions, especially as there exists a large independent pop. of peasant proprietors. C. B. may be said to be non-existent in the Fr., Portuguese African, and other dependencies; but this would not be true of the Dutch colonies, especially the Dutch E. Indies, where before the Second World War there was a strong Nationalist movement founded largely on the disparity, social and economic, between the Dutch or other Europeans there and the natives. In the Asiatic dependencies of other European powers the C. B. question does not arise, though in S. Africa and Kenya there are discriminatory laws against the large Indian immigrant pop. in those two ters. The C. B. legislation in the Union of S. Africa, begun in 1912, had an important psychological effect, as it seemed to justify all the unwritten C. B.s which had developed in the previous century or more in that country. A process was begun which soon excluded natives from working on the railways and in other forms of gov. employment, and led finally to the abolition of the Cape native franchise which began in Cape Colony in 1853 and ended in 1936 with the passing of the Native Franchise Bill. The removal of the Cape Coloured from the electoral roll in the Cape Prov. of S. Africa followed the passing of the Separate Representation of Voters Act Amendment in 1956, which brought into force the Separate Representation of Voters Act of 1951.

The C. B. in S. Africa had its foundation in the clause of the original constitution of the Transvaal: 'There shall be no equality between black and white, either in Church or State,' the very antithesis of the political ideal implicit in Cecil Rhodes's phrase: 'Equal rights for all civilised men south of the Zambesi.' In 1912 a political philosophy, based on the segregation of natives and Europeans, was put forward by the S. African Labour

party, a policy which assured the permanent maintenance of the white community in a position of political and economic supremacy, and the preservation of the standards of European civilisation by reducing the contacts of the 2 races to the minimum which the economic system necessitated. Gen. Hertzog (q.v.) came into office on this programme in 1924, and developed it to the full. But this C. B. policy only works effectively where there are big industries or mines, especially where white labour is organised. The number of natives residing in urb. areas is rigorously controlled and their locations kept separate from the European residential areas. It is at the same time assumed in S. Africa, as in S. Rhodesia, which has adopted the same principles, that within the sphere of the native reserves the professions and skilled trades shall be fully open to Africans. Union policy has not only strongly influenced S. Rhodesia, but also to some extent determined the attitude of European settlers in the highlands of Kenya. Most of the Brit. ters. in tropical Africa, however, are climatically unsuitable for white settlement and their development has been characterised by a different philosophy. But local opinion in Kenya has favoured the S. African segregation policy, while public opinion in Britain has taken the view that native interests deserve more explicit consideration. In Fr. colonial ters., C. B. does not exist, for economically the aim of the Fr. is that the mother country and the colonies should form a unit—a centralising attitude bound up with the 'assimilationist' theories which had their origin in the egalitarian doctrines of the Fr. Revolution and which remain the foundation of Fr. colonial philosophy.

Although in S. Africa the operation of the legal C. B. is confined to the mines, the trade union system applies in practice a C. B. discrimination in most of the skilled trades. The state, moreover, supports this, the so-called civilised labour policy, by legislation designed to prevent natives from entering the higher grades of skilled employment. But the policy of the S. African gov. is to encourage natives, within their demarcated areas, to become skilled artisans and to practise professions. The Mines and Works Amendment Act, 1926, is the most conspicuous C. B. measure, and the one that is generally known as the C. B. law. It authorises the gov. to make regulations providing that certificates of competency in certain occupations shall be granted only to Europeans and certain classes of coloured persons; in practice the regulations apply to the grant of certificates of competency for certain operations in mining. The 'civilised labour' policy exists in principle in S. Rhodesia, but in the absence of any large 'poor white' community, and of large industrial organisations, it is less in evidence than in the Union; but there is none the less a considerable body of differential legislation, particularly in relation to land apportionment, trade unions, marketing

systems, and the regulation of the movements of natives by the 'pass' system. The pass laws appear in their most conspicuous form in S. Africa—there are trek passes to enable a native to leave his reserve, an identification pass to satisfy the police, a travelling pass to buy a ticket, a monthly pass serving as a contract of service, a daily labourer's pass, and sev. other kinds. These passes were originally in the nature of police regulations, but were later utilised to assist in securing a supply of labour, and to prevent desertion; and, in their latest stage, while still used to safeguard the labour contract, they have become part of the machinery of the segregation policy, being instrumental in restricting the influx of a native pop. into urb. areas. The pass system also exists in S. Rhodesia and Kenya, but in both cases the regulations are simpler and less exacting. In Kenya the use of pass laws originally arose from the need to check wandering tribesmen and stock thieves, and it was only later that they were used to meet labour difficulties. Despite the C. B. tendencies in imitation of S. Africa, there is no actual C. B. legislation in S. Rhodesia; but the Industrial Council Act and the strength of organised labour in transport and skilled occupations there have been able to prevent the rise of any large class of native skilled workers occupied in the European economic system. Kenya does not show the same conflict of interests between the European and African as in the industrial development of the Union of S. Africa. Such conflict with European interests as does exist has arisen from the position claimed by Asiatics in the political field and in regard to land settlement; and in the industrial sphere the settler community has supported the tendency of Africans to replace Asiatic skilled labour. These considerations largely explain the nature of the differential laws applicable to natives in Kenya; they deal primarily with the place of the native in the European farming areas and have only in a small degree been motivated by apprehensions of the result of contact in the industrial and social fields.

Whether there is any biological justification for the assumption of coloured inferiority in intellectual capacity to the white man, or real biological foundation for the concept of 'race,' may be studied in A. C. Haddon, *The Races of Man*, 1929; J. Huxley and A. C. Haddon, *We Europeans*, 1935; Ruth Benedict, *Race and Racism*, 1942.

Unlike the old Transvaal Constitution (quoted above) the Amer. Declaration of Independence, 1776, proclaimed as a self-evident truth the fact that all men were created equal and endowed by their Creator with certain inalienable rights, including 'liberty.' But evidently the framers of this constitution regarded Negroes as property and therefore incapable of having rights. After the Civil war the whites of the S. feared that if the Negroes had the vote they might outnumber them; hence it was decided

that only those who paid a certain sum in taxes could vote, and this is still the law in most of the states where there are large numbers of Negroes—a law which is essentially discriminatory in view of the poverty of the Negro. But while in the S. the Negroes are made to keep apart from the whites in all public places such as railway stations or public conveyances, and in the N. contact is reduced to a minimum, there exists no C. B. legislation.

The foregoing observations take account of the C. B. simply as a problem of social adjustment. The Christian view, however, is that of a moral problem, and the great majority of Christian Churches are strongly opposed to the C. B. Rom. Catholic theology is explicit on this point: race prejudice, discrimination, and compulsory racial segregation are sinful. The assertion rests upon 2 fundamental principles, as follows: (1) Since all men have been created by God, and are consequently sons of the same Eternal Father, they all possess the same fundamental human dignity and rights. (2) The redemptive mission of Christ was fulfilled on behalf of all men, who therefore enjoy the same supernatural dignity and rights as members of His Mystical Body.

Colour-blindness (Achromatopsia), affection of the eyes which renders them unable to distinguish certain colours or shades of colour; in an extreme form, which is very rare, everything appears grey. C. is nearly always congenital. More common to the male than the female sex, it is transmitted through the female to male children. About 10 per cent of the male population have some defect of colour vision. The colour-blind woman is rare. The most common form of defect consists in difficulty in distinguishing differences between red, green, and yellow. People with this defect are sometimes called red-green blind. They can see the colours but have difficulty in distinguishing which is which. There is also a defect in which blue, green, and yellow are confused. Often boys with defective colour-vision grow up unaware of their disability, and since 1953 many education authorities test schoolchildren for colour vision.

It is wise for the test to be repeated between the ages of 16 and 20, as the condition may have deteriorated by then. The cause of colour-blindness is in some cases a defect in the function of the rods or cones of the retina (see *under EYE*), and in others the defect lies in the nerve cells of the visual centre in the brain. There are various test-cards used in the Mercantile Marine service and for railways, which show the colours of the spectrum, and candidates for appointment are required to pick out the various colours as they are named. Holmgren's test consists of matching and naming five finely matched shades of each of twelve different coloured wools, which are handed over, well mixed up, to the examinee. This has now been abandoned. The distinguishing feature of the Jap. Ishihara tests (10th ed. 1953; H. K. Lewis, London) is the application of the peculiarity of red-green C. which sees blue and yellow more brightly than red and green. The test plates consist of groups of tiny circles in varying colours and intensities of the same colours. Some of these form a numeral which may be read off correctly or incorrectly as it is seen by the person being tested. A coloured lantern test is also in use. See also HEREDITY, *Types of Inheritance*. See W. D. Wright, *Researches on Normal and Defective Colour Vision*, 1946.

Colour Photography, see PHOTOGRAPHY.
Colour Printing is of three styles: relief, intaglio, and lithography. Relief is the oldest style, and includes printing from wood blocks, photo-engraved surfaces, and stereotype and electrototype plates. Intaglio work began in the 15th cent., and includes engraving on copper or steel, etching, mezzotint process, and photo-gravure. Printing in colour may have been practised even before the time of John Gutenberg of Mainz, the reputed inventor of printing, and some authorities think that the Romans used a process of copying by engraving on ivory and then making tinted reproductions on canvas by means of plates. Even if this is mere speculation, as indeed is the assumption that C. P. was known in the Far E. before the 18th cent., there is extant a 5th-cent. work, the 'Gospels of Ulphilas,' now in the Univ. Library, Upsala, the text of which is in gold and silver on vellum of a mauve hue. There are also in the Victoria and Albert Museum some examples of fabrics whose patterns would appear to have been made from wood blocks in the 11th cent.; and again, in the 15th cent. a Venetian decree was issued for the protection of the local industry of making coloured playing-cards and pictures of saints. But according to the leading authorities, notably R. M. Burch, C. P. had its origin in attempts to imitate by mechanical means the colour decoration of the MSS. which furnished the text for the earliest printed books (see *ILLUMINATION OF MANUSCRIPTS*). It is doubtful whether, in the earlier period of C. P., any separate pictures in colours, as distinct from rubricated typography and other coloured type, were produced, one difficulty, however, being to distinguish, in the extant

MSS., where the printer's work ends and hand-work begins. The chief printers in colour at this period were those of Venice, London, Mainz, Paris, and St Albans. The 16th cent., however, saw the rise of the art of printing pictures in colours by the method which is known to this day as *chiaroscuro* (q.v.), the aim being the rendering of various tones of one colour. Among the earliest printers in *chiaroscuro* were Ugo da Carpi, who is believed by older writers to have been the inventor of the process, and Jost de Necker, an Antwerpian, believed by Bartsch to have invented the process; but there are other names anterior in date to these, including Maier of Landshut, a Ger. artist, and Francesco Dentato, a Venetian, who printed in a dark brown colour; and it was also practised by many of the great masters of engraving, painting, and drawing who were contemporary with the inventor of the process, whoever he was. These included Burgkmair, Cranach, Dürer, many of whose drawings, engravings, and woodcuts suggest *chiaroscuro* work. Colours in *chiaroscuro* printing were evidently applied by the press at this time, hand-colouring or stencilling being a later process used to supplement the press colouring and chiefly for colouring playing-cards, though to some extent it was used in the 16th, 17th, and 18th cents. for book illustrations. The art of producing prints in the original *chiaroscuro* style appears to have died out with John Skippie of Lodbury, about whom little is known beyond the fact that he was educ. at Merton College, Oxford. Skippie, who lived in the 18th cent., used three- or four-tone blocks, generally browns, ochres, or olive greens in varying shades. With the 18th cent. comes the rise of intaglio-printing processes. Mezzotint engraving was invented by Ludwig von Siegen (1609-c. 1675), an officer in the service of William VI, landgrave of Hesse, in the 17th cent.; but the printing of mezzotinted plates is a late 18th-cent. art, and together with it, two other processes—stipple engraving and aquatinting—were invented. All these are 'grain' processes, i.e. the grain is formed by a series of dots so arranged as to conform to the planes and modelling of the subject (see *under ENGRAVING*). The first engraver to practise stipple work was Johann Lutna, a 17th-cent. Ger. silversmith, sev. of whose plates are extant. Notable Fr. engravers in stipple were Jean François, of Nancy (b. 1717), Louis Bonnet (b. 1743), and Gilles Demarteau (b. 1722), the last two being engravers in the crayon style. Bonnet printed in colour from sev. plates to imitate pastel. The first Eng. stipple engraver was Wm Wynne Ryland (1732-83), who, after completing his training in Paris, became engraver to King George III. Improvements on the process were made by a London engraver, Robert Laurie (c. 1755-1836), who invented a method of producing copperplate pictures in colours at one impression, by inking the plate with stump brushes—a combination of mezzotint and stipple designed to produce book

illustrations at a low cost. Aquatint, the latest of the intaglio engraving processes not dependent on photography, is really tone etching, the graving being effected by the use of acid, so that there need be no lines. The authorities ascribe the invention to Jean Baptiste le Prince, a Fr. painter and engraver, who d. in 1781, and give the date of the first adaptation of the aquatint method to C. P. as about 1768. In England the earliest exponent was Paul Sandby (1725-1809), whose work was in monochrome only. Other notable names in the art of aquatinting are P. L. Debucourt, court painter to Louis XVI, whose 'Promenade in the Gallery of the Palais Royal' is famous; J. F. Janinet (b. 1752), a fine draughtsman and designer; and J. T. Prestel (b. 1739), a Ger. artist. Some of the most familiar 18th-cent. Eng. prints in colour are Wheatley's 'Cries of London,' of which modern copies are still produced. Jap. colour prints, made from wood blocks, were well advanced by the early 18th cent., the greatest of the earlier exponents being S. Harunobu, who was imitated by Utamaro, the latter's prints initiating the European vogue of Jap. prints and their influence on colour in European painting. Hokusai (1760-1849) was the most famous of all Jap. colour-prints artists, his best-known series being the 'Thirty-six Views of Mount Fuji' (see JAPAN, Art). In the 19th cent. there was a notable revival of the old chiaroscuro process in a new form known as chromo-xylography, and the most famous name in this connection is that of George Baxter (1804-67), the son of a Lewes typographer, whose process, really only printing in oil colours from wood blocks, consisted in colouring an impression from an outline or key block, which was either a copper or steel plate or a litho stone, by successive impressions from colour blocks of wood or metal. He certainly achieved his object, which was to produce ornamental prints in colours which resembled highly coloured painting in water colour or oils, and for some time he held the field alone. Later names in chromo-xylography were those of Charles Knight (1791-1873), the pioneer of cheap illustrated magazine literature, whose coloured plates for *Old England Worthies* (1847) were well known; George C. Leighton (b. 1820), the printer-publisher of the *Illustrated London News*, in 1884; Henry Vezelley (1820-94), who engraved pictorial subjects for popular books; Edmund Evans (b. 1826), the best known of all the wood engravers for colour work except Baxter: his coloured line engravings, e.g. those after pictures by Walter Crane, Randolph Caldecott, and Kate Greenaway, are remarkable for daintiness, and he will always be remembered as the pioneer in the production of cheap colour-illustrated children's books; Benjamin Fawcett (b. 1808), whose coloured prints in the illustration of the books he pub. on Brit. birds, moths, and butterflies exemplify his process of fine printing in colours; and the Knöfler brothers (b. 1859 and 1861) of Vienna,

whose beautiful colour prints soon became familiar in the windows of London art dealers. The 19th cent. also witnessed the introduction of an entirely new colour-printing method, chromo-lithography (for the principle see under LITHOGRAPHY). The application of the principle of lithography to C. P. consists, as in chromo-xylography, in first preparing the design, and determining the number of tints in which it is to be reproduced, and then drawing on a litho stone that portion which is to be in a particular colour, and so on with each of the other colours, the print being made up by the successive impressions from all the colour stones. This process is considered to begin with the issue of the *Pacific Monumentum*, a record of the facts of the peace of 1815, by J. A. Barth, of Breslau, produced in 1816. Other notable names in the earlier period of chromo-lithography are those of Engelmann, Hülsmann, Owen Jones, Michael Hanhart, and Wm. Day. The later stage in chromo-lithography dates from the middle of the 19th cent., when lithographic printing machinery was introduced. After this comes the adaptation of photography to chromo-lithography, said to have been suggested by Mr. Burnett, a member of the Edinburgh Photographic Society, in 1857—called photo-chromo-lithography, and later perfected under the name of photochromy. A 'photochrom' is a colour photograph, the base of which is generally a collotype print, produced direct from the film or through the medium of a transfer on to stone. Modern Fr. chromo-lithographs are among the best examples of this process, especially those of Pierre Vidal. The artist-lithographer producing his own colour effects from stone or plate is well represented by Toulouse-Lautrec (q.v.), and there has been a modern revival of this 'auto-lithography' for posters and book illustration. Modern colour processes in printing are developments of processes for making photography the means of reproducing natural colours as far as this is possible, and the 20th cent. saw many improvements in working the three- and four-colour half-tone process. Photo-gravure, a mechanical intaglio process which superseded the hand-engraved copper plate, is now widely used for colour reproductions, especially in popular journals. See also COLLOTYPE; ENGRAVING; LITHOGRAPHY; PHOTOGRAPHURE; PRINTING; PROCESS WORK. See W. Gamble, *Line Photo-Engraving*, 1909, and *Photography and its Applications*, 1920; V. Preissig, *Zur Technik der farbigen Radierung u. des Farben-Kupferstichs*, 1909; R. M. Burch, *Colour Printing and Colour Printers*, 1910; L. C. Martin, *Colour and Methods of Colour Reproduction*, 1923; E. J. Wall, *The History of Three-Colour Photography*, 1925; H. Curwen, *Processes of Graphic Reproduction*, 1934; T. Griffiths, *Colour Printing*, 1949.

Colour-sergeant, the highest non-commissioned rank in the Brit. army (i.e. that immediately below warrant officer). It was introduced in 1813. Since 1913 the holders of the rank have always been

designated by the appointments they hold (e.g. company sergeant major) and it is usually incorrectly assumed that the rank no longer exists.

Colours, Fast, see DYE.

Colours, Military, flags and standards borne by most infantry regiments and battalions, and sometimes also by other troops. From the very earliest times banners or similar devices have been used by fighting bodies both on land and sea to act as a rallying-point and a signal. From the very fact of this practical value as a rallying-point, the banner or standard began to exercise a moral influence. This is already seen in fully developed form in the days of the Rom. Empire, when the loss of the eagle was the greatest disgrace a legion could sustain. Similarly, the flags of later times became, as it were, an embodiment of the spirit of the regiment, the link binding the soldiers of the time with the veterans of the past. The loss of the standard was the break-up of the regiment. The colours, then, were invariably taken into battle until the last quarter of the 19th cent. but now the systems of modern warfare have led to the colours being left at home by Brit. regiments. According to the present arrangement, dating from the time of Queen Anne, each Brit. regiment or battalion has two colours, the queen's colour and the regimental colour. The former is a Union flag, except in the case of foot guards. The regimental colour is a flag of the same colour as the facings of the regiment, with the name and titles of the regiment, together with the names of its pre-World War I battle honours, blazoned thereon. (Later battle honours appear on the queen's colour.) Both colours measure 3 ft. 9 in. by 3 ft. the stave being about 8 ft. 6 in. Rifle regiments, engineers, artillery, and the departmental corps do not carry colours. With cavalry (and armoured) regiments colours take the form of standards and guidons. Household Cavalry and Dragoon Guard regiments bear standards. Dragoons and now also Hussars and Lancers bear guidons. See T. J. Edwards, *Standards, Guidons, and Colours of the Commonwealth Forces*, 1953.

Colours of Animals, see ANIMALS, COLOURS OF

Colt, Samuel (1814-62), Amer. inventor, b. Hartford, Connecticut, went to sea, and later lectured on chem. In 1833 he obtained his first patent for a six-barrelled rotating breech revolver, and founded the Patent Arms Company at Paterson, New Jersey, for the manu. of these weapons. In 1852 he built the enormous works of the Colt's Patent Fire-Arms Manufacturing Company at Hartford.

Coltsfoot, popular name of *Tussilago farfara*, a herb of the family Compositae, growing wild in Britain. Its leaves are heart-shaped and denticulate. Stems bear a head of bright yellow flowers. The leaves form the basis of herb tobacco used as a remedy for asthma.

Coluber, genus of ophidian reptiles (snakes). The fifty-odd species are all

non-poisonous, and occur in Europe, Asia, and America. The eye is large, the pupil round, the scales are either smooth or keeled. The species attain a great length and are oviparous. *C. quatuorlineatus*, a native of S. Europe and the Tirol, is up to 8 ft. long; *C. longissimus*, the Aesculap snake, of S. and SE. Europe, attains a maximum of 5 ft.; *C. leopardinus* is a beautiful snake found in Europe and Asia Minor.

Colum, Padraic (1881-), poet, b. Longford, Ireland. Educ. at local schools, he removed to Dublin, where he joined the Irish Renaissance group of writers which included Yeats, Synge, E. and Lady Gregory. His second play, *The Land*, 1905, was the Irish Theatre's first success; others were *The Fiddler's House*, 1907, and *Thomas Muskerry*, 1910. With James Stephens and Thomas MacDonagh he founded the *Irish Review*, of which he was editor 1912-13. In 1914 he visited America and eventually settled in Connecticut. His vols. of verse include *Wild Earth*, 1907, and *The Story of Loury Marn*, 1937. He also wrote a large number of books for children, and ed. *An Anthology of Irish Verse*, 1948, and *A Treasury of Irish Folklore*, 1955. In 1953 he was awarded the Gregory Medal of the Irish Academy of Letters.

Columba, Saint (521-97), known also as Columkille and Colm, is said to have been b. at Garton, co. Donegal. He early learned the principles of asceticism under St. Finnian of Clonard, and embraced the monastic life at Glasnevin; ordained priest in 546. About four years later he founded the monastery of Durrow; he also founded many smaller ones in Ireland. In 563 he set out with twelve followers for the little is. of Hy or Iona, off the W. coast of Mull, Argyll, and founded a monastery there. He then settled down to the work of his life, the conversion of the Picts, Scots, and N. Eng. Through his teaching, example, and miracles the work progressed favourably, and C. estab. monasteries in several parts, all subject to Iona and a rule which he himself compiled. His biographer, St. Adamnan (q.v.), tells us that he could not bear to remain idle a moment, and the aggressiveness of some of his acts may be put down to this same cause. According to tradition as recorded in the Annals of Clonmacnoise he wrote some 300 books with his own hand, though there is scant authority for the identification of any. His life was austere in the extreme, yet everywhere his cheerfulness and virtue predisposed men in his favour. His feast is on 9 June. See W. P. Montalembert, *St. Columba*, 1868; W. F. Skene, *Celtic Scotland*, 1877; Adamnan, *Vita Sancti Columbae*, ed. J. T. Fowler, 1894; W. D. Simpson, *The Historical St. Columba*, 1927; Lucy Menzies, *St. Columba of Iona*, 1935.

Columba, Columbidae, see PIGEON.

Columba Noachi (Noah's Dove), small constellation in the S. hemisphere, close to Canis Major and Lepus. Puppis, Pictor, and Caelum are also near by.

Columban, or Columbanus, Saint (c. 545-615), Irish monk and missionary,

whose feast is celebrated on 21 Nov. *B.* in Leinster, he entered the great Celtic monastery of Bangor in Ulster. In 580 he led a band of monks on a missionary journey to the Continent, where he preached with success in Brittany and the Vosges, and founded the abbey of Luxeuil. His denunciation of the Frankish court led to his exile: he went to N. Italy and founded the abbey of Bobbio, where he *d.* His followers embraced the Rule of St Benedict, and thenceforward exercised an important influence on W. civilisation (*see* ST GALL). The Maynooth mission to

W. slope of the Rocky Mts., 80 m. N. of the U.S. line. Second to the Mississippi in vol. among U.S. rivs., it drains a basin of 259,000 sq. m., including most of Idaho, Washington, and Oregon, and parts of Montana, Wyoming, Nevada, and Utah. In the Big Bend region is the Grand Coulee, the site of a large irrigation reservoir of the Columbia R. project. Its course at first is S. through various lakes, till it reaches the N. border of Washington. It then continues its course irregularly to the Oregon frontier, before reaching which it receives, on the l.b., the Spokane

The Iona Community

THE CATHEDRAL CHURCH OF ST MARY, IONA, AND MONASTERY BUILDINGS

The existing buildings were originally founded by Benedictines, c. 1203, near the site of St Columba's church, c. 563. The church has been restored by the Church of Scotland, and the monastery buildings by the Iona Community.

China is dedicated to St C. and the missionary priests are trained at St C.'s College, Dalgan Park, Navan.

Columbarium (Lat. *columba*, dove), name of the niches or buildings for the storage of sepulchral urns containing ashes of the dead. The fancied resemblance between a dove-cote and the niches round the walls of Rom. burial-chambers gave rise to the name. Such tombs were mainly used for the poorer classes, and were erected by wealthy families for their slaves, or by funeral associations under the empire. Examples near Rome are those of the Vigna Codini at the Licinian Gardens. The *ustrina* were attached to the *columbaria*. In modern times *C.* means a room connected with a crematory, provided with niches for the funeral urns.

Columbia, with the exception of the Yukon the largest riv. of the W. side of America, rises in Brit. Columbia on the

R. and the Snake R., the latter being its largest trib. It then turns W. once more, and flows along the N. border of Oregon, casting itself into the Pacific by an estuary about 35 m. long and from 3 to 7 m. wide. Its mouth forms a deep-water harbour; ocean-going ships pass through a channel to the mouth of the Willamette R. and the ports of Portland and Vancouver. Bonneville Dam is at the head of tide-water. The C. passes through a mountainous country, and its scenery is remarkable. The salmon fisheries flourish (39,000,000 lb. annually), and there are large canning stations at the mouth of the riv. The falls, however, make clear navigation possible for only 160 m., up to the Cascades. Above these there is another navigable stretch of 50 m. reaching to The Dalles. Canals, however, allow riv. boats to go farther upstream. The C. is 1200 m. long.

Columbia: 1. Cap. and largest city of S. Carolina, U.S.A., on Congaree R. just below the falls; it is navigable to this point. C. is an important railway, trade, and distributing centre, with manufs. of cotton goods and cars, large iron-works, and trade in cotton. The state univ. was founded in 1805. Allen Univ. and Benedict College (both Negro) and Columbia Bible College are also here. Near by is Fort Jackson, a large U.S. Army post. There are many fine public buildings. C. was occupied by Gen. Sherman in Feb. 1865, and much of it burnt. Pop. 86,915, many coloured.

2. Cap. of Maury co., Tennessee, U.S.A., on the Duck R. 40 m. SW. of Nashville, in fine farming country. Many mules are raised and there are flour mills, etc. There was fighting here during the Civil War. Pop. 10,900.

3. City, cap. of Boone co., Missouri, U.S.A., in agric. and coal-mining area 20 m. NW. of Jefferson City. It manufs. shoes and clothing and is the seat of the Univ. of Missouri and Stephens College. Missouri State Historical Society Library is here. Pop. 32,000.

Columbia, British, see **BRITISH COLUMBIA.**

Columbia, District of, the seat of gov. of the U.S.A. It is an artificially rectangular piece of ter. of some 69 sq. m., within the ambit of the state of Maryland. After the Amer. colonies achieved their independence and formed themselves into a new nation, Philadelphia was at first the cap. But as there were in the beginning sharp jealousies between the various states, it was deemed wise to establish a cap. about midway between the N. and S. states along the Atlantic sea coast, this ter. at that time comprising all the U.S.A. Originally an area of 100 sq. m. was ceded for this purpose by Maryland and Virginia, but in 1846 Virginia's portion S. of the Potomac was given back to that state. The Potomac R. flanks the dist. for its entire length to the S., and also flanks part of the perimeter of the city of Washington. Since an Act of Congress of 1895 the city of Washington has been co-extensive with the dist. The dist. was formally estab. by Acts of Congress in 1790-1. Under these Congress itself assumed entire jurisdiction. Congress first met in the dist. in 1800. John Adams, second president of the U.S.A., was inaugurated in Philadelphia, but was the first chief executive to live in the White House in Washington. Thomas Jefferson, third president, was the first one to be inaugurated in Washington. The feature of the dist. is that the gov. is by Congress directly as to legislation and by three executive commissioners named by the President and confirmed by the Senate. Each house of Congress has a special committee on dist. affairs. The result is that the dist., and Washington in particular, have not grown up in a haphazard fashion, but according to a fixed plan, with the determination to make the cap. one of the most beautiful in the world. Another peculiarity about the dist. is that persons born there are

practically disfranchised. There are no municipal elections, because the gov. is in the hands of the executive commissioners and Congress. In presidential election natives of the dist. have no vote. The total pop. is 802,178. There are many industries in the dist., goods being produced primarily for local consumption. The revenue of the dist. is raised by real estate, personal, and business taxes, and from treasury grants in aid. Univs. are Georgetown, under the Jesuits; George Washington, non-sectarian; Howard, for coloured students; the Catholic Univ. of America; the National Univ.; and the Amer. Univ. Trinity College is also here.

Columbia University, New York City, was founded as King's College in 1754, reorganised as C. College in 1784, and became C.U. in 1896. It is one of the most important educational institutions in America, and owes much to Nicholas Murray Butler (q.v.), who was president 1902-45. The leading colleges are C. for men undergraduates, Barnard (founded 1889) for women, and Teachers (founded 1888—a part of C. U. since 1898). In addition there are faculties, schools, or colleges of arts, political science, philosophy, pure science, mines, engineering, chemistry, law, medicine, pharmacy, architecture, journalism, business, and social work; also Russian, E. Asian, European, and accounting institutes. The combined libraries had 3,000,000 volumes in 1956. There was a teaching staff of 4285, and the students numbered 27,000. The C. U. Press was founded in 1893. Gen. Dwight D. Eisenhower was president 1948-53. See also **BARNARD COLLEGE.**

Columbine, or *Aquilegia vulgaris*, a perennial herb, Brit. and European species of Ranunculaceae, which grows wild and is cultivated in variety as an ornamental plant. Leaves are spirally arranged, bi-ternate; flowers are sev. to a stem, with 5 petaloid sepals, 5 petals, each with a long nectar-secreting spur, and numerous stamens, arranged in whorls of 5. The androecium matures before the gynaecium, and fertilisation is effected by long-tongued humble-bees seeking pollen and nectar.

Columbine, see **HARLEQUINADE.**

Columbite, niobate and tantalate of iron. It occurs chiefly in pegmatite veins, bearing tantalite, cassiterite, and wolframite, in the Black Hills, S. Dakota, and in W. Australia.

Columbium, alternative and less usual name for the chemical element Niobium (q.v.).

Columbus, Bartolomeo (d. 1514), brother of Christopher. He was an excellent cosmographer and produced many ingenious globes, maps, and sea charts. He is said to have been deputed by Christopher to lay his project of exploration before Henry VII of England, but to have been delayed by pirates till after the patronage of Ferdinand of Spain had been obtained. He took part in his brother's discoveries, and was honoured together with him in 1493. In 1494 he went to San Domingo, of which he became governor, and where, after sev. expeditions, he d.

Columbus, Christopher (Latinised form of It. Cristoforo Colombo; Sp. form Cristóbal Colón) (c. 1446-1506), famous navigator and discoverer of the New World, b. near Genoa, where his father was a wool-carder. The exact date of his birth is uncertain, authorities varying from 1436 to 1457, but 1446 is the most probable. It is said that for a time he followed his father's trade, but he was certainly at sea before the age of fifteen. The accounts of his early voyages are doubtful and obscure, but they extended over a vast range, from the Levant to

Museo Naval, Madrid
CHRISTOPHER COLUMBUS

Iceland. In 1470 he was wrecked off the coast of Portugal, near Cape St Vincent, but he came ashore on a plank, and settled in that country. Before 1480 he had married Felipa Moniz, the daughter of Bartholomeo Perestrelo, an important navigator and captain, first governor of Porto Santo. For some years C. had been in correspondence with Paolo Toscanelli, the Florentine astronomer, as to the possibility of reaching Asia by sailing westward. This project was present in his mind as early as 1474, and had been fostered by the reports of seamen, rumours heard in Iceland, and the surmises of the ancients. His hypotheses were fairly correct. He realised the spherical form of the earth, but he underestimated its circumference. When, in addition to this, he over-estimated the size of Asia, his idea of the distance he must go was about one-third of the correct one. It was necessary for him to find

some sovereign to support him in his enterprise. He applied first to John II of Portugal, and then by letters to Henry VII of England. He visited Spain and applied to the powerful dukes of Medina Sidonia and Medina Cell, and this latter nobleman referred him to Queen Isabella. After some seven years of journeying, persuasion, and uncertainty, C. at last succeeded in obtaining the help he required. On 3 Aug. 1492 he set out from the tn of Palos with one ship of 100 tons, the *Santa Maria*, and two caravels, the *Pinta* of 50 tons and the *Niña* of 40 tons. He first went to the Canary Is., and thence, on 6 Sept., the expedition really set out. His men were insubordinate and discontented from the beginning. Whatever happened they interpreted in an adverse manner, and the variations of the magnetic needle reduced them to great terror. On 12 Oct. an is. was sighted, and named by C. San Salvador, now probably Watling Is. The expedition then cruised in the neighbourhood, discovering Cuba and Hispaniola or Espanola (Haiti). On this latter is. the *Santa Maria* went aground and had to be abandoned, and C. was compelled to return to Europe with the two caravels. Here he was received with the greatest enthusiasm, and honours were showered upon him. After six months in Spain he started westward once more, on 25 Sept. 1493, with a larger squadron and 1500 men. On this voyage the is. of Dominica was discovered. The great explorer, however, found the task of governing his colonies beyond his power, and after vexatious quarrels and illness he returned to Spain in 1496. In 1498 he made his third voyage, on which he reached the mainland of S. America, though he had coasted it as far as the Orinoco before he discovered its character. Many complaints had meanwhile been sent home from the colonists, and Ferdinand withdrew his favour from C. In 1499 a governor was sent out to supersede him, and he himself returned to Spain in chains. On his arrival the tide of popular feeling again turned in his favour and he was released with fresh honours, and in 1502 he made his fourth and last voyage in search of the passage to India. After exploring the gulf of Mexico he returned to Spain, and d. in none too prosperous circumstances at Valladolid. See Fernando C.'s life of his father (Eng. ed., 1867), and biographies by Washington Irving, 1828; Sir A. Helps, 1869; H. B. Adams and H. Wood, 1892; and Sir C. R. Markham, 1893. See also R. H. Major's trans. of his *Select Letters* (Hakluyt Society), 1847; H. Harrisse, *Christophe Colomb*, 1884, and *Christophe Colomb devant l'histoire*, 1892; M. André, *Christopher Columbus* (Eng. trans.), 1928; A. de Hevesey, *The Discoverer* (life and adventures) (trans.), 1929; *The Voyages: Journals of First and Third, and Letters concerning the First and Third Voyages* (including an account of the second voyage, by A. Bernaldez), ed. by C. J. Jones, 1930; S. de Madariaga, *Christopher Columbus*, 1939, 1949.

Columbus, Giacomo, or Diego (c. 1450–c. 1515), youngest brother of Christopher, b. at Geneva; went to Spain at the news of his brother's discovery, and accompanied him on his second voyage. In 1493 he commanded the commission entrusted with the temporary gov. of Hispaniola, but was unsuccessful, and was sent back to Spain as a prisoner in 1500.

Columbus, Samuel (1642–79), Swedish author, a friend and pupil of G. Stiernhielm (q.v.). He is especially noted for his hymns, which are the first genuine ones in the language. Among his works are *Den Bibliske Verld* and *Odae Sveticac*, in which he follows the Ger. poet Opitz. See R. Ekholm, *S. Columbus*, 1924.

Columbus: 1. Cap. of Ohio, U.S.A., on the Scioto R. 103 m. NE. of Cincinnati, and an important trade, distribution, and industrial centre. The streets are handsome and broad, and there are splendid buildings, including the capitol and Ohio State Univ. (20,500 students). There is a stadium with 78,600 seats, and the libraries include Ohio State Univ. Libraries, Ohio State Archaeological and Historical Library, Ohio State Library, and C. Public Library. Other points of interest include C. Gallery of Fine Arts and the Battelle Memorial Institute. Pop. 375,900.

2. City of Georgia, U.S.A.: one of the leading industrial centres of the S. of the U.S.A. The falls of the R. Chattahoochee generate electricity. It is a cotton market and an industrial and shipping centre, with textile mills, foundries, farm products processing plants, and railroad shops. It manufs. clothing, yarn, fabrics, machinery, electrical equipment, agric. implements, fertiliser, and food products. The first cotton-mill worked by electricity was in C., and artificial ice was first made here on a commercial scale, and industrial training provided by public schools. Pop. 79,611.

3. City, cap. of Bartholomew co., Indiana, U.S.A., 40 m. SSE. of Indianapolis. It manufs. Diesel engines and wood and metal products. A large prehistoric Indian mound is near. Pop. 18,400.

4. Cap. of Lowndes co., Mississippi, U.S.A., on the Tombigbee, has timber and cotton industries. The Mississippi College for Women, with 1100 students, is here; 1500 soldiers, victims of the Civil War, were buried in Friendship Cemetery. Pop. 17,200.

Columella, Lucius Junius Moderatus, Lat. writer on agriculture of the 1st cent. AD. B. at Gades in Spain, lived partly in Syria, but chiefly at Rome; probably d. at Tarentum. His chief work, *De Re Rustica*, the fullest ant. treatise on practical agriculture, consists of 12 books in dactylic hexameters, and is addressed to a certain Publius Silvinus. The style is easy and copious, but the information is often of doubtful accuracy and seems to have been derived from books. There is an ed. by V. Lundström, 1897, and another (still incomplete) with trans. by H. B. Ash (Loeb Library, 1941 ff.).

Column, in architecture, a vertical and

COLUMN: THE CLASSICAL (GREEK AND ROMAN) ORDERS OF ARCHITECTURE.

A, Greek Doric; B, Roman Doric; C, Greek Ionic; D, Roman Ionic; E, Greek Corinthian; F, Roman Corinthian.

cylindrical member; usually supporting a load, but occasionally detached, as a commemorative monument, e.g. Nelson's C., London. Normally a C. consists of

three parts: capital, shaft, and base; but certain early types of C. (e.g. Gk Doric) had no bases. Ancient Egyptian C.s were massive and often clumsy in design, without bases. Slender C.s formed a notable feature of Assyrian and Persian architecture. Gk architecture (q.v.) was 'trabeated,' i.e. based upon C.s and beams. The three types of C.s invented and used by the Gks were described by the Rom. architect Vitruvius (q.v.) under names which have been adopted ever since—'Doric,' 'Ionic,' and 'Corinthian.' Vitruvius formulated standard rules for each of the three types, prescribing the correct relation of diameter to height in each case, and relating these dimensions to the series of beams—the 'entablature' (q.v.)—which the C.s supported. His rules came to be known as 'The Orders of Architecture,' and were followed by Rom. architects of his own time, also throughout the Renaissance. They still play a most important part in architectural design. The three types are shown on the illustration here. The Gks favoured the Doric Order, using the Ionic less frequently, and the Corinthian very seldom. The Romans favoured the Corinthian. The so-called 'Tuscan Order' was an unimportant Renaissance variant of the Rom. Doric, and the 'Composite Order' a rare Rom. variant of the Corinthian. Both Gk and Rom. C.s were subtly swelled, not merely tapered, the swelling being termed the 'entasis' (q.v.). Except in the Doric Order, the capital (q.v.) was carved into ornamental forms. Byzantine, Romanesque, and Gothic C.s and capitals did not strictly follow the classical Orders, but owed many of their features to them. Rom. architecture was essentially 'arcuated' (i.e. based primarily upon the arch-form); and where the Romans introduced C.s from their Gk predecessors, they used them structurally in colonnades round their temples, etc.; but also applied them, for purely decorative purposes, to arcuated buildings, e.g. the Colosseum (q.v.).

Column, military formation in which the units are arranged one behind the other, sev. ranks in depth. When military science was less developed, the European armies always fought in C., the soldiers of Napoleon invariably using this formation. The one exception was the Eng. Army, which always preferred the line. The advent of the breech-loading rifle, making it still more advantageous than formerly to have a long fighting front, led to the giving up of the columnar formation and the general adoption of the line. Reserves, however, still move in C., as this method is easier for movement. A Brit. battalion in C. has its four companies disposed one behind the other in parallel lines, the distance between each pair being equal to the front of one company. In half-C. this distance is halved, and in quarter-C. it is reduced to six paces. When cavalry moved in squadron C., the four troops which composed a squadron were arranged one behind the other in such a manner that a wheel to either side would bring them into line. There are various other minor distinctions of columnar formation,

according to the kind of troops employed, and the term is often used somewhat vaguely to describe any body of troops moving rapidly. Thus we speak of C.s of artillery, supply C.s, and C.s under the command of a certain general.

Columna Rostrata: 1. Triumphant pillar in the forum at Rome commemorating the victory of Duilius over the Carthaginians off Mylae in 260 bc. The name originated in the fact that the column was decorated with the beaks (*rostra*) of the vessels which had been captured.

2. A book of this name, dealing with the Brit. Navy, with special reference to the Dutch wars, was written by Samuel Colcliber in 1727.

Colunga, Sp. in the prov. of Oviedo, near the coast of the bay of Biscay. It is famous for its apples, and there are anthracite mines near by. Pop. 8000.

Colutea, genus of leguminous plants, consists of hardy shrubs, all of which are found in S. Europe, in Palestine, and in the Himalaya. *C. arboreascens*, the bladder-senna, is often cultivated as an ornamental plant. The fruit is an inflated legume, and the leaves are frequently used in the adulteration of senna.

Colville, Sir Charles (1770-1843), general who served against the Irish rebels in 1798, in the Ferrol expedition of 1800, the Egyptian expedition of 1801, the Peninsular war of 1810-14, and in Belgium, 1815. In 1819 he became commander-in-chief at Bombay, and in 1828 governor of Mauritius.

Colville, Sir Henry Edward (1852-1907), soldier. His first experience of active service was in the Sudan campaign of 1884. During 1884-5 he served with the Nile expedition. He was acting-commissioner in Uganda from 1893 to 1895, and commanded the Unyoro expedition. In 1899 he went out to the Cape at the outbreak of the S. African war in command of a brigade of guards. He served under Lord Methuen at the battles of Belmont, Modder R., and Magersfontein; later given command of the 9th Div., and assisted in the operations leading up to the battle of Paardeberg in Feb. 1900. Owing to the unfortunate engagements at Sanna's Post in Mar. and at Lindley in May, C. was superseded and recalled to England in July. Among his pub. works are *The History of the Sudan Campaign*, 1886, and *The Work of the Ninth Division*, 1901.

Colvin, Sir Sidney (1845-1927), literary and art critic, b. London. In 1876 he became director of the Fitzwilliam Museum, and in 1884 keeper of the prints and drawings at the Brit. Museum. His works include contributions to many leading periodicals and to the *Dictionary of National Biography*; *Landor*, 1881; *Keats*, 1887, both in the English Men of Letters series; *A Florentine Picture-Chronicle*, 1898; *Drawings by Old Masters at Oxford*, 1902-8; *Engraving and Engravers in England*, 1906. He has also ed. *Selections from Landor*, 1882; *Letters of Keats*, 1887; *Works of R. L. Stevenson* (Edinburgh ed.), 1894-7; *Letters of R. L. Stevenson*, 1899, 1911; *John Keats: his Life and Poetry, his Friends, Critics, and After-fame*, 1917;

Memories and Notes, 1921. See E. V. Lucas, *The Colvins and their Friends*, 1928.

Colwyn Bay, watering-place in Denbighshire, Wales, $4\frac{1}{2}$ m. N.E. of Conway, with a fine sandy beach. Pop. 22,240.

Colza, or **Rape**, **Oil**, is obtained from the seeds of *Brassica campestris oleifera*, by expression or by extraction with a solvent. The crude oil is dark brown and has an unpleasant taste and characteristic odour. When refined it is a pale yellow liquid and free from taste and odour, but is inclined to revert in flavour and acquire an unpleasant taste. Its sp. gr. is about 0.912. It can be 'blown' like linseed oil (q.v.). C. O. is heated with sulphur to produce dark factice or treated with sulphur chloride to produce white factice, both of which are used as rubber substitutes and in rubber compounding. The oil is also used in lubricants, as an illuminant, for oiling wool, and as a quenching oil in tempering steel. When refined it is sometimes used for edible purposes—in the manufacture of ghee-substitute. The cake remaining after extraction of the oil may be used in cattle foods, but as mustard seed often becomes mixed with rapeseed and is injurious to cattle, the cake residue is often used as a manure. The plant is cultivated chiefly in China, India, Pakistan, Japan, and Sweden.

Coma (Gk *koma*, deep sleep), condition of absolute unconsciousness in which the patient does not react to external or internal stimuli. The patient is totally insensible to his surroundings. C. may be due to disease or injury of the brain or to the effects on the brain of poisons, certain drugs, and toxic substances in the blood resulting from various diseases. C. may also result from cerebral anaemia and is thus the terminal state in conditions in which there is circulatory failure. See also UNCONSCIOUSNESS.

Coma Berenices (**Berenice's Hair**), in astronomy, a small cluster of stars in the N. hemisphere near the equinoctial colure. It is said to have been so named by Conon to console Berenice, the wife of Ptolemy Euergetes, for the loss of a votive lock of her hair which had been stolen from the temple of Venus. Its definite location is generally ascribed to Tycho Brahe (1602). The cluster has now been accurately measured by Dr Chase from Yale Observatory.

Comacchio, It. tn, in Emilia-Romagna (q.v.), 28 m. SE. of Ferrara (q.v.). It has ant. walls and a cathedral. The tn is 3 m. from the Adriatic, and is built amidst shallow lagoons (Valli di C.) known for their fisheries. There is a trade in preserved eels and other fish, fruit, and salt. Pop. 14,000.

Comanches, tribe of N. Amer. Indians belonging to the Shoshonean stock. The C. now number about 2500, and are found in the Kiowa agency, W. Oklahoma. They were originally fierce, restless, and courageous prairie Indians, and were for long a constant terror to white settlers on the Mexican and Texan frontiers. They were largely instrumental in introducing horses to the Plains Indians, giving them greater power in war.

Comayagua, dept of Rep. of Honduras. It is mountainous, with some fertile plains, and watered by the Sulaco and Humuya R.s. Contains numerous prehistoric remains. Agriculture is carried on in the valleys. There is gold and silver mining and felling of timber trees in the primeval forest. Big game abounds. Area 1919 sq. m. Until 1880 C., its cap., was the cap. of Honduras under the name of Valladolid. Pop. (dept) 75,000; (tn) 4800.

Comb (Gk *gomphos*, pin, Ger. *Kamm*), toothed toilet instrument, used for cleaning and arranging the hair, for keeping it in position when dressed, and as an ornament for the head. The use of the C. is of great antiquity, and specimens have been found in anct Egyptian, Gk, Rom., and early Christian tombs, and in Swiss lake-dwellings, being variously composed of wood, especially boxwood, bone, horn, and ivory. All these materials are still used in the manuf. of C.s, together with tortoiseshell, metal, india-rubber, xylonite, celluloid, etc. The one most commonly employed is horn, and there are two main methods of manuf. For both the horn is cut into rectangular pieces, damped and heated, and passed out flat. In the first method a series of fine slits, varying with the size of the teeth required, are cut on one side by a small circular saw, which has now superseded the 'stadde' or double handsaw. This involves considerable waste of material, but is the only method possible in dealing with some substances. The second method, known as 'twinning,' or 'parting,' invented by Lyne about 1828, utilises the wedges left between the teeth of one comb to form the teeth of another, so that all waste is avoided. C.s of vulcanite, xylonite, celluloid, nylon, etc. are made by moulding the soft material and afterwards hardening it.

Combat, **Trial by**, custom in England, according to the old laws, by which the two parties either in criminal or civil cases challenged each other to fight to decide the guilt or innocence of the accused. The idea was that if the evidence were insufficient the result of the combat would declare the actual truth. If the case were a criminal one the parties themselves fought, unless one of the two was a woman, or unfit in any way by reason of age or infirmity. In civil cases they were allowed to employ champions. At the beginning of the 19th cent. this custom was abolished, owing to the decision in the case of *Ashford v. Thornton*.

Combe, George (1788-1858), phrenologist and philosopher, b. Edinburgh. His works include *Essays on Phrenology*, 1819; *The Phrenological Journal*, founded 1824; *The Constitution of Man*, 1828, his ablest work; *Notes on the United States of North America*, 1841; *On the Relation between Religion and Science*, 1857. See life by C. Gibbons, 1878.

Combe, William (1741-1823), poet, b. Bristol. Educ. at Eton and Oxford, he afterwards travelled in France and Italy, lived in princely style, and was known as Count Combe. But lean years followed;

he was successively soldier, waiter, and cook, and spent much time in a debtor's prison. In 1776 he pub. a satire, the *Diaboliad*. From 1809 to 1811 he contributed doggerel verses to accompany a series of Rowlandson's illustrations in the *Poetical Magazine*. They were collected as *The Tour of Dr Syntax in Search of the Picturesque*, and were very popular. Dr Syntax reappeared in *A Second Tour in Search of Consolation*, 1820, and *A Third Tour in Search of a Wife*, 1821. C. also wrote a series of imaginary letters of the second or 'wicked' Lord Lyttelton, who was at Eton with him.

Comber, tn of co. Down, N. Ireland, on Strangford Lough. There are flax mills and distilleries. Pop. 3000.

Combermere, Sir Stapleton Cotton, sixth Baronet, first Viscount (1772-1865), field marshal. At 21 years of age C. commanded the 6th Dragoon Guards. He served through the campaign against Tipoo Sahib in 1799, including the battle of Malavelly and the siege of Seringapatam. He commanded the cavalry div. in the Peninsular War. In 1826 he besieged and took Bharatpur, a fort which 22 years earlier had resisted even Gen. Lake's skill and was indeed deemed impregnable. It was for this exploit that he received his viscounty. See *Memoirs and Correspondence*, 1866.

Combin, or **Grand Combin**, peak between Italy and Switzerland. It is in the Pennine Alps, and lies E. of the Great St Bernard, 9 m. SE. of Martigny. Elevation 14,168 ft.

Combination, in mathematics, see PERMUTATIONS AND COMBINATIONS.

Combination, Laws of. Till 1824 these laws forbade as common law misdemeanours any combination of masters or workmen to raise or lower wages, or to increase or diminish the hours or quantity of work. In addition thirty-five statutes prohibited combinations of workmen against masters. An Act in 1824 repealed all these laws, the rationale of which was the removal of all restraints on trade, and forbade all combinations characterised by some element of *violent* interference. The effect of the Act, whether anticipated or not, was to legalise the formation of trade unions for the purpose of controlling masters in the conduct of their business. Some limitations on this result were enacted by a repealing Act passed the following year, but there are now no laws against combinations other than the common or statute law against such as amount to criminal conspiracies. See CONSPIRACY.

Combination Tones (obsolete **Resultant Tones**), secondary musical sounds produced by certain intervals of two notes struck at the same time, in the nature of inverted harmonics, since they sound (all but inaudibly) below instead of above the generating notes. There are two kinds of C. T.: differential, produced by the difference between the two generating notes, and summational, produced by the sum of those two notes, i.e. in both cases the vibrations of these notes.

Combinatorial Analysis, see PERMUTATIONS AND COMBINATIONS.

Combine, term used in industrial warfare to denote temporary federation of employers, usually in one particular industry or related industries, for the purpose of protecting their common interests, whether by keeping up the price of commodities produced by them, or by reducing wages or the hours of labour, or by any other means. Such a federation was formed in London in 1911 of a great number of employers in entirely different industries by way of mutual protection against the effects of the very prevalent strikes of that year. The basic principle of a C. is that of defence, and therefore it is to be distinguished from a trust (q.v.), which is an amalgamation for all or most purposes, usually with the ultimate object of forcing up the price of certain articles. A C., however, is not always of a temporary nature, but sometimes denotes a consolidation of business interests, practically analogous to a cartel, a merger (q.v.), or a trust. The permanent C. is either 'horizontal' or 'vertical.' The horizontal C. is the result of the union of a number of firms doing similar business who wish to organise their production on the same basis and to profit from the technical improvement which a united effort makes possible. The vertical C. is that which exists between firms dealing with the same material but at different stages in its manuf. This combination between the interests of producer and manufacturer tends to suppress the middlemen's profits. Vertical C.s have been common in Germany and the U.S.A., and they increased in England after the First World War, notably among the industries connected with iron, steel, shipbuilding, paper, and soap. If the C. is not the result of absorption of the smaller industries by the larger, one company, known as the holding company, may sometimes hold controlling shares in each of the other constituent companies in the C. A C. may exist between a number of unrelated businesses. The future of the C. in Britain depends on the success of the 1948 Monopolies and Restrictive Practices Act and the Restrictive Practices Act, 1957, in dispersing monopolistic activities and maintaining a competitive economy.

Combine Harvester, see AGRICULTURAL MACHINERY AND IMPLEMENTS.

Combined Cadet Force, name given since 1939 to the Officers Training Corps, formed in March 1908 to provide students in schools and univs. with a standardised measure of elementary military training in order that they might eventually become officers in the Territorial and Reserve forces. Those who obtained certificates of proficiency were exempted from a portion of the examination for officers of those forces. The Corps was in two divisions—senior, which included univ. units, and junior, consisting of public school units. C.C.F. contingents are formed in schools where education is normally continued to the age of 17. The present scheme provides for a common basis of training

up to the standard of Certificate 'A', Part I, and for the formation of specialist Navy, Army, and Air Force sections for older boys. It simplifies the administration of the various cadet units in schools and makes it easier for schools to run cadet forces for all three services instead of for only one or two of them.

Combined Operations Command, formed in Britain during the Second World War and consisting of personnel of all three fighting services. Its primary function was to provide training for amphibian warfare, which comprises all kinds of offensive action from small raids to large assault landings. It was also the duty of the command to plan and carry out raids on the coasts of the enemy. A combined operation is defined as one in which 'two or more of the fighting services co-operate in order to strike the enemy with the maximum of effect at a chosen place and a chosen moment.' The C. O. C. had its own troops of which the 'commandos' formed a notable part. Combined operations are an inevitable consequence of sea power. Drake in the W. Indies in 1585, and Howard and Essex at Cadiz in 1596, showed how a combination of sea and land forces could inflict much damage on the enemy. Some 'conjunct expeditions', to give them their 18th cent. name, achieved permanent results, e.g. the capture of Gibraltar by Rooke and Byng (1704), of Quebec by Wolfe (1759), and of Cape Town (1795). Some, like the expeditions to Walcheren (1809) and in the Gallipoli campaign (1915) were failures. Yet others, like the destruction of eighty Fr. ships in St. Malo (1758), were raids designed to inflict loss in men, ships, and stores. It is in this last category that all combined operations against the Gers. fell until nearly the end of 1942, when an Anglo-Amer. army, supported by numerous ships and aircraft, landed in Fr. N. Africa (Nov. 1942) and, by so doing, altered the course of the war. Before this no more had been attempted than raids in varying strength on enemy coasts from Norway to France and Libya, though some, like the raid on St. Nazaire in March 1942, made hist. The first troops specifically chosen for raiding were independent companies formed from volunteers from all the regiments of the regular army and trained for urgent use against the Gers. in Norway. From these companies was developed the idea of forming guerrilla bands known as commandos, from the Boer war parallel. It has been officially stated that commandos were formed because at the time (June 1940) there was no existing unit of the Brit. Army which could be made available for raiding operations, as the most stringent economy in weapons had to be exercised, everything being subordinated to the task of organising the defence of the Brit. Isles against invasion. When the independent companies were replaced by special service battalions, and these in their turn were converted into the commandos, the original conception of their tactical use was preserved, i.e. that they were to be

amphibious and learn first and foremost to co-operate with the navy. Among the most notable commando raids organised by C. O. C. were the raid on Bruneval radiolocation apparatus, which was successfully destroyed 27-28 Feb. 1942; the raid on Vaagsø, Norway (March 1942), which resulted in a minor battle over the fjords and some desperate street fighting; the raid on St. Nazaire (also in March 1942), the chief features of which were the smashing of the lock-gates by blowing up the ship *Cambeltown* filled with explosives and the firing of delayed action torpedoes; the destruction of a large fish-oil factory on the Lofoten Is. (March 1941); a raid by guerrillas landing from the sea on Rommel's headquarters at Beda Littoria and on the It. headquarters at Cyrene, Libya (Nov. 1941); the storming of Diego-Suarez in Madagascar (May 1942); and the great raid on Dieppe (18-19 Aug. 1942). Subsequently combined operations formed part of all the major British military operations in World War II (Africa, Normandy, etc.). C. O. C. ceased to have general direction of operations of this character and these became the responsibility of the campaign commander. See also COAST DEFENCE; COMMANDO; DIEPPE RAID. See Ministry of Information, *Combined Operations*, 1943; Adm. Lord Keyes, *Amphibious Warfare and Combined Operations*, 1943; A. Vagts, *Landing Operations*, 1940.

Combining, see CARBIDE; WOOL.
Combining Weight or Equivalent, of any element is the number of units of weight of that element which will react either directly or indirectly with one of the same units of weight of hydrogen. It is not possible always to make hydrogen compounds of all the metals, so sometimes the standard of comparison is taken as oxygen or even chlorine. But by the law of reciprocal proportions (see CHEMISTRY) it is easy then to determine the equivalent of the element; for the combining proportions of oxygen and chlorine with hydrogen are respectively 8 and 35.5 (approximately). Occasionally C. W.s of elements are the same as their atomic weights, although this is by no means universally true, e.g. the equivalents of carbon, oxygen, and sulphur are 3, 8, and 16 respectively, while their atomic weights are 12, 16, and 32. But from this it may be seen that the atomic weight is either the same as the equivalent weight or is a multiple of it, the multiple depending on the valency of the element. See ATOM AND ATOMIC THEORY; CHEMISTRY.

Combies, tn of France, in the dept of Somme. During the First World War severe fighting took place about C. during the 1916 battle of the Somme. The Gers. swept over C. in their final advance of March 1918, and in the Allies' counter-offensive held it with great determination during Aug., before being forced to abandon it. Its military importance was entirely due to its being the only tn in that area. C. has breweries and weaving industries. Pop. 760.

Combours, tn in the dept of Ille-et-Vilaine, France, 24 m. SSE. of St. Malo.

Cheese and shoes are manuf. Chateaubriand (q.v.) lived in the feudal castle as a youth. Pop. 4400.

Combrailles, plateau in central France, largely in the dept of Cher (q.v.). The chief in on the plateau is Evaux.

Combustion, a chemical reaction between at least two substances (of which one at least is gaseous) with the liberation of heat. This liberated heat must be sufficient to make the reaction self-supporting once it has been started. The burning of magnesium in steam and of phosphorus in chlorine are examples of C., and it must be noted that the gas need not necessarily be oxygen or air. C. may or may not occur with the emission of light. Thus the burning of magnesium in oxygen produces both heat and light, whereas the rusting of iron produces only a very small quantity of heat. It is the rate of evolution of heat that decides whether light is emitted. In C. processes it is usual to regard one substance as being combustible and the other as the supporter of C., but the terms are only relative. Thus while a jet of coal gas will burn in air, a jet of air will burn in coal gas. During C. processes heat is evolved and a certain temp. is reached. This temp. may vary, depending on whether the C. is slow or rapid, but the heat evolved is always the same for the same two substances. If, during C. of a gas or vapour, the combustible substance reaches a definite temp., a flame is produced. This temp. is the ignition temp. Some substances are spontaneously inflammable because this temp. is below the normal temp. of the atmosphere. If the ignition temp. is higher than the temp. produced during C., then no flame occurs. Thus both nitrogen and oxygen can be ignited by an electric spark, but the ignition temp. of nitrogen in oxygen is higher than the temp. produced and so no conflagration occurs. If the ignition temp. were lower than the temp. produced, then a flash of lightning would remove all the oxygen from the air and render life impossible. See also FLAME; SPONTANEOUS COMBUSTION.

Comedia, term used in old Sp. drama, meaning a tragedy or comedy in three acts. It can be divided into two sections: (1) *Comedia de capa y espada* represented actors of middle-class life in everyday incidents. The characters were clothed in ordinary dress—the cloak and sword of the civilian. (2) *Comedia de teatro*, or *de ruido*, played by kings and princes. The actors were very richly dressed, and dramatic scenes were chosen.

Comédie Française, official name of the Théâtre Français, the national theatre of France, which dates its estab. from the year 1680, though we may carry it a little farther back. In 1658 Molière's company, playing under the name of L'illustre Théâtre, quitted the provs. and settled in Paris. At that time a rival company at the Hôtel de Bourgogne already held the field, but Louis XIV, who early took the new company under his protection, ordered the two to amalgamate in 1680 under the name of La C. F. This theatre, then the only one left in Paris, received

an ann. subsidy of 12,000 livres from the king. In 1687 the C. F. moved from the rue Guénégaud to more commodious quarters in what is now known as the rue de l'Ancienne-Comédie, where a large house had been built for it. Here it remained for nearly ninety years, producing the plays of Molière and of contemporary dramatists. In 1771 the C. F. was removed to the Tuileries, where the company played in a hall built on the site of the Hôtel de Condé, afterwards to be rebuilt as the Odéon. It remained here during the early part of the revolution, but political events led to such dissensions that a split occurred about 1790, which led to the break-up of the old Française and the estab. of two rival companies, the Théâtre de la Nation and the Théâtre de la République. These came to an end in a few years, and a gap occurs in the hist. of the company until 1802, when it was re-estab. by an edict of Napoleon. When at Moscow in 1812 Napoleon pub. a further decree, giving full regulations for the conduct of the theatre, and these regulations, with slight modifications, still govern the theatre. Sound films, however, have modified the veto on members appearing on any other stage. In March 1900 the C. F. was set on fire, and a considerable portion was destroyed, though the papers and works of art were saved. A grant of 220,000 francs was promptly made by the gov., and the work of rebuilding was immediately carried out. Many of the most eminent Fr. actors and actresses of recent years, whether of comedy or tragedy, have made their début at the C. F. or have been connected with it during part of their careers, e.g. Sarah Bernhardt, who made her first appearance there in 1862 and for nearly twenty years belonged to the company; Coquelin aîné, whose association with this theatre lasted for over thirty years; Réjane, Jane Hading, Mounet-Sully, Adrienne Lecouvreur, Dumesnil, La Claron, Talma, Mars, and the Guitrys. The State owns the Théâtre Française and grants it to the Comédie with certain funds for maintenance, and with an administrator who is appointed by the minister of fine arts. Students after matriculation at the Conservatoire may become *pensionnaires* and receive a contract. Later they can become, and remain, *sociétaires* (i.e. *pensionnaires* co-opted by the partner-members). The training of the young players is severe; they must be versed in all styles of Fr. acting to deal with the classic repertory of the Comédie, both to deliver the exacting tragic tirades (e.g. of Racine) on the one hand, and on the other to catch the very spirit of Molière. On the evening of 20 Oct. 1930 the C. F. celebrated the two hundred and fiftieth anniversary of its official creation. Its leading artistes are content, mainly because their position enables them to earn extra money elsewhere and on the films, to receive from the C. F. no more than an average of £800 a year. Its traditions and fame ensure steady receipts, and it has the privilege of engaging at a very

modest salary the prize-winners at the Conservatoire, who, as indicated above, are given a free dramatic training by the State and are bound to accept engagements offered at the C. F. In addition to these advantages it has an ann. subsidy of some £8000. See Fournier's *Le Théâtre Français*; De Julliville's *History of French Literature*, 1900, which not only deals fully with the literature of the period, but also supplies an excellent bibliography; J. Claretie, *La Comédie Française de 1680 à 1900*, 1901; F. Sarcey, *A Company of Actors*, 1928; L. Dubech, *La Comédie Française d'aujourd'hui*, 1928; and S. Saud, *La Comédie Française*, 1936.

Comedy, *see* DRAMA.

Comedy Theatre, Panton Street, London, first opened in 1881 with the comic opera *La Mascotte*. Well-known actors and actresses such as Hawtrey, Beerbohm Tree, Marion Terry, Penley, Winifred Emery, Violet Cameron, Cyril Maude, and Maxine Elliott have appeared there, and the works of Jerome, Barrie, Pinero, Grundy, Fitch, and Sutro have been performed at the theatre. It was rebuilt, and reopened in 1955 with the Amer. play *Morning's at Seven*, which was followed by Brendan Behan's *The Quare Fellow* and Peter Brook's production of Arthur Miller's *A View from the Bridge*, R. C. Anderson's *Tea and Sympathy*, and Tennessee Williams's *Cat on a Hot Tin Roof*.

Comenius (properly Komensky), Johannes Amos (1592-1671), distinguished scholar and educational reformer, b. Comna, in Moravia, or, according to another account, Niwnitz in the same dist. His parents were poor adherents of the Moravian Brethren. Having studied at Herborn (1612) and at Heidelberg, and having made a tour through England and Holland, C. became rector of the Moravian school at Prerau in 1614. After that he was made pastor at Fulnek, where he remained until 1621, when the tn was taken and sacked by the imperialists, his house and library being destroyed. He wandered into Poland, and finally settled at Leszno, where he supported himself by teaching Lat. It was here that he worked out the educational system which was to make him famous, and produced his *Didactica magna* in 1632, the year in which he was chosen elder of the Moravian Brethren. The year before this he had pub. the *Janua linguarum reserata*, written in Lat. and Moravian, which had securely estab. his reputation. This work was trans. into twelve European languages and sev. oriental ones. It was followed in 1633 by the *Januae linguarum vestibulum*, which formed an introduction to it. In 1641 he was invited to England by the Parliament, on the suggestion of Hartlib, to assist in the reformation of public educational methods. The outbreak of the Civil war put a stop to this design, and C. went on to Sweden, from which country he had received an invitation to aid in the same work. Oxenstjerna, the great Swedish minister, commissioned him to prepare a plan for the regulation of Swedish schools, and settled him at Elbing with a pension. Here he remained

until 1648, when he returned once more to Leszno, and was made Moravian bishop of that tn. In 1650 he went as educational reformer to Hungary. Here he found time to put together his *Orbis sensualium pictus*, 1658, the first book which tried to instruct children by pictures. In 1656 Leszno was attacked and sacked by the Poles, and C. again lost his house and books. He found a refuge at Amsterdam, where he remained till his death. He was buried at Naarden. In his *Pansophiae prodromus*, 1630, he attempted to give an encyclopaedic digest of the humanistic learning of his time. In theology he was a fervent evangelical, and pub. sev. works

COMENIUS

on his own sect. See S. S. Laurie, *John Amos Comenius: Life and Educational Works*, 1881; M. W. Keatinge (trans.), *The Great Didactic*, 1896; P. Monroe, *Comenius and the Beginnings of Educational Reform*, 1900; R. F. Young, *Comenius in England*, 1932; J. Needham (ed.), *Teacher of Nations*, 1942.

Comeragh, mt. range of Waterford, Rep. of Ireland, rising to 2597 ft.

Comet, heavenly body of a luminous and nebulous appearance which approaches to and recedes from the sun. The name is derived from the Gk *komētēs*, hairy, and is bestowed on these bodies because they generally possess a 'tail' or 'tails'; this tail in ant. times also being called a beard when the train preceded the nucleus, as is the case when the C. is receding from the sun. Most C.s are divided into three parts, the nucleus and the coma, which together form the head of the C., and the tail. It is impossible to define exactly the limits of each of these parts, as they shade gradually into one another; quite often, too, a C. is without a tail, others again (as e.g. that of Cheseaux, 1744) may

have half a dozen. The nucleus is the brightest portion; the coma which surrounds it is a hazy area of light, while the tail becomes more and more faint and attenuated until it fades out. How attenuated is the matter that composes a C. may be judged by the fact that stars have repeatedly been seen through the thickest parts, and that the earth has passed through the tail of a C. without any observable effect. Thus Sir J. Herschel records that in 1832 he saw a group of stars of the sixteenth magnitude through almost the centre of Biela's C. The composition of a C. as revealed by the spectroscopic (which was first successfully applied to determine the constitution of C.s by

ORBITS OF COMET

Sir Wm Huggins in 1868) is of extreme tonuity, while metallic lines, such as those of sodium and iron, have been observed in the spectrum of the nucleus. The spectrum of a C. also shows that the light is partly reflected sunlight and partly original. Dr J. G. Porter's list of C.s in 1952 includes 737, but many of these refer to the same C.s at different returns, and only 525 individual C.s were then known. Of these, 274 had parabolic orbits, 52 hyperbolic orbits, and 199 elliptical orbits. Amongst the last were 114 with periods greater than 200 years. Of the 52 hyperbolic orbits, all of the C.s moving in these orbits were originally moving in elliptical orbits, and perturbations by one or more planets forced them into hyperbolic orbits. C.s break up by the expulsion of matter from the head of the C. Large C.s such as Halley's C. emit fresh matter forming new tails at each approach to the sun. The present view is that the cause of the expulsion is electrical in origin. The heads of the C.s contain reservoirs of the gases identified by spec-

troscopic analysis, and as meteoric masses are found to contain hydrogen and other gases it is considered that the heads of C.s are composed of meteors. Ultimately C.s will cease to exist when all the gases in their reservoirs have been lost. One of the more recently discovered C.s appeared on 23 June 1927, known as Pons-Winnecke, after its discoverer. A member of the Jupiter family, its nearest distance from the earth on that occasion was about 3,500,000 m., the closest approach of a C. in the past few cents. Its period is six years. Regarded merely spectacularly and historically, C.s have ever been the object of man's curiosity and sometimes his fear. Thus the dream of Julius Caesar and the battle of Hastings were believed to have been heralded by C.s, a representation of the latter C. appearing in the Bayeux tapestry. (See HALLEY'S COMET.) The most spectacular of the C.s of the 19th cent. was that found by Donati on 2 June 1858. Its tail stretched over a space of 40°, or nearly a quarter of the sky, and its maximum width was about 10°. The Arend-Roland (q.v.) C., discovered by two Belgian astronomers in 1956, was first seen by the naked eye in April 1957. It is of the non-returning category. Mrkos (q.v.) was discovered in Aug. 1957. See METEOR and SOLAR SYSTEM. See also George F. Chambers, *The Story of the Comets*, 1909; Charles P. Olivier, *Comets*, 1930; Mary Proctor and A. C. D. Crommelin, *Comets*, 1937; and J. G. Porter, *Comets and Meteor Streams*, 1952.

Comfort, Alexander (1920-), poet and novelist, educ. at Highgate, Cambridge, and London Hospital. In 1948 he became Lecturer in Physiology at London Hospital Medical College. His novels include *No Such Liberty*, 1941, *The Almond Tree*, 1943, *The Power House*, 1944, *On This Side Nothing*, 1948, and *A Giant's Strength*, 1952. *A Wreath for the Living*, 1943, *The Signal to Engage*, 1947, and *All But He Departed*, 1951, are vols. of verse; while *Into Egypt*, 1942, and *Gengulphus*, 1948, are plays. He also pub. sev. sociological works, including *Art and Social Responsibility*, 1946, *The Pattern of the Future*, 1949, and *Authority and Delinquency in the Modern State*, 1950.

Comfrey, name given to plants of the *Symphytum* genus, family Boraginaceae. *S. officinale* is the native C., with white to pink flowers; *S. asperum*, rough C., and *S. peregrinum*, blue or Russian C., are Caucasian introductions; *S. tuberosum*, tuberous C., is native to Britain in damp places.

Comillah, tn in the prov. of E. Bengal, Pakistan, in the Chittagong div. It is situated on the R. Guntl.

Comines, Philippe de la Cloye, Sire de (1445-1509), Fr. statesman and chronicler, b. at the château de Comines, near Lille. In 1464 he entered the service of Charles the Bold, but in 1472 went over to Louis XI of France, Charles's enemy, and soon became a great favourite of the king, who employed him on various diplomatic missions. On the death of Louis in 1483 C. incurred the displeasure of the regent, Anne de Beaujeu, and was condemned to

forfeit his estates. However, Charles VIII soon recalled him, and he was subsequently employed on diplomatic business by Charles and by Louis XII. His *Mémoires* (written c. 1488-1500) form a complete critical survey of the politics of the time. They are characterised by vigour and most acute observation and insight. Their psychological perception and vivid style unite to give them a rare value, and the first part of them is especially important for its unique portrait of Louis XI and his policies. There are sev. Eng. trans.

PHILIPPE DE COMINES

Comines, Fr. tn in the dept of Nord, on the R. Lys. It has textile and chemical manufs. Pop. 7200.

Cominform, the name given to the revival in 1947 of the Communist International or Comintern (which had been formally disbanded in 1943). The C. was formed by 9 European Communist Parties which announced their decision to set up an 'Information Bureau' (whence the name C.) in Belgrade. Between 1924-9, as the U.S.S.R. grew in power, the Comintern was increasingly drawn into the factional struggles through which Stalin gradually consolidated his personal dictatorship inside Russia—against Trotsky, Bukharin, and others; and gradually the dependence of International Communism on the Soviet Union became more explicit. During those years free public discussion of Comintern policy began to disappear, and after 1929, when Stalin's nominees, Molotov, Maniulsky, and Kuusinen, assumed the control of the Comintern apparatus, the C. became exclusively an instrument of the Russian State and public discussion has played no part in the formation of Comintern policy. The dissolution of the Comintern in 1943—dictated by its propagandist effect on Allied public opinion—was

entirely to the advantage of the Soviet Union, for the central direction and control of all Communist parties from a single source in Moscow remained unaltered. When the Second World War ended Communists tried to convert the National Liberation Fronts into National Front Govs. in which they could still retain the essential power, even if by remote control. But except in E. Europe, under the shadow of the Red Army (q.v.), this transformation could not be effected, for the fall of Hitler had removed the bond which united Catholics, Socialists, and Christians generally in resistance. Hence the necessity to revive the Comintern in a disguised form. The Cominform is intended to keep before public opinion the fact that Communism is an international movement working to a plan—and to exaggerate the strength of the movement in the eyes of its supporters and its enemies. In this respect the C. has not been unsuccessful, for there is scarcely any political disturbance from Alexandria to Bogotá or from Burma to Indonesia which has not been attributed to the machinations of the C. But so far the existence of the C., by an ironically dialectical process, has on balance damaged the Communist cause far more than promoted it. Opposition to the Soviet Union has always been most firmly rooted in the belief that she is planning and supporting a world-wide revolutionary movement. The Comintern was dissolved mainly in order to destroy the popular ground for that belief. By founding the C. however blameless and nugatory its real activities, the Communists have resurrected the old spectre. The part played by the C. in speeding the passage of the Economic Co-operation Act through the Amer. Congress was some evidence of this fact. The functions of the Communist International in directing and supporting the activities of world Communism remain, as before, the responsibility of the Russian State, a fact which was made evident in 1948 by the conflict with Marshal Tito over the industrialisation policy of Yugoslavia. The purpose for which the C. was founded was to exaggerate the strength and importance of world Communism, but by succeeding in this purpose the C. has largely contributed to the success of the policies which its sponsors wish to frustrate. See COMINTERN.

Comino, see GOZO ISLAND.

Comintern, the Third or Communist International. It was founded in 1919 in Moscow for the organisation of the revolutionary forces of the world. Membership obliged adherents to press vigorously all communist activities in affiliated countries. During the Second World War the C. proved more of a liability than an asset to Russia, and it dissolved itself in 1943, when the Presidium of the executive committee of the C. decided that unity in the struggle against Germany could best be achieved by the 'vanguard of the working-class movement in each separate country, working within the framework of its own country.' In fact it had held no

congress since 1935, while its executives with only very limited success, had continued the role of mentor to the Communist parties in other countries. This dissolution did not, however, mean that the influence of Moscow over the Communist movement in foreign lands would disappear, but it had become evident to Moscow that the C. had served as a rallying point for anti-Communist forces in other states. See also ANTI-COMINTERN PACT; COMINFORM.

Comiso, tn in Sicily (q.v.), 7 m. WNW. of Ragusa (q.v.). It has a castle and fine churches. Textiles, household utensils, and soap are manu., and there is a trade in olive oil and wine. Pop. 23,400.

Comitan, tn in the state of Chiapas, Mexico, a customs station near the Guatemalan border, the centre of a large trade in fruit, maize, cotton, sugar, and cattle, with distilleries and textile mills. Pop. 8700.

Comitia, constitutional assembly of the Rom. people, summoned and presided over by a magistrate. There were three kinds of C., named according to the way in which the people were arranged. These were: (1) The *C. curiata*, the original form of assembly, which first consisted in the meeting of the patricians in their thirty *curiae*, or wards. On the breaking down of the distinction between patricians and plebeians, this assembly lost its distinctive character. Though it still retained one or two unimportant privileges, most of its duties were transferred to (2) the *C. centuriata*, an assembly of the whole people in their centuries, as arranged by Servius Tullius. To this king is ascribed the div. of the people into five classes according to the amount of property they possessed, and the div. of each class into hundreds. To this body the chief power belonged during the rep. It elected the higher magistrates, e.g. the consuls and censors, gave judgment in special cases of appeal, decided on wars of aggression, and passed laws. In 287 BC, however, it lost much of its power through the rise of the *C. tributa*. The *C. centuriata* was originally a military assembly, and its meetings could not take place in the city of Rome itself. They were held in the Campus Martius. Each century voted as a unit, according to the majority in itself, and as the decision was by centuries; (3) The *C. tributa* was the assembly of the people according to tribes, and the power of summoning it rested with the tribunes. Originally the city of Rome was divided into four tribes, but as its dominions increased the franchise was extended to comprise thirty-five tribes in all. Gradually power passed to the *C. tributa*, until it became the chief legislative assembly, and it continued in a more or less shadowy form down to the 3rd cent. AD.

Comity of Nations. In international law, C. of N. means a code of conduct, voluntarily observed in inter-state relations on grounds of courtesy rather than under treaty obligations. The application by law courts, in certain circumstances, of the principles of a legal system other than their own, is based on C.

Comma: 1. In music, the smallest interval, the 9th part of a tone. See MUSIC.

2. In grammar, see PUNCTUATION.

Commagene, ant. prov. in N.E. Syria, lying between the Taurus and Euphrates. It retained its independence under the Seleucidae (q.v.), and was finally included in the Rom. empire by Vespasian. The cap. was Samosata on the Euphrates.

Command Papers, documents like blue-books, comprising reports of royal commissions, census returns, and other information collected or issued at the instance of the gov. C. P. are said to be 'presented to Parliament by command of Her Majesty,' in contradistinction to papers issued by the order of either House of Parliament, such as drafts of Bills with their amendments. They are usually numbered C 1, C 2, and so on up to the number issued. See BLUE-BOOKS.

Commandant, title usually given to the officer in command of a besieged fortress or military station, without regard to his rank otherwise. The name is also applied to the heads of most military schools. In conjunction with the rank of the officer the title is also given to an officer in charge of a greater number of men than his rank warrants, as for example captain-commandant.

Commander, title given to the capt. of the second rank in the Brit. Navy (equivalent to a lieutenant-colonel in the Army). A C. is generally given the command of a small vessel, but in a number of cases is the second in command of a large one. The responsibility of the navigation of a large vessel usually falls on a C.

The title is also used in the U.S.A. to signify a naval officer ranking next to a captain.

Commander-in-Chief was formerly the highest appointment in the Brit. Army. Before 1855 the office was to a very large extent independent of the secretary of state for war, but since that date and up to its abolition in 1904 was subordinate to that minister. The title was held by the Duke of Cambridge up to his death and afterwards by the Earl Roberts. It was resigned by the latter in 1904, and was discontinued. The duties of the office devolved upon the Army Council, formed in 1904. The title is now, in the Brit. service, borne in peacetime by those commanders who report direct to the joint chiefs of staff, e.g. C.-in-C., M.E., C.-in-C., F.E.L.F. In wartime it is usually applied to the commander of an expeditionary force, and is comparable to generalissimo in continental armies.

Commander of the Faithful (*Emir al Muminin*), title of the caliphs, first assumed by Omar I., 634-44, and retained by his successors in the caliphate.

Commandery, dist. under a commander, of the Templars, Hospitallers, or other religious order. The Templars possessed 12 such C.s, which embraced whole kingdoms and provs. in Europe and Asia Minor, viz. Jerusalem (city and kingdom), Acre, Tripoli, Antioch, France, England, Poitou, Aragon, Portugal, Apulia, Hungary. The commanders, or preceptors,

were subject to the grand master of the order, but were alone responsible for the treasure of their dist., to which the grand master was allowed no access.

Commandino, Federigo (1509-75), It. mathematician, b. Urbino. He was especially learned in the commentation and trans. of the anc. mathematicians, and pub. many eds. of Archimedes, Euclid, etc. Nearly all subsequent commentators made use of his works.

Commandite, Société en, kind of limited partnership of a fiduciary character in which the managing partner or partners is responsible with his whole fortune for the engagements of the concern, but has others associated with him who contribute only definite sums, and are not liable for anything beyond those sums, though they participate in the profits according to any rule which may be agreed on. It is a form of partnership prevalent in France, Belgium, Germany, Italy, and other continental states, and adopted in parts of the U.S.A. The names of the active partners (in Fr. law called *commandites* or *complémentaires*) alone appear before the public, and they alone manage the partnership business, the dormant partners (in Fr. law *commanditaires*) being usually interdicted from all interference. Such partnerships are not allowed by Eng. law, all the members of an Eng. firm being equally liable for the firm's debts, with no limitation of liability. In England, however, practically identical results can be secured by the formation of a small limited company, and, especially since 1901, by what is known as a 'private company' (see COMPANY); the legalisation of the latter indeed depriving of a large measure of their weight the arguments of J. S. Mill on the indefensibility of the Eng. prohibition.

Commando, Afrikaans word meaning a small (usually mounted) battalion, the basic unit in the armies of the Transvaal and Orange Riv. Reps.; the word is applied to the raiding parties formed by the Brit. Army in 1940 and operating from ships for 'hit-and-run' attacks on the Germans. The C.s owed their existence to the inspiration of Gen. Dill, chief of the imperial general staff, supported by the zeal and authority of Winston Churchill, and their immediate *raison d'être* was to find some effective means of helping the army, after the Dunkirk evacuation, to exercise its offensive spirit once again. The term itself was derived from the Boer C.s of the S. African war, whose successful mobile guerilla tactics after the disorganisation of the main Boer army suggested to the Brit. authorities in 1940 the adaptation of the idea to the conditions of modern warfare and the employment of analogous tactics against the Germans, then masters of the Continent. Freedom from cumbersome supply columns and reliance on winning their equipment and, if need be, their arms from the enemy were the dominant features of the Boer C.s. For the Brit. C.s each trooper was picked for his individual qualities and taught to act on his own initiative. In a raid on the Continent the trooper would

have nothing but what he could carry and what he could forage for himself. The C. leaders were picked first—men under 40 and exceptionally well qualified in physical fitness and professional ability. The leader was given the rank of lieutenant-colonel and sent to command headquarters to raise his unit. From a list of officer volunteers each troop leader chose one other officer to act as his assistant; and then between them the two selected 50 N.C.O.s and men who composed their troop. Each man retained the right to go back to his regiment after giving reasonable notice, but few did. As soon as a unit had its complement of officers and men it was concentrated at a seaside tn, and the men of the 'irregular army' joined up with their corresponding numbers of the 'irregular navy.' These were the raiding flotillas of fast motor boats, commanded by R.N.V.R. officers, with yachtsmen and fishermen to form their crew. After rehearsal for a projected raid there followed the night dash across the sea, a few minutes for landing, then sharp fighting on shore, with E-boats and Stukas of the enemy in close pursuit, until in the end the C. returned home to restart training for the next attack. With the small boat squadrons of the navy they began in 1942 to pave the way for the landing of great armies, as in N. Africa, Italy (especially at Anzio), Normandy, and Burma. In such situations their role was usually to secure the flanks of the beach-head, and a tendency developed to group them in brigades for this purpose. Within these brigades the Marine element gradually came to prevail, and after 1946 C.s became exclusively a branch of the Marines (q.v.), which had originally been raised for just this purpose. Among the most noted C. raids were those on the Lofoten Is. and Vangsö in Norway; the landings on Crete; the attacks on Bardia and Tobruk; and the raids on St Nazaire, Diego Suarez (Madagascar), Dieppe (see DIEPPE RAID), and Walcheren. C.s also fought together with U.S. Marine formations in Korea (autumn, 1950). See also KEYES OF ZEEBRUGGE, BARON.

Commedia (Gk *kōmos*, revel, *aoidos*, singer), It. word, is applied to a tale or romance with a happy ending, and is not used particularly of a tale in the dramatic form, as is the word *comedy* in Eng. literature. Thus Dante entitles his great poem *Divina Commedia*, and likewise some of Chaucer's *Canterbury Tales* are called comedies in this sense.

Commedia dell' Arte, in the hist. of It. drama denotes the popular comedy of masks prior to its transformation into literary shape by Gozzi and Goldoni. *Arte*, in this connection, is equivalent to actors' guild or profession. The stock characters (to give them the names of their familiar Eng. equivalents) were the Clown, Harlequin, Columbine, and Pantaloon. This type of improvised comedy, or *commedia a soggetto*, is supposed to have been originated by Francesco Chereza, the favourite actor of Leo X. Its scenes were written only in *scenario*, i.e. in skeleton form,

being connected by the *lazzi* or buffoneries of the *arlechino*, the representative of the older Rom. *sannio*. It was in this kind of comedy that Harlequin (*Arlecchino*) reached the apex of his glory. The *C. dell' A.* was essentially an actors' play; the dramatist only wrote an outline plot and left the actors to fill in the parts. Each actor took a particular mask part, such as those of Harlequin, Pulcinella, and Pantaloon, and always had his stock phrases and stock actions. More types were evolved in course of time, but they were all virtually comprised in the following, mostly developed from the older types: the Doctor, a poor ridiculous learned pedant; Pantaloon (*Pantalone*), named after Venice's patron saint, Pantaleone, and dressed in skin-tight trousers, who was sometimes an old bachelor but more often the husband of an unfaithful young wife or the father of vexatious young daughters, especially Columbine (*Columbina*, originally *Fraschetta*), while Harlequin (*Arlecchino*) was sometimes his lackey (*see HARLEQUIN*); the Captain, a braggart poltroon taken from contemporary Sp. drama and modelled on the many unemployed Sp. soldiers of fortune then roaming Italy; the young lovers, often the sons of the old men and their sweethearts; the lackeys or *zanni*, *Arlecchino*, *Brighella*, or others, of varying degrees of doltishness, brutality, and sly cunning. Variants of these were *Pulcinella*, ancestor of Punch; *Scaramouche* (*It. Scaramuccia*) (q.v.), *Scapin*, *Mezzetin*, *Pierrot*, etc., all of whom had traditional costumes and often wore masks. Towards the end of the 18th cent. certain of the more famous It. troupes were invited to visit the various courts of Europe. In Italy the *C. dell' A.* remained popular until the tradition of improvised acting appeared to die out, towards the end of the 17th cent., and was replaced from the time of Gozzi and Goldoni by regular comedy. In France the permanent It. company gave offence to the king, and their theatre was closed in 1697, but reopened about 1720 and continued playing throughout the 18th cent. In England also this style of acting was reintroduced after the Restoration (it had reached this country in the reign of James I), but early in the 18th cent. it gave way to the more popular pantomime, in which the traditions of the *C. dell' A.* lingered on.

Pirandello, the modern It. psychological or metaphysical dramatist, has, to some extent, revived this traditional It. dramatic art or its later development in the masked comedy, for, like the writers of *scenaris* for masked players, he delights in constructing fantastic plots with unexpected situations and in embroiling them to such an extent that the unravelling has to be left to some individual character in the role of chorus or interpreter. The initiation of this new movement of the 'Teatro del Grottesco' is, however, attributed to Luigi Chiarelli, a young dramatist who, in 1916, produced a play called *La Maschera e il Volto* (*The Mask and the Face*) which enjoyed great popularity.

Commelin, John (1629-92), Dutch botanist, son of Isaac C., b. Amsterdam. He there became director of the botanical gardens, which by his skill and labour became the finest in Europe. He pub. sev. books on horticult. subjects. The genus of tropical plants *Commelina* is named after him, as also the family *Commelinaceae*, which includes this genus and *Tradescantia*, the spiderwort.

Commemoration, or *Encaenia*, concluding festival of the academic year at Oxford Univ., when benefactors are commemorated and honorary degrees conferred upon distinguished Brit. or foreign celebrities. It consists of an oration in Lat. in C. of benefactors; prize compositions are recited in verse or prose. The ceremony generally takes place immediately after the summer term when 'Schools' are over, and is held in the Sheldonian Theatre. 'C. Balls' are held during the festivities by groups of colleges.

Commendatam, anct method of holding benefices, abolished in 1836. When a living fell vacant, its spiritual duties were given to some priest until a successor might be appointed, and the benefice was said to be held in C. The emoluments were later also given and poor bishops thus held sev. livings. **Commendators** were stewards appointed to take charge of the revenues of a vacant benefice.

Commensalism (Lat. *com* = cum, together, *mensa*, a table), an association of one organism with another advantageous to one or both without detriment to either (the term was used by Van Beneden). Care should be taken to distinguish it from parasitism (*see PARASITES*), an association harmful to one of the two organisms; and from symbiosis (q.v.), the most intimate form of association, illustrated by the union of algae and fungi, or fungi and plants. In one of the most interesting examples of C. a crab becomes covered with shells or sponges, etc. The sedentary growth is carried about to new feeding grounds and the crab obtains a disguise which aids it to capture its prey. The most striking form, however, is the association between the sea-anemone and the hermit crab. With one species of hermit crab (*Eupagurus prideauxii*) which is found off the Brit. coast a beautiful sea-anemone (*Adamsia palliata*) is found in association. The anemone envelops the mollusc shell which the hermit has taken, and if disturbed the hermit withdraws into the shell, while the anemone throws out stinging threads. It is therefore a protection as well as a mask, and in return the crab carries it about and finds its food. The crab, as it grows, has to change its shell, and it takes the anemone with it. Then again in association with another form of hermit crab (*Eupagurus bernhardus*) is found a colony of zoophytes. In this case, however, the C. is not so perfect, for both organisms may be found existing separately. Again, even when they are associated, since the crab is carnivorous, and the zoophyte feeds on matter in the water, no sharing of food takes place, and the mutual advantage is harder to

understand. But when we bear in mind the fact that zoophytes obtain their food by means of slender waving tentacles, and they possess no means of setting up currents in the water, and the fact that the respiration of the hermit would keep the water constantly circulating, the advantage accruing to the zoophyte can be seen. The hermit, of course, in this case also, is masked from its prey; but this time, instead of the hermit moving as the shell becomes too small, the colony grow at the mouth of the shell and lay down matter which actually enlarges the shell, so prolonging the period during which the hermit can remain. Sometimes, again, as when a hermit has become

COMMENSALISM: COMMON HERMIT CRAB AND SEA-ANEMONES

On the left of the whelk shell is the hermit crab worm, which generally inhabits the upper whorls of the shell. Barnacles, other worms, and saddle oysters add to the hermit's retinue.

associated with sponges, the commensal grows so large that the hermit can abandon its shell and depend entirely for protection on its associate. Further, when the commensal of the crab is a polype, which buds into a colony, dissolving the shell as it grows, the hermit is finally surrounded by the polype, which yields as the hermit itself grows. But apart from these fixed commensals, a large number of organisms are in constant association without being connected. This may be because the same environment suits each, or it may be that one alone is, or perhaps both are, gaining benefit. Thus little crabs (*Pinnotheres*) can be found inside bivalves, and the same thing is common with crustaceans. The little crab benefits by obtaining food and oxygen from the currents inhaled by the bivalve. It has been suggested that these crabs with their developed sense organs can, by some means or other, warn their hosts of impending danger, thus causing them to close their shells. It is probable, however, that the advantage is in this case on the side of the intruder, and that the host is unable to eject it, even should it wish to. While

no damage is being done, it is easy to see how it is possible for C. to pass by slow degrees into parasitism. In a similar manner, not all insects visiting plants are parasites; very often they serve a good purpose by feeding on other visitors, and may therefore act as a defence for the plant.

Commensurable (Lat. *commensurabilis*). Two magnitudes are called C. when they are of the same kind and each contains a third magnitude exactly, examples being a foot and a yard, or the numbers 14 and 21. If no unit or common measure can be found, the magnitudes are incommensurable, examples being the diameter and circumference of a circle, and in arithmetic numbers which are prime to one another, as 17 and 23. See also APOTOME.

Commentry, Fr. tn in the dept of Allier, on the Banne and the Oll. It has coal mines and iron works. Pop. 8800.

Commerce, Chambers of, see CHAMBER OF COMMERCE.

Commerce, Degrees in, see COMMERCIAL EDUCATION; UNIVERSITIES.

Commerce, Department of (American), one of the chief depts of the organisation for federal administration. The duties of its sev. heads are to promote commerce, mining, manufacturing, shipping, fisheries, patents, and transportation. The dept includes branches of aeronautics, radio, navigation, lighthouses, standards, steamboat inspection, census, coast and geodetic survey, fisheries, and mines.

Commercial Court is not a separate court estab. by law; the term C. C. applies to any court in the queen's bench div. to which may be assigned the disposal of cases included in the commercial list. Such as it is, the C. C. originated in the special arrangements made by the king's bench judges in 1895 for the dispatch of commercial business 'in accordance with the existing rules and orders.' There are no pleadings in the ordinary sense, but the plaintiff may submit 'points of claim,' to which the defendant may reply with 'points of defence'; nor is there a jury. The whole practice of the court being designed to ensure expedition in trial.

Commercial Education, educational facilities provided to meet the needs of those wishing to take up, or already engaged in, a commercial occupation. Often regarded as an aspect of technical education (q.v.). The activities associated with commerce might be studied under three broad headings: (1) buying and selling and the organisation of markets; (2) the structure of industry, trade, transport, and finance; and (3) the policy, organisation, administration, and direction of a business. Within each group various levels of training and a number of specialised skills are necessary. These include at the lower levels skills like bookkeeping, shorthand, and machine operating. Some knowledge of foreign languages has long been considered desirable. At the higher levels, business executives accepting the highest responsibility might be expected to have a thorough knowledge of economics, commercial law, personnel management, and

so on. Ancillary services like banking, accountancy, and insurance might be included in C. E. The commercial requirements of the 19th cent. were primarily for persons with sufficient skill in the three R's to become clerks. The expansion of industry, the growth of large corporations, the increasing complexity of business, and the introduction of more technical processes created in the 20th cent. a need in commerce for specialists. The response to this demand has varied from country to country. In the U.S.A. nearly a sixth of the students graduating from each college do so in business and commercial studies. Many leading univs. have estab. important graduate schools in C. E., and recently more than 25 have followed the Univ. of Harvard's example of offering short management courses for business executives. These facilities are supported by a considerable amount of C. E. in the public secondary schools. The Ger. speaking countries are noted for their commercial secondary schools and colleges which provide a variety of courses leading to further professional study in the technical univs. or to commercial occupations. In England, certain encouraging developments in the 19th cent. were checked. Consequently the growth since 1900 of C. E. has been unco-ordinated. Responsibility for it is shared by a number of agencies. Within the national system, a growing number of schools provide courses in economics, shorthand, bookkeeping, typewriting, and other commercial subjects. But the total number is not large and the percentage of entries in commercial subjects for the General Certificate of Education (1955) was little more than 1. Opportunities for pre-employment training are available in all three types of secondary school, although grammar school pupils frequently transfer at the end of their normal course to specialised commercial schools housed in technical colleges. Many private commercial schools exist attended by a considerable number of children under the school leaving age. A second type of private school offers short intensive secretarial courses for pupils who have left school. In technical colleges throughout the country students follow full-time, part-time, or evening courses in C. E. Chambers of Commerce, the Royal Society of Arts, and professional organisations have promoted C. E. by conducting examinations or by laying down professional qualifications. The examinations of the professional organisations are usually in three parts; the first is a preliminary test of general education, the second an intermediate examination in general commercial subjects, and the final one is usually highly technical in character. Finally the univs. are associated with C. E. through their degrees in commerce. Certain professional associations grant exemption from their intermediate examination to graduates who have taken specified subjects in their degree courses. At the London School of Economics and Political Science, commerce is included in the faculty of Economics and Political

Science; at Birmingham there is a faculty of Commerce and Social Science; at Leeds, Econ. and Commerce; at Liverpool there is a B.Com. degree; at Manchester a B.A. (Com.); and at Southampton a faculty of Economics and Commerce. See Ministry of Education report, *Education for Commerce*, H.M.S.O., 1949.

Commercial Federation, see CUSTOMS UNION.

Commercial Intelligence Department, inaugurated in 1899 as a branch of the Board of Trade under a controller-general, to collect all available information on all subjects of commercial interest and for the benefit of Brit. trade to reply authoritatively to all trade enquiries. In 1917 the C. I. D. was merged with the Dept of Overseas Trade (q.v.), which was itself absorbed into the Board of Trade after World War II.

Commercial System, see MERCANTILE SYSTEM.

Commercial Traveller. The modern C. T. may be defined as the direct representative of a manufacturer, merchant, or wholesaler employed to travel round specified areas to invite orders from retail tradesmen. He usually carries samples or some other indication of the nature and quality of the goods he 'travels in,' takes orders not in his own but in his firm's name, and is paid either by salary or commission, or by both. The C. T. of the coaching days was generally known as a travelling chapman (cf. Ger. *Kaufmann*, merchant), and as the ponderous public vehicles traversed only the main roads, many of the travellers who desired to penetrate into remote parts of the country had their horses and saddle-bags. Since the era of railways their numbers have increased enormously, and where formerly London, Manchester, and Glasgow trading houses sent 1 traveller to each in they now send many, each of whom deals with but 1 special dept instead of taking orders for all the classes of goods dealt in by his principals. In modern times the C. T. rapidly covers widespread areas, by motor-car and aeroplane. Among the organisations for the C. T. are the United Commercial Travellers' Association of Great Britain and Ireland (U.K.C.T.A.), the Commercial Travellers' Benevolent Institution, the Commercial Travellers' Christian Association, the Royal Commercial Travellers' Schools, U.K.C.T.A. Benefit Society, and the Commercial Travellers' Unemployment Society. The equivalent of the U.K.C.T.A. in the U.S.A. is the United Commercial Travellers' Association of America with H.Q. at Columbus, Ohio.

Commercial Treaties. A commercial treaty is a bilateral agreement between two nations under which each contracting party binds itself to observe a number of definite stipulations regulating their mutual trading relations. Such treaties have existed in one form or another from the earliest times. The text is extant of a C. T. between Rome and Carthage as early as 500 bc. C. T. during the period of Charlemagne, and in the 10th and 11th cents., existed in W. Europe in the

shape of royal charters, or other documents from sovereigns, expressly permitting foreign merchants to carry on commercial intercourse within their ters. The purpose of these C. T. made in more turbulent times was rather, through the medium of promises for the protection of the person, effects, and privileges of the foreign merchant, to make commercial intercourse reasonably possible than to adjust mutual relations for the economic advantage of either party; and further, they were of uncertain duration. The modern C. T., in the sense of bilateral arrangements for a fixed period regulating tariffs and differential duties, have their origin in the political and commercial rivalry of the medieval It. republics. The advantages derived from the greater certainty of a treaty over usage or the personal guarantees of a foreign monarch soon ensured the universal prevalence of C. T., providing for the greater security of navigation and commerce. At first C. T. were restricted to exclusive undertakings between the contracting states, the ultimate object being to destroy the competition of other nations in foreign markets, while at the same time excluding as far as possible all imports other than raw material. Later the most-favoured-nation article came into vogue. This article, which is susceptible of varying forms, has for its object the mutual extension to each of the contracting states of whatever rights and privileges each has already granted or conceded to some other state or states. An early instance of the most-favoured-nation article is afforded by the Turkish capitulations (see CAPITULATIONS), under which Turkey conferred certain rights and immunities to the subjects of Christian nations resident in the Ottoman dominions. The endeavours of various European powers, especially France and Germany, during the 17th and 18th cents. to introduce schemes of tariff reform by means of C. T. led to the formation of a number of treaties between England, those powers, and other European states, designed to lower the prohibitive rates on Brit. exports. Before the First World War Germany followed the old principle of exclusive C. T., having concluded or renewed in 1909 a number of treaties with Austria-Hungary, Belgium, Bulgaria, and Italy of a strictly protectionist character. The C. T. concluded between 1884 and 1900 regarding dists. and spheres of influence in various parts of E., W., and tropical Africa are universal in the recognition of the principle of most-favoured-nation treatment to the exclusion of all exclusive privileges. The advent of the First World War brought about a tremendous upheaval in the world of commerce. Nations which had been on friendly terms for years were now ranged in opposing camps, and the C. T. by which they had been bound for long periods were treated as mere scraps of paper. The depression in trade which naturally follows all wars set in after the First World War, and from 1930 began to be felt most acutely, not only in Europe,

but in all quarters of the world. The World Economic Conference, held in London in 1933, was convened in the hope of accelerating the flow of international trade by mutual arrangements for the stabilisation of currencies and by devising ways and means of raising commodity prices. But the conference completely failed in its purpose and served only to intensify the economic nationalism of each great nation. But Great Britain, having already reverted to a protectionist fiscal policy and concluded at Ottawa a series of trade agreements with the dominions (see OTTAWA CONFERENCE), was able in 1933 to conclude advantageous C. T. with sev. foreign countries, including Argentina and Denmark. See Hertslet's *Commercial Treaties*, 21 vols.

Commercy, Fr. tn, cap. of an arron., in the dept of Meuse, on the Meuse. There is a fine castle, now barracks. There are iron forges and weaving. Pop. 6200.

Commation (Cursing), the Office of, a solemn 'denouncing of God's anger and judgments against sinners' appointed to be read in the Anglican Church on Ash Wednesday. It is one of the last remains in the offices of the Anglican Church of the public acts of penitence which the primitive Church imposed at the beginning of Lent. The office is based on elements found in the Uses of Sarum and York. The curses contained in Deut. xxvii against impenitent sinners are read, and the congregation answer 'Amen' to every sentence as acknowledging the justice of the sentences. The *Miserere* (Ps. li) is then said, followed by prayers.

Commings (Lat. *Convenae*), old dist. of S. France between Armagnac and the Pyrenees.

Commiphora, synonym **Balsamodendron**, genus of tropical Asian and African trees, family Burseraceae. *C. myrrha* is a source of myrrh, a resin of bitter taste and peculiar odour; *C. africana* yields bdellium; and *C. opobalsamum* the Balm of Gilead (q.v.).

Commissariat, designated the dept responsible for the supply of food and forage for the army in the field. The transport of these articles was also in the hands of this dept, as were the responsibilities for the horsing of the army medical wagons and the ordnance store depts. The C. as a dept no longer exists; its functions are now carried out by the Royal Army Ordnance Corps and the Royal Army Service Corps, which between them provide the Army with arms equipment, stores, food, transport, etc.

Commissary, generally the representative of another. An eccles. C. is the deputy of a bishop, by whom the jurisdiction of the latter is exercised in distant parts of the diocese. A military C. is an officer whose duty it is to supervise the provision of food and clothes for an army. This term is still used in Scots Law in connection with the confirmation (q.v.) of executors. The supervision of such matters was originally an ecclesiastical concern and when it became a secular one the name C. Court was retained.

The C. Courts were amalgamated with the Sheriff Courts in 1876 but separate records are still kept, and the terms 'Commissary Office' and 'Commissariat' have been retained.

Commission, in business, denotes an agreed reward payable by a principal to his agent in consideration of the agent performing the particular business or service for which he was employed. The right of the agent to remuneration in the shape of C. may either depend on an express term in the contract of agency, or it may be implied from the custom in the trade, or from the general course of dealing between him and his principal. The agent is not entitled to make a personal profit out of the business into which he may enter on behalf of his principal other than the C. agreed upon. If the agent obtains such a profit he is bound to account for it to his principal (see also COMMISSION, SECRET), and further, the principal in such a case may not only repudiate the contract, but recover any C. he may have already paid to the agent. Some of the commonest kinds of agents for whose services C. is usually paid are factors and brokers. A factor is an agent employed by merchants to buy or sell goods or to discount or otherwise negotiate bills of exchange, bills of lading, etc. A factor employed to sell is customarily entrusted with the goods of his principal, and may or may not sell in his own name. A broker is also an agent employed to dispose of goods or property, but differs from a factor in that he is not usually put into possession of his principal's goods; but he may buy or sell in his own name without disclosing the identity of his principal. A distinction should be drawn between factors' and brokers' agreements on the one hand and C. agencies on the other. A C. agency is not an agency in the true sense of that word. It exists where a C. agent or merchant supplies goods to a foreign merchant, or undertakes to buy or sell goods for another on the best terms he can secure for the other party. It is true he gets not only the price from the other party, but also his C.; but the transaction differs from an ordinary contract of sale in that the C. agent sells to the other at the lowest price and looks to the C. for his profit. A broker differs from a C. agent in that he is no more than a medium for establishing privity of contract between his principal and a buyer or seller of goods. A stockbroker furnishes an illustration of an agent whose right to C. or, as it is termed, brokerage is usually implied in the agreement to buy or sell stock, being generally reckoned at one-eighth per cent of the amount of the stock bought or sold at the market price on the date of the transaction. Since the Gaming Act, 1892, an agent employed to make bets for another is not entitled to recover any C. that may have been promised him. Such agents may style themselves C. or turf agents, but they are not legally recognised agents.

Commission, Military, in its most general sense, is the document by virtue of which an officer is authorised to perform

military duty for the service of the State. The royal authorisation to the feudal barons in Norman times presents but few features in common with the grant to-day of a C. in the army. In the Norman period the regular mode in England of assembling an army, either to resist an invading enemy or to accompany the king on a foreign expedition, was by sending a royal command to the chief barons and spiritual lords, that they should meet at a given time and place with their due proportion of men, horses, etc. properly equipped, according to the tenure by which they held their landed estates. These *tenants in capite* appear to have appointed by their own authority all their subordinate officers. But C.s were occasionally granted by the king authorising individuals to raise men for particular service. *Commissions of Array*, as they were called, were also issued by the king of England, probably from the time of Alfred, for the purpose of mustering the inhab. of the shires and training them in military discipline; and in the reign of Edward III the Parliament enacted that no person trained under these C.s should be compelled to serve out of his own shire except the kingdom were invaded. Of the same nature as these C.s of array was that which in 1572, when the country was threatened with the Sp. invasion, Queen Elizabeth issued to the justices of the peace in different counties. This privilege of granting C.s to the officers of the national militia continued to be exercised by the lord-lieutenants of cos. until 1872, when the militia became more closely connected with the regular army. Prior to 1871 C.s were obtained by purchase, except in the artillery and engineers, where they were always conferred without purchase. To a certain extent this was the case with C.s granted to officers of the line—those cadets who had completed a course of military education at Sandhurst being so appointed. In other cases the price of an ensigncy or C. was regulated by authority, varying from £450 for a first C. in an infantry regiment to £7250 for the C. of a lieutenant-colonel in the Life Guards. In proceeding to higher grades, an officer paid the difference between the price of the grade which he left and of that which he entered. But the system of purchase was abolished by royal warrant in 1871 in favour of the present system of entrance into the army by examination, with promotion to higher grades depending on examination in military subjects (as laid down in the Appendices to the Queen's Regulations) and (though to a lesser extent than before the First World War) on seniority. By far the greater number of C.s are given as the result of success in open competitive examinations. First appointments as sub-lieutenants are, however, also granted to non-commissioned officers with a special recommendation, univ. students who have passed certain qualifying examinations, and to 'Queen's' cadets. A number of cadetships for Sandhurst are given annually to young soldiers from the

ranks who show qualities of leadership. C.s now entail previous service in the ranks for a period of at least twelve months, followed by entry to Sandhurst. At Sandhurst the cadet is still in the ranks until he has passed out. The commissioned officers of a battalion of infantry are as follows: Field-officers—lieutenant-colonel and major. Regimental officers—captain and lieutenants. Staff-officers—chaplain, adjutant, quartermaster. In the navy the various C.s are a sort of warrant signed by the Lords Commissioners of the Admiralty; but the documents are called C.s. and are signed in the name of the king or queen. Under the Cardwell (see CARDWELL, EDWARD, VISCOUNT) reforms civil servants were granted C.s in certain military depts, e.g. purveyors of the Military Store Dept. and others of a like nature. In course of time these officers passed through the stages of relative rank, honorary rank, and quasi-military ranks such as surgeon-capt. The rank of quartermaster and honorary lieutenant (capt. or maj.) survived until 1918, when the honorary was dropped. An innovation took place in 1927 as regards C.s by the issue of a C. in standardised form for all officers of all branches of the service (with a few exceptions). The forms of C. are three in number: the first gives the sovereign's authority to the holder 'in such manner and on such occasions as may be prescribed by Us to exercise and well discipline in arms both the inferior officers and men serving' under the holder; the second refers to chaplains and exhorts the holder 'carefully and diligently to discharge his duty as an officer of the Royal Army Chaplains' Department'; and the third 'gives and grants' the holder 'full power and authority to have, hold, and enjoy' his said honorary rank. The Queen's Regulations prescribe when the command given by a first C. is exercisable and over what bodies. See also RANK.

Commission, Permanent and Special. C.s are occasionally set up for special purposes which may ultimately necessitate permanent session; as in the cases of the Charity C., 1853, the Civil Service C., 1855, and the Railway and Canal C., 1873. The C.s of this nature which are at present in existence include the Charity C., constituted under an Act of 1853 for the better administration of charitable trusts in England and Wales; Civil Service C.; Brit. Transport C., estab. under the Transport Act, 1947, for the general control of the nation's rail, road, and other transport services; Boundary C.s set up under the 1944 Act to review parl. constituencies (see ELECTORATE); Monopolies C., reconstituted in 1956 from the Monopolies and Restrictive Trade Practices C. appointed in 1948 to investigate questions of trade practices; National Parks C.; Crown Lands C.; Agric. Lands C.; Prison C.; and C.s to review co. and co. bor. boundaries in relation to local gov. reform; Development C., appointed under the Development and Road Improvement Fund Acts 1909-10, for the development of agriculture and rural industries, re-

clamation and drainage of land, harbours, and fisheries; Royal Fine Art C., appointed in 1924 (and extended by royal warrant of 1933) to inquire into such questions of public amenity or of artistic importance as may be referred to them by any state dept; Forestry C., appointed under the Forestry Acts 1919-45 and charged with the general duty of promoting the interests of forestry; Historical MSS. C., authorised under a C. issued in 1869 and renewed in 1919, to inquire into the location of MSS. of general public interest with a view to their pub.; standing C. on Museums and Galleries appointed in 1931 to advise generally on questions relevant to the development of the national institutions as a whole; Royal C., for the exhibition of 1851, which promotes scientific and artistic education through funds derived from its Kensington estate purchased with surplus moneys of the exhibition of 1851; Tithe Redemption C., constituted by an Act of 1936; Imperial War Graves C. (see GRAVES, SOLDIERS); War Damage C., appointed in 1941 to administer the War Damage Acts 1941-3; War Works C., appointed to adjudicate on disputes arising out of the Requisitioned Land and War Works Act of June 1945; and all Wheat C. (see under AGRICULTURE). All the foregoing are, in effect, gov. depts of a permanent or quasi-permanent character. Other C.s again, may be set up to meet an exceptional but temporary state of affairs. Judicial C.s, too, have been appointed for unusual cases where the ordinary legal procedure has been inadequate, and similarly under the Tribunals of Inquiry (Evidence) Act, 1921, tribunals were appointed under a high court judge to ascertain the facts in the wreck of H.M.S. *Thetis*; in the case of alleged disclosure of budget secrets by Mr J. H. Thomas (q.v.) in 1936; and in 1949 under Mr Justice Lysney to inquire into the rumours of corrupt conduct of public servants.

Commission, Royal. A R. C. is a body appointed to gain information about the operation of existing laws, as a preliminary to their amendment, or on various matters social, educational, or otherwise, and to report to the gov. by what method it is considered the best change could be achieved. A R. C. is constituted by the sovereign, on the recommendation of the Prime Minister, by a royal warrant submitted and countersigned by the home secretary. The particular objects of the inquiry, and the limits within which it must work, are expressly set out in the warrant or terms of reference. Members are selected by the depts most closely concerned with the particular legislation or topic to be investigated, and their record of service and knowledge of the subject under examination are the usual bases for selection. They are normally drawn from outside the ranks of the Civil Service. Sittings and duration of a R. C. are independent of Parliament. Commissioners are not paid for their services, although compensation may be allowed for time and labour in cases where a high degree of professional skill is necessary.

Parliament provides annually for the expenses of R. C.s. When an inquiry is completed the C. signs and presents its report to the Crown. If the commissioners are not unanimous, those in the minority may record their dissent, expressing their personal views in separately signed memoranda, as, for example, in the case of the minority report of the R. C. on the B.B.C. A R. C. has no power to compel disclosure of documents, nor even to administer an oath or compel persons to give evidence. There is no settled practice as to whether, when counsel appear before a R. C., they are entitled to cross-examine such witnesses as do volunteer to give evidence. The procedure adopted before the Evicted Tenants (Ireland) C. in 1892 was to allow questions to be put only through the commissioners themselves; and in the Featherstone Riots inquiry in 1893, Lord Justice Bowen, who presided, followed the same procedure. Instances of R. C.s may be furnished to almost any number, but post-war examples which may be mentioned are that on pop. (1948), which considered the declining birthrate with the object of advising on long-term policy; that on capital punishment (1949-53), whose recommendations were the basis of a revision of the law of murder in 1957; that on the press (1947), which led to the voluntary estab. of the Press Council; that on the B.B.C. (1949) which paved the way for commercial television in Britain; and the C.s on equal pay for men and women (1946); Civil Service pay (1955); betting and lotteries legislation (1951); mental health (1957) (with proposals affecting legislation going back more than 50 years); marriage and divorce; and the taxation of income and profits (1953-4), whose recommendations influenced some aspects of budget policy in 1957, and will probably be incorporated in subsequent instruments of financial policy; and on the problems of Greater London and Middx gov. (1957).

Commission, Secret. With the object of preventing the bribery of agents, employees, or servants of any kind, especially by the payment of money by way of commission, without the knowledge of the agent's or employee's principal or employer, the legislature in 1906 passed the Prevention of Corruption Act, which punishes as a misdemeanour with imprisonment for a term not exceeding 2 years with or without hard labour; or with a fine of £500, or both; or *summarily*, with 4 months' imprisonment or a fine of £50, or both: (1) the corrupt acceptance or obtaining by an agent either for himself or for any other person, e.g. his wife or child, any gift or valuable consideration of any kind as an inducement or reward for doing or forbearing to do any act in relation to his principal's affairs or business; and (2) the corrupt giving or agreeing to give anything to an agent as an inducement to act in such a way. 'Agent' includes employees of all kinds. The passing of the Act was generally regarded as a necessity in view of the ever-increasing corruptibility of persons in

large business houses entrusted with the power to contract for the supply or purchase of considerable quantities of goods, and of various other persons, such as the servants of local authorities, who could not be reached by the criminal law as it stood prior to 1906. The gist of the offence is the paying or receiving *corruptly*, it being no offence in itself either to reward an agent or for an agent to accept a reward. Prosecutions under the Act may only be instituted by leave of the attorney-general.

Commissionaires, Corps of. This useful body was founded in 1859 by Capt. Sir Edward Walter, K.C.B. At its inception it was composed exclusively of a few wounded soldiers, the founder's idea being to make the association a means of obtaining some form of employment for discharged warrant and non-commissioned officers of good character. The corps soon developed into a large institution, which comprises pensioned soldiers, sailors, and armen. There are branch institutions of the corps in Birmingham, Bristol, Leeds, Liverpool, Manchester, and Newcastle-on-Tyne; Edinburgh and Glasgow; and Belfast. The headquarters are at Exchange Court, 419A Strand, London. The men wear a distinctive uniform, and are generally engaged in light duties of a temporary or permanent character.

Commissioner of Police. There are 2 C.s of P. in England—one for the Metropolis and one for the City of London. The C. of P. for the Metropolis is assisted by 5 assistant commissioners (one of whom has the status of a deputy commissioner), 10 commanders, and 8 deputy commanders. The City of London has a separate police estab. under the C. of P. for the City of London, who has an assistant commissioner to help him.

Commissioners, Church, *see* CHURCH COMMISSIONERS.

Commissioners, Lords, *see* ASSENT, ROYAL.

Commissioners, Naval, *see* ADMIRALTY. **Committal, warrant or order of a court or justice of the peace directing a sheriff, bailiff, or constable to take a named person to the common jail, whether on remand or to await trial.** If the arrested person is already in jail, the C. directs the governor to detain the person named for a specified period, and either to produce him or discharge him on the expiration of such period. Apprehension without a warrant is not C. in the proper sense. The Habeas Corpus Act, 1679, provided that a jailer was not justified in receiving a prisoner unless the C. was in writing. A C. must state the offence for which the prisoner is detained.

Committee of Imperial Defence originated in 1890 as a select combination of civil and professional advisers on naval and military matters, formed with the object of securing a greater degree of efficiency of preparation for political contingencies and for joint action in time of war. At its inception it was a naval and military council whose prin. function was to consider the estimates with a view to determining the relative importance of the

respective demands of the two services. During the First World War it was regularly presided over by the Prime Minister, while the members included the war secretary, the first lord of the Admiralty, the head of the Army General Staff, the First Sea Lord, and heads of the Army and Navy Intelligence Depts. The C. of I. D. was subsequently concerned primarily with questions of imperial defence and only secondarily with the estimates. The Prime Minister continued to be the chairman and the secretaries of state of the service depts, the dominions, Colonial and Foreign Offices, and other interested ministers were members. Under an arrangement made in 1936 to secure a higher degree of co-ordination between the three fighting services a minister for the co-ordination of defence was appointed to act as deputy chairman and to devote his whole time to the duties. The overseas dominions made provision for the defence of their own areas, but the general strategical defence of the empire was undertaken by the imperial gov., through the C. of I. D. which co-ordinated the work of the sea, land, and air forces. One of the most important sub-committees was that of the chiefs of staff of each of the fighting services, whose function was to draw up plans for defence to be submitted to the main committee and for the execution of the accepted policy of the committee. (This sub-committee, of course, continues to exist, but now reports to the minister of defence.) The C. of I. D. was ancillary in its functions to the Cabinet, being in the main advisory and informative. The plenary sittings of the committee took place some six or seven times a year. Ordinarily the committee conducted its business through permanent sub-committees. The C. of I. D. was replaced by the Defence Committee in 1946 (n.v.). See also DEFENCE, MINISTRY OF.

Committee of Public Safety (*Comité du Salut Public*), body which was co-opted by the members of the Fr. convention in 1793. The powers entrusted to it were at first merely those of supervising the actions of the executive, but by degrees it usurped all the powers of that body. Local committees were subsequently instituted in all the coms. to try suspected persons, and any conception of impartial justice was thenceforth non-existent in France. Robespierre was the leader of the *comité* till his fall in 1794; in Oct. of that year a new constitution introduced a directorial gov.

Committees, Parliamentary. In the endeavour to cope with the ever increasing vol. of work which its expanding powers have brought in their train, Parliament has devised and adapted a system of C. to which it delegates limited authority. These range in size from the committee of the whole House to the select committee of 5 members appointed for a particular purpose. A committee of the whole House, as its name declares, is the House itself, presided over by a chairman instead of the Speaker, and working under rather less rigid rules, e.g. a member may speak

more than once in any question. One or 2 of the major Bills of the session are referred to a committee of the whole House for their committee stage, but the extent to which this can be done is limited by the claims on its time of financial business. The House of Lords, with no such restrictions on it, takes almost all public Bills in the whole House.

Committees of Supply, and Ways and Means. Through these C. the Commons exercise their authority over finance. These 2 C. are appointed at the beginning of every session, and their origin in the Sovereign's demand for supply is indicated in the resolutions moved to establish them: for Supply, 'to consider of the supply to be granted' to the Crown; and for Ways and Means, 'to consider of the ways and means for raising the supply to be granted.' The function of the former is to vote grants to meet public expenditure, and it does this on the estimates presented by the sev. Ministries, in resolutions subsequently confirmed by the House when reported to it, and finally authorised by an Act. When the main estimates are first brought up—naval, military, air, and civil—a special motion to move the Speaker out of the Chair keeps alive and effective the historical doctrine of redress of grievances before the grant of supply, and gives back-bench members the opportunity (for which they ballot) to initiate debates on matters related to the estimates. It is also the custom on these occasions for the Minister responsible to present a substantial review, past and prospective, of the work of his dept. The committee of Ways and Means finds the money for the required supply by the imposition of taxation. The resolutions which give immediate authority to the taxation changes proposed by the Chancellor of the Exchequer in his Budget speech, and exceptionally at other times, are passed in this committee, and reported to the House, after which they are included in the Finance Bill. Bills originating in resolutions of the committee are protected from alteration or delay in the House of Lords.

Standing Committees. All Bills other than money Bills are referred to standing C. after second reading unless the House orders otherwise, and each session standing C. are appointed as necessary to consider them. They consist of not less than 20 nor more than 50 members, nominated in direct proportion to the Gov. and Opposition strengths in the House. A standing committee is thus a miniature House, and it follows in general the rules and procedure of the House in committee, except that in divisions the votes are taken by a roll call of members. C. may sit on any day on which the House is sitting. If a division is called in the House while the committee is in progress the chairman suspends the sitting so that members may vote in the House. One of the standing C. is appointed for the exclusive consideration of Bills and estimates relating to Scotland, and includes all members for Scottish constituencies plus 10 or 15 others. Another

is reserved for Bills introduced by private members. A standing committee dealing with a Bill relating exclusively to Wales and Monmouth must have in its membership all M.P.s for Welsh constituencies.

Select Committees are appointed by each House to consider particular matters or Bills. They have not more than 15 members, and the scope of their activities is defined by the order of reference in which they are set up. They are given power to send for persons, papers, and records, and may take evidence and hear counsel on behalf of parties. A select committee can only extend its inquiries by resolution of the House, which similarly may restrict it to the investigation of specific points. *Joint committees* are sometimes appointed, at the instance of either House, to save time or for other reasons of convenience. They consist of an equal number of members from both Houses, and exercise powers like those of select C. Some select C. appointed every session deal with matters of procedure or domestic matters. The most important of those regularly appointed are the Committee of Privileges (*see* PRIVILEGE), the Estimates Committee, and the Public Accounts Committee. The Estimates committee examines details of expenditure, and has authority to report on what economies might be effected consistent with policy and to suggest the form in which estimates should be presented to the House. It has long had power to form its own sub-committees, and since the Second World War has regularly used a system of investigating sub-committees. The Committee on Public Accounts has 15 members who seek to make sure that grants authorised have been applied to the objects Parliament intended, and call attention to cases in which expenditure has been incurred in excess of the authorised grant. The pub. of its reports, coupled with the reports of the Comptroller and Auditor General on which it acts, constitute an effective check on the actions of the spending depts. *See* PARLIAMENT.

Commodore, in the R.N., a temporary rank between that of an adm. and that of a capt. A C. is usually appointed for a squadron of three or more ships detached from the main body on special service. There are two classes of C.s, of which the first holds his pennant, white with a red cross, at the main, and holds the temporary rank of a rear-adm. A C. of the second class holds his pennant at the fore, and has no capt. under him in the ship. A C. may not hoist his pennant in the presence of an adm. without permission. The title is often given by courtesy to the senior capt. of a squadron of sev. ships. In the U.S. Navy the title was purely a courtesy one before 1862, applied to capts. who commanded a squadron. In 1862 it was made a permanent rank equal to that of brig-gen. in the army, but was abolished in 1899. The title belongs also to the president of a yacht club and to the senior capt. of a fleet of merchant vessels. The equivalent rank in the R.A.F. is Air C.

Commodus, Lucius Aelius Aurelius,

known also as Marcus Antoninus, Rom. emperor 180-92; b. at Lanuvium AD 161, the son of Marcus Aurelius (q.v.), whom he succeeded in 180. Three years after his accession an attempt was made upon his life, and this let loose the cruelty and extravagance of a disordered brain. Thousands were put to death on the occasions of this and other abortive conspiracies; the treasury was quickly exhausted by the emperor's wild expenditure; and C. descended so far from the dignity of his rank as to fight with beasts in the arena, claiming divine honours as Hercules. Eventually, in 192, the prefect of the praetorian guard and C.'s concubine, Marcia, learned that they were secretly doomed to death, and procured C.'s murder by poison and strangulation.

Common, Right of, right of taking a profit in the land of another in common with others. It may either be such a right as is enjoyed in common with others to the exclusion of the owner of the land, or it may not exclude the owner of the land. The commoner has no interest or estate in the soil of the land on which he has a R. of C. The profits which may be the subjects of common right are the natural produce of land or water, such as grass and herbage, turf, wood, and fish. Hence the four species of 'commonable' rights are called common of *pasture*, the right to pasture one's cattle on a particular piece of land; common of *turbary*, the right to cut turves; common of *piscary*, the right to take fish from a particular piece of water; and common of *estovers*, the right to take wood for fuel, or for agric. implements. Where a person enjoys a R. of C. over land by reason of his title to other land, the common is called a common *appendant*, e.g. freeholders of a manor may have the right to pasture a certain number of beasts on the manorial waste lands. A R. of C. is said to be *appurtenant* when claimed (a) by copyholders; (b) by freeholders of a manor when they claim independently of their freehold interests; (c) by freeholders not of a manor. Copyholders may claim by special custom, while freeholders' rights may depend upon grant or prescription (i.e. title by user). There are various ways of extinguishing R.s of C. otherwise than by buying the commoner out, e.g. the enfranchisement of copyhold to which a R. of C. is annexed extinguishes the right. The most usual mode of extinguishing R.s of C. in modern times is by inclosure under Act of Parliament.

Common, Tenancy in. Tenants in common are they who own lands or tenements, whether by a freehold or a leasehold title, in common as distinct from joint ownership. The characteristic features of joint ownership are that each owner has an equal aliquot share of benefit in the undivided whole; and that, assuming no proceedings for severance, the whole ultimately goes to the survivor. In T. in C. each is the owner of an undivided share in the whole, the quantum of his proportionate part depending on the terms of the grant or devise. It is solely the fact that the tenants are all interested in the possession

of the same property that constitutes them tenants in common; and each one of the tenants in common may derive title from a different instrument, whereas joint tenants derive one and the same title from one and the same instrument. There may be tenants in common of other things besides land, as, e.g. of £5000 consols, or a racehorse. The undivided shares of tenants in common no less than the quantity of their interest or estate may be equal or unequal, e.g. A may have the freehold inheritance of two-thirds of a particular park, while B may have only a life estate in the remaining one-third. But so long as B's lesser interest exists, A and B are tenants in common. For all the purposes of sale, disposition by will, or transmission of intestacy, the undivided shares of tenants in common are like separate property. Enjoyment must be in common if possible; if not the tenants must come to some agreement about the mode of enjoyment, and if they cannot agree they must sell the thing and divide the proceeds in the proper proportions. Equity (q.v.) is said to lean against joint tenancies, and the courts endeavour to construe all instruments in such a way as to create tenancies in common rather than joint tenancies. A T. in C. ceases when the ownership of the sev. shares subsists in a single individual; it can also be destroyed by means of a partition suit in equity, unless, indeed, the thing be indivisible, when a sale must be effected.

Common Council of London, *see* CORPORATION OF LONDON.

Common Field System, *see* LAND; OPEN FIELD SYSTEM.

Common Form. In the great majority of causes of action the material circumstances are such that judgment can generally be entered in C. F., i.e. in accordance with the long-estab. practice of the courts. In such cases nothing more is required than to fill in the form of the judgment the names of the parties, the dates, the amount of the damages, etc. From the simplicity of the issues in most common law actions, the C. F.s of judgment are usually far shorter than in the case of judgments, orders, and decrees (q.v.) in equity (q.v.) suits. Nevertheless the usage of the Chancery courts has evolved an equally stereotyped set of precedents for use in every conceivable class of case. The term C. F. is not, however, restricted to a form of judgment, but may be regarded as synonymous with precedents in the sense in which that word is used to denote any legal document whatever drafted in accordance with common practice.

Common Good, in Scots law, denotes all the property of a burgh (q.v.) held by the corporation for the general good of the community. C. G. may be either alienable for the debts of the burgh, or inalienable. The lands, mills, and fishings of a burgh which are generally leased for periods customary in the dist., and houses, which are ordinarily let for a year, are alienable. Public lands and buildings, e.g. churches, in halls, market places, and common greens, and other property

dedicated by grant, Act of Parliament, or otherwise to the special use of the burgh are inalienable. Inquiries have been instituted from time to time ever since 1662 into the mismanagement and maladministration of C. G., the object of the act of grant of which was to enable the burghs to meet the Crown burdens and to discharge their local and municipal duties. These inquiries were productive of but little result, but in 1822 Sir Wm Rae's Act was passed to regularise the administration of the affairs of burghs royal, and under the Town Councils Act, 1900, the local body must make out a yearly account of the C. G. and the revenue arising therefrom.

Common Law, a term of varying import, the different senses or rather shades of meaning of which are to be gathered by contrast with a number of opposed terms. Broadly speaking, the C. L. of England is the universal law of the realm, the fundamental principles of which, based on general customs, have existed from time immemorial, while their subsequent development to meet every new combination of circumstances has been the peculiar province of judicial interpretation acting avowedly on estab. precedent. In this broader sense C. L., as opposed to *lex scripta*, the written or statute law, is styled *lex non scripta*, or the unwritten law of the kingdom. Blackstone includes in the *lex non scripta* not only *general customs*, but also the particular customs of certain parts of the kingdom and such particular laws as are by custom observed only in certain courts and jurisdictions, and explains the description *non scripta* on the ground that the original institution and authority of such parts of our law were not set down in writing, as Acts of Parliament were, but received their binding force by long and immemorial usage and by their universal reception throughout the kingdom. In thus adhering to the classic distinction, Blackstone points out that those parts of the C. L. which he included in the *leges non scriptae* had long since lost their purely oral character, and were to be found in the records of our courts, in books of reports, and in treatises by writers of estab. repute. He accordingly identifies C. L. in its stricter significance with one class only of the 'unwritten' laws, viz. *general customs*, which he describes as the laws by which proceedings in the ordinary courts of justice are directed, e.g. that the eldest son alone is heir to his ancestor; that a deed is of no validity until delivered. *Particular customs*, as opposed to general, affect only the inhab. of particular dists., e.g. the right of the youngest son to inherit by custom of *borough-English* (now abolished). The third branch, *particular laws*, connotes the civil or Rom. municipal law, and canon law or Rom. eccles. law compiled from the opinions of Lat. fathers, the decrees of general councils, and papal bulls, which systems have no authority in England other than that they may have received by immemorial usage in certain particular cases. In its narrower or contrasted sense C. L., or general

custom, crystallised by judicial decisions into positive law, is further and pre-eminently opposed to equity (q.v.), or that body of rules which savours of the *ius naturale* of Rom. law, and was originally formulated by the chancellor acting as the keeper of the king's conscience, and developed by a long line of chancery judges, for the purpose of mitigating the rigour, formalism, and technicality of the C. L. For centuries equity existed side by side with the C. L. as a body of opposed rules gradually growing as technical in its own way as the C. L., until in the year 1873 the Judicature Act abolished the distinction by enacting that the rules of equity should prevail. But though nominally equity and C. L. are fused, practically the distinction is retained by reason of the fact that certain subjects, e.g. trusts, the interpretation of wills, etc., were assigned to the chancery div. of the high court, and, further, from the fact that the queen's bench or C. L. courts have provided no machinery for carrying out equitable judgments.

Common Market, see EUROPEAN COMMON MARKET.

Common Pleas, Court of, one of the old common law (q.v.) courts; before 1881 it existed as a superior court of record, having jurisdiction over England and Wales in all *common pleas*, i.e. civil suits between subjects. Like the present queen's bench div. and the old court of exchequer, it was an emanation of the *Curia Regis*, or committee of the *Commune Concilium* or Great Council of the Realm of Norman times. The term *common pleas* was used in contradistinction to *pleas of the Crown* or criminal causes. By Magna Charta, Article 17, it was provided that the court should be held in a fixed place instead of following the king, an enactment which led to the estab. of the C. of C. P. at Westminster Hall. By the end of the 13th cent. it had acquired, like the other common law courts, a separate staff of judges, distinct from the permanent members of the *Curia Regis*. The number of its judges varied considerably from time to time, but at the period prior to its abolition it was composed of 5 judges, 1 of whom was chief justice and the other 4 puisne justices. Before the passing of the Real Property Limitation Act, 1833, which abolished all *real* and *mixed* actions except that of *ejectment*, it had exclusive jurisdiction in all *real* actions, or actions concerning the freehold title of lands. After 1833 this jurisdiction was restricted to actions of *dower* and *quare impedit*, i.e. actions by a patron against a bishop for refusing to admit and institute to a vacant benefice the clerk nominated by the patron. In *mixed* actions, i.e. those in which a claim for damages was made along with a claim for the specific recovery of some tenement, and in *personal* actions—that is, actions on contract and tort, or civil injury—the C. of C. P. and the 2 other common law courts of king's bench and exchequer exercised concurrent jurisdiction. It was also constituted a court of appeal from the decisions of revising barristers on disputed

franchise claims, a function now delegated to the divisional court. By an Act passed in 1831 it was provided that the judgments of the C. of C. P. could only be reversed by the judges of the king's bench court and the court of exchequer sitting as a court of error in the exchequer chamber, the final appeal being by *writ of error* returnable to the House of Lords. By the Judicature Act, 1873, the C. of C. P. was merged in the C. P. div. of the high court of justice, but it was finally transferred to the queen's bench div. by an order in council issued in 1881.

Common Prayer, Book of, see PRAYER, BOOK OF COMMON.

Common Room, apartment in a monastery, similar to the C. R. of colleges where dons take their wine after hall. A fire was constantly kept burning for the use of monks, and a master monk presided.

Common School, see EDUCATION, U.S.A.

Common Sense, Philosophy of, bases all axioms and reasoning on certain fundamental beliefs. Among these conceptions may be named the universality of causality, and the belief in the reality of the material universe apart from the mind of the person perceiving it. These conceptions are all recognised as true by the common sense of mankind. The school is chiefly represented by Thomas Reid and the Scottish school. See also BERKELEY, GEORGE. See J. McCosh, *Scottish Philosophy from Hutcheson to Hamilton*, 1875; A. Seth, *Scottish Moral Philosophy (Philosophical Review, vii)*, 1898.

Common Serjeant, judicial officer of the city of London whose functions are (1) to sit at the Central Criminal Court (q.v.) to aid the recorder in the disposal of criminal cases; (2) to act as a judge of the mayor's court of London for the trial of civil causes; (3) to act as legal adviser or law officer to the city corporation, and to act as counsel in court for the corporation if called upon; and (4) to perform certain duties at elections of the lord mayor, sheriffs, and other corporate officers. The C. S. is next in rank to the recorder. Before 1888 he was elected by the Court of Common Council; since then the appointment has been vested in the Crown. The C. S., who must be a duly qualified barrister, is not disqualified from a seat in Parliament. The salary of the C. S. is at present £3000 a year.

Common Time, name applied to music with two or four beats in a bar. It is especially applied to 4-4 time, four crotchets in a bar, as this time is the most common.

Commoner, term of varying import denoting primarily any person under the rank of a peer. It also means a member of the House of Commons; one who has a title to a right of common (see COMMON, RIGHT OF); and, at Oxford or Cambridge, a student of the second rank, i.e. one who is neither a scholar nor an exhibitioner of his college.

Commons, House of, see HOUSE OF COMMONS.

Commons and Enclosures, see OPEN SPACES AND COMMONS.

Commonwealth, a form of gov. without a

monarchy. Particularly applied to Eng. hist. between the death of Charles I and the accession of Charles II, from 1649 to 1680. Also the official designation in the U.S.A. for the states of Massachusetts, Pennsylvania, Virginia, and Kentucky. C. has replaced Empire in relation to the self-governing Brit. dominions. The modern description, Brit. C. and Empire, connotes the fact that the Brit. C. is partly centrally controlled (i.e. the colonial dependencies proper) and partly a C. of individually sovereign states (i.e. the sev. dominions). The term finds its concrete expression and authority in a report by a committee on inter-imperial relations, presided over by Lord Balfour, which was unanimously adopted by the imperial conference of 1926. This report, defining the relationship between Great Britain and the dominions, said: 'They are autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their external or domestic affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations,' and this definition was subsequently given legislative sanction in the Statute of Westminster (1931). *See further* BRITISH COMMONWEALTH AND EMPIRE; DOMINION STATUS.

Commonwealth and Empire Settlement Acts, 1922-57. The Empire Settlement Act of 1922 formed the basis of Brit. policy of state-aided empire settlement until the gradual suspension of the Gov. schemes after the economic depression 1930-2. It empowered the gov. to co-operate in agreed schemes for assisting the emigration of suitable persons from the U.K. to the dominions. Subsequent Acts, i.e. the Empire Settlement Act, 1937, the Empire Settlement Act, 1952, and the Commonwealth Settlement Act, 1957, have considerably modified and expanded the basic principles underlying the original act. *See further under* EMIGRATION; and for the individual immigration policies of the various dominions, *see under* the dominion concerned.

Commonwealth Institute, until 1958 called the Imperial Institute, founded in 1887 on the initiative of King Edward VII (then Prince of Wales) to commemorate the golden jubilee of Queen Victoria. The cost was met by contributions from all over the Empire. The buildings, on a site in S. Kensington, London, consisted of a main block with an overall frontage of 750 ft to Imperial Institute Road, and an extensive range of exhibition galleries at the back. The architect was T. E. Colcutt, and the Institute building, completed in 1893, was opened by Queen Victoria in May of that year. The main building had 3 towers, the central or Queen's Tower, which contains a peal of 10 bells, being nearly 300 ft high. The bell-chamber, 200 ft above pavement level, is said to be the highest in the Brit. Is. The Institute acts as a centre for information about the Brit. Commonwealth. It is an independent grant-aided organisation operating under the aegis of the

minister of education. From its foundation until 1902, when by Act of Parliament it was placed under the care of the Board of Trade, the Institute was a private body governed by royal charter. In 1907 management of the Institute passed by agreement to the Colonial Office, and this arrangement was given statutory sanction by an Act of 1916. In 1925 an Act was passed which repealed earlier Acts and transferred the Institute to the control of the Dept of Overseas Trade (Board of Trade). At that time the Institute's functions were partly scientific (the examination of raw materials from the Commonwealth) and partly educational. In 1949 Orders in Council limited the Institute's activities to education and public information, under the general direction of the minister of education. The scientific depts were taken over by the Colonial Office. In 1953 by a further Order in Council the Institute once more became an independent body, although the minister retained his parl. responsibility.

The exhibition galleries, open free every day of the year except Good Friday and Christmas Day, illustrate the life, scenery, and resources of all the countries and ters. of the Brit. Commonwealth. A magnificent collection of dioramas (illuminated picture models) is a notable feature. The Institute has a small cinema which shows documentary films, and an art gallery for temporary exhibitions of the work of Commonwealth artists. The Institute's galleries and cinema are excellent media for visual teaching, and they are visited by many thousands of school-children who come in organised parties to receive lessons from the permanent teaching staff. Other educational services include lectures, conferences, visual aids, and pubs. A book-stall offers a large and carefully selected stock of inexpensive maps, wall charts, books, and leaflets about the Commonwealth drawn from official and other reputable sources. The Institute issues an ann. report which is obtainable free on request.

By early in 1958 plans were being developed for the rebuilding of the C. I. on a site at Holland Park, London; of the original Colcutt building it was proposed that the campanile might be retained free-standing on a re-planned site for the enlarged Imperial College (q.v.) of London Univ.

Commonwealth Institute of Entomology, founded in 1913 to encourage and co-ordinate entomological work throughout the Empire in relation both to human and animal diseases and to agriculture. The head office is at the Brit. Museum (Natural Hist.), Cromwell Road, London, S.W. The Institute absorbed the Entomological Research Committee appointed in 1909 with the object of furthering the study of economic entomology particularly in the Brit. Tropical African Colonies and Protectorates. The Institute publishes a quarterly bulletin entitled the *Bulletin of Entomological Research* and a monthly review entitled the *Review of Applied*

Entomology, which summarises all current entomological literature bearing on injurious insects.

Commonwealth Mycological Institute, founded in 1920 and now at Kew, Surrey. It was the outcome of a proposal adopted by the Imperial War Conference in 1918, that a central organisation should be estab. for the encouragement and co-ordination of work throughout the Empire on the disease of plants caused by fungi. Since 1933 the Institute has been under the control of the executive council of the Imperial (later Commonwealth) Agricultural Bureau. Its work on the diseases of plants caused by fungi is broadly on the same lines as that of the Commonwealth Institute of Entomology (q.v.) in regard to insects. Its primary function is to assist plant pathologists in the Commonwealth by the accumulation and distribution of information on all matters connected with plant diseases and by the identification of specimens.

Commonwealth of Australia, The, came into existence on 1 Jan. 1901, when the five Australian colonies of Great Britain united with Tasmania in a federal state under this name. See AUSTRALIA.

Commonwealth Telecommunications Board, incorporated by Act of Parliament, 1949, to supersede the former C. Communications Council (which in 1944 had itself superseded the Imperial Communications Advisory Committee constituted in 1929). Its object is to co-ordinate the telegraphic services (cable and wireless) connecting the various parts of the Commonwealth, and it is particularly concerned with questions of policy regarding the institution of new services, the discontinuance of existing services, and the distribution of traffic between alternative routes.

Commune, in feudal times in France, meant a body of bourgeois in a town which had been granted a charter of incorporation by the king. Subsequently it came to denote any body of persons in a par. or dist. organised for the purposes of local gov., and subordinated to the central authority of the state. The C. is now the unit of local governmental administration in France, and is composed of the citizens, a council elected by the C. itself, and a *maire* appointed by the state.

Commune of Paris, 1871, name given to the municipality proclaimed by the insurrectionist element in Paris on 18 March 1871, while the victorious Ger. Army was encamped on the heights outside the city. Some five months after the proclamation, in Sept. 1870, of the Third Republic, the National Assembly, elected after the capitulation of Paris, succeeded to the functions of the provisional Gov. of National Defence. This Assembly contained a majority of Monarchists, and the knowledge that the Assembly, with its anti-Republican feelings, was about to disband the National Guard kindled disaffection among the revolutionary element in the city, with the result that the latter proclaimed a C. in accordance with the traditions of the C. of the Fr. Revolution. The National Assembly and the

garrison troops then retired to Versailles, whence the latter, reinforced by the liberated Fr. soldiers of the Sedan and Metz armies, returned to conduct a second siege of Paris under the eyes of the silent Ger. Army. The Communards, having burnt the palace of the Tuileries, the Hôtel de Ville, and some other public buildings of historic interest, were themselves speedily made the victims of the fury of the Fr. regulars. Four days after the burning of the Tuileries, on 28 May 1871, Paris was taken by storm, some 20,000 to 30,000 men and women having been shot in the streets of the city, the C. was deposed, and a number of its chiefs executed or transported.

There is, however, really but little relationship between the C. of P., 1871, and that of the Fr. Revolution. The latter was the spontaneous expression of the hatred of the Parisian populace for the Fr. aristocracy. The Girondists, having encouraged the revolt against the tyranny of the privileged classes, were utterly unable to destroy the force to which they had given birth, and Paris fell under the Reign of Terror, fomented by the triumvirate of Robespierre, Marat, and Danton. But the C. of 1871 was an insurrection motivated by a desire for local or self-gov. for Paris, and the democratic expression, loose and incoherent though it might be, of dislike for the prevalent centralisation (q.v.) and the growing power of the industrial bourgeois class. The point of contact, however, between the two C.s is that they were essentially the instruments of the mob; but while the earlier Communards based their pretensions on no sounder theories than the doctrine of an original social compact and the moral superiority of the state of nature promulgated by Rousseau, and ended with nothing clearer than a frenzied cry for equality, liberty, and fraternity, the intellectual chiefs of the later C. displayed strong socialistic views which, even if theoretically vague, nevertheless contained in them a clear expression of revolt against economic oppression by the moneyed classes. The Communards of 1871, however, should not be confused with the Marxian Communists of later revolutions, with whom they have no connection. See also P. Lissagaray, *Histoire de la Commune de 1871* (Eng. trans. by E. B. Aveling), 1886; E. Belfort Bax, V. Dave, and W. Morris, *A Short Account of the Commune of Paris, 1886*; and F. Lepelletier, *Histoire de la Commune, 1911*.

Communications, see AIR MAIL; AVIATION, CIVIL; BROADCASTING; CANAL; RAILWAYS; SHIPPING ROUTES; TELEGRAPHY; TELEPHONY, etc., and under *Communications* in the general articles on countries.

Communion (Lat. *communio*, Gk. *koinōnia*), participation in the sacrament of the Lord's Supper. Since only those holding the faith of and belonging to the Church were admitted to this rite, the word C. became applied to the fellowship of those united by belief in the tenets and reception of the sacraments of any particular religious body or Church. Hence

we speak of the Rom. C., the Anglican C., and the Lutheran C. C. in both kinds is a theological term signifying that in the celebration of the Lord's Supper communio means receive the sacrament under both the species of bread and wine. This was undoubtedly the general practice of the primitive Church, but in the early Middle Ages the custom of withdrawing the cup from the laity gained ground. The Council of Trent in 1563 ratified this practice in the Rom. Catholic Church.

Communism, in its limited application, means the common management of industry and the sharing of its fruits. There is common management of parks, schools, public pleasure grounds, etc., and practical C. in water which is supplied free to the poorest inhab. As a social theory, C. finds few adherents either in Great Britain or in the U.S.A., but the movement has gathered many adherents since the Second World War in France, Italy, and Yugoslavia, though some allowance must be made for the influence of Russia over countries of E. Europe. Again, the Communists in pre-Nazi Germany polled many votes, but were ultimately disrupted by Hitler (see COMMUNIST PARTIES).

In early times property was often held in common, and in this respect the religious orders have always practised a form of C. Plato's *Republic* and Sir Thomas More's *Utopia* advocate social organisations having many communistic elements. Saint-Simon and Fourier are also generally considered to be Communists, though their systems do not demand absolute equality. New interest was aroused in C. by the estab. of the Soviet system in Russia following the revolution of 1917. The C. of Russia aimed at much more than the socialisation of wealth, for it seized the means of wealth-production. In the deliberate and avowed policy of the leaders of the movement some startling and paradoxical methods were upheld. It was contended that revolution must precede good order, and that a dictatorship was essential in order to procure national equality. The milder Fabian notions of gradual change were openly repudiated and the necessity of tearing down existing systems, at no matter how great an immediate cost, before new ones could be devised, was proclaimed. Russian C., successful at all events in revolution and in the estab. of a dictatorship, proceeded along the 2 definite lines of education and propaganda in order to estab. its future; but even the vigorous prosecution of these methods did not lessen the apparent need for ever-increasing powers of dictatorship. C. in Britain and other countries is a title frequently adopted by politicians for whom the prevailing Socialist teachings are not sufficiently forceful. During the 1919 general election in Great Britain, candidates adopting this description first stood for election in sev. constituencies. But the movement as a whole gained few adherents. Since then it has made little headway, the common opinion being that it is a movement subsidised by Moscow. In the 1945 general election the Communist

party had 21 candidates of whom only 2 were elected. These lost their seats in 1950.

See also BOLSHIEVISM; COMMUNIST PARTIES; COMMUNIST PARTY OF THE SOVIET UNION; ENGRS, F.; MARX, H. K. See J. S. Mill, *Principles of Political Economy*, 1848; K. Marx, *Das Kapital*, 1867-85; S. and B. Webb, *Social Communism: a New Civilization*, 1941. The development of C. from Marx's reflections on the philosophy of Hegel is outlined in R. L. Heilbroner, *The Great Economists*, 1955.

Communist Parties. The Communist Party of Great Britain (C.P.G.B.) was founded in 1920 to propagate the principles of Communism (q.v.), many of its founder members having belonged to Socialist bodies, particularly to the Social-Democratic Federation. It has had little parl. success. Its first member, S. Saklatvala, was elected for Battersea N. in 1924 and sat till 1931. W. Gallacher was elected in 1935 for W. Fife and sat till 1950. P. Piratin was elected in 1945 for Stepney but lost his seat in 1950. The party is affiliated to the Cominform (previously the Third International), whose seat is in Moscow. The Brit. Labour party forms part of the Labour and Socialist International, which is in line of succession of the old Second International, and is supported by most of the democratic parties in Europe, and by some in other continents. Unlike the Third International, which was the creation of the Communists of Soviet Russia, and was dominated by them (as the present-day Cominform still is), the Labour and Socialist International cannot give orders to its affiliated organisations. In Germany the Communist party in the 4 Reichstag elections of 1930-2 polled between 5 and 6 million votes; but after these successes they were gradually overwhelmed by the Nazis; their leader, Thaelmann, was flung into jail, and repressive measures were taken against the party as a whole. Even the notorious Reichstag-building fire of 1933 was laid, though without evidence, at the door of the Communist party. Similarly, in Austria, the Gov. decided to dissolve the Communist party on account of its subversive propaganda. The Communist party played only a minor role in the Sp. revolution, the Sp. Communists affiliated to the Third International comprising a negligible minority; the more influential left-wing party in that country was identified with the *Sindicate Union*, an independent Labour organisation. Late in the Civil War (Mar. 1939) there was a determined Communist revolt in Madrid, but it was crushed by the Republicans in a few days, and attempted uprisings in Valencia, Almeria, and other prov. centres were similarly overcome. In Great Britain in 1933 the Communist party agreed with the Independent Labour party that a 'united front' should be presented by the 2 parties against Capitalism and Fascism. They approached the Labour party and the T.U.C. in the hope of securing their co-operation, but signally

failed. There was a large Communist party in Czechoslovakia up to about 1938, but, with the Ger. threat to the Sudetenland, its influence rapidly waned, and with the Ger. invasion of the whole country it was driven underground. The outbreak of the Second World War saw the rapid decline of the C. P. in most countries whose sympathies were with the cause of the W. democracies, and the policy of Stalin towards the Poles and Finns hardened world opinion against them everywhere, notably in Italy (see also ANTI-COMINTERN PACT). With the end of the Second World War in 1945, however, the C. P. made their influence felt in many countries in Europe, largely owing to the rise in the cost of living (see COMINFORM). Again, the revolt in the Dutch E. Indies was largely organised by Communists (see INDONESIA). But perhaps their most striking advance is in China, where during 1946-9 a successful civil war was waged between their forces and the forces of Chiang Kai-shek (see CHINA). The military suppression of the revolt against the Russian-controlled Communist party in Hungary in 1956 caused widespread dissension and disaffection in C. P. all over Europe. See also COMMUNISM.

Communist Party of the Soviet Union, political party in Russia, which has an absolute monopoly of power. Article 126 of the U.S.S.R. Constitution states that 'the most active and politically conscious citizens in the ranks of the working class, working peasants, and working intelligentsia voluntarily unite in the C. P. of the Soviet Union, which is the vanguard of the working people in their struggle to build communist society and constitutes the core of all organisations of the working people, both public and State.' In fact the party's monopoly of power extends to all spheres of economic life, social relations, political and cultural activities, artistic work, and scientific theory. The only sphere where the party's authority is not claimed is the doctrine and the ritual of the Church. The C.P.S.U. achieved this dominant position gradually between 1917 and 1950 through the seizure of political power, suppression of all other parties and non-Communist organisations, nationalisation of industry and trade, collectivisation of agriculture, elimination of foreign influences, and imposition by decree of specific views, doctrines, and tastes. The party leadership are determined to preserve the monopoly of power and their statements on this point are most emphatic. The internal affairs of the party have had a similar development. It first appeared in 1900 as a private group (see ISKRA) within the Russian Social Democratic Labour Party (q.v.), became one of the latter's 2 factions (Bolsheviks) in 1903, and a separate party in 1912 (changing the name to C. P. in 1919 and finally dropping the word Bolsheviks in 1922); factions within the party were proscribed in 1921, and all open oppositional groupings suppressed by 1930. From 1934 to 1953 Stalin exercised unlimited personal dictatorship

inside the party as well as outside. Now the supreme authority is concentrated in the Presidium (former Politburo, q.v.) of the party's Central Committee, and to some extent in the Central Committee itself. See also BOLSHEVISM; LENIN; STALIN. See N. Popov, *Outline History of the Communist Party of the Soviet Union*, 2 vols., N.Y., 1934; J. Towster, *Political Power in the U.S.S.R.*, N.Y., 1948; W. Kolarz, *How Russia is Ruled*, 1953; M. Fainsod, *How Russia is Ruled*, 1953.

Community Foundations, or **Trusts**, exist in the U.S.A. and Canada for the administration of charitable funds. These funds are the accumulation of grants from private donors, and for the majority of C. F. banks act as trustees. The first C. F. was founded in 1914 under the auspices of the Cleveland Trust Company, and was called the Cleveland Trust Foundation. There were seventy-five C. F. in 1956, each especially concerned with the welfare of the town in which it existed. The largest C. F. were in New York, Cleveland, Boston, Chicago, and Los Angeles. The New York Community Trust was founded in 1923, and distributed \$150,000 in 1955 from a capital of \$26,840,000.

Communitator, a copper cylinder split into segments insulated from one another with mica, placed on the shaft of d.c. machines and a.c. motors. Each armature

coil is connected to a pair of segments, and fixed carbon brushes are placed in contact with the segments. In the fig. the C. is assumed (for brevity) to have 2 segments only; the small circles represent the ends of the coil rotating in the magnetic field as indicated (see ALTERNATING CURRENT). In position (a) the induced e.m.f. is maximum and the top segment is the positive terminal of the coil; as the coil rotates to (b) the e.m.f. decreases to zero; the brush bridges the gap, passing over to the other segment as

and in the S. is the Brianza (q.v.) dist. It is fertile, and produces wine, corn, silk, olives, and fruit. Area 810 sq. m. Pop. 576,000.

2. (anct Comum) It. city, cap. of the prov. of C., at the SW. end of Lago C., 20 m. N. of Milan (q.v.). It stands in a valley enclosed by hills which are clad with luxuriant gardens and plantations of olives and oranges. It was for long a centre of the Ghibellines (see GUELPHS AND Ghibellines); it was destroyed by the Milanese in 1127, was rebuilt thirty

COMO, SHOWING THE CATHEDRAL AND PART OF THE LAKE

the e.m.f. reverses. Thus the top brush is again in contact with a positive segment (c). The induced alternating e.m.f. has its negative half-wave 'rectified' (see RECTIFIERS). The C. is the most delicate part of a machine. The carbon brush must fit precisely on the copper surface; any portion or point of defective contact leads to sparking, with consequent further deterioration. The mica insulation must not reach the surface, and the free part of the groove between segments must be kept clean. Any bridging of the gap by carbon, dust, etc. short-circuits the corresponding armature coils.

Comnenus, see ALEXIUS I. COMNENUS.

Como: 1. Prov. of Italy, in W. Lombardy (q.v.). It is in the Alps (q.v.), is bounded in the N. by Switzerland, and has very beautiful scenery. It contains Lake C. and part of Lake Lugano (qq.v.),

years later, and finally yielded to the Visconti (q.v.) in 1335. The town has Rom. remains, and the medieval walls still exist. The cathedral (1396-1770), in a blending of Gothic, Renaissance, and baroque styles, is considered one of the finest in Italy. There are other notable anct churches, and a 13th cent. Palace of Justice in black and white marbles. C. is a celebrated tourist resort, and has an important silk industry. Optical instruments, metal goods, and motor cycles are also manuf. The two Plinys and Volta (qq.v.) were b. here, as were sev. popes and, possibly, Caecilius Statius (q.v.). Pop. 72,000.

Como, Lake (It. Lago di Como; anct Larius Lacus), It. lake, in NW. Lombardy (q.v.), lying at the foot of the Alps. It is formed chiefly by the waters of the R. Adda (q.v.), which enters at the NE. and issues at the SE. extremity of the lake. Its greatest length is 30 m., but 15 m.

from its N. end it divides SE. and SW. into two branches, of which the SE. branch is also called the *Lago di Lecco* (see *LECCO*). Its greatest breadth is $2\frac{1}{2}$ m. and its greatest depth 1378 ft. There are numerous fashionable resorts on its shores, including Bellagio, Cadenabbia, and Cernobbio (qq.v.).

Comorin, Cape, most southerly point of India. It is low and sandy, and not visible from vessels at a distance of more than 16 m. A vil. and temple have been built on rocks, and there are remains of Dutch fortifications.

Comoro Islands, group of is. belonging to France, situated in the Indian Ocean, midway between Madagascar and the African continent. There are 4 chief is., viz. Great C., Anjouan, Mayotte, and Mohéli. Since 1 Jan. 1947 the C. I. have had administration and financial autonomy, and are represented in the National Assembly, the Council of the Republic, and the Assembly of the Fr. Union by 1 deputy each. The is. are of volcanic origin and are extremely mountainous. The largest and most westerly is Great C., about 35 m. long and 12 m. wide. Next in size is Anjouan, 30 m. long and 20 m. at its greatest breadth. Mayotte is 21 m. long, and Mohéli 15 m. long. The Fr. headquarters are at Zandzi a small is. off the coast of Mayotte. The fertile soil produces vanilla, copra, coffee, sisal, and citronella, while turtles are caught abundantly in the neighbourhood and form an article of export. The is. were first visited by Europeans in the 16th cent., and Mayotte was ceded to France in 1841; the others became Fr. in 1886. Brit. forces occupied Mayotte on 2 July 1942. The combined pop. in 1953 was 180,000 (Great C. 90,000; Anjouan 65,000). The people are mostly Muslim.

Compagnie Générale Transatlantique, or **French Line**, most important of the Fr. shipping companies which for over a century has been an essential factor in the economic life of its homeland. It was founded in March 1855 as the *Compagnie Générale Maritime*, but its name was changed in 1861 to the present title. Before the Second World War it ensured France's commerce with the countries bordering the Caribbean and the coast of N. Africa; its ships fetched and transported cargoes from the E. and W. coasts of S. America and the great ports of the Amer. Pacific coast, and it held a leading position on the N. Atlantic, a fine fleet, of which the great *Normandie* was the flagship, maintaining a frequent service between Le Havre, Southampton, and New York. Serious losses were sustained in the Second World War—two-thirds of Fr. Line tonnage was lost, and amongst these losses were many of the major ships of the line. An outstanding postwar reconstruction programme has resulted in remarkable recovery. The present-day fleet of 75 ships totalling more than 500,000 gross tons exceeds the line's tonnage in 1939. The flagship is now the *Liberté* (the world's fourth largest ship); other famous ships of the line include the *Ile de France* and *Flandre*

on the New York run and the *Antilles* and *Colombie* serving the W. Indies.

Companies, City (i.e. of the city of London), also known as **Livery Companies**, name given to certain societies or corporate bodies existing in the city of London. These C. began in the Middle Ages, and are a survival of the industrial and municipal system of trade organisations known as guilds (q.v.) or gilds. In the reign of Henry II (1212) the C. of the Goldsmiths and that of the Pepperers, later incorporated with the Grocers', are mentioned, and also 'Guildhall.' Edward III was a member of the Linen Armourers and Merchant Taylors, a signal instance of royal favour. The name of 'Livery' comes from the distinctive costume or livery that the members of the C. wore. Originally they were genuine corporations of the members of the particular trade, and had important and valuable functions in regulating trade matters, especially as to apprenticeship, good production, etc. Their power gradually fell into the hands of the wealthiest members, and passed away from the trade altogether, and now they have little or no connection with the trade to which their name attaches, except so far as their educational funds are devoted to special or technical education. Many of the C. are possessed of great wealth, and large sums are held in trust for specific charities, etc. The twelve greater C. are here given in order of civic precedence: Mercers', Grocers', Drapers', Fishmongers', Goldsmiths', Skinners', Merchant Taylors', Haberdashers', Salters', Ironmongers', Vintners', and Clothworkers' (qq.v.). These C. had halls of their own in the city; the anc. halls having for the most part suffered in the Great Fire of 1666, the existing halls were fine and comparatively modern, but of thirty-four standing at the beginning of the Second World War only three were undamaged at its end—the Apothecaries', the Ironmongers', and the Vintners'. Many C. possess fine old plate, pictures, and other valuable artistic property. There are sixty-four other C. still in existence, their incomes varying very much. The names of some of them, such as the Loriners', the Girdlers', the Fletchers', are interesting survivals of old trades. The lord mayor, sheriffs, city chamberlain, and other corporation officers are elected by the liverymen of the C. C. as freemen of the city, a right that has been left them, though many of their former privileges have been taken away. The C. are ruled by the court of the master and wardens, chosen from the liverymen who are recruited from the third class or freemen of the company. In 1880 a royal commission inquired into the Livery C.s and their finances. The report (1884) contains much information. They are large supporters of charities and educational estab.—Tonbridge School, by the Skinners' Company; St Paul's, by the Mercers'; Merchant Taylors' by that company, being the chief. See W. Herbert, *History of the Twelve Great Livery Companies*, 1837; W. C. Hazlitt, *The Livery Companies of the City of London*, 1892;

G. Unwin, *The Gilds and Companies of London*, 1908; W. Kent, *An Encyclopaedia of London*, 1951.

Company, John, popular nickname for the old E. India C.

Company, subdivision of a battalion. The Brit. infantry battalion is divided into C.s, each of which is commanded by a major or captain. The Army Service Corps is divided in a similar manner into C.s. The C. is itself again divided into platoons, and these are subdivided into sections. In itself the C. is practically self-controlled, keeping its own books and its own arms chest. The Engineers are

which incorporate the main provisions usually found in earlier special Acts creating such public utility C.s; (b) C.s incorporated by Royal Charter, which are now rarely launched, exist for trading activities in certain regions abroad, e.g. Hudson's Bay Company; (c) C.s for trading purposes registered under the Companies Act, 1948, comprise the great majority of C.s. The prin. advantages enjoyed by C.s are the limitation of personal liability of members and the increased commercial efficiency in co-operative effort and outlay of capital. The main provisions regulating Eng. and

THE HALL OF THE MERCERS' COMPANY

This hall and the company's chapel were destroyed by bombing on 10 May 1941.

divided into squadrons. A battery of artillery and a squadron of armour are the equivalents of a C. of infantry. C. of a ship includes the whole of the persons employed on board and paid for specific duties, and therefore excludes troops and passengers.

Company and Company Law. Most commercial activities are carried on by associations of persons either in partnerships which are registered as firms under the Business Names Act, 1916, or as corporations called C.s mostly registered under the Companies Act, 1948. Individual partners have no separate legal identity from that of their firm; a C., however, has a legal entity separate from the members comprising it. Most C.s today are in one of the following categories: (a) C.s formed under a private or special Act of Parliament to undertake some public utility service, e.g. waterworks, docks, or harbours. They are regulated by the Companies Clauses Acts, 1845-69,

Scottish C.s are now consolidated in the Companies Act, 1948. This article considers the prin. topics relating to the management of C.s.

Formation of a company. A C. becomes a legal entity on the issuing of a certificate of incorporation by the registrar of C.s, who is an official of the Board of Trade. Applicants for the registration of a C. must file at the C.'s registry the following documents: (i) a memorandum of association signed by at least 7 persons, each taking at least 1 share in the C. (only 2 persons need sign if the C. is to be a *private C.*); (ii) articles of association; (iii) a statutory declaration that all the statutory requirements for registration have been complied with.

Memorandum of Association. Under the Companies Act, 1948, this must contain the following 5 clauses: (1) the name of the C.; (2) the situation of the registered office; (3) the objects of the C.; (4) liability of members; (5) the amount

of share capital. (1) The name of the C. must be approved by the Board of Trade, which may refuse to register a name which it considers to be undesirable. The word 'limited' must be included at the end of the name, although non-profit-making C.s may, with the licence of the Board of Trade, omit it. The name may be altered by special resolution of the C. and the consent of the Board of Trade. (2) The office clause states whether the registered office of the C. is to be in England or Scotland but does not specify its address, although this must be notified to the registrar of C.s. Any change of address, must be notified within 14 days. (3) The objects clause sets out the powers of the C.; any act not authorised by this clause is *ultra vires* and cannot be ratified by the shareholders. The objects may be altered by special resolution for one of seven purposes specified by section 5 of the Act (e.g. to carry on the C.'s business more economically or efficiently). (4) The liability clause indicates whether the liability of members is limited by their shares or by guarantee. On the winding up of a C. limited by shares, the liability of members is limited to the amount unpaid, if any, of shares held by them. In the winding up of a C. limited by guarantee, the liability of each member is limited to the amount which he has guaranteed to contribute to its assets in such a contingency. (5) The capital clause states the amount of the initial authorised capital and the manner of its division into shares (e.g. £100 divided into 100 ordinary shares of £1 each). A memorandum may only be altered in the circumstances and in the manner permitted by the Act. Under section 23 a C. may, by special resolution, alter any conditions in its memorandum which could lawfully have been contained in its articles, unless the memorandum prohibits such alteration; it may not, however, vary the special rights of any class of members. Dissenting shareholders holding between them 15 per cent of the issued share capital may, within 21 days of the special resolution, apply to the court to cancel the alteration.

Articles of Association. This document constitutes a contract between all the members (shareholders) and the C. It contains the regulations for the internal administration of the C., including such matters as the mode of div. of profits and losses, calls on, transfers, and transmissions of shares, conversion of shares into stock, increase or reduction of capital, borrowing powers, qualifications of directors, meetings, powers of directors, auditing of accounts, and the winding up of the C. A C. limited by shares need not, but usually does, file articles; a C. which does not do so is automatically governed by the model articles specified in Table A of the first schedule to the Act. The articles may amplify the memorandum but must not contain any provision contrary to its tenor; they may be altered by special resolution subject to certain restrictions (e.g. a member may not be compelled to increase his liability to the

C.; the alteration must not be illegal or conflict with the memorandum or constitute a fraud on the minority of members). When registered the articles bind the C. and its members to the same extent as if they had been signed by each member and contained covenants (q.v.) on the part of each member to observe them.

The Promoter. The promoter is the person who is responsible for the C.'s existence as such. The typical promoter starts the scheme of forming the C., negotiates with the vendors (if any), gets together the board of directors, retains brokers, bankers, and solicitors for the C., has the memorandum and articles of association prepared, provides the registration fees, drafts the prospectus, pays for the expense of issuing it, etc.; in a word, undertakes to form a C. with reference to a given project and to set it going and to take the necessary steps to accomplish that purpose. A promoter stands in a fiduciary relation to shareholders and subscribers, and therefore may not make any secret profit out of the flotation, whether he is selling his own property to a syndicate or himself forming a syndicate with other promoters to purchase property for the purpose of reselling it at an enhanced figure to some other syndicate. An intending shareholder should be careful to ascertain what the vendors paid for the property or concern the exploitation of which is to be the substratum of the C., for unless the true purchase price is disclosed, and the profit on resale accruing to the vendors, the shareholder will never know what liabilities the C. is under in regard to its preliminary contracts. For this reason he should beware of the 'waiver' clause in the prospectus which is mainly designed to put him off inquiry. Section 97 of the Act is aimed at making it impossible for promoters to arrange for charges being created before the C. is registered, and thereby avoid the necessity for registration of charges which affect the property of the C. no less than would have been the case if the charges had been created by the C. itself. The promoter or promoters are liable (together with directors and others) to pay compensation to all persons who subscribe for shares or debentures on the faith of the prospectus for the loss or damage such persons may have sustained by reason of any untrue statement in the prospectus. Promoter in this context does not include any person acting in a professional capacity for persons engaged in procuring the formation of the C.

Prospectus. This is a circular issued by the promoter or directors of a C. inviting the public to take up shares. The issue of prospectuses must satisfy certain statutory conditions which are designed to protect the public from the reckless or dishonest representations about C.s for which their capital is solicited. 'Public' means any section of the public including existing shareholders. New issues of shares are often offered to the public by 'issuing houses' (financial concerns specialising in C. issues) to whom the C. allots

the shares for re-issue to subscribers. Although the prospectus may be prepared and issued by the issuing house, it is deemed to be issued by the C. whose shares are offered for sale. Section 38 and the Fourth Schedule to the Act provide that prospectuses (other than those issued to existing share or debenture holders) must disclose certain information and reports. The matters to be disclosed include, *inter alia*, the number of founders', management, or deferred shares (if any), and the nature and extent of the interest of the holders of such shares in the property and profits of the C.; any provisions in the articles concerning the remuneration of, and the number of shares as the qualification of, directors; the names, descriptions, and addresses of directors or proposed directors; the minimum amount which the directors consider must be raised by the issue of shares to provide for the purchase of any property to be purchased wholly or partly out of the proceeds of the issue; any preliminary expenses payable by the C.; any underwriting commission (i.e. commission payable to any person or syndicate undertaking to take the whole or a portion of any offered shares that may not be subscribed for by the public); the working capital; the time of the opening of the subscription lists; the amount payable on application and allotment on each share; particulars of any options to purchase shares and debentures of the C.; the number of shares and debentures issued as fully or partly paid up otherwise than in cash; the names and addresses of the vendors of any property acquired or proposed to be acquired by the C.; the amount paid or payable in cash, shares, or debentures to the vendors; any amount or benefit paid or given within the two preceding years, or intended to be paid or given, to any property, and the consideration for the payment or benefit; details of every material contract (other than contracts in the normal business of the C.); the names and addresses of the auditors (if any) of the C.; full particulars of the interest of each director in the promotion of or in the property proposed to be acquired by the C., and any sums in cash or shares paid to him, or agreed to be paid to him, to induce or qualify him to become a director; the voting rights attached to the sev. classes of shares (where divided into different classes); and the length of time the business of the C. or a business which it proposes to acquire has been carried on (if such business has been carried on for less than 3 years). The prospectus must disclose an auditor's report on certain financial matters relating to the C. and any subsidiaries (e.g. profits and losses, assets and liabilities). Thus a prospective investor will be able to obtain a reasonably accurate impression of the activities and financial strength of the C. Any condition in the prospectus which purports to waive the requirements of Section 38 and the Fourth Schedule to the Act is void, but Section 38 does not apply to shares and debentures previously issued or dealt

in on a prescribed stock exchange. Any untrue statements, whether fraudulent or innocent, will, if material, entitle the persons taking shares on the faith of such representation to rescind the contract. In the case of fraud, damages may also be obtained. A person who has been misled by the non-disclosure of information required by Section 38 to be included in the prospectus may rescind his contract to take the shares, or obtain damages. Criminal liability attaches to any person authorising an untrue statement in a prospectus, unless he proves that the statement was immaterial or that he had reasonable grounds to believe, and did believe, it to be true (Section 44). This section does not extend to experts.

Members. These are persons who sign the memorandum on the incorporation of the C. and others who subsequently acquire shares and are entered on the register of members. Anyone can become a member, but an infant may repudiate his shares on attaining full age. Members must generally pay for their shares unless these are allotted in consideration of services rendered or property sold to the C. Every C. shall keep a register of its members, containing their names and addresses, the amount and numbers of their shares, amount paid for them, the date of entry on the register of each member, and the date at which any person ceased to be a member. In its ann. return to the Companies Registry, a C. must give, *inter alia*, a list of the names and addresses of its members; this return must also give the names of persons who have ceased to be members since the date of the last return; and it must contain a summary distinguishing between shares issued for cash and shares issued as fully or partly paid up otherwise than for cash; and specifying particulars as to the share capital of the C., the number of shares taken from the commencement of the C. up to the date of the return, the amount called up on each share, the total amount of calls received, and of calls unpaid, the number of shares forfeited, particulars of any discount allowed on the issue of any shares, the amount of share warrants issued, and the total amount of the C.'s indebtedness in respect of all mortgages and charges. No notice of a trust may be entered on the register (Section 117).

Directors. Every public C. registered after 1 Nov. 1929 must have at least two directors and every private C. at least one (Section 176). Both must have a secretary, but a sole director may not also be secretary (Section 118). An undischarged bankrupt may not act as a director or be concerned in the management of a C. Directors act as trustees and agents for the C. They are not personally liable on contracts expressly made on behalf of the C. The first directors are usually named in the articles, but if not named they are generally appointed by the persons named in the memorandum. The appointment of the director of a public C. is not valid unless he has (a) filed with the registrar his written consent to act, and (b) either (i) signed the memorandum for his qualification

shares, or (ii) taken up and paid for them, or agreed to do so, or (iii) signed a declaration that the requisite number of shares is registered in his name. Subsequent appointments are governed by the articles. In performing his duties a director must act with the utmost good faith and prudence. Unless negligent, he is not liable for the acts of co-directors. Provisions in the articles relieving directors, auditors, etc. from liability for default or breach of duty are void (Section 205), but Section 448 empowers the court to relieve a director who, having acted honestly and reasonably, ought fairly to be excused. A director is obliged by Section 199 to disclose any interest in any contracts made with the C. In the absence of agreement, directors are not entitled to remuneration. The C.'s accounts must show the aggregate of directors' emoluments, and the aggregate amount of past and present directors' pensions and compensation paid to them for loss of office. A fine of £50 may be imposed for failure to comply with the provisions relating to the disclosure of payments to directors and officers of the C. (Section 198 (4)). The removal of directors is generally governed by the articles, but Section 184 empowers the C. to remove them at any time by ordinary resolution. In these circumstances 28 days' notice of the resolution must be given; a copy of the resolution must be sent to the director, who is entitled to be heard at the meeting. The retiring age of directors of public C.s is fixed by the Act at seventy, but this provision can be excluded by the articles. Directors reaching the age of 70 may nevertheless be reappointed by resolution at a general meeting of which special notice stating his age has been given.

Shares. A share denotes a right to receive a certain proportion of the profits of the C. and of the capital of the C. when it is wound up. A member of a C. obtains his shares by allotment, his title being completed by the issue of a share certificate. Shares may be transferred in the manner provided by the articles of association. Transfer is usually effected by deed, and completed by registration of the transfer. Every shareholder is entitled to transfer his shares, subject to any restrictions that may be imposed by the articles; thus a shareholder may assign his shares to a man of straw to avoid liability on the winding up, if not prohibited by the articles. If the C. be wound up within 1 year of such a transfer, the transferor remains liable to the amount unpaid on his shares. Transfers may be made subject to the approval of the directors by the articles, but, generally speaking, the rules of the Stock Exchange will not allow any such restriction on fully paid shares. Where a shareholder fails to pay calls due on his shares, the shares may be forfeited in accordance with the articles. On the liquidation of the C. the amount outstanding on the shares must be called up.

Allotment of shares and debentures. (a) *Offered to public.* The prospectus must state the minimum subscription to the

proposed issue which the directors consider to be the essential amount required to provide for certain expenses (see *Prospectus* above). Shares may not be allotted before the minimum amount has been subscribed and the sum payable on application has been paid to the C. The amount payable on application must be not less than 5 per cent of the nominal value of the share or debenture. If these conditions have not been complied with within 40 days of the issue of the prospectus, the money must be repaid to applicants within the next 8 days. If not repaid after the forty-eighth day, it is repayable by the directors personally with interest at 5 per cent. On subsequent allotments, only the requirement that at least 5 per cent must be paid on application applies. (b) *Not offered to public.* At least 3 days before allotment, the C. must deliver to the registrar a 'statement in lieu of prospectus' in the statutory form. This applies only to the first allotment. Neither (a) nor (b) applies to private C.s. Where the prospectus offers shares and debentures to persons who are not existing share or debenture holders, allotment cannot be made until the third day after the issue of the prospectus.

Capital is generally divided into preference shares, ordinary shares, and deferred shares. Preference shares are usually entitled to receive a fixed dividend before any dividend is paid on the ordinary shares. Preference shares are said to be cumulative where any deficiency in the dividends accruing in a bad year rests to be made good out of the profits of subsequent years. Deferred or founders' shares, which are usually taken by the promoters, are generally entitled to a proportion of the profits if the dividend on the ordinary shares amounts to more than a fixed amount. Deferred shares are sometimes allotted as fully paid up, and sometimes issued by way of bonus to ordinary shareholders. Preference shares on the winding up of the C. are paid off in full before the ordinary shares are paid anything, where they are made 'preferential as to capital'. Where the C. by special resolution elects that any portion of its capital not yet called up shall be incapable of being called up except to wind up the C., such uncalled capital is *reserve capital*, and it cannot be dealt with or charged by the directors. Capital may be increased or altered if authorised by the articles; if not the C. may give itself power to do so by special resolution. Alteration of capital occurs where existing shares are either consolidated, as, for example, by changing every ten £5 shares into one £50 share, or subdivided, as, for example, by changing every £5 share into five shares of £1 each. Capital may also be altered by converting fully paid shares into stock. The essential distinction between shares and stock is that the former are issued in round sums, whereas the latter may be divided into any aliquot amounts; neither are the divs. of stock numbered as are shares. The conversion of shares into stock means that the shares

have been completely paid up, and that the time has come when the shares may be transferred in fragments. On the Stock Exchange stock is quoted at a certain price per £100 of stock, while shares are quoted at the price per share. A C. may by special resolution, with leave of the court, reduce its capital. A reduction which affects the C.'s creditors will be sanctioned by the court only if the creditors consent or are paid.

Dividends. Dividends must be payable only out of profits. Section 65, however, permits payment out of capital of interest on shares issued to raise money for certain long-term building or plant construction schemes. Such payments must be authorised by the articles or by special resolution, sanctioned by the Board of Trade, and not exceed 4 per cent or such other rate as is prescribed by order of the Treasury.

Debentures. A debenture is a document given to evidence the fact that money has been lent to the C.; it creates a charge on the C.'s assets, and provides for the repayment of the loan on the happening of certain events, as, for example, the making of an order for winding up the C., or an order for the appointment of a receiver. Debentures may be payable to bearer, or only to the registered holder; bearer debentures are transferable by delivery, and no notice of the transfer need be given to the C.

Meetings and Resolutions. The Act of 1929 provides that a C. must hold a general meeting within not less than one month and not more than three months from the date of commencing business. The purpose of this, the *statutory* meeting, is that all the shareholders shall have an opportunity of forming an opinion of the exact position of the C. within a short time of its commencement. The directors are required to send out to the shareholders seven days before the statutory meeting a report stating the number of shares allotted and the general state of the C. The articles usually provide for the convening of an *annual general meeting*. Special business is transacted at an *extraordinary meeting*; the directors are bound to hold an extraordinary meeting if required to do so by the holders of one-tenth of the issued capital. Voting at meetings may be by show of hands, or on a poll, according to the articles (see CASTING VOTE). Unless the articles make the voting dependent on the number of shares held, each shareholder has 1 vote. Resolutions are either ordinary, special, or extraordinary. An extraordinary resolution is one which has been passed by a majority of not less than three-fourths of the members voting at a general meeting of which notice specifying the intention to propose the resolution has been given. A special resolution is one which has been passed by a three-fourths majority, at a meeting of which at least 21 days' notice has been given. It was formerly necessary for a special resolution to be confirmed at a second meeting, but this is now unnecessary. An extraordinary resolution appears to be effective only in the

case of the shareholders resolving that the C. cannot go on with its business and that it is advisable to wind it up.

Winding up is of three kinds: (a) by the court; (b) voluntary; (c) subject to supervision by the court. A C. may be wound up by the court if a special resolution has been passed to that effect, or if the C. does not commence business within a year of its incorporation, or if the C. is unable to pay its debts, or if the court is of opinion that it is just and equitable that the C. should be wound up. Winding up by the court is begun by petition, and any contributory or creditor may present a petition, but the court may refuse to order a winding up if the majority of the creditors oppose it. The most usual manner of winding up a C. is voluntarily. A voluntary winding up takes place when the period fixed for the duration of the C. by the articles has expired, or where the C. passes a special resolution to wind up the C. voluntarily, or resolves that as it cannot meet its liabilities it is advisable to go into liquidation. When a C. has passed a resolution to wind up voluntarily, the court may make an order that the voluntary winding up shall continue *subject to such supervision of the court and upon such terms and conditions as the court thinks just*. Whichever mode of winding up is adopted, a liquidator is appointed to call up the amount unpaid on the shares and generally to administer the property of the C. by applying the assets first in the payment of debts, and then, if there be any residue, among the shareholders according to their priority. On the winding-up order being made by the court the official receiver becomes provisional liquidator unless the creditors have chosen some other person to act as liquidator. The liquidator may bring and defend actions in the name of the C., and carry on the business of the C. so far as may be necessary for its beneficial winding up. Sometimes winding up is effected with the object of *reconstructing*, i.e. selling the undertaking of the C. to a new C. in return for shares in the new C. C.s generally reconstruct when more capital is required, and when the only way to get it is to put pressure on existing shareholders, usually by inviting them to take up partly paid shares in the new or reconstructed C. In substitution for their fully paid shares in the old C. A shareholder who has not voted for the special resolution to wind up the C. may express his dissent to the liquidator, and require him to purchase his share interest in the old C., but he must dissent within a week of the resolution. The number of C.s on the registers in Great Britain at the end of 1937 was 155,279 (excluding those in course of liquidation or removal from the registers). Of these 17,761 were public and 137,518 were private C.s. After making various allowances, at the end of that year there were 14,677 public C.s with a paid-up capital of £4,067,035,904, and 137,493 private C.s with a paid-up capital of £1,828,814,099. The paid-up capital in each case was higher than any previously recorded. At the end of 1938

there were 147,861 C.s (England and Wales) on the register with a paid-up capital of £5,542,800,000; 9715 (Scotland), capital £447,800,000; and 1753 (N. Ireland), capital £45,500,000; a total of 159,329 with a paid-up capital of £6,036,100,000.

Private Companies. A private C. is defined by the Companies Act as one which limits the number of its members to 50 (exclusive of employees), restricts the right to transfer shares, and prohibits any invitation to the public to subscribe for shares or debentures. Usually all the shares are held by members of a single family. A private C. may consist of no more than 2 members. Such a form of C. is usually resorted to when a trader desires to have the advantage of limited liability without the disadvantage of sharing his profit with other persons. A number of partnerships have been converted into private C.s since the Act was passed, one great advantage of incorporation being that the death of a partner does not bring an end to the association, and a partner's interest may be continued in his son by giving the latter debentures in the C.

Accounts. Section 147 of the Act obliges C.s to keep such proper books of account as are necessary to give a true and fair view of the state of the C.'s affairs and to explain its transactions. The books must deal with all items of income and expenditure, sales, and purchases by the C. and the assets and liabilities of the C. The C. must prepare an. balance sheets and profit and loss accounts giving the information and in the form prescribed by the Act, so as to give a true and fair view of the state of its affairs for its financial year. All holding C.s must, with certain exceptions, furnish consolidated accounts for themselves and their subsidiaries so as to disclose a true and fair view of the position of the group as a whole. The accounts must be audited by a member of one of the professional bodies of accountants recognised by the Board of Trade.

Investigation of C.s. An investigation of a C.'s affairs by the Board of Trade may be applied for by not less than 200 members or by members holding not less than one-tenth of the shares issued. It may in any case be ordered by the court, and the Board of Trade can itself order an investigation if it considers that the matter is one of public concern—subject to there being circumstance of maladministration or of oppression of members. See Sir Francis Palmer, *Company Guide*, 36th ed. 1950; *Company Law*, 20th ed. 1956, and *Private Companies*, 47th ed. 1956; F. Shackleton, *Law and Practice of Meetings*, 3rd ed. 1951; L. C. B. Gower, *The Principles of Modern Company Law*, 1954; A. Topham, *Principles of Company Law*, 12th ed. 1955.

Comparative Anatomy, that portion of the science of anatomy which concerns itself with the comparison of the structures of various classes of animals. It is of great importance in the science of biology. See ANATOMY, BIOLOGY, and the articles on the various forms of life,

and those on the different parts of the body.

Comparative Ethics comprises the study of the moral standards by which man has lived from the earliest times to the present day. This study does not aim at evaluation; but although conduct does not become ethical until it is guided by a consciously held principle of what is right and what is wrong, C. E. take us back to primitive times. The life of primitive man, as soon as he came to live in family and tribal groups, was hedged about by rules and taboos which were ethical in so far as they were directed towards securing the highest good for the individual or the tribe to which he belonged. Primitive morality, however, was governed by fear and the desire to placate the gods. Even among the ancient Egyptians ethics were a form of piety towards the gods, but the spirit pervading Gk ethics was essentially different. In the words of Apuleius: 'The Egyptian deities were chiefly honoured by lamentations, and the Gk divinities by dances.' The Egyptian Book of the Dead, however, inculcates a high standard of conduct, of a restrained and prudent kind. The influence of oriental religions, with the mysticism found in Egyptian and Semitic religions, tended to produce a system of ethics which superseded the purely Gk spirit. The Brahmanic code of India and the Zoroastrian code of Persia both taught a moral law which was part of the divine will. While the former was ascetic and pessimistic, the latter was active and optimistic, preaching a dualism of good and evil and a conflict between them in which man must play an active part. Ethical teaching divorced from religion also had its roots in the E., in the teaching of Gautama-Buddha and of Confucius. Gautama preached a resignation to evil, but Confucius laid down common-sense rules of conduct and courtesy which have been the mainstay of the Chinese polity ever since. Lao-Tze, however, a contemporary of Confucius, had considerable influence in teaching that everything had its essential character which it was useless to try to alter. The Neo-Platonists became mystical and polytheistic; but Plotinus, their founder, remained monotheistic, and he had considerable influence on Christian ethics, as also did the teaching of the Stoics. The ethics of Porphyry, the disciple of Plotinus, were very similar to those of his Christian contemporaries, and the antagonism between them is therefore surprising. The fathers of the Church did, indeed, borrow largely from earlier philosophies, but they were interested in dogma rather than ethics, and the problem of conduct did not claim precedence over science and politics until the 18th cent. The Eng. philosophers, Locke, Berkeley, and Hume (qq.v.), advocated a morality founded on practical experience. Later in the century came the utilitarian hedonism of Bentham, from which were born the humanitarian ethics of the 19th cent. In the meantime, however, Kant had estab. morality as law, man's law unto himself. See W. E. H.

Comparative Religion, see RELIGION.

Comparetti, Domenico Pietro (1835-1927), It. scholar, b. Rome, where he studied at the univ. He later became one of the chief classical scholars of Italy, being appointed prof. of Greek at Pisa in 1859. Of his works on classical literature

gives us N. by E., NE. by N., NE. by E., E. by N., etc., as shown in the figure. The reading off of the thirty-two points in order, going round either way, is known as 'boxing the C.' The needle swings on a jewelled pivot which rises perpendicularly from the centre of a bowl, which has a glass covering to protect the needle. The C. is generally situated in the binnacle, but other varieties of C. are known as standard, hanging, and steering C.s, according to their position on the ship. Until the end of the eighteenth century Brit. naval C.s were very carelessly constructed, but since that time much progress has been made. The C. at present in general use is that patented

THE POINTS OF THE COMPASS

Philip Harris, Birmingham
MARINER'S COMPASS

the best known are an ed. of the *Euxenippus* of Hyperides, monographs on Pindar and Sappho, and trans. of some fragments of Hyperides. His researches concern the *Book of Sindbad* and *Virgil in the Middle Ages*. He also ed. a collection of It. national songs. He d. at Florence.

Compass, Magnetic, or Mariner's Compass, instrument for determining the magnetic meridian and its angle to a given direction. It consists of a magnetised needle turning on a pivot, and is used chiefly for directing the courses of ships at sea. The ordinary C. is composed of three parts, the box or bowl, the card, and the needle. The needle consists of a fine magnetised strip of steel, or of sev. magnetised strips joined together. Fastened to the needle, and moving round with it, is a circular card having its circumference divided into 360 degrees. In addition to this it is marked with the thirty-two points of the C. The four cardinal points are N., E., S., and W. and the directions midway between these are NE., SE., SW., NW. The spaces between these eight points are again equally divided as NNE., ENE., ESE., SSE., etc. The last sub-div. of the sixteen spaces

by Sir Wm Thomson, elevated to the peerage as Lord Kelvin, in 1876. A special form of magnetic C. is used on aircraft, and a gyroscopic C. is employed on both ships and aircraft (see GYROSCOPE). Two important forces combine to form the error of a ship's C. One of these is the attraction of the ship itself. The magnetic influences of the hull, machinery, and metal work in general all affect the needle and divert it from its proper position. The error thus caused is known as the *deviation* of the C., and is met in various ways. First, the C. is situated or placed some distance above the upper deck so as to be less susceptible to these influences. Secondly, the deviation is diminished by placing magnets and bars of soft iron in such a position around the C. that the attraction of the rest of the ship's metals is neutralised. Thirdly, deviation charts are made, showing carefully the deviation of the particular C. when pointing in various directions. A second error is known as the *variation* of the C. When free from deviation, the needle points to the magnetic pole of the earth and not to the geographic pole. The two are differently situated and hence occurs the variation of the C. This variation varies

considerably at different parts of the earth's surface, and at certain points becomes nil. The variation changes from year to year, gradually rising to a maximum and then diminishing again. Irregular sources of variation are found in magnetic storms and similar electric disturbances. The dip of the C., induced vertically by the magnetic field of the earth, also varies. An azimuth circle is used to take bearings, and to discover the angle between the C. N. and the true N., the total error made up of variation and deviation. This circle has reflecting mirrors and sighting wires, and fits over the top of the C. bowl. Thus, from the position of the sun, when from 8° to 15° high, the amplitude, or azimuth, is made out. The early hist. of the C. is somewhat obscure. It was known to the Chinese at a very early date, and their own historians ascribe its discovery to the year 2634 B.C. Certainly it was in common use in the Far E. by the end of the 3rd cent. A.D. However, the Chinese were not inclined to take a high place as navigators, and their knowledge never led to the perfecting of this aid to navigation. It was once reputed that the principle of the C. was introduced into Europe by Marco Polo on his return from travels in Cathay, but it was well shown by Chappell (*Nature*, 346, 15 June 1876) that early in the 12th cent. the knowledge had been arrived at by independent discovery. Some ascribe the discovery of its variation to the same century, but others ascribe it to Columbus. The terror that was caused by the variation of the magnetic needle on this explorer's voyage to America is well known, and certainly led the way to further knowledge on the subject. See GEO-MAGNETISM; MAGNETISM.

Compass Berg, mt. in the Schnee Berge range, Cape Province, S. Africa, 30 m. N. of the tn of Graaff Reinet (q.v.). It rises 8200 ft above the sea and is the highest point in the prov.

Compass Plant, see SILPHIUM.

Compasses, instruments for describing arcs and circles, or for measuring distances. They generally consist of two legs joined together at one end by a hinged joint, and having one leg furnished with a pen or pencil. C. are divided into common, spring, beam, and proportional C., according to their kind. Triangular C. have three legs, so that the three points of a triangle may be transferred at once. Hair and bow C. are additional varieties.

Compasser, Elliptic, see ELLIPTIC COMPASSES.

Compensating Beam. A C. B. may often be seen fitted between the springs of the driving-wheels of a locomotive, in which case it is pivoted at its centre and supports the hangers of the two springs at its extremities. Any damage that might arise from a greater shock or jerk on one spring due to faults in the track, etc. is in this way minimised, for the motion of the C. B. effects an equalisation of the shock by transmitting it to the other spring. C. B.s appropriately arranged are used on various machines for the same reason.

Compensating Winding, on a.c. commutator motors, a winding for neutralising the cross-field, at right angles to the mainfield, due to the self-induced e.m.f. in the armature. The C. W. is either connected in series in the main circuit or short-circuited upon itself, in which case the action is like that of a short-circuited transformer secondary. See ELECTRIC MACHINES.

Compensation, see COMPULSORY ACQUISITION OF LAND.

Compensation, Workmen's, see WORKMEN'S COMPENSATION.

Compensator, auto-transformer (q.v.) used for starting a.c. motors, the voltage being gradually increased, from an initially small value, by tap-changing. The capacitor used for improving the power factor (q.v.) of an induction motor is sometimes called a C.

Competition. Perfect C. is the state of affairs in which a commodity or service is produced by such a large number of producers that each cannot affect the price by altering his output. The more control each producer has over the price by altering his output, the less perfect the C. becomes. When one producer has complete control over the price, the commodity or service is said to be produced under conditions of monopoly (q.v.). In the real world most commodities are produced under more or less imperfect C. Only basic commodities traded internationally, such as wool, metals, wheat, and so on, where buyers and sellers are in touch with one another by telegraph and other modern communications, are sold in perfectly competitive markets. On the other hand, C. is not as imperfect as is often supposed: although there may be few producers of a particular commodity or service, they compete with producers of similar commodities and services, and 'monopolists' often compete fiercely with one another.

Economists distinguish degrees of C. between the two extremes of perfect C. and monopoly. 'Duopoly' is C. between two sellers; 'oligopoly' is C. between a small number of sellers. A common error about the place of C. in the modern economy is that it has been replaced by forces making inevitably for C. On the contrary, much imperfect C. and monopoly are the result of State action or inaction fostering them or permitting them to continue. The laws on patents, inventions, licensing, control of imports, and outright nationalisation create monopoly or highly imperfect C. as a conscious aim of policy. And the State's commercial laws on contracts, the conduct of companies, and so on, may permit monopolistic arrangements in restraint of trade.

C. can be made imperfect by heavy costs of transport, so that producers in a given area are protected from outside C., and by the ease with which consumers can be persuaded by advertising and other marketing techniques to prefer some brands to others although there is little essential difference between them. The degree of competitiveness of an economic system tends to be under-estimated

because insufficient account is taken of change. Over a period, new industrial processes and techniques and changes in fashion and tastes tend to disperse monopolies possessed by individual firms. Another error is to confuse the nature of C. with its symptoms—the forms it takes in actual commercial practice. Often action taken to suppress C. merely drives it from one form into another: a common example is control of prices by gov. or by agreement between firms, which leads to increased C. in quality, credit terms, etc.

In Britain between the wars, C. lost much public sympathy because it seemed to make for unemployment. But this was probably because the economic system was having to adjust itself to deep-lying changes in international supply and demand. If monetary conditions are such that the economy can be kept more or less fully employed, C. can be an effective force making for economic progress. After the Second World War public opinion seemed to accept this view, and laws were passed against monopoly. See MONOPOLY; CARTEL; TRUST; RESALE PRICE MAINTENANCE. See also W. H. Hutt, *Economists and the Public*, 1936; L. C. Robbins, *International Planning and Economic Order*, 1937; Ludwig Erhard, *Prosperity through Competition*, 1958.

Compiègne, Fr. tn, cap. of an arron., in the dept of Oise, on the l.b. of the Oise (q.v.). It stands at the NW. end of the beautiful forest of C., once a favourite hunting-ground of the Fr. kings, which covers 36,000 ac. There is a splendid château, founded in Merovingian times, rebuilt by Louis XV, and later embellished by Napoleon I (qq. v.); it contains fine paintings and tapestries, and has a museum of carriages. The tn hall dates from the 16th cent., and there are 2 ancient churches of note. C. is a fashionable holiday tn for the Paris region, and it has machinery, printing, rubber, and timber industries. The tn is said to date from Rom. times, and it was later the site of a hunting lodge of the Frankish kings. The Emperor Charles II (q.v.) founded at C. the great abbey of St. Cornille, and built 2 castles in the neighbourhood. It was at C. that Joan of Arc (q.v.), making a sortie from the tn during a siege, was taken by the Burgundians in 1430. Situated on the direct route to Paris from Belgium, it was impossible for C. to avoid being overrun during the First World War by the Gers. in their advance on the cap. in 1914. When the Allies counter-attacked at the first battle of the Marne, the Gers. tried to hold the line of the R. Aisne, with their right flank, under Gen. von Kluck, resting on C. Marshal Joffre, however, having organised his army for a still further counter-advance, drove the Gers. back far beyond C. within a fortnight of that battle. C. was again the strategically-important objective of the Ger. armies in June, 1918, when Marshal Ludendorff ordered Gen. von Hutler's army, then posted between Montdidier and Noyon, to attack with no fewer than 15 divs. on that part of the front. His plan was to link up the Marne and Amiens

salients, made earlier that year in the Brit. lines, and thereby eliminate the great bulge in his own line and so capture C., and again endanger Paris. The essential element of surprise was lacking, and contributory factors to the complete failure of Von Hutler's attack were the obstinate resistance of the Fr. at Rheims and the entire success of the Amers. at Château Thierry; and in 4 days his effort on the Oise had ceased (13 June, 1918). It was in the forest of C. that the armistice between the Gers. and the Allies was concluded on 11 Nov. 1918. In the same railway coach which Foch used when the Allies granted the Gers. the armistice of 1918 and in the same spot in the forest of C., Hitler, and his associates, on 21 June 1940, met Gen. Huntzinger and the other Fr. delegates to conclude the armistice sought by the Pétain (q.v.) Gov. in the Second World War. The centre of the tn and those parts lying near the railway were severely damaged during the war. Pop. 18,500. See ARMISTICE.

Complement, term with many applications. In geometry, the C. of an angle is that angle which added to it will make 90°. So the C. of 30° is 60°. Again, the C. of an arc is that required to make it a quadrant. In astronomy, the C. of a star's altitude is its zenith distance. In music, any two intervals which make up an octave are complementary. In arithmetic, the C. of a number is that required to raise it to the next power of 10. Thus 7 is the C. of 3, 89 of 11, 0.254 of 9.746. In chromatics, the C. of any colour is that one which added to it will give white, e.g. red is the C. of greenish-blue, and yellow of indigo-blue (see COLOUR).

Complex Number. The theory of C. N.s is a branch of mathematics. A C. N. consists of two parts, one real and one called imaginary, e.g. 10+3.1 is a C. N., where 10 is the real part and 3.1 the imaginary part. i or $\sqrt{-1}$ is defined by the equation $\sqrt{-1} \times \sqrt{-1} = -1$. It is imaginary in the sense that the square of a real number whether positive or negative is a positive quantity. The symbol i is of great use in mathematical analysis. The factors of x^2+y^2 are written $(x+iy)(x-iy)$, each factor being a C. N.

A C. N., $a+ib$, is often written in the form $r(\cos\theta+i\sin\theta)$, where $r = \sqrt{a^2+b^2}$, and $\tan\theta = b/a$. To multiply two C. N.s we use the fact that $i^2 = -1$. Thus $(a+ib)(c+id) = ac+iad+ibc+i^2bd$, i.e. $(ac-bd)+(ad+bc)i$. If $a+ib = r_1(\cos\theta_1+i\sin\theta_1)$ and $c+id = r_2(\cos\theta_2+i\sin\theta_2)$, their product can be written $r_1r_2(\cos\theta+i\sin\theta)$, where $r = r_1r_2$ and $\theta = \theta_1+\theta_2$.

Complutum, see ALCALA DE HENARES. Compositae, largest family of plants, containing over 13,000 species which are world-wide in distribution. The inflorescence is practically always a capitulum, and the flowers are surrounded by one or more external rows of bracts forming an involucre; the flowers collected in a single head may often comprise hermaphrodite, pistillate, and sterile florets. The calyx is often absent, but its usual form is a pappus of hairs, e.g. in the dandelion,

which develops after fertilisation, forming the familiar parachute by which the fruits are dispersed. The corolla is gamopetalous, and may be tubular, ligulate, or labiate (see COROLLA). There are 5 stamens inserted on the corolla, and they alternate with the petals; the anthers are united (syngenesious). The fruit is a cypselia with an exalbuminous seed. Self-pollination is the general rule among the plants, though cross-pollination is also common, and distribution of the seeds is effected most often by animals and the wind. The plants in the family are mostly herbaceous, but sometimes shrubby or tree-like. The root is usually a tap-root, often thickened, e.g. in the

COMPOSITAE: THE DANDELION

A, single floret, side view; B, single floret, front view; C, fruit with tuft of hairs (pappus); D, plan of floret.

dandelion, sometimes tuberous, e.g. in the dahhila. The leaves are usually exstipulate, radical, or alternate, but in some cases, e.g. in the sunflower, they are opposite. In many species laticiferous vessels are found containing the milky juice well seen in the dandelion and sow-thistle, and oil-ducts are very commonly present. Few of the plants are of economic importance, but many are cultivated for their beauty. Important genera are: *Achillea*, *Ageratum*, *Amellus*, *Ammobium*, *Anthemis*, *Arcotis*, *Artemisia*, *Asclepias*, *Bellis*, *Calendula*, *Callistephus*, *Carduus*, *Cassinia*, *Chrysanthemum*, *Cichorium*, *Cineraria*, *Coreopsis*, *Cosmos*, *Dahlia*, *Doronicum*, *Echinops*, *Emilia*, *Erigeron*, *Gaillardia*, *Gazania*, *Gerbera*, *Gratiola*, *Helianthemum*, *Helichrysum*, *Helipterum*, *Inula*, *Layia*, *Liatris*, *Olearia*, *Petasites*, *Rudbeckia*, *Santolina*, *Scotimus*, *Senecio*, *Silphium*, *Solidago*, *Sonchus*, *Tageles*, *Taraxacum*, *Tolpis*, *Tussilago*, *Ursinia*, *Ventidium*, *Waltia*, *Wulfia*, *Xeranthemum*, *Zinnia* (qq.v.).

Composition, in bankruptcy, the scheme of arrangement of his affairs proposed by a debtor after a receiving order has been made against him, embodying in writing the terms upon which he is desirous of satisfying or compromising the claims of his creditors. See BANKRUPTCY.

Composition and Compositor (of type), see under PRINTING; TYPE AND TYPE-FOUNDING; TYPE-CASTING AND TYPE-SETTING MACHINES.

Composition of Vectors, in mechanics, refers to such vectors as velocities (see VELOCITY) and forces (see PARALLELOGRAM OF VECTORS). The converse of C., as will be seen later, is resolution, and these two problems, i.e. of the C. and resolution of vectors, form two of the fundamentals of the science of mechanics.

Consider, e.g., the C. and resolution of velocities (see DYNAMICS). A body cannot be in two places at the same time, therefore it cannot move in two different directions at the same time. But it is often convenient and even necessary to regard the motion of a body as being compounded of sev. velocities, usually in different directions. These various velocities are termed the component velocities, while the actual velocity is said to be the resultant velocity, and the process of finding this resultant velocity is termed compounding the velocities. Thus, supposing one steamer passes another going in the same or the opposite direction, then the resultant velocity of one steamer relative to the other is the algebraic sum of the velocities of the steamers, which are the component velocities. The velocities are added or subtracted according as the steamers are going in opposite or the same directions. But take the case of a ball thrown up in a railway carriage in motion. In this case the ball moves upwards under its own velocity and at the same time continues forward with the velocity of the train. In this case, and all cases where the directions of the velocities are different but are co-planar, the theorem known as the parallelogram of vectors (q.v.) is used. If two component vectors be represented in magnitude and direction by the two adjacent sides of a parallelogram drawn from a point, then their resultant vector will be represented by the diagonal of the parallelogram drawn from that point. Other theorems, such as the triangle, polygon, and parallelepiped of vectors, aid in finding the resultant vector in particular cases. All these theorems concern the C. of V., but if the resultant vector is given and it is required to find the component vectors it would be necessary to use the process called the resolution of vectors. This is evidently the converse problem to the C. of V., and it is clear that just as it is possible to construct an infinite number of parallelograms around a diagonal, so there are an infinite number of possible component vectors to any given vector. When, however, the resolved component vectors required are to be at right angles to each other, as they usually are, then the problem is capable of an easy solution. See DYNAMICS; STATICS.

Compost, *see* GARDENING.

Compostels, Santiago de, *see* SANTIAGO.

Compound, *see* CHEMISTRY.

Compound Engine, steam engine in which the expansion of the steam is divided into two phases, the first being effected in the high-pressure, and the second in the low-pressure, cylinder. The two phases may be divided over 3 cylinders by dividing the steam from the high-pressure cylinder to supply 2 low-pressure cylinders, or by having 2 high-pressure supplying 1 low-pressure cylinder. This should not be confused with the triple expansion engine, in which the steam passes successively through 3 different cylinders.

Compound Householder, occupier of a 'small tenement,' whose rates are included in his rent. This happens principally where rating authority compounds with the owner or landlords for the payment of the rates. The various Acts concerning the registration of voters require that those claiming the occupation franchise be separately rated. But the Poor Rate Assessment and Collection Act, 1869, provides that in cases where the ratable value of a house does not exceed £20 in London, £13 in Liverpool, £10 in Birmingham or Manchester, and £8 elsewhere, the owner may agree with the rating authority to become liable for the rates himself whether his property be occupied or not, and that the rating authority may allow him a commission not exceeding 25 per cent on the ratable value. The Act also provides that the rating authority may order the owner to be rated instead of the occupier, subject to an abatement or deduction of 15 per cent. In such cases the C. H. is deemed to be separate for the purposes of the occupation franchise. The object of the Act of 1869 was to obviate the great expense and loss of time consequent on the collection of the rate from the numerous small occupiers. (Ryde on Rating, 3rd ed. 1958).

Compound Interest, *see* INTEREST.

Compound Quantities, in algebra, are figures consisting of more than one term; in arithmetic they are quantities expressed in terms of various denominations, as cwt, qr, lb.

Compound Winding, field winding on d.c. electric machines (q.v.) consisting of both shunt and series turns, used especially on traction generators to obtain a rising voltage on increasing load (over-compounding) or normal full voltage at a given load current. As the load current increases, this higher current, which goes through the series turns, increases the field, and thus the voltage. In ordinary compounding the number of series turns is so determined that the increase of the field at the given load current is just sufficient to compensate the volt drop that would occur with the shunt winding alone.

Compounding Offences. Compounding a felony means forbearing to prosecute a person who has committed a felony in consideration of some reward received, as for example agreeing not to prosecute a thief in consideration of receiving back the

stolen goods. Compounding a felony is a misdemeanour punishable by fine and imprisonment. The pub. of an advertisement in a newspaper or by any other means offering a reward for the return of stolen or lost property, *coupled with words indicating that no questions will be asked or inquiry made* on the production of the goods, renders the advertiser, printer, and publisher each liable to a penalty of £50. Compounding misdemeanours without proper leave is also an offence. But where a particular misdemeanour more closely affects an individual than the public at large, the court will sometimes allow the accused, before any judgment is pronounced, to settle with the prosecutor, when a nominal sentence only will be inflicted. *See also* CONCEALMENT.

Compressed-air Baths are made of iron plates riveted together, of such a strength that they can withstand pressure. Air is pumped into the chamber until the required pressure, indicated by barometers, is reached. These baths will hold two or more persons. Another manner in which compressed air is used is that in which a mask fitted with tubes and valves is fitted tightly over the mouth and nose. The patient can then inhale compressed air and breathe out into rarefied air. The use of these in treating disease comes under the term aerotherapeutics (q.v.). The use of compressed air tends to lower the frequency of the chest and heart movements while increasing the oxygen absorption and the blood tension; the action of rarefied air will, of course, be opposite.

Compressed-air Motors, machines that use air which has been raised by a special compressor to a pressure above that of the atmosphere. They should not be confused with air engines (q.v.), which work on a different principle.

C.-A. M. have attained considerable use in mines and elsewhere, for driving coal-cutters (*see* COAL MINING), driving drills for boring holes in rocks and in tunnelling operations, for manipulating hammers, riveting (q.v.), in sculpturing, and, on a small scale, for sheep-shearing. All these machines require to be portable and easily handled and controlled, and C.-A. M. can be supplied with air through flexible tubes, and consequently the power generators do not add weight to the motor, nor do they make the rigid portion of the machines large and therefore cumbersome. Further, the working parts are not at a high temp., and therefore the danger attached to their use is less than in the case of steam. Compressed air can, of course, be stored in cylinders without loss of power. Stored in this manner at a pressure approaching 2000 lb. per sq. in., in reservoirs under the vehicle, it has been used as the motive force for driving trams; it has also, even at much greater pressure, been used in motor cars. Again, pneumatic tubes for transmitting letters and small parcels of all kinds are worked partly by compressed air and partly by exhaustion. Further, in some of the Amer. arsenals locomotives are driven by compressed air, and their advantage over

steam engines in the neighbourhood of explosives is easily understood. Lifts or elevators, and the automatic brakes on passenger trains, are sometimes worked by compressed air. One of the most important uses is as locomotive power for torpedoes. Sometimes the air is heated before it reaches the motor. This causes it to expand, and the power is thus increased, in some cases by as much as 30 per cent. The pneumatic hand-hammer is much used for riveting. The supply of compressed air is obtained from a unit driven by a petrol engine, mounted on a small truck, the power being conveyed by flexible armoured tubing. The pneumatic road drill is taking the place of the pick. In mining machinery there are two main types of C.-A. M. used to drive pneumatic tools: (a) turbine-type and (b) cylinder-type motors. In the former the C.-A. M. consists of three parts, a stator and two rotors. The rotors, which revolve inside the stator, consist of two V-shape-toothed gear-wheels meshing together; the inflowing air is forced on to both gears, and the teeth of the gears as they revolve form valves and stop the air from escaping to the other side of the gears. In the cylinder type of machine the motive force is obtained from the motive action of two or more cylinders; the valves, which are driven from the crankshaft, admit the air, which drives down the piston, and at the end of its motion the air escapes from ports on one side of the cylinder casing. *See PNEUMATIC POWER TRANSMISSION; PNEUMATIC TOOLS; STEAM AND POWER HAMMERS. See also D. Braid, Compressed Air in Engineering Production, 1943.*

Compression and Compressibility. When a body is acted on by a force in such a manner that it decreases in volume, it is said to be compressed, and the diminution in volume is its compression. The term compressibility is sometimes used to denote this property of yielding to pressure, but strictly used it represents the extent of this property as possessed by various substances. Different bodies will diminish by different amounts under the same pressure, and to represent this varying amount of yielding, compressibility is defined as being the ratio of the amount of compression per unit of volume to the pressure applied. So it is found by measuring the amount of compression of a given volume under a given pressure, and dividing this by the product of the original volume and the pressure. This gives the average compressibility per unit of pressure, and the unit of pressure is usually taken as one atmosphere, or the weight of a sq.-in.-section column of mercury, 29.905 in. (760 mm.) in height at a temp. of 0° C., weighed at sea level. This is really equal to 14.7 lb. weight per sq. in. The compressibility of gases is greater than that of liquids or solids. For gases, the relation between pressure and volume being determined by Boyle's law, that the volume is inversely proportional to the pressure, it follows that the diminution in volume grows less as the pressure becomes greater, i.e. that the compressibility is

inversely proportional to the pressure. Liquids are compressible, e.g. water can be compressed, although the compressibility is less at high than at low temps. and pressures. Measurements of the compressibility of liquids are made in an instrument called a piezometer. Thus it has been proved that the compressibility of water at 10° C. and a pressure of 1 ton per sq. in. is approximately 1/20,000. Sea water is roughly 10 per cent less compressible than fresh water. Mercury has the smallest compressibility of any fluid, its compressibility being roughly one-sixteenth that of water. The compressibility of solids is very much smaller than that of gases or liquids, and except for theoretical purposes can be neglected. In measuring the compressibility of liquids, however, corrections must be made for the compressibility of the instrument employed. This being usually of glass, careful measurements have been made of its compressibility. This varies for the different kinds of glass but is roughly about one-twentieth that of water.

Compression-ignition Engines, *see* DIESEL ENGINES.

Compressors. C. are used chiefly in connection with mining machinery. There are two main types of C., namely reciprocating and rotary C. The first is the more widely used, and there are many models, all varying in design and action. The low-pressure compressor, up to 200 lb. per sq. in., is a single-stage compressor, i.e. the air is compressed by the single action of one piston. In pressures of 200 lb. and over the C. are two, three, four, or multi-stage C., i.e. the air is first compressed in one cylinder, and then suffers one or more subsequent compressions before it is finally stored. The valves of a compressor are of two types: those placed in the cylinder casing and those fitted in the piston itself; the valves in both cases are automatic in action, being opened and closed by the suction and compression strokes of the piston. In recent years high-speed C. have been developed in connection with refrigerating plants, and for liquefying gases such as air, with the object of subsequently separating their constituents by evaporation. Most ammonia C. are the single-acting enclosed type with the ammonia in the crank case; the valve ports are situated in the cylinder walls and lie between the limits of travel of the upper and lower parts of the piston.

Compromise Measures of 1850. These were a series of measures which had for their object the settlement of five questions in dispute between the pro-slavery and anti-slavery factions in the U.S.A. As a fact the compromise of 1850 settled nothing, but 'was compounded by every element of the country's politics, and may be made to yield on analysis almost every ingredient of the historian's narrative.' Tex. had just been acquired by conquest and purchase from Mexico; Texas had just been admitted to the Union, and the perplexing question was the extension or restriction

of slavery, for it threw obstacles in the way of a plan and gov. for the new ter., and made the determination of the Texan boundary a matter of grave sectional interest. Part of the country wanted the slave trade abolished from the Dist. of Columbia—the seat of the national gov.—and slavery from the new ter.; the other part urged with equal vehemence that the slavery question was a matter for decision by the framers of the state constitution (when it should come to be formed) of the new ter.

The result of this controversy was the series of measures framed and introduced by a committee of which Henry Clay was chairman, called the C. M. of 1850, which were signed by the President in September of that year. It was agreed (1) that Texas should be paid 10,000,000 dollars to relinquish her claim upon any portion of New Mexico; (2) that California should be admitted as a state under a constitution which prohibited slavery; (3) that New Mexico and Utah should be organized as ters. without any regulation in respect of slavery, leaving it to the election of their own settlers whether there should be ownership of slaves or not; (4) that the slave trade should be excluded from the Dist. of Columbia, but be interfered with nowhere else by the Federal law; and (5) that the whole judicial and administrative machinery of the Federal Gov. should be put at the disposal of the S. slave-owners for the recovery of fugitive slaves found within the free states. There seems little doubt that the C. M. helped to postpone secession and civil war for some years, during which time the NW. grew more wealthy and was brought into closer touch with the NE. states. See *Cambridge Modern History*, vol. vii, chap. xii, and J. F. Rhodes, *History of the U.S. from the Compromise of 1850, 1853–1906*.

Comptat Venasquin (from *Venasque*, Lat. *Vindaxinum*) was a parallel div. to Comptat d'Avignon, the two being cos. of the papal states, held by the popes from 1228 to 1791. C. V. was, however, larger, having an area of 450,000 ac. and now forms more than half of Vaucluse. The country is fertile, with magnificent scenery. Ventoix (1912 ft) is the loftiest peak. The dist. is irrigated by a system of canals and by the Rhône, Durance, and Sorgue. Venasque is a tn in Vaucluse.

Compton, Arthur Holly (1892–), Amer. physicist, b. Wooster, Ohio. Graduated College of Wooster, 1913; instructor of physics in univ. of Minnesota, 1916–17; and research physicist of the Westinghouse Lamp Company, Pittsburgh, 1917–19. Came to England, and pursued research at Cambridge, 1919–20; prof. of physics at Washington Univ., St. Louis, Missouri, 1920–3; prof. of physics at univ. of Chicago in 1923. Awarded the Nobel Prize in 1927. In 1945 he was appointed chancellor of Washington Univ. His speciality is X-rays. Made first measurement of wavelength of hard gamma rays, discovered change in wavelength of X-rays when scattered (the so-called Compton Effect, q.v.). Amongst his books are

X-Rays and Electrons, 1926, 2nd ed. 1928; *The Freedom of Man*, 1935; *X-Rays in Theory and Experiment*, with S. K. Allison, 1935; *Human Meaning of Science*, 1941; *Atomic Quest*, 1957.

Compton, Denis Charles Scott (1918–), Eng. cricketer and footballer. He made 114 on his début at Lord's (London Elementary Schools v. C. F. Tufnell's XI, 1932). Début for Middx, 1936, and for England, 1937. He has toured Australia and New Zealand, S. Africa and W. Indies. His aggregate in 73 tests is 5565 runs. In 1947 he made the record first-class aggregate of 3816 runs and 18 hundreds in a season. He is also a slow left-handed bowler. Retired from professional cricket, 1957; created C.B.E., 1958. He joined Arsenal Football Club in 1932, and was in the winning Cup side, 1950. He represented England in 10 war-time international and in the Victory International v. Scotland, 1946. See his autobiographies *Playing for England*, 1948; *In Sun and Shadow*, 1952; also E. W. Swanton, *Denis Compton: a Cricket Sketch*, 1949.

Compton, Fay (1894–) actress, b. London, daughter of the distinguished actor and actress Edward C. and Virginia Bateman. She made her first stage appearance at the Royal Albert Hall at Christmas 1906, in a Christmas fantasy entitled *Str Philomel, or Loe's Victory*, and in the theatre proper when she joined the famous Follies, 1911; she married H. G. Pellissier, the leading genius of the troupe, who d. 2 years later. Fay C. has had a long and brilliant career and is one of the most versatile actresses of the Eng. theatre. She has played leading parts in straight plays, farces, musical comedy, and revue. She is a most accomplished Shakespearean actress and is one of the finest Ophelias the Eng. stage has known. She has played with great success in America, Australia, and almost all over the world, and has also had a very successful film and radio career.

Compton, Henry (real name **Charles Mackenzie**) (1805–77), comedian, b. Huntington. In 1844 he appeared as Touchstone in *As You Like It*, and at once became famous. Other roles were Blenkinsop in Tom Taylor's *Unequal Match*, Muggles in Byron's *Partners for Life* at the Globe Theatre, and Dr Pangloss in *The Heir at Law*.

Compton, Spencer Joshua Alwyne, see NORTHAMPTON, MARQUESS OF.

Compton Effect (X-rays). Discovered in 1923 by A. H. Compton, this effect is the increase of wavelength of a beam of X-rays when scattered by substances. The change of wavelength is a function only of the angle through which the beam is scattered, and is independent of the nature of the scatterer. This change of 'colour' cannot be accounted for by the theory of electromagnetic waves (q.v.), which, however, accounts for many of the properties of X-rays (q.v.), known to be rays of extremely short wavelength. A satisfactory explanation was given by Compton, and also by Debye, in terms of quantum theory (q.v.). The effect is caused by scattering of X-ray quanta by

free electrons. Scattering by electrons bound to atoms leads to no change of wavelength.

Compton Wynyates, beautiful Tudor mansion, once moated, some 12 m. S.E. of Stratford-upon-Avon, Warwickshire, England, seat of the Marquess of Northampton. Begun in the 15th cent., it is built round a courtyard, with the arms of Henry VIII and Catherine of Aragon over the porch. There is a fine Great Hall, panelled, with two minstrels' galleries, carved screens, and a timber roof, and the house has a number of secret staircases and hiding-places. In the grounds is a church, rebuilt in 1665, with many memorials of the Compton family.

Comptonia Asplenifolia, or Sweet Fern, genus, the one species of its family Myricaceae. It is a small bush, 3 to 4 ft high, yielding a powerful aromatic fragrance when rubbed between the fingers. It is a native of the woods and mts of the U.S.A., and possesses tonic and astringent properties.

Comptroller, official title for one who keeps or audits accounts, used mainly for gov. offices, or in connection with the royal household, when it refers to a kind of steward or treasurer. Thus the C.-general is the head of the National Debt Office, the C. and auditor-general the head of the Exchequer and Audit Dept, etc. The word is more correctly spelt *controller*, as it comes from the Fr. *contrerolle*, from Med. Lat. *contrarotulus*, a counter-roll or copy of a document used to check the original; in this form it is applied to the controller of the Navy and to the head of the Stationery Office in England, and in the U.S.A. to the controller of the Treasury and the controller of the currency, the latter being one who administers the law relating to national banks.

Compulsory Acquisition of Land. The Crown has a prerogative right compulsorily to acquire the land of private owners. In practice, however, even in war-time, it acquires land with statutory authority. The Brit. railway and canal systems were made possible only by a series of special Acts of Parliament empowering railway and canal companies compulsorily to acquire the land through which tracks and canals were to pass. The Lands Clauses Consolidation Act, 1845, was passed to provide a standard procedure for the compulsory acquisition of land and payment of compensation. It incorporated the provisions usually to be found in statutes empowering public utility companies and local authorities to acquire land. Subsequent statutes giving these powers would incorporate the relevant provisions of the Lands Clauses Act, 1845, which was later modified by a series of Lands Clauses Acts, passed between 1860 and 1895. The basis of assessment of compensation has been amended by the Acquisition of Land (Assessment of Compensation) Act, 1919, the Lands Tribunal Act, 1949, and the Town and Country Planning (q.v.) Acts, 1947, 1953, and 1954. This has been neces-

sitated by the wide compulsory purchase powers given to local authorities to carry out town development schemes. Land may be permanently acquired or merely requisitioned for public purposes during an emergency. An acquiring authority may require only a limited interest in land (e.g. the control in its development) or do some act called 'injurious affection', which in some way diminishes the landowner's enjoyment of his land (see LOCAL GOVERNMENT).

An acquiring authority (e.g. gov. dept., local council, or nationalised industry) will normally derive its powers from one of the following sources: (1) A public general Act which empowers it to acquire unspecified land for particular purposes (e.g. building of highways, civil airfields, or housing estates). Sometimes, however, a gov. dept may introduce into Parliament a Bill authorising the compulsory purchase of a particular piece of land for a definite purpose, e.g. Public Works (Festival of Britain) Act, 1949. (2) A local council may obtain a special Act of Parliament conferring special powers (e.g. the Birmingham Corporation Act, 1946, empowered the corporation to acquire a considerable number of residential and business premises for the construction of a ring road). In 1956 Croydon Corporation sought powers to acquire property to enable it to carry out a road widening scheme. (3) Some local and general Acts empower in general terms authorities to acquire land for specified purposes subject to the obtaining of specific authority to take any particular piece of land. This is given after the holding of a public inquiry and the confirmation of the acquisition by an Act of Parliament. This procedure is rarely used. (4) The most common authority for compulsory acquisition is the compulsory purchase order, which is made by the acquiring authority and confirmed by the appropriate gov. dept after hearing any objections from interested parties.

In practice the procedure for the compulsory acquisition of land, however authorised, is usually carried out in accordance with a standard formula prescribed by the Acquisition of Land (Authorisation Procedure) Act, 1946. The essentials (subject to modifications in certain cases) are, broadly, the making of a compulsory order by the acquiring authority, its advertisement, service of notice on persons whose land is affected by the order, the hearing of objections, local public inquiries (where deemed necessary), and the confirmation of the order, usually by the Minister of Housing and Local Government.

The amount of compensation for compulsorily acquired land, if not agreed, is usually assessed by the Lands Tribunal, from which appeals on points of law only are considered by the court of appeal (q.v.). The basis of compensation varies according to the purposes for which the land is acquired. See M. W. Van Oss and N. MacDermot, *The Lands Tribunal: Law and Procedure*, 1950; C. A. Cripps, *Compulsory Acquisition of Land*, 10th ed. with

ann. supplements; R. D. Stewart-Brown, *A Guide to Compulsory Purchase and Compensation*, 1955.

Compurgare (Lat. *compurgare*, to purge completely), name given to a witness of character who swore to the character of the accused person in a trial. The word was used only in eccles. law until the 17th cent., when it was used by legal antiquaries in connection with the civil law. In Glasgow, up to the middle of the 18th cent. when the office was abolished, an official whose duty it was to clear the streets of strollers during the time of church worship on Sunday was called a C.

Comrades of the Great War, organisation of ex-service men which arose out of the First World War, absorbed into the British Legion (q.v.).

Comrie, par. and vil., Perthshire, Scotland, on the R. Earn, 6½ m. W. of Crieff. It lies on the fault line which divides the Highlands from the Lowlands and is subject to occasional earthquake shocks. Pop. 1800.

Comstock, Anna Botsford (1854-1930), Amer. naturalist and natural-hist. artist; b. Otto, New York; wife of John Henry C. (q.v.). Prof. of nature study, Cornell, 1920-2; associate director, Amer. Nature Association. Works include *Ways of the Six-footed*, 1903; *How to Know the Butterflies* (with her husband), 1904; *Confessions to a Heathen Idol*, 1906; *Handbook of Nature Study*, 1911; sixteenth ed., 1925; *Bird, Animal, Tree, and Plant Handbooks*, 1914; *Trees at Leisure*, 1916. Ed. *Nature Study Review*, 1917-23.

Comstock, John Henry (1849-1931), Amer. entomologist; b. Janesville, Wisconsin. U.S. entomologist, Washington, 1879-81. Prof. of entomology and invertebrate zoology, Cornell, 1882-1914, and responsible for the classification of insects according to the arrangement of wing veins. Works include *Report on Cotton Insects*, 1879; *Notes on Entomology*, 1888; *The Wings of Insects*, 1891; *Manual for the Study of Insects*, 1895; *Insect Life*, 1897; *How to Know the Butterflies* (with his wife), 1904; *The Spider Book*, 1912.

Comstock Lode, famous silver mine in Nevada, U.S.A., discovered in 1857; the richest known silver deposit, the mine may be said to have caused the rise of Nevada as one of the great gold- and silver-mining dists. of the world. It was financed chiefly from San Francisco, and the 'bonanza' boom of the seventies led to a financial panic. The Comstock dist. is exceedingly rich in both gold and silver, but the fall in the price of the latter resulted in great depression. Virginia City, built on the site of C. L., had a pop. of 11,000 in 1880; in 1940 of 950.

Comte, Auguste (1798-1857), Fr. philosopher, founder of Positivism; b. at Montpellier, where his father, a strong Royalist and Catholic, was the receiver-general of taxes. C. received his early education at the public school of his own town, and later proceeded to the Ecole Polytechnique in Paris. About 1818 he came under the influence of Saint-Simon, a relative of the famous Duc de Saint-Simon;

and although he himself at a later date declared that the influence of Saint-Simon was for evil rather than for good, there is no doubt that during this period of his life he had a great admiration for his patron. Saint-Simon's teeming imagination seems at any rate to have supplied C. with the bases for some, at least, of his later philosophical ideas. In 1824, after a quarrel, C. severed his connection with Saint-Simon entirely. In the following year he married, but the union was not an unqualified success. He now found the greatest difficulty in making a living; he tried to get pupils but failed; he wrote a little for the papers, and finally undertook a course of lectures which would embody the main principles of his philosophy. These were interrupted by an attack of insanity, from which, however, in the course of a few months he recovered. In 1828 the lectures were resumed, and two years later appeared the first vol. of his great work, *Cours de philosophie positive*. Financially, matters had become brighter; he was in possession of a modest income, although he had to work excessively hard for it. Until 1842 things went more or less smoothly, but in that year the temperamental differences between himself and his wife culminated in their separation. By this time also he had lost half his income owing to a gratuitous attack which he had made on the directors of the Ecole Polytechnique, and for some time he lived on the subsidies of friends. In 1842 had appeared the sixth and final vol. of the *Philosophie positive*, and during the pub. of this work he had become friendly with J. S. Mill, who helped him very considerably in his financial difficulties. In 1845 C. fell under the influence of Mme de Vaux, an influence which seems to have been entirely for good, but which, unfortunately, lasted for only a year, being terminated by the lady's death in 1846. In 1851 appeared the first vol. of *Système de politique positive*, the last vol. in 1854. *Catechisme positiviste* was pub. in 1852. During the years 1849-51 C. gave lectures at the Palais Royal, where he strenuously advocated his general theories. He was attacked by cancer in the year 1859, and d. towards the close of that year. See also POSITIVISM; PHILOSOPHY. See L. Lévy-Bruhl, *La Philosophie de Comte*, 1900; M. Wolff, *Le Roman de Comte et de Clotilde de Vaux*, 1929; H. Gouhier, *La Jeunesse de Comte et la formation du positivisme*, 1933.

Comum, see COMO.

Comus (Gk *kómos*, revel, or a company of revellers), god of festive mirth. He belongs to the later Gk mythology, and is depicted by Philostratus, in the 3rd cent. AD, as a sleeping youth winged, crowned with flowers, and holding a hunting spear and an inverted torch. Milton in his *Comus* represents him as the offspring of Bacchus and Circe endowed with power to turn human faces into those of beasts.

Comyn, Cumming, or Cumyn, Norman family who came to England with Wm the Conqueror. Robert was made earl of Northumberland, his son William becoming chancellor of Scotland. John

Comyn (d. c. 1300), known as the Black C., was a Scottish baron and nephew of the earls of Buchan and Menteith, from the latter of whom he inherited the lordship of Badenoch. He took part in the negotiations between Edward I and the Scots (1289), and was one of the claimants for the Scottish throne on the death of Margaret, the Maid of Norway. He fought, however, for John de Balliol, but in 1296 submitted to Edward I, and came to England. His son *John*, known as the Red C., also fought for Balliol, and was kept as a hostage in England for a time. After the battle of Falkirk he was made guardian of Scotland, and for five years carried on the feud with England. He has become famous on account of his quarrel with Robert Bruce, the origin of which is unknown, but in Jan. 1306 they met at Dumfries, where C. was stabbed to death, whether by Bruce or his followers is not certain.

Conacre (a corruption of corn-acre), obsolete land system once prevalent in Ireland, under which small patches of land were let out for potato growing in lieu of wages.

Conakry, cap. of Fr. W. Africa, situated on the is. of Tumbo at the mouth of the Dubreka, in lat. 9° 30' N. and long. 13° 40' W. It is connected with the mainland by an iron bridge. C. is linked by rail with Kankan, 412 m. It is an important harbour. C. is said to ship 50 per cent. of the bananas consumed in France. There is a radio station. Pop. 75,000 (estimated 1956).

Conca, Sebastiano (1676-1764), It. oil- and fresco-painter, b. Gaeta, who studied under Solimena (q.v.). In his work he was an imitator of Pietro da Cortona, whom he resembled in his superficiality and rapidity. Of his works the 'Sacred Pool of Siloam,' in the hospital of Santa Maria della Scala at Siena, is the best.

Conca, see CUENCA.

Conca D'Oro, see PALERMO.

Concan, see KONKAN.

Concarneau, seaport in the dept of Finistère, France, 14 m. SE. of Quimper. The old tn, which is surrounded by ramparts, is believed to date back to the 14th cent.; it lies on an is. near the bay of La Forêt, while the newer portion, St Croix, is on the opposite shore. It is a centre of the sardine, mackerel, and tunny fisheries. Pop. 10,500.

Concave (Lat. *concavus*, hollowed) and **Convex** (Lat. *convexus*, vaulted) are two opposite terms. As their etymological derivation signifies, the former is applied to a surface falling, the latter to a surface rising, in a circular form. Thus the outer surface of a saucer is convex, the inside concave. In mathematics a curve is convex on the side on which the point of intersection of two tangents falls, and on the other side concave.

Concealment, in the law of contract, means any improper suppression of facts or circumstances by one of the parties to a contract so as to induce the other party to enter into it. In certain contracts, styled contracts *uberrimae fidei* (of the utmost faith), each party must make the

fullest disclosure of all material facts within his knowledge, or the contract will be voidable at the option of the party misled. The remedy for a fraudulent C. is an action to rescind the contract and for damages; for an innocent but material C., rescission only (see **CONTRACT**). In criminal law, a person knowing of any treason or felony without in any way assenting to it, is guilty of misprision if he conceals his knowledge. Misprision of felony is punishable by fine and imprisonment (see also **MISPRISION**). Various acts of C. by a bankrupt if fraudulent render the bankrupt liable to certain penalties under the Debtors Act, 1869 (see **BANKRUPTCY**). C. of treasure trove is punishable by fine and imprisonment. C. of birth is a misdemeanour punishable by imprisonment. C. of documents of title to land or any testamentary instrument is a felony punishable by imprisonment.

Concealment of Birth, see BIRTH.

Conceição do Mato Dentro, tn of Brazil, in the state of Minas Geraes, 75 m. ENE. of Belo Horizonte. It has gold and iron mines. Pop. 3000.

Concentration, in metallurgy, see **ORE AND ORE DRESSING.**

Concentration Camp, institution of Nazi Germany for the detention of opponents of the Nazi régime. It has been estimated that about 50,000 persons were in the C. Cs at the outbreak of the war in 1939, and that upwards of 200,000 had passed through them in the previous 7 or 8 years. Prisoners in these camps included, besides Jews, Communists, Socialists, Democrats, Catholics, opposition Protestants, Czechs, and indeed even such Nazis as had refused to conform to the party line. Detention in the camps was entirely arbitrary; no person there was ever tried nor was there any legal time-limit to their detention, and indeed most were there for years. Among the worst of these C. Cs were those at Belsen, Buchenwald, Dachau, Auschwitz (q.v.), Oranienburg, Popenburg, Maidanec, and Treblinka. The prisoners were beaten, forced to hard work far beyond their physical capacity or endurance, and exposed to frightful tortures and humiliations by their guards. There was, moreover, convincing Polish evidence that the camps of Maidanec, Oswiecim (Auschwitz), and Treblinka were torture camps, where the reign of terror and sadism far exceeded all that had been reported from Belsen, Buchenwald, or Dachau. Millions of persons were killed in these camps, the majority slowly tortured to death in the execution of a deliberate policy of mass extermination (see **Brit. White Paper of Oct. 1939**). The existence of the C. Cs was officially admitted; but they were represented as political reformatories of a rather humane character: on 23 Aug. 1934 Goebbels (q.v.) declared to the delegates of the International Penal and Prison Congress in Berlin that the purpose of the camps was to turn 'anti-social' members of society into 'useful members' by the most humane means. The terror practised in these camps was entrusted exclusively to the Gestapo by

a special law which was promulgated on 12 Feb. 1935, though camps had been in existence for at least 2 years before that date. The unique horror of the C. C.s, and the persistence of that horror for more than 12 years, the more than inhuman cruelty of the terrorists, and the connivance or at least the indifference of a huge public—all these demanded an expiation which in the nature of things was impossible to exact. After the war, sentences were duly passed on the officials who had conducted the C. C.s and on those responsible for their organisation.

Concentric (*con* and *centre*), name which is applied in mathematics to any two or more similar figures which have a common centre. Thus the outer and inner edges of the rim of a wheel form two concentric circles.

Concepción: 1. Prov. of Chile, situated between Nuble prov. in the N. and Biobío, Malleco, and Aranco provs. in the S. Its area is about 2200 sq. m., and there are large and extremely fertile plains. The cap., C., is a port, situated on the r. b. of the It. Biobío, 6 m. from its mouth, and it is the main city of S. Chile, and the third largest in the country. Talcahuano, 8 m. NNW. on the bay of C., is its port. C. has a considerable trade in wine and grain, and manufs. of leather goods, textiles, flour, sugar, metal products, chemicals, and other commodities; it exports coal. The steel plant now being built at Huachipato is expected to increase the economic importance of this area, and in the vicinity are large coal mines. The tn was founded by Pedro de Valdivia in 1550 on a site some 7 m. NNE. In 1730 it was destroyed by an earthquake, and again in 1751. It is now a well-built tn with a fine modern cathedral, law courts, and univ. Pop. (prov.) 411,559; (tn) 119,887.

2. Dept. of the oriental section of Paraguay, lying to the E. of Paraguay It. It is largely low-lying marshland. The cap. of the same name lies on the riv. s l. b. about 135 m. NNE. of Asunción. A road leads NE. to the Brazilian border. C. has an important trade in *maté* tea. Pop. (dept) 46,500; (tn) 32,500.

Concepción de la Vega, city, cap. of La Vega prov., Dominican Rep., 65 m. NW. of C. Trujillo on the Camd. It was founded by Bartholomew Columbus in 1495. It is a suffragan bishopric and has a fine cathedral. The wooden cross erected by Christopher Columbus and the tree from which it was cut still exist at Santo Cerro 4 m. to the N. C. is linked to the economically important Samaná Bay by rail. Pop. 14,450.

Concepción del Uruguay, city and railway terminus in Entre Ríos prov., cap. of Uruguay dept., Argentina, on the r. b. of the R. Uruguay. It has a national college; its port, 114 m. N. of Buenos Aires, can be used by ocean-going vessels. There is a trade in grain and beef. Pop. 30,900.

Concept and Conceptualism. *Concept*, a term in philosophy: logical, metaphysical, and psychological. It is the result obtained by the mental process popularly

known as 'abstraction.' We recognise various particular objects which we call 'horses,' and form a general idea, by abstracting certain common qualities from these particulars, of a universal 'horse'; the mind 'affirms' a concept 'horse' by a process of abstracting, combining, and reconstructing 'perceptions'; thus 'conception' is contrasted with 'perception.'

Conceptualism was the scholastic theory, mainly connected with the name of Abélard, which, in attacking the rival theories of Nominalism and Realism, attempted to steer a middle course between the two. The question in debate was as to the nature of genera and species; do they exist in themselves or only in the mind? While the Nominalists held that 'universals,' i.e. genera and species, are only names invented to express the sum of qualities expressed, e.g. by the term 'horse,' and are *post res*, i.e. after things, subsequent, the Realists affirmed that 'universals' have real existence and are antecedent, *ante res*. The conceptualist theory held that they are concepts, existing in the mind, expressing a similarity: they are really existent, but not apart from particular objects to which they apply; or, as Abélard put it, a 'universal' obtains reality by being predicated of something; e.g. there is no reality in the concept 'horse' till you affirm 'Persimmon is a horse.' The rival schools had a great influence in the development of medieval theology. Abélard's conceptualism swayed too much towards the dangerous, materialistic Nominalist school for him to escape the censure of the Church.

Concepts of Law, see JURISPRUDENCE.

Concert, in music, is the collaboration of a number of singers and/or players in giving a public performance. An earlier Eng. word was consort. Concerted music is that written for several voices and/or instruments where each part is of equal importance.

Concert Pitch, see PITCH.

CONCERTINA

Concertina, or Melodeon, is a wind instrument with free reeds. It is composed of 2 hexagonal or rectangular key-boards which are connected by a long, expanding bellows. On the keyboards are rows of knobs which, when pressed,

open valves which admit the air to the free reeds, by whose vibration the sound is formed. The reeds are narrow slips of brass riveted to the inside surface of the keyboard at one end. The outer ends are bent in alternate ways; those bent inwards are actuated by compression, those outwards by suction. The length and thickness of the reeds determine the pitch. The Eng. C. was invented and patented by Sir Charles Wheatstone in 1829; it has a double action, playing the same note on compression and expansion. The Ger. variety, on the other hand, plays two different notes when compressed and then expanded. The C. is made in several varieties—treble, tenor, bass, and double bass—the compass of the whole set being 7 octaves. The timbre of the instrument is soft, and capable of delicate gradations. The most prolific composer for C.s was Edward Silas.

Concerto, musical composition written with an orchestral accompaniment, calculated to display the powers of an instrument or a performer. C.s are generally written for a solo instrument, though Bach's C.s for two or more pianofortes, Mozart's for two pianofortes, and Beethoven's for pianoforte, violin, and violoncello, may be cited as exceptions. Early C.s (see CONCERTO GROSSO below) are more suite-like in form, but a modern C. usually consists of three movements, the first in sonata form, the second a slow piece, and the last in rondo, sonata, or variation form. There is usually a cadenza in the first, or sometimes in the last, movement; this is an embellishment or flourish, prepared or improvised, for the solo instrument. Modifications of C. form were introduced by Corelli, Geminiani, Bach, and others; Mozart gave it its modern form, and Beethoven introduced some modifications of this. The romantic composers often treated the C. more freely: Schumann's piano C., for instance, was first conceived as a Fantasy in one movement; Mendelssohn wrote pieces in one and two movements; and Liszt introduced his transformation of themes into the C. Brahms, on the other hand, reverted to the classical form.

Concerto Grosso (It. 'grand' or 'big concerto'), a musical form preceding the modern concerto (see above) for solo instrument(s) and orchestra. It was in suite rather than sonata form, and sometimes had alternating slow and quick movements, like the church or chamber sonata; but the three movements of the modern concerto, though not their form, were sometimes anticipated. Solo instruments known as the *concertino* (little consort), usually two violins and cello, were already in evidence, but they contrasted with the orchestral (*ripieno*) strings in blocks or layers of sound rather than by brilliant display passages. The whole was invariably supported by a *continuo* part for harpsichord. A great variety of *concertino* instruments was used by Bach in his six Brandenburg Concertos, which still retain the character of the C. G.

Conch (Gk *kogchē*, mussel or cockle

shell), name applied to various shells, but especially to the fountain shell, a species of gastropod mollusc in the wing-shell family. In art it is represented by a Triton shell, from the allied family Tritonidae.

Conchagua, Bay of, see FONSECA, GULF OF.

Conchifera, term which Lamarck applied to the *Acephala testacēs* of Cuvier, together with the Brachiopoda, which forms Cuvier's fifth class of molluscs. The term *Acephala Testacea* has been replaced by Lamellibranchiata by modern zoologists.

Conchoid (*kogchē*, shell, *eidos*, form), plane curve invented by Nicomedes, who used it to solve the problem of the duplication of the cube, the trisection of an angle, etc. AB is a fixed straight line and P a fixed point. Equal straight lines

CONCHOID

are drawn through the point P so that they are bisected by the straight line AB, and their ends trace out the two branches of the conchoid. Thus, in the figure, $OC = OD = RN = RM = ST = SP$. When OD is greater than OP the lower branch forms a loop below P, as in the figure; when $OD = OP$ a cusp is formed at P; when OD is less than OP the lower branch does not reach P. The curve is obviously symmetrical about the straight line XY. The equation of such a curve may be written $(x-b)^2(x^2+y^2)-a^2x^2=0$.

Conchology, branch of zoology which treats of molluscs with reference to their shells. See SHELL.

Conchos, riv. of N. Mexico, which rises in the E. of the Sierra Madre, and, flowing through the state of Chihuahua for about 350 m., joins the Río Grande del Norte at Ojinaga, opposite Prosidio (Texas).

Conciliation, Industrial. Machinery for the settlement of industrial disputes by C. and arbitration has been in operation in various countries for many years. The Conciliation Act of 1896, combined with the Industrial Courts Act, 1919, are the characteristic Brit. form of the system, with its emphasis on voluntary resort to investigation, C., and arbitration by competent tribunals. Such voluntary resort with or without assistance from the gov. has been long estab. in all the well-organised Brit. industries. Trade boards supply a need in those less well organised. At the opposite extreme is the principle

of compulsion. Australia and New Zealand are conspicuous among the countries which have adopted this principle. In Queensland the arbitral tribunal established by law has legislative functions. In the sense that its awards have legal effect even in regard to employers and employees who may not have been involved in the dispute which gave rise to the award. C. machinery is now being introduced in the W. Indies and in other Brit. colonies parallel with the development, under official guidance, of trade union principles. Important changes in the machinery of C. have been made by most countries in the past 25 or more years, but no perfect system has yet been evolved. Far more disputes are settled by the voluntary machinery set up by the trade unions and organised employers for purposes of joint consultation than by any other agency; but cases do arise from time to time which call for mediation and where collective bargaining is out of the question. The Act of 1896 did little more than empower the Board of Trade to inquire and report, and it was not until 1911, when the Industrial Council was established, that any attempt was made to systematise the application of the principle of C. embodied in the Act of 1896. But this body had no power to require disputants to refer to it, the voluntary character of the Act being maintained. In 1919, however, the Standing Industrial Court was established under the Industrial Courts Act, consisting of independent persons and representatives of employers and employees, to deal with such disputes as might be referred to it with mutual consent, or to investigate the circumstances if the Ministry of Labour deemed inquiry to be desirable. Neither an award by the court nor the findings of an inquiry were made binding. In its original form the measure contemplated compulsory arbitration and the attachment of trade union funds for strikes against the decisions of the arbitrators. This was necessarily opposed by the unions, with the result that the voluntary tradition subsists. The National Arbitration Tribunal was constituted by the Ministry of Labour and National Service under the Conditions of Employment and National Arbitration Order, 1940, for the purpose of settling trade disputes which cannot otherwise be determined. Many advocates of C. think that almost any system of C. is useful in so far as it promotes investigation. The method of arbitration, on the other hand, leads to the formulation of agreed principles of determining wage questions. In Australia and New Zealand, for example, the system which began last century as a method of averting strikes and lock-outs has developed into one of wage regulation, based on a fairly scientific attempt to ascertain what wages can and ought to be paid. On the whole experience seems to reinforce the traditional Brit. method of voluntary C. and arbitration; but it also tends to strengthen the opinion that, in a state of full employment and labour shortage, and particularly in the 'public service' industries in which breakdown

would disrupt the whole economy, C. and/or arbitration should be compulsory, and that the tribunal should be such as to ensure its permanence. *See also* ARBITRATION, INDUSTRIAL; INDUSTRIAL RELATIONS.

Concini, Concino, *see* ANCRE.

Conclave (room), name given to the place of assembly when the cardinals of the Rom. Catholic Church meet to elect the pope. The name is also applied to the assembly itself. The regulations for such a meeting were laid down in 1274 by Pope Gregory X, who had suffered from the dilatoriness of election then prevailing. By them it was laid down that after 10 days from the pope's death the cardinals present should assemble in the palace, and should be secluded until they had elected the deceased pope's successor. These regulations are still observed in the main; since most of the popes have *d. at Rome* the Vatican has been the usual place of the C.

Concord: 1. The cap. of New Hampshire, U.S.A., and co. seat of Merrimack co., on the Merrimack R. It has some fine public buildings, including a state house, built of granite, a state library, and the Rumford Press. There are celebrated white granite quarries, and manufs. of machinery, woollen, cotton, metal, and leather goods, and shoes. Benjamin Thompson (Count Rumford), the statesman and natural philosopher, was a schoolmaster here in 1770-2, and it was the home of Mary Baker Eddy, the discoverer and founder of Christian Science. Pop. 28,000.

2. The co. seat of Cabarrus co., N. Carolina, on the S. railroad, 13 m. N.E. of Charlotte. It has textile mills. Pop. 16,486.

3. Tn in Middlesex co., Massachusetts, on the Concord R., 17 m. N.W. of Boston, on the Boston and Maine railroad. The first skirmish in the war of Independence took place here on 19 April 1775, and an obelisk marks the spot where the first Brit. soldiers fell. In C. have lived many notable men of letters, including Emerson, Hawthorne, the Alcotts, and Thoreau. Pop. 8623.

Concord, or Consonance, in music, is a sounding together of notes that satisfy the ear without leading it to expect any further sound to give the impression of finality. The C. which gives the most complete impression of stability is the major triad, with a major third and a perfect fifth above the fundamental note.

Concord, Book of, the 8 Symbolical Books of the Lutheran Church, among which are the Apostles' Creed, the Nicene and Athanasian Creeds. The Lutheran books proper are the Augsburg Confession, drawn up by Luther, Melancthon, Jonas, and Bugenhagen (1530); the Apology for the Confession by Melancthon (1530); the Articles of Schmalkald by Luther (1537); the Smaller and Larger Catechisms of Luther (1529); and the Formula of Concord, drawn up by 6 Lutheran divines (1577). The whole was united by order of Elector Augustus of Saxony and officially recognised as the B. of C. at Dresden on

25 June 1580. The first trans. of the B. of C. into Eng. was made by Ambrose, Socrates Henkel, and others in 1851.

EMERSON'S HOUSE AT CONCORD,
MASSACHUSETTS

Concordance (late Lat. *concordantia*, agreement), name given to a book containing citations of parallel passages in any work, and an alphabetical arrangement of words contained therein, with reference to the passages where they are found. Originally each group of parallel passages was called a concordantia, and the plural form concordantiae used for the collection of such passages, and the Germans still distinguish between C.s of things and C.s of words. The first book to which C.s were made was the Bible; the reason for this was the belief that was formerly held that all parts of the Bible are in harmony with one another, and form one divine whole. Anthony of Padua (1195-1231) is said to have been the author of the earliest C. we have, an anonymous work based on the Vulgate. The first authentic C. was that of Cardinal Hugh of St Cher, a Dominican friar of the middle of the 13th cent.; he is said to have felt the need of such a work for his studies, and to have employed 500 religious to aid him in compiling it. The C.s of Conrad of Halberstadt (fl. c. 1290) and of John of Segovia in the 14th cent. were based on the work of Hugh. The first Hebrew C. was compiled between 1437 and 1445 by Rabbi Mordecai Nathan, and printed at Venice in 1523 by Daniel Bomberg. It was entitled *Meir Nativ* (Light of the Way), and served as the basis for the C. in 4 vols. of Marius de Calasio, a Franciscan friar, dated 1621. The C. of Johann Buxtorf, senior, is only useful to those acquainted with the Massoretic method. C.s of biblical proper names have been pub. by G. Brecker (1876) and Schusselovitz (1878). In 1642

Conrad Kiroher of Augsburg produced a C. to the Septuagint, and Abraham Tromm one in 1718. The best modern C. on such lines is that of the Clarendon Press, Oxford, *A Concordance to the Septuagint and the other Greek Versions of the Old Testament, including the Apocryphal Books*. This was pub. in 1897, and a C. of proper names was added in 1900. The first Gk C. to the N.T. is that of Xystus Betuleius (1500-54); other C.s were produced by the Stephensens, father and son, and Erasmus Schmid, a Lutheran divine, whose work forms the basis of most subsequent C.s. A C. of the Gk text with an Eng. version to each word, and the prin. Hebrew roots corresponding to the Gk words of the Septuagint, was produced in 1767 by J. Williams. The first C. of the Eng. version of the N.T. is that of T. Gibson (1535), and the first Eng. C. of the entire Bible was produced by J. Marbeck in 1550. Alexander Cruden's C., which is the basis of all modern C.s, was produced in 1737, with the title, *A Complete Concordance to the Holy Scriptures of the Old and New Testament, to which is added a Concordance to the Works called Apocrypha*. More recent C.s are J. Strong, *The Exhaustive Concordance*, 1890; *The Oxford Cyclopaedic Concordance*, 1910; R. Young, *Analytical Concordance to the Bible*, 1913; D. M. Miller, *The Topical Bible Concordance*, 1947. Since the value of a C. was discovered, the works of many other authors have been furnished with more or less complete C.s, notably Dante, Chaucer, Shakespeare, Milton, Shelley, Browning, and Dickens.

Concordat originally denoted a compact or an agreement. Later it came to mean an agreement between the eccles. and secular authorities. From this usage came the present one: a compact between the pope, as head of the Rom. Catholic Church, and a temporal sovereign, having for its object the regulation of eccles. affairs within the dominion of the sovereign. A C. may take any one of three forms. The pope may consult with the gov. with which the C. is to be drawn up, and then issue a papal bull to regulate the affairs of the Rom. Catholic Church in that country; the contents of the bull are incorporated by the gov. in the law of the land. Another method is for two identical acts to be drawn up; the pope signs one of these, and the sovereign the other. The third and most common is a formal treaty drawn up after consultation, signed by plenipotentiaries on both sides, and ratified by the high contracting parties. Such a method was adopted in the Fr. C. of 1801. A C. is concerned with such matters as Church property, eccles. appointments, the rights of the clergy, regulation of public worship, etc. Various views are held as to the binding force of a C. Some secular jurists have held that it can be annulled at will by the State; some favourable to the absolute authority of the pope have declared it to have no binding power on him. The general view is that, like any other contract, a C. is binding on both the signatories, with the proviso that no gov. can guarantee that it will be

accepted by the next gov. in office. See STATE OR ESTABLISHED CHURCH.

Concorde, Place de la, famous open square in Paris, beside the Seine and the garden of the Tuilleries. It was originally named after Louis XV, who planned it. During the Revolution its name was changed to Place de la Révolution, and it was here that Louis XVI, Marie-Antoinette, Charlotte Corday, Danton, Robespierre (q.v.), and numerous others were guillotined. An obelisk from Thebes stands in the centre.

Concordia, Rom. goddess of harmony and peace, to whom many temples were raised. The earliest was that of Camillus, on the Capitol (367 bc), celebrating the reconciliation of the patricians and the plebs by the Licinian laws. The Senate frequently met here, and here Cicero delivered his oration against Catiline. C. is represented on coins as a matron, holding in her left hand the cornucopia, and in her right an olive branch.

Concordia: 1. City and riv. port of Entre Rios prov., Argentina, on the Uruguay R.; virtually the limit for seagoing vessels. It has vegetable oil, confectionery, and other industries, and saw mills, tanneries, flour mills, etc. The chief exports are cereals, citrus fruits, and maté. There are fine public buildings; the famous Rivadavia park is on the outskirts, 3 m. away. Pop. 51,600.

2. Or **Concordia Sagittaria**, It. tn. in Veneto (q.v.), 34 m. N.E. of Venice (q.v.). It has a fine cathedral.

Concrete, in grammar, term opposed to abstract, denoting a thing as opposed to a quality. Thus a sweet taste is C., sweetness is abstract; red as a colour is C., redness is abstract. However, some logicians place adjectives apart as attributes.

Concrete, building material composed of a cement (q.v.) which will enter into chemical combination with water forming a solid, mixed with definite proportions of sand and broken stone or other aggregates. The cement as it hardens binds these together, forming an artificial stone which can be moulded to any required shape, and will set and harden even under water.

History. C. as known to-day is a result of the discovery by J. Aspdin in the year 1824 of the material he called Portland C. because when set it resembled Portland stone in colour. Forms of C. were known to the ancients, but the binding materials they used were clays, or mortars made with lime or pozzolana, some of which had the property of setting under water. Most of these ancient materials, including that used by the Romans, would nowadays be called lime mortars, and Rom. cement, differing but little from that used by the Romans, was used in the manuf. of C. up to about the middle of the last century. What is called C. to-day is made with a variety of Portland cement or high-alumina cement, which sets in water.

Properties. Strength, durability, and watertightness are the properties generally required of C., and these properties depend upon the following factors: (1) the quality and properties of the materials

used; (2) the proportion of cement in the finished C.; within limits, the higher this proportion, the stronger is the C.; (3) the strength of the cement paste; the wetter the mixture the weaker the C. so long as the proportion of cement is not altered; (4) the even distribution throughout the mixture of different sized particles of aggregate and of the cement paste; (5) thorough compaction to produce maximum density: the lower the density of C. the weaker it will be; and (6) drying out slowly, and protection against frost and heat and drying winds during the hardening period. The reasons for these requirements, and methods of meeting them, are discussed in the following.

Aggregates. The main requirement of the material to be added to cement to form C. is that it must be clean and inert. C. cannot be stronger, more durable or weatherproof than the materials with which it is made. If C. is to be strong and durable to keep out the weather, and to be fire-resistant, it must be made of materials that have these properties. If C. is to be light in weight, a lightweight aggregate must be used. If C. is wanted that will reduce the passage through it of heat and cold, an aggregate and mixture that will produce a C. with this special property must be used. In constructional work the requirements are strength, durability, and watertightness. These properties are present in gravel and sand, and, because these materials are found in most parts of the country and can be cheaply obtained, they are used for most C. work. Crushed hard stone is satisfactory. C. made with these materials weighs about 140 lb. per cub. ft. The aggregate must be clean. If it is coated with clay or loam or other foreign matter the cement cannot bind the pieces together, because it will adhere to the layer of foreign matter instead of to the surface of the aggregate.

Lightweight Concrete. If lightweight C. is the primary consideration, then clinker (furnace ashes), pumice, or foamed slag may be used. Lightweight C.s are not waterproof, and must be rendered if they are used for external walls. If C. is to be resistant to the passage of heat it is best to use a porous aggregate (such as clinker and foamed slag) and to use this aggregate in a C. that is not solid—that is, by omitting some of the fine material. Pockets of air are highly resistant to the transmission of heat from one face to another, and, generally, the greater the proportion of voids in C. the greater its insulating properties. These C.s are weaker than gravel C. Aerated or 'cellular' C. has a high insulating value. This class of C. can be made to weigh as little as 18 lb. per cub. ft., but has very low strength. Sawdust and wood-wool are also used to make lightweight and insulating C., usually in precast slabs.

Size of Aggregate. The maximum size of the aggregate depends on the work in which it is to be used. For foundations or heavy work it may be up to 3 in. in size. For road work 1½ in. is commonly used. Generally, however, in reinforced

C. structures, all the aggregate should pass through a sieve with $\frac{1}{2}$ -in. meshes, or meshes $\frac{1}{2}$ in. less in size than the distance between the most closely spaced bars, whichever is the smaller. In thin walls the largest particles of aggregate should not exceed one-fifth of the thickness of the C.

Grading of Aggregate. If C. is to be strong, watertight, and durable it must be dense. A cub. ft. of solid stone weighs about 160 lb. When it is in the form of coarse aggregate it weighs about 100 lb., so that more than one-third is voids. The cheapest material with which to fill these voids is smaller stones, and there must be smaller and still smaller particles to fill the spaces between all the sizes larger than the smallest. The more carefully an aggregate is graded the stronger a C. will be if all other processes are the same. The ideal aggregate is one comprising all sizes from the largest to the smallest in the proportions that produce greatest density, and this can best be obtained by dividing the aggregate into two sizes, the coarse and the fine. Coarse aggregate is all the material retained on a sieve with $\frac{3}{4}$ -in. meshes. Fine aggregate is the material that will pass through a $\frac{3}{4}$ -in. sieve, with any excess of dust removed. If the coarse and fine materials are both properly graded, then a suitable aggregate is produced by mixing them together in the proportions of about 2 parts of the coarse aggregate to 1 part of the fine aggregate, because the fine material is more than sufficient to fill the voids in the coarse. Fine aggregate is sometimes screened out and only the coarse material, say that between $\frac{1}{2}$ in. and $\frac{3}{4}$ in., used, with the object of providing a 'no-fines' that will have insulating value owing to the presence of voids.

Proportions of Materials. So long as the materials, workmanship, and manufacturing processes are the same, the strength of C. depends upon the quantity and the strength of the cement paste it contains. By proportioning is meant the selection of the quantities of cement and aggregate to be used in a C. or, more frequently, the quantities of cement, fine aggregate, and coarse aggregate to produce a C. of a required strength.

When aggregates are separated into fine and coarse, and then mixed together in the proportions that will give greatest density, the combined bulk will be little, if any, greater than the bulk of the coarse aggregate alone, because most of the fine aggregate will fit in between the pieces of coarse aggregate. Thus a mixture comprising 1 part of cement to 6 parts of all-in mixed aggregate (a 1:6 mixture) will contain less cement than a mixture comprising 1 part of cement, 2 parts of fine aggregate, and 4 parts of coarse aggregate (a 1:2:4 mixture); in the 1:2:4 mixture most of the fine material will fit into the spaces between the coarse aggregate, so that the mixture will, in fact, be 1 part of cement to 4 to 6 parts of combined or 'all-in' aggregate.

For ordinary work, C. in the proportions of 1 part cement, 2 parts fine aggregate,

and 4 parts coarse aggregate (or 1 part cement to 4 to 5 parts 'all-in' aggregate) is suitable. For work that must be watertight, or where extra strength is required, the mixture should be 1 part cement, $1\frac{1}{2}$ parts fine aggregate, and 3 parts coarse aggregate (or 1 part cement to 3 to $3\frac{1}{2}$ parts of 'all-in' aggregate). For work of minor importance a mixture of 1 part cement to 3 parts fine aggregate and 6 parts coarse aggregate (or 1 part cement to 6 to 7 parts 'all-in' aggregate) is sufficient.

Strength of Concrete. In ordinary good-class C. the following strengths may be expected. The figures are crushing strengths 28 days after placing C. made with ordinary Portland cement, ballast, and sand: 1:1:2 mixture, 4500 lb. per sq. in.; 1:1:3 mixture, 3750 lb. per sq. in.; 1:2:4 mixture, 3000 lb. per sq. in. Where special precautions are taken to control the quality of C. these strengths can be considerably exceeded, and strengths of 8000 and 10,000 lb. per sq. in. are fairly easily obtained.

Water Content. Cement will not begin its chemical action of setting and hardening until it is wetted, and $1\frac{1}{2}$ hrs or so after water is added the setting process becomes noticeable. The water combines with the cement and makes a paste which coats the particles of aggregate and binds them together. The amount of water determines the strength of the cement paste and therefore of the C. so long as the same amount of cement is used. If the quantity of cement remains the same, the more water that is added the weaker becomes the cement paste and the weaker the finished C. If more water must be added to make the C. workable enough for the work in hand, then more cement must be added to keep up the strength of the cement paste if the strength of the C. is to be maintained.

Too little water will also make a weak C. because it may not be sufficient to enable the chemical action of the setting of the cement to proceed properly, for setting only goes on while the cement is moist, and stops as soon as the C. dries out. A good rule to follow is to use no more water than is necessary to enable the C. to be placed and compacted. A good average C. is obtained by the use of 6 gallons of water to a bag (112 lb.) of cement. Porous aggregates, such as broken brick, pumice, and foamed slag, absorb some of the mixing water, and this must be allowed for by soaking the aggregates before they are mixed.

Mixing. If the materials are mixed by hand the aggregate should first be measured and spread out on a clean mixing platform and the cement spread on top. The coarse material should be spread out first, followed by the fine material, and then the cement on top. After the materials have been mixed dry until the colour is uniform they should be shovelled to the shape of a saucer so as to retain water, and the water poured into the middle. The materials and water are then mixed by shovelling from the side to the middle, and then turning over the heap to a different part of the platform

and back again until the water is evenly distributed.

Machine mixing is more efficient and cheaper than hand mixing, such machines generally being in the form of steel drums rotated by power. In machine mixing it is not necessary first to mix the materials in the dry state. Very small machines are fed by filling the dry materials into the drum by shovel; larger machines are charged by means of a skip or from an overhead bin. The water is added when the dry materials are in the drum. All

C. The drum is emptied by running the C. down a chute into a hopper or on to a platform.

Placing in Position. If the site for a floor or road slab is muddy, hardcore should be rolled on to it to make a level surface, or 3 in. of lean C. (say 1:10) laid over it before the structural C. is placed. The site must also be brought to an even surface, as irregularities will cause variations in the thickness of the slab.

The depth of C. placed in each layer or 'lift' in walls and columns depends

The Cement and Concrete Association

FACTORY AT BRACKNELL NEW TOWN, BERKS
An example of reinforced concrete framing

except the smallest mixers are fitted with tanks with a ball-cock or other device which enables the correct quantity of water to be added to the batch.

Continuous mixers have a separate hopper for cement and aggregates which are taken by Archimedean screws to the mixing compartment, from whence the mixed C. is discharged through a spout in a continuous flow. The size and rate of rotation of the screws determine the quantity of each material carried into the mixing compartment, and thus automatically proportion the mixture.

A recent innovation in Britain is the supply of ready-mixed C. At a central depot the dry materials are filled into a mixing drum mounted on a lorry chassis and the water is filled into a tank over the drum. As the lorry, known as a 'truck mixer,' approaches the site the driver empties the water into the drum and causes the drum to rotate and mix the

upon its consistency and the strength of the shuttering. Very stiff C. should be placed in lifts of 4 in. to 6 in. Wetter mixes may be placed in lifts of 2 ft or 3 ft so long as they can be properly consolidated. Wet C. exerts a side pressure similar to water, and it is probably true to say that most collapses of shuttering have been due to placing wet C. at too rapid a rate; when C. is placed in small lifts the lower lifts have time to harden, or partly harden, and the pressure on the shuttering is reduced before fresh lifts are placed. Each lift of C. should be the same depth throughout the work and the C. should be spread evenly in the shutters.

Consolidation. Each lift must be consolidated and worked well into the layer below. In the case of stiff mixes, heavy rammers should be used. A piece of wood, or a reinforcement bar with the bottom bent at right-angles, is a useful tamping tool in confined spaces. For

road and floor slabs, 6 in. by 13 in. timbers with handles fitted at each end may be used by two men, one on each side of the slab. Tamping must be continued until air bubbles cease to escape and a film of moisture appears on the surface; it is then discontinued. Excessive trowelling or tamping brings neat cement and water to the surface, and this will set as a skin which will flake off if it is on a floor subjected to traffic, or crack if it is on a surface subjected to changes of temp. Excessive trowelling of wet C. is the commonest cause of 'dusty' floors.

Consolidation can be assisted by hammering the shuttering with a mallet, the vibration thus set up helping the pieces of stone to slip into place and also helping to produce a smooth face. Vibrating machines for consolidating C. are of three types, namely: (1) vibrators for attachment to the outside of the shuttering; (2) vibrators which are pushed into the C.; and (3) plate vibrators which are placed on the C. so that the vibrations are imparted in a downward direction; these are generally used for floor and road slabs.

Construction Joints. When concreting is stopped for more than an hour, a stop-board must be used to keep the edge vertical and the C. well tamped up to the board. Any scum must be removed before more C. is placed, and the new C. thoroughly tamped against that already in position. If the work has to be left until the older C. is hard, then the surface must be hacked to form a key for the new C. After hacking, a wire brush should be used to remove dust and loose material, the old surface thoroughly wetted and brushed over with a very thin coating of mortar mixed in the proportions of 1 part of cement to 2 parts of sand, and the fresh C. then placed. This applies to all cases where new C. is bonded to old.

Concreting under Water. When C. is placed under water a tremie is used. This is a pipe with a funnel at the top and a valve at the bottom, and is sufficiently long for the funnel to be above water when the bottom of the pipe is resting on the bed of the sea or riv. The C. is fed into the funnel, and the pipe is raised as the level of the C. rises. Care must be taken to keep the pipe full of C. in order to prevent water from entering. If there is much movement of the water, such as occurs in a flowing stream, it is necessary to provide a coffer-dam so that the work can be done in the dry.

Guniting. C. may also be placed by a cement gun. In this process C. is 'shot' on to an existing structure. The materials are mixed dry and fed to a hose through which they are forced by compressed air. When the dry materials reach the nozzle, water is added by a jet. Owing to the force with which it impinges against the surface to be treated, guniting is very dense and waterproof, and is mostly used for repairing or strengthening structures built of C., brick, or other material.

Hardening. If C. is to harden properly it should remain moist and warm until it has gained the greater part of its ultimate

strength. For normal purposes this period can be taken as seven days with ordinary Portland cement, four days with rapid-hardening Portland cement, and twenty-four hours with high-alumina cement. During these periods the C. must be protected against drying winds, hot sunshine, and extreme cold. C. should not be placed when the temp. is below 40° F. unless precautions are taken to prevent the C. falling below that temp. When the temp. does not fall below 30° F., the addition of 2 lb. of calcium chloride per cwt of cement expedites setting.

Surface Finish. There are two main trends in the treatment of C. surfaces. One is to produce a surface that will need no, or very little, finishing after the shuttering is stripped, and the other is painting, rendering, brushing, or bush-hammering. Shuttering for the production of smooth surfaces should be of steel or plywood. The C. must be thoroughly spaded against the shuttering in order that the face of the C. shall be as free as possible from holes due to entrapped air and water pockets. If a smoother surface is required the C. can be rubbed with carborundum bricks or power-operated carborundum disks after the face has been made good. Ordinary oil paint is not suitable for use on C., because it is affected by the free lime in the cement. Paints specially made for the purpose are available in a variety of hues. Coloured and white C.s are made with aggregates and cement of the desired colour. Generally the aggregate is crushed natural stone, and this is used with cement of the same colour.

When C. is tamped or vibrated a skin of cement and fine material is brought to the surface and the face of the work has the appearance of neat cement. If this skin is removed the aggregate will be seen on the face. To make the aggregate visible on the face of the work is the object of 'exposed aggregate' finishes. The methods usually adopted are scrubbing and hammering. In the scrubbing process the best results are obtained if the shutters can be stripped within 48 hrs, or at any rate before the cement is too hard to be brushed off. The scrubbing is done with a wire brush, using plenty of water, until the surface skin of cement is removed. If a hammer is used the work is best done when the C. is hard. For unimportant work C. surfaces can be improved by hammering off the skin and projections, filling holes with mortar, and giving the whole surface a brush coat of grout mixed in the proportions of 1 part of Portland cement to 3 parts of sand.

Floor Surfaces. Hard-wearing floor surfaces, known as granolithic, are toppings 1 in. to 2 in. thick of a dense concrete made with crushed granite or other aggregate with a high resistance to abrasion. The usual method of hardening a C. surface is to apply a solution of 1 part of silicate of soda to 4 parts of water. The solution must be copiously brushed on with a soft broom, and three applications at intervals of twenty-four hrs are desirable. The simplest way to make a non-slip

C. surface is to form grooves in it or roughen it with a brush before it hardens. Another method is to sprinkle carborundum powder on the surface before it is hard, or iron filings may be mixed with the top in. or so of C.

Precast Concrete. C. products are made separately in moulds. Almost every part of a building that is commonly made in wood or stone can be made in C., from members weighing many tons such as sectional bridges and blocks for harbour wharves to roofing tiles, as well as C. poles and posts, paving flags and kerbs, manholes, stairs and steps, and so on. Steel and wood are generally used for the moulds, but plaster piece-moulds and gelatine moulds are used for ornamental work. Power machines are used for the mass production of wall-blocks, paving flags, kerbs, roofing tiles, and other common C. products. See also REINFORCED CONCRETE. See J. Singleton-Green, *Concrete Engineering*, 1933-5; A. C. Davis, *Portland Cement*, 1934; W. H. Glanville (ed.), *Modern Concrete Construction*, 1939; H. L. Childs, *Concrete Products and Cast Stone*, 1940; F. M. Lea and C. H. Desch, *The Chemistry of Cement and Concrete*, 1956.

Concretion, nodular mass of calcareous, siliceous, or ferruginous material deposited in rocks or soils by circulating waters. Flints are among the commonest types of C.

Concubinage. Cohabitation of a man with a concubine is a very ancient custom. Among the Gks married men were allowed to have concubines; the position of the latter was not utterly despised, and their children had some status, if recognised by their father. The Rom. law, too, recognised concubines; their position was in many cases respectable, but Augustus, to encourage regular marriages, passed the Lex Julia and the Lex Papia Poppaea, which enacted that only women of low rank should be chosen as concubines. The children of concubines were not legitimate, but were called natural, and their right of inheritance was very limited, though they were rendered legitimate if their parents afterwards married. In the O.T. times C. was permitted as a relief from a barren marriage, and was extensively practised. Christianity did not permit such irregular unions, and Constantine the Great was the author of legislation intended to check the practice. It is common in Muslim and Asiatic countries, and was extensively practised in the New World, where plantation owners commonly kept Negro slave concubines. See HAREM.

Concussion of the Brain, form of shock where the injury received has shaken the brain and reduced the patient to a state of stupor, without producing any apparent structural damage to the brain. Any severe blow on the head will cause concussion; the symptoms are complete unconsciousness, with pallid, cold skin and feeble pulse. This condition continues for a length of time varying with the severity of the shock received from a few minutes to a few hours, when the pulse becomes stronger and consciousness

returns. Though the recovery from concussion is usually complete, such symptoms as loss of memory and headache may remain for some time. There is always complete loss of memory for events immediately preceding the accident. The patient should be put to bed as quickly as possible with hot-water bottles, and should then be left undisturbed. No stimulants should be given unless specially ordered by the doctor in charge; and during the period of recovery all excitement is to be avoided.

Condamine, C. M. de la, see LA CONDOMINE.

Condé, Henry I de Bourbon, Duc d'Enghien, Prince de (1552-88), son of Louis I, a Fr. Huguenot leader; he fought for Henry of Navarre under Coligny. To save his life after the massacre of St Bartholomew he embraced the Catholic faith, but on the death of Charles IX he recanted and went to Germany, where he raised an army and joined Alençon, 1575. Eventually he was taken prisoner and d. from the effects of poison alleged to have been given him by his wife, Catherine de la Tremouille.

Condé, Henry II de Bourbon, Duc d'Enghien, Prince de (1588-1646), son of Henry I and father of the 'Great C.' He was a Catholic, and fought zealously against the Protestants, becoming one of Richelieu's most faithful supporters. He was made president of the Council of Regency when Louis XIII d., 1643, and his second son, Armand, was founder of the house of Conti.

Condé, Louis I de Bourbon, Prince de (1530-69), fifth son of Charles de Bourbon, Duke of Vendôme, and younger brother of Antoine, King of Navarre. He was the first to bear the famous title, and had a distinguished military career under Marshal de Brissac in Piedmont, at Metz while Charles V was besieging it, and in the battle of St Quentin. A supporter of the Huguenots, he was one of the leaders in the conspiracy of Amboise, designed to remove Francis II from the Guise influence and make him acknowledge the Huguenot faith, and only the death of Francis saved his life. On the accession of Charles IX, Catherine de' Medici made him governor of Picardy. In 1562 he took command of the Huguenot army, against the Guises and was captured at Dreux, but released again by the treaty of Amboise, 1563. When renewed fighting broke out C. again led the Protestants, but after the battle of Jarnac he surrendered, and was shot.

Condé, Louis II de Bourbon, Prince de (1621-86), the 'Great C.', Fr. soldier, b. in Paris. He defeated the Spaniards at Rocroi in 1643, the Bavarians at Freiburg, 1644, and at Nördlingen in 1645, and took Dunkirk for the Fr. in 1646. In 1646 he succeeded to his father's estates and title, and since he had married Richelieu's niece in 1641, this made him one of the most powerful figures in the realm. He at first took the side of the Court against the Fronde, and brought back the young Louis XIV to Paris in 1648. He considered himself ill-treated by Mazarin,

however, and put himself at the head of the faction of the Petits Maitres; he was captured and imprisoned by Mazarin in 1650. After a year the union of the old and new Frondees brought about his release, and he marched upon Paris as the rebel leader and fought an indecisive battle in the suburb St Antoine. Many of his adherents then left him, and he joined the Spantards, who appointed him generalissimo of the Sp. armies. He fought for the Spaniards at Arras in 1654, Valenciennes in 1656, and Cambrai in 1657. He was defeated at the battle of the Dunes by Turenne in 1658, but was restored to his rank in France by the peace of the Pyrenees in 1659. He conquered Franche-Comté, afterwards fought the Dutch at Senefle, 1674, defeating the Prince of Orange (afterwards William III of England), and in the following year drove Montemarli out of Alsace. Four years later he retired to Chantilly.

LOUIS I DE BOURBON, PRINCE DE
CONDÉ

Condé, Louis Antoine Henri de Bourbon, see ENGHUEN, DUC D'.

Condé, Louis Joseph de Bourbon, Prince de (1736-1818), Fr. soldier, son of Louis Henry, Duke of Bourbon (1692-1740). He was for some time governor of Burgundy and, when the revolution broke out, commanded the 'army of Condé' for the king, joining the Austrians until the peace of Campo Formio in 1797. He fought for the Tsar of Russia, afterwards going to Bavaria in the pay of England. In 1800 he settled at Malmesbury in England, but returned to France on the restoration of Louis XVIII. He was the author of an *Essai sur la vie du grand Condé*, 1798.

Condé-Smendou, com. in the arron. of Constantine, Algiers. It is noted for its wines. Pop. 17,000.

Condé-sur-l'Escaut, Fr. tn in the dept of Nord, at the confluence of the Scheldt and the Hayne. It was formerly a stronghold, and has the 15th-cent. château of the princes of Condé (q.v.), who took their name from this place. There is coal mining. Claire Clairon (q.v.) was b. here. Pop. 7100.

Condé-sur-Noireau, Fr. tn in the dept of Calvados, at the confluence of the Noireau and the Druance. There are cotton industries. The tn was very badly damaged during the battle of Normandy (1944). Pop. 3400.

Condensation, see GAS AND GASES; STEAM.

Condenser, apparatus for condensing steam or other vapour into the liquid form by introducing cold water into the vapour, or by passing the vapour through cold water. See STEAM ENGINE and TURBINES for the various forms of C.

Condenser, Electrical, see CAPACITOR; ELECTRO-STATICS; INDUCTION, ELECTRO-STATIC.

Condensing Engines, see STEAM ENGINES.

Conder, Charles (1868-1909), artist, b. London, son of a civil engineer, educated in England; went to Australia when 17, worked on the *Illustrated Sydney News*, but in 1890 returned to Europe and studied art in Paris. He attracted attention with his painting 'The Hot Wind,' 1890, and settled in London in 1894. He developed an original decorative style, especially in water colours on panels of white silk, Watteau-like designs for fans, and charming pastoral scenes. See J. Rothenstein, *The Life and Death of Conder*, 1938.

Conder, Claude Reignier (1848-1910), colonel, Royal Engineers, and explorer, b. Cheltenham. He studied in Italy, also at the University College, London, and the Royal Military Academy, Woolwich. He became head of the survey party at Nablus, Samaria (1872), and took charge of the survey of Palestine (1872-8 and 1881-2), his *Memoirs* of which were brought out in 7 vols. by the Palestine Exploration Fund in 1880. This work is of great value to the student of the O.T. and N.T. hist. In 1882 he was attached to the Egyptian expedition under Garnet Wolseley, and took part in the battles of Kassassin and Tel-el-Kebir. He worked in the ordnance survey of Plymouth (1887-94) and in the W. of Ireland till 1905. C. pub. many scholarly works on archaeological and philological subjects. These include *Tent Work in Palestine*, 1878; *Syrian Stone Lore*, 1886; *Ancient Hieroglyphs and Hittite Inscriptions*, 1887; *The Tell Amarna Tablets*, 1893; *The First Bible*, 1902; and *The City of Jerusalem*, 1909.

Condillac, Etienne Bonnot de (1714-1780), Fr. philosopher, b. Grenoble. He spent practically all his life on his estate of Flux, near Beaugency, engaged in philosophical studies, and d. there. His first notable work appeared in 1746, the *Essai sur l'origine des connaissances humaines*. This work, in conjunction with his *Traité des systèmes* (1749),

outlines his theory. He explained almost everything by the law of association of ideas, and whilst allied to the principles of Locke, he disagreed with those of Descartes, Spinoza, Malebranche, etc. Sensation, according to him, is the only possible source of knowledge, and all intellectual processes may be traced back to sensation. The clearness and perspicacity of his writings obtained for him the post of instructor to the infant duke of Parma, for whom he wrote seven instructional works which form seventeen vols. of the complete works of C., pub. in 1798. C.'s philosophical writings have been ed. by G. Le Roy, 1947. See Z. Q. Schaupp, *The Naturalism of Condillac*, 1926.

Condiments (Lat. *condire*, to season or pickle), any substances of pronounced flavour used as seasoning agents, to give relish to food or stimulate the appetite. Many C. are essential. Among the chief are salt, vinegar, olive oil, sugar, and aromatic or pungent C., such as spices, mustard, pickles, pepper, and ginger.

Condition. In the law of contract (q.v.) the non-fulfilment of a C. *precedent* by one of the parties disentitles him from enforcing the contract against the other party. By a C. *precedent* is meant some act to be performed or some contingency to be fulfilled or some time to elapse before one party can be called on to carry out his part of the contract. For example, if A agrees in writing to sell his business to B, and they verbally agree that the transfer shall be subject to the consent of A's partner, A cannot be forced to sell until A's partner does consent. C.s may also be *concurrent*, i.e. each party must perform his agreement at the same time. For example, A agrees to buy a slate quarry from B, and B agrees to purchase all slate from A: A cannot sue B for not taking slate unless he can show that he was ready to buy the quarry or had bought it. Sometimes the parties to a contract introduce a provision that the occurrence of an event shall discharge them mutually from further liabilities, e.g. that the happening of an excepted risk of a charter-party shall discharge the ship-owner from liability for failure to carry a cargo. Such provision is known as a C. *subsequent*. It is entirely a matter of construction whether representations or alleged verbal stipulations in any particular can amount to C.s. Not every representation made prior to a contract can be called a C. Whether it be a C. depends on whether the court comes to the conclusion that such statement or representation was the *condition on which the other party contracted*. C.s must be distinguished from warranties. A warranty is part of the contract itself, whereas a C. is something collateral to it. A breach of warranty only entitles the injured party to damages: the breach of a C. entitles the injured party to repudiate altogether. But the Sale of Goods Act, 1893, expressly provides that in certain cases C.s shall be implied in a sale which, if unfulfilled, shall entitle the buyer to repudiate. (As to these see SALE.)

Conditional Immortality, or Annihilationism, the doctrine that the immortality of the soul depends on faith and union with Jesus Christ. Its adherents maintain that the Bible teaches immortality as something to be hoped for, and as a future gift of God. They are thus opposed both to Universalism (the doctrine that all, even the devil, will ultimately be saved) and to belief in eternal punishment. Everlasting destruction or annihilation is considered to be the fate of the wicked. In 1878 the C. I. Mission was founded for propaganda in the Brit. Is. See also IMMORTALITY. See E. White, *The Life of Christ*, 1875; S. D. McConnell, *Evolution of Immortality*, 1901.

Conditioned Reflex, term introduced by the celebrated Russian physiologist I. P. Pavlov, to describe certain kinds of acquired automatic behaviour, the investigation of which has thrown much light upon the activities of the brain. Pavlov noticed that the flow of saliva, for instance, which is normally caused by the taste of food in the mouth, can equally well be caused by some new event that occurs at or about the same time as the taking of food (as it can by the sight of food). The flow of saliva at the sight of food is a *conditioned reflex*. Pavlov showed by experiment that flow of saliva could be induced in a dog by the mere ringing of a bell, the ringing of which had for sev. previous occasions been followed shortly afterwards by the appearance of food. The importance of a study of C. R.s is that it enables us to understand better some forms of learned behaviour which may be C. R.s. As an aid to the analysis of behaviour the artificially produced C. R. is of value, and it has been used in experimental psychology. See I. P. Pavlov, *Conditioned Reflexes*, trans. by Aupres, 1927.

Condom, Fr. *tn*, cap. of an arron., in the dept of Gers, on a hill above the Baise. It was formerly the seat of a bishopric once held by Bossuet (q.v.). It has a trade in brandy, wine, grain, and cattle. Pop. 6700.

Condonation, in law, the conditional forgiveness by one spouse of an offence which the other spouse has committed in breach of the marriage vow. The condition is that the party if forgiven will not repeat the offence. C. may be either expressed in writing or implied by conduct. It is a complete bar to proceedings for divorce so long as the condition remains unbroken.

Condor (from Peruvian *cuntur*), *Vultur gryphus*, large S. Amer. vulture, found particularly in the region of the Andes, especially in the higher regions, where it makes its nest at a height of from 10,000 to 15,000 ft. The general colour is black, and in both sexes there is round the lower part of the neck a white ruff of feathers. Above this the head and neck are bare. The C. feeds on flesh, to obtain which, in default of carrion, it will attack small or aged animals. It is the largest bird capable of flight, having a wing span of 12 ft. or more.

'Condor,' Brit. gunboat, which was

commanded by Lord Charles Beresford (then captain) at the bombardment of Alexandria in 1882. Another C. of the R.N. went down with all hands near Honolulu in 1901.

Condor Vine, see CONDURANGO.

CONDOR

Condorcet, Marie Jean Antoine Nicolas Caritat, Marquis de (1743-94), Fr. sociological and mathematical writer, b. at Ribemont, near St Quentin, of a very ancient family. He was educated at the college of Navarre, and distinguished himself especially in mathematics. He wrote in 1764 his *Essai sur le calcul intégral*, and in 1767 his *Mémoire sur le problème des trois points*. These works, afterwards pub. together under the title of *Essais d'analyse*, and dedicated to the Academy of Sciences, procured for him in 1769 the distinction of a seat in that institution. The facility with which C. treated the most difficult mathematical studies was remarkable, and until 1792 his output was large, as, in addition to the works already mentioned, he contributed frequently to the transactions of the learned societies of St Petersburg, Berlin, Bologna, Turin, and Paris. His *Eloges des académiciens morts avant 1699*, 1773, was immensely popular, and gained for him in 1773 the honour of being made permanent secretary to the Academy of Sciences. He won the prize offered by the Academy of Berlin in 1777 by his theory of comets, and because of his acquaintance with D'Alembert he wrote many articles for the *Encyclopédie*. He was not elected a member of the Fr. Academy until 1782, owing to the aversion which was felt for him by Maurepas. When the Fr. Revolution broke out he sided with the people, and was elected deputy to the legislative assembly of Paris. He was soon appointed secretary, and in Feb. 1792 was made president. The legislative assembly was merged in

the national convention in Sept. 1792, and C. was there in sympathy as a rule with the Girondist party. He was in favour of the punishment of Louis, but not of his death, as he believed in the abolition of capital punishment. On the fall of the Girondist party he attacked the new constitution, was denounced at the Bar on 8 July, and later accused of being an accomplice of Brissot. He was protected by Mme Verney for eight months; but, learning that she was in danger of death for harbouring him, he fled from Paris, and was recognised and arrested at Clamart. He was found dead in his cell, having probably taken poison, which he always carried about with him. His best-known work was written whilst he was with Mme Verney, *Esquisse d'un tableau historique des progrès de l'esprit humain*, 1794. C. was a free-thinker, and had a high standard of virtue. In both his public and private life he was blameless; his application of the problems of philosophy to mundane affairs and the betterment of social conditions is the distinguishing feature of his polemical works. C.'s complete works were edited by M. F. Arago and A. Condorcet-O'Connor (12 vols., 1847-9); his correspondence with Turgot by C. Henry, 1882. See J. F. E. Robinet, *Condorcet*, 1893.

Condottieri (It. 'leaders'), name given to the captains of those bands of soldiers which overran Italy and held the military power there from the 13th to 15th cents. They were composed of professional fighting-men who would serve under anyone who held out prospects of plunder, the idle riff-raff of the country, and criminals fleeing from justice, with a proportion of men who had lost their all in the wars. Naturally with such ingredients the chief objective of the armies was always plunder; it was immaterial to the combatants which of the contending govs. gained the victory. After some time the C. became heads of organised bodies of men, and sev. attained much power and position. Francesco Sforza, for example, became duke of Milan (1450). Other famous C. were Francesco di Carmagnola (q.v.) and Sir John Hawkwood (q.v.), an Englishman.

Condrieu, Fr. tn in the dept. of Rhône, on the Rhône. It produces good wines, and fruit. Pop. 2400.

Conductance, in an electric circuit on d.c., the inverse of resistance, on a.c., the ratio of resistance to (impedance)², measured in *mho* (see ADMITTANCE). The C. of a conductor is always taken as the inverse of resistance and is directly proportional to the cross section *S*, inversely proportional to length *l*, written $\sigma S/l$ where σ is a material constant—the conductivity.

Conducting, in music is the art of directing orchestral and choral performances, where the interpretative intentions have of necessity to be left to the will and the skill of one single person. Fundamentally a conductor's task is to beat time in order to keep the performers together, but apart from that he has to see to it that the composer's indications, conveyed to the performers by notation,

are carried out faithfully, that the different parts balance and blend satisfactorily where notation alone cannot achieve this, and that his own ideas of interpretation are reconciled with the composer's intentions. The great conductor is he who effects this reconciliation in such a way as to secure a satisfactory artistic result; neither the mere time-beater nor the capricious or selfishly wilful showman is capable of serving the art of music properly. A good conductor must have studied the music beforehand, so as to be thoroughly familiar with the score; he must realise the technical possibilities of the voices and instruments under his command and be able to bring out the best that is in them; above all he must have a good ear and interpretative talent. He has to rehearse his performers beforehand, separately and together, so that they become familiar both with the music and with his methods and intentions. C. of some sort goes back to the church choirs of the 15th cent., if not earlier, when the choir-master beat time with a roll of music-paper. The orchestra (including opera) was conducted up to the 18th cent. by the *continuo* player at the harpsichord (called *maestro al cenobalo*) or by the leader of the violins. The idea of interpretative C. is first clearly seen in the Mannheim School under Stamitz during the first half of that cent. C. with a baton began about the turn of the 19th cent. Many composers have conducted their own works, but they have rarely been great conductors, and creative genius is not essential to good C. See Adam Carse, *Orchestral Conducting*, 1929; Hermann Scherchen, *Handbook on Conducting*, 1933; Sir Adrian Boult, *Handbook on the Technique of Conducting*, 1940; Fred Goldbeck, *The Perfect Conductor*, 1951; D. E. Inghelbrecht, *The Conductor's World*, 1953.

Conduction of Electricity. Transfer of electricity through matter. In metals C. is due to a flow of electrons (q.v.) from points at low potential to points at higher potential. The electrons are derived from the atoms of the material, and the atoms take no part in the movement. Metals contain many 'free' electrons that move with little hindrance from the parent atoms, and they are therefore good conductors. In the other solids the electrons are more tightly bound to the atoms and C. is less. Increase of temp. in this case frees more electrons, so the conductivity of non-metals increases with rising temp. C. in gases and in many liquids involves a flow not merely of electrons, but of atoms or groups of atoms as well. When a salt, sodium chloride for example, is dissolved in water the chlorine atoms each gain an electron and become negatively charged, while the sodium atoms each lose one and become positively charged. These charged atoms, or ions, can move through the liquid and transport electricity (see ELECTROLYSIS). Gases are, under normal circumstances, almost completely non-conducting. They may be 'ionized' by irradiation with X-rays or by radioactive radiations. They are more readily

maintained in a conducting state at high temps., as in the electric arc, or at low pressures, as in electric discharge lamps. (See ELECTRIC DISCHARGES; VALVES; SEMICONDUCTORS.) At very low temps. certain metals such as lead become almost perfect conductors, and if a current is set up in a ring of a metal in this superconducting state the current persists for a long time without any energy being supplied. In all other cases the flow of a current through a conductor is accompanied by a loss of energy as heat, and a continuous supply of energy is required to maintain the current. A magnetic field (see MAGNETISM) is always present in the space around a conductor in which a current is flowing.

Conduction of Heat. Heat may be transferred in three ways: by radiation, by convection, and by C. (See HEAT.) C. differs from convection in that the flow of heat is unaccompanied by a flow of matter, as when a poker that is heated at one end in a fire becomes warm at the other end. It may occur in gases or in liquids, but is of more importance in solids. Metals are good conductors of heat, and owe their high thermal conductivities to the presence of free electrons, so the best conductors of electricity are also the best conductors of heat. Good conductors are essential for such articles as steam boilers, domestic cooking utensils, etc., while poor conductors are required for house walls, furniture, and clothing, where it is desirable to limit the transfer of heat. The thermal conductivities of air and other gases are low, so porous and fibrous substances such as felt, asbestos, and woollen materials serve as relatively good insulators of heat on account of the high proportion of air contained in their interstices.

Conductivity, of an electrical conductor material, is the inverse of resistivity or specific resistance, measured in *mho/cm*. See CONDUCTANCE; RESISTANCE.

Conductors, Electric. Substances which conduct electricity; also the overhead lines which carry the current in a transmission or distribution system. Overhead C. must have sufficient mechanical strength to hang freely in a fairly long span (900 ft in the Brit. Grid) without undue sag, to save in the number of pylons, and sufficient conductance (q.v.) to carry full load current without undue heat loss or rise of temp. which would increase sag and accelerate corrosion. Copper has a higher conductance for a given cross-section, aluminium has a higher conductance for a given weight. Increased mechanical strength is obtained by composite C. In steel-reinforced aluminium C., a steel core (usually stranded) is covered by strands of aluminium of sufficient aggregate cross-section to carry the current. The conductance of the steel is neglected. In copper-clad steel a steel core is covered with a layer of copper, having been dipped in molten copper which adheres to and partly diffuses into the steel, a further layer being added by rolling. The conductance of this composite conductor is measured and

expressed as 'equivalent copper cross-section.' The increased overall cross-section of both composite C. is of advantage with respect to skin-effect (q.v.) and corona (q.v.) loss. See CONDUCTANCE; TRANSMISSION, ELECTRIC POWER.

Condurango, or **Cundurango**, name applied to sev. species of Aeclepiadaceae found in S. America, but especially to the plant *Marsdenia C.* (condor vine). The bark yields a drug used as a remedy for snake-bites and chronic dyspepsia.

Condyle, rounded eminence in a bone which serves to articulate it with another bone. Such structures occur in the femur, the humerus, the jaw, and the occipital bone.

Condyloma (plural, condylomata), wart-like growth or tumour near the genital organs or the anus. It may be pointed or, in the case of syphilitic C., broad, flat, and moist.

Condylura Cristata, genus and species of the New World moles, is an insectivorous mammal of the family Talpidae. The animal is about 7 in. long, 2½ in. being taken up by the tail, whence the name long-tailed condylure; at the end of the snout there is a curious radiating structure from which the creature is sometimes called the star-nosed mole. The fur is a deep lustrous brown above, lighter beneath; in habit the condylure is a burrowing animal, and its diet consists of worms, insects, and their larvae.

Conc. surface generated by a straight line which passes through a fixed point and is intercepted by the circumference of a fixed curve. The moving straight line is called the generator, the fixed point the vertex, and the fixed curve the directrix. The term is also applied to the space enclosed by the curved surface and the fixed curve, and often refers to a right circular C., which is defined by Euclid as the solid figure formed by the revolution of a right-angled triangle about one of the sides containing the right angle. The side about which the triangle revolves becomes the axis of the C., and its length becomes the altitude; the circle described by the other side containing the right angle becomes the base. An oblique C. is one in which the base is not at right angles to the axis. Some of the characteristics of a conical surface are: All planes tangential to the curved surface pass through the vertex; the curved surface is 'developable,' that is, it can be unrolled to form a plane, or conversely, this plane surface can be wrapped round the same C. without rupture or wrinkling. The curved surface when unrolled becomes a sector of a circle whose radius is the slant height of the C. Its area is one-half the slant height multiplied by the perimeter of the base. The volume of a C. is one-third that of a cylinder with the same base and height; therefore it may be measured by multiplying one-third of the height by the area of the base, the area of the base being πr^2 , where r = the radius of the base. Similar C.s are those in which the axes and the diameters of the bases are proportionals. A truncated C. is formed when the upper part containing the vertex is

cut away by a plane parallel to the base. In machinery the term C. is applied to a truncated surface tending to converge to a point. See also CONIC SECTIONS.

Concigliano, **Giambattista da**, see CIMA. **Concigliano**, IL. tn, in Veneto (q.v.). 15 m. N. of Treviso (q.v.). It has a 14th-cent. cathedral, and a castle. The surrounding hills are covered with vineyards, and the tn has an institute for the study of wine production. Pop. 16,000.

Coney (Lat. *cuniculus*) means a rabbit, but the word is now used only in legal phraseology and as a trade term for rabbit fur. The C. mentioned in the O.T. is probably the daman, *Hyrax hyraxes* (see HYRAX). In Elizabethan times the word meant simpleton or dupe, and a coney-catcher was a confidence-man or sharper.

Coney Island forms part of the bor. of Brooklyn, New York city. It stands at the entrance of New York harbour, on the S. shore of Long Is. It is 6 m. long, its greatest breadth being three-quarters of a m. It has a fine beach, and is a very popular summer resort. The coming of the subway extension in 1920 made it a public playground for New York's millions. It is divided into sev. dists.—W. Brighton, Brighton, Sea Gate, and Manhattan Beach. There are sev. bathing pavilions, and the boardwalk is 2 m. long. (See illustration, p. 704.)

Confarreatio was 1 of the 3 Rom. forms of marriage. It was the only one which was invested with the sanctity of a religious performance; an offering was given to Jupiter, and bread made of spelt (*panis farreus*) was eaten. The priest spoke certain sacred words over the couple in the presence of 10 witnesses. C. is supposed to have been confined to the patricians, and certain offices in the state could only be held by persons whose parents had been so married.

Confectionery (Lat. *confectio*, a preparation, from *conficere*, to make up). C. is of two kinds, (1) sugar C. and (2) flour C. Sugar C. means sweets in which sugar is the main ingredient. Either they consist of sugar in very fine crystal form dispersed in a sugar solution and flavoured, i.e. chocolate *crèmes*, fondants, etc., or there may be sugar maintained in a solution of careful blend of the different types of sugar, i.e. boiled sweets, toffees, caramels, etc. Fats, milk, nuts, etc. are employed to obtain a variety of forms. Before the 19th cent. sweets and candies were the monopoly of apothecaries, who made them to hide the taste of their drugs. Sweets were at first made by hand, but by the middle of the 19th cent. machinery was introduced for many of the operations, such as mixing and rolling. Flour C. consists of pastries and fancy cakes having as their basis flour but sweetened and mixed with various dairy products such as butter, eggs, etc. These, although now being made more and more on a large scale, are usually made by bakers at local shops. See also COCOA and CHOCOLATE.

Confederate States, name adopted by those S. states of the N. Amer. Union which seceded and formed an independent union at the end of 1860 and beginning of

1861. The name stressed the profounder cause of the Amer. Civil war, which was to see their rise and extinction. It was for the vindication of state rights against the Federal Gov. of the N. (see CONFEDERATION) that the S. states seceded, though the vital issue was the question of slavery. The 11 C. S. were, in order of secession, S. Carolina, Mississippi, Florida, Alabama, Georgia, Louisiana, Texas, Virginia, Arkansas, Tennessee, N. Carolina, the first in Dec. 1860, the last in May 1861. The president was Jefferson Davis (q.v.); the

insists on the individual independence of each state or society in a common union, while federation insists on the supremacy of the common gov. Thus the Brit. Commonwealth, as at present constituted, is a C., as was the Ger. C. estab. at the Congress of Vienna, 1815. The distinction is well illustrated by the Ger. terms *Bundestaat*, a bond of states or federal state, and *Staatesbund*, a states bond or C. The Amer. Civil war was fought not only on the slavery question but also on the profounder question

PART OF CONEY ISLAND BEACH IN SUMMER
There are over 10,000 people in this photograph
Sid and Ben Ross

vice-president Alexander H. Stephens; and the secretary of state Judah P. Benjamin. The seat of the gov. was at Richmond. The constitution, adopted on 11 Mar. 1861, based on the U.S.A. constitution, varied in freer independence to the separate states, in the right of the Cabinet to seats in the two Houses of Congress, in the prohibition of protective tariffs or bounties, and in the avowed upholding of the institution of slavery and rights of property in slaves. The inherent weakness of the C. S. lay in their numbers, about half of those of the N. states, in railways, and in finance; and, moreover, they were crippled by the overwhelming naval superiority of their antagonists. The brilliant military capacity of their generals alone kept the war going as long as it did. See UNITED STATES, *History*.

Confederation, political term, contrasted with or opposed to federation, for a form of union of individual states or societies. It

whether the union should be confederate or federate. The term C. has been used in constitutions which embodied the principle of subordination of a general gov. to regional gov's. Thus it was used in the Articles of Confederation of 1777 (United States); in the Union of Utrecht (constitution of United Netherlands); in the constitutions of Switzerland from earliest times; of Germany from 1815 to 1867; of the N. Ger. C. of 1867 to 1871; and of the Ger. Empire from 1871 to 1918. It was adopted by the seceding states in America when they called themselves the Confederate States of America. But immediately after styling themselves 'the people of the Confederate States' they declared that their object was to form a permanent federal gov. The terms are treated as interchangeable in the Swiss Constitution of 1874, which is headed 'Constitution fédérale de la Confédération Suisse.' The authors of *The Federalist*

itself did not distinguish between the two terms, although they distinguished between the two principles involved. To increase the confusion the Canadian Constitution, which when it is not federal is unitary, describes the gov. it sets up as a C. But if the use of the term C. is linked with the principles of the Articles of Confederation of 1777 and of the Confederate States and of the Ger. C.s, its meaning may be kept distinct. See also **FEDERATION**. See K. C. Wheare, *Federal Government*, 1946.

Confederation of the Rhine, name given to the union of the states which seceded from the Ger. empire in 1806, and were placed under Fr. protection. Napoleon adopted the title of protector of the C. of the R., which had its cap. at Frankfurt. Its members included Saxony, Württemberg, and Bavaria, and sev. lesser states. The confederacy at the time of its greatest power extended over a space of 125,000 sq. m., with 14,600,000 inhab. after Napoleon's Russian campaign (1812) the power of the C. declined, and the whole structure fell to pieces, 1813.

Conférence, L'lie de la, see **FAISANS**.

Confession, in law. If the accused at his trial volunteers an unqualified C., that is conclusive evidence against him, but in trials on a capital charge he is generally advised to withdraw such a C. and plead not guilty. A C. made elsewhere than before a judge or on summary proceedings before justices may be conclusive, but is only admissible in evidence where proved to have been made freely and voluntarily; and a C. is not free and voluntary if made as a result of some improper threat or inducement of a temporal nature held out by a person in authority, such as a committing magistrate, a police constable, or the prosecutor. The accused's master would not be a person in authority unless the offence was committed against him. A C. following on a statement by a person in authority to the accused that he need say nothing to incriminate himself, but that anything he might say would be used against him, is admissible in evidence. A sacramental C. to a priest would probably be privileged from disclosure. Although a C. may be inadmissible, any facts discovered thereby, and so much of the C. as relates to those facts, are admissible. In arraignment, if the accused pleads guilty no further proof or trial is necessary, and the court proceeds to judgment on his 'own confession.'

Confession, or more specifically **Auricular Confession**, is the disclosure of sins to a priest of the Church for the purpose of obtaining absolution. The practice was ordained by the early Catholic Church of a public C. of three mortal sins; these were murder, idolatry, and adultery. About the time of Pope Leo I (440-61) the list of mortal sins was extended so as to include all crimes which under the Rom. law were punishable by death, exile, or severe corporal punishment. We should note, however, that there was a distinction between C. in itself to a priest and the public *exomologesis*, or penitential discipline for crimes. By the fourth General

Lateran Council of 1215 it was laid down that it was the duty of every faithful member of the Church who had reached years of discretion to confess his or her sins to the priest at least once a year. This is still binding upon Rom. Catholics. The great difference between the anct and the modern C. is that formerly great sins were to be confessed publicly and publicly atoned for, whereas now much emphasis is laid on the seal of secrecy. C. is practised by the Rom. Catholic, the Gk, and all oriental churches, and also by an Anglican section.

Confession and Avoidance, in the language of pleading, means an *admission* by one party of the facts alleged against him by the other party, coupled with counter-allegations of fresh facts going to show either some justification or excuse, or a discharge or release, so as to *avoid* the legal effect of the admission. A plea in C. and A. may be used either in the defence to a statement of claim or in the plaintiff's reply to a counterclaim. A party pleading in C. and A. is not thereby prevented from putting in a separate plea called a traverse denying the facts confessed.

Confession of Augsburg, see **AUGSBURG**, **CONFESSION OF**, **CONFESSION OF FAITH**.

Confession of Faith, reasoned statement of the religious beliefs and doctrines of a particular Church or body. The anct Christian C.s of F. are more usually called creeds, under which heading they are treated. Modern confessions begin more or less with the Reformation, when the leading Protestant reforming bodies formulated their doctrines. The first of these is the Confession of Augsburg, 1530, drawn up by Melancthon and revised by Luther, who desired to define his position not only towards the Rom. Catholics, but also towards the followers of Zwingli. This was presented to Charles V, who had summoned the diet of Augsburg to offer a fair hearing to all the religious parties of the empire. It expounded in plain teaching the doctrine of God and of the Son of God; of original sin and of justification; it also dealt with the marriage of the clergy, invocation of saints, the celebration of the eucharist, and rejected, among other things, the doctrine of transubstantiation. An answer to the confession from the Rom. Catholic Church evoked Melancthon's Apology, which was presented to the emperor but not received. Both the confession and the apology were pub. in 1531. The Articles of Schmalkald were drawn up by Luther in 1536, the Confession of Württemberg in 1552, and the Formula of Concord in 1580; together with the Augsburg Confession they formed the body of the Lutheran C. of F. A separate confession (the *Confessio Tetrapolitana*), Zwinglian in tendency, was presented at Augsburg by Strasburg, Constance, Lindau, and Memmingen; but the Zwinglian position was more clearly defined by the Confession of Basle, 1534, and the First Helvetic Confession, 1536. Calvinism was formulated in 1559 by the Gallican Confession, presented to Francis II and Charles IX. The Second Helvetic Confession, strongly Calvinistic, revised

in 1562, was accepted widely in Switzerland, Hungary, France, and Scotland as an authoritative statement of the doctrines of the reformed Churches. In England Henry VIII held a convocation in 1536, at which ten articles were drawn up aiming at a compromise between the old and new theology. In 1538 a conference was held at Lambeth with envoys from the Lutherans; thirteen articles were formulated, but the Catholic reaction followed with the Statute of the Six Articles, 1539. In 1549 Cranmer required all preachers to subscribe to the Articles of Religion, chiefly drawn up by himself. In 1552 they were revised, and as the Forty-two Articles held the ground till their revision as the Thirty-nine Articles of the Church of England, 1563, by Archbishop Parker and Guest, bishop of Rochester; the final revision was in 1571. In 1647 the Westminster Confession, strongly Calvinistic, with predestination as its main characteristic, was drawn up. The clergy of the Eng. Church withdrew, and the Independents took little share in it. It was Presbyterian throughout. It was sanctioned by the Scottish parliament in 1649, and enforced throughout the U.K. The Baptists issued a Vindication of the Truth as a formulary of their teaching, they having been excluded from the conference which drew up the Westminster Confession. The latter, with the larger and shorter catechisms, has, with modifications, remained the confession of English-speaking Presbyterians (see PRESBYTERIANISM and SCOTLAND, CHURCH OF). In 1673 Robert Barclay issued a statement or Apology embodying the faith of the Society of Friends. In 1833 the Congregational Union pub. a confession which was prepared by Dr George Redford, not as a confession in the strict sense, but as embodying general principles.

Confessional: 1. Place for hearing confession of penitents. They are so designed as to protect the penitent from publicity and embarrassment, and the priest from scandal or obloquy.

2. The term is also given to the burial-places of martyrs (who had 'confessed' Christ) and to the places of their tombs beneath the high altars of churches, e.g. the C. (or Confession) in St Peter's, St Mary Major's, and other Rom. basilicas, which are sunken areas before and beneath the High Altar.

Confidentiality. Eng. law recognises that in the interests of justice there are occasions when certain communications, written or oral, should be regarded as confidential and therefore privileged from the requirement of being given in evidence in court proceedings. Communications between husband and wife are always privileged. Communications made in self-protection are equally privileged, e.g. a warning given by a master to his workmen not to associate with a former fellow workman dismissed for dishonesty. Communications as to affairs of state or official communications between public officers on public affairs cannot be disclosed without the consent of the head of the dept concerned. The C. of com-

munications with legal advisers extends to all statements or documents concerning matters made the subject of professional intercourse; but communications made in furtherance of a common unlawful design are not privileged. The compulsory disclosure or discovery of documents after action commences is no real exception to the rule of C., such discovery being based on the principle that if the party makes the documents part of his case they must come out sooner or later; and their purport ought, in ordinary fairness, to be divulged to the other party, that he may know what case he has to meet. Medical men may be compelled to disclose communications made to them even though imparted in professional confidence; and the rule of privilege probably does not extend to communications made to clergymen; but judges have evinced a disinclination to enforce disclosure. In this latter respect Eng. law differs from that of Rom. Catholic countries and the U.S.A. In Scots law confessions made by a prisoner to obtain spiritual advice and comfort are, but confidential communications to clergymen in the ordinary course of their duty are not, privileged. A broad distinction must be noted between statements made in answer to confidential inquiries and those merely volunteered. The latter would only be protected if it were the duty of the person making the statement to volunteer the information contained in it: for the law does not protect idle gossip. Generally it may be said that where a confidential relationship exists, e.g. as between master and servant, brother and sister, employer and employee, or perhaps intimate friends, there is a mutual duty to volunteer information on anything which each of them ought to know. But where there is no confidential relationship volunteered statements are not often privileged.

Confirmation (Lat. *confirmare*, to strengthen), the sequel to baptism (q.v.), consisting of the invocation of the Holy Ghost as comforter and strengthener, and the laying on of hands (q.v.) by a bishop, to impart the sevenfold gifts of the Spirit. In the Rom. Catholic and Eastern Orthodox Churches it is always accompanied by the anointing with oil. In the former it is normally administered by a bishop, in the latter by a priest, though always with oil (chrism) consecrated by a bishop. In the Rom. Catholic Church it is administered, in the W., usually after the age of discretion, i.e. after about 7 years of age, when a child can discern between right and wrong; in the Lutheran Church between the ages of 13 and 16 years; and in the Church of England usually between 14 and 18 years of age, though the Prayer Book only specifies the age of discretion. In the primitive Church baptism and C. were administered immediately one after another, followed by Holy Communion, even in the case of infants, and this is still the practice in the oriental Church. The Rom. Catholic and Eastern Orthodox Churches teach that C. is a sacrament. Protestant Churches generally have abandoned it with episcopacy, substituting an

admission to adult membership of the Congregation. The Anglican Church has tended to waver between these two views (see SACRAMENT); but the High Church and moderate parties accept the sacramental view of C. as conferring a special indwelling of the Holy Ghost, and this is the more common teaching found in the Church of England to-day.

Confirmation. In Scots law the nomination or appointment of an executor is not sufficient authority for him to administer a deceased person's estate. He must obtain from the sheriff a decree authorising him to act. This decree and the document in which it is issued are known as C. In effect it is equivalent to the Eng. probate or letters of administration.

Confiscation (Lat. *fiscus*, the treasury), in its literal signification, means forfeiture of property to the Treasury, as, for example, in Rom. law the *Lex Julia* punished violence without arms by C. of a third of the offender's property. In Eng. law C. of property, generally known as forfeiture, followed on conviction for felony (see CRIMINAL LAW); but the Forfeiture Act, 1870, abolished forfeiture for felony, although in certain cases the accused may be condemned to pay compensation up to £100. The expropriation of neutral ships carrying contraband of war (see DECLARATION OF LONDON) is practically the only other kind of C. now known either to municipal or to international law.

Conflict of Laws, or Private International Law, the body of recognised principles for deciding cases where the private or local law of different nations is in conflict. Private International Law, or, to use Prof. Dicey's phrase, C. of L., consists of the rules acted upon by courts of justice in determining (1) the limits of their own jurisdiction in disputes relating to foreign transactions; and (2) the appropriate law, whether local or foreign, to be applied in a case which is within their jurisdiction. Most civilised countries concur, for example, in deciding cases on contract according to the law of the land where the contract was made. The question whether the courts of one country are guided by courtesy or by legal principle in applying foreign law to the decision of particular cases has given rise to much academic controversy, owing to the truism that the courts of one country cannot be legally compelled to respect alien legal principles. See COMITY.

Confoeal, having the same foci. In geometry, a conic or conic section may be regarded as the curve formed by the intersection of a cone by a plane, or as the locus of a point whose distances from a fixed point called the focus and a fixed line called the directrix form a constant ratio, called the eccentricity. If conics have the same foci they are termed C. If an ellipse and a hyperbola have each the same two foci, they intersect at right angles.

Confolens, Fr. tn, cap. of an arron., in the dept. of Charente, at the confluence of the Vienne and the Gôire. It has

interesting old buildings, including a ruined 12th-cent. château. Flour is manuf., and there is a market. Pop. 2900.

Conformable Strata are beds which rest upon one another in a regular manner, the bedding planes being parallel throughout. This shows that no strong earth movements took place between the deposition of successive strata, and the formation is conformable because continuous and uninterrupted. When, however, land is raised out of the water, denudation takes place, and should those strata become again submerged and new deposits arise, then the bedding would not, as a general rule, be conformable. See UNCONFORMITY.

Confucius (551-479 BC), Chinese sage, b. Ch'ieh-fu, in the state of Lu. His family name was K'ung, personal name, Ch'in, and courtesy-name Chung-ni; his clan being an offshoot of the state of the dukes of Sung. In C.'s 3rd year his father, who had been a soldier of distinction and valour, died, leaving his second wife, who was C.'s mother, ill provided for. The name C. is a Latinised form of K'ung Fū-tzu, the Master K'ung. In 532 C. married, a son, Li, and 2 daughters being the fruits of this marriage. In the following year he began to teach in his native state Ch'uehli, having occupied the interval as a subordinate official in charge of public herds and stores. Between 531 and 517 he paid a visit to the cap. at Loh, where it is thought he may have met the great teacher Lao-tzu. In the latter year he took refuge in the neighbouring state of Chi', for Lu was the scene of civil strife in which the reigning Duke Chao suffered defeat. On the death of this ruler in the year 510, Ting became duke in his stead, and when in 501 he appointed C. governor of the city of Chungtu he found that he had done an excellent service alike for his own house and for his subjects, for C., who was rapidly promoted to the Ministry of Works and later of Crimes, became at once the idol of the people and the practical reformer of many outstanding abuses. Gov. grew strong; men grew loyal, and women gentle. Immorality and corruption both vanished, and from far and wide men came to see a model state. But petty jealousies undermined his success, and a crafty gift to the duke of some beautiful dancing girls led indirectly to a rift between the latter and his counsellor. Accordingly in the year 497 C. set out on his wanderings, which were destined to last till 483. With a little band of faithful disciples he travelled from state to state and court to court, settling always where there seemed most chance of freedom from persecution. Friends and believers in his word were not lacking, yet it was no uncommon thing for his company to be in actual want and even in peril of their lives. At length there came a message to the teacher in Wei from the 10-year-old Duke Ai, who had succeeded Ting, bidding him return to his native place, which he accordingly did. It is improbable that he made any effort to pick up the threads of his old political life. Rather he devoted

his last years to literature, to the collection and exposition of the anc't writings, and especially to the piecing together of his *Ch'un Chiu* which recounts the annals of Lu from 722 to 479 BC, and to which a peculiarly high interest was attached in the past as the only classical work of this greatest of Chinese sages. But to gain any insight into C.'s personality, it is necessary to turn to the many memorabilia compiled by his disciples, for the Confucian analects were collected shortly after his death, and give a true picture of what the Master said and did. They should, therefore, be carefully distinguished from that mass of legendary and apocryphal literature that later grew up round the name of C. as round that of every great religious teacher. And first of all it seems clear from the analects that, unlike other men of equal influence, C. was careful to disclaim any special communion with God. Indeed his conversation was rarely of the nature of divinity or heaven, and his answers to such questions, as 'What becomes of man after death?' or 'What is the meaning of sacrifice to the spirits of the dead?' were always enigmatic or evasive. So deficient are his sayings in the fervour of the piety of a Francis of Assisi or in the belief in human progress and in a great social regeneration to come, that many regard Confucianism rather as a system of ethics than as a religion. Yet in the days of his misfortunes and exile he was supported by a belief in the reality of his mission as a preacher of the truth. He said once to his followers fearful for his safety: 'After the death of King Wên, was not the cause of the right way lodged in me? While Heaven doth not wish this cause to perish, what can the people of K'wang do for me?' Further, he is said to have remarked of himself at the age of 70 that he 'could do whatever his heart prompted, without transgressing what was right.' But he has himself told posterity how he liked best to imagine his life's work. Once a disciple was non-plussed when a certain ruler asked him to describe his Master. 'Why did you not tell him,' said C., 'that I am a man who in his eager pursuit of knowledge forgets his food, and in the joy of its attainment forgets his sorrows, and who does not perceive that old age is coming on?' Thus he would have men picture him as a philosopher eager in the search of truth, but it was always in the truth of this world, that is of the just relationship between man and man, rather than the truth of the Unseen and of what all sceptics regard as the Unknowable. 'While you cannot serve men,' he once argued, 'how can you serve spirits?' But the practical nature of his teaching is best realised in his emphatic assertion of the golden rule: 'What you do not like when done to yourself do not do to others.' It seems that he stated it only thus, that is, in its negative form, but his writings make it clear that he also appreciated its worth in its positive and higher form: in one passage he regrets bitterly that he had not taken the initiative in obeying it. The formulation of

this axiom of conduct illustrates his sympathetic knowledge of human nature—a knowledge that further illuminates the countless epigrams and sententious maxims upon which it is no exaggeration to say has grown the fabric of Chinese morality. Scattered up and down throughout all the Chinese classics they have upheld the standard of right conduct to which every good citizen tries to conform. Here are a few of his sayings: 'A poor man who does not flatter, and a rich man who is not proud, are passable characters; but they are not equal to the poor who yet love the rules of propriety.' 'What the superior man seeks is in himself; what the small seeks is in others.' 'A man can enlarge his principles; principles do not enlarge the man.' 'In style all that is required is that it convey the meaning.' 'Learning undigested by thought is labour lost; thought unassisted by learning is perilous.'

C. devoted most of his time to the preservation and 'transmission', as he put it, of anc't literature, rituals, and music, which he considered essential for the advancement of civilisation and good gov. Before his time those who wanted to learn had to go to court archives which, due to constant civil wars, were rapidly being destroyed, and only scions of noble families were privileged to do so. C., as the first founder of a private academy or univ., declared that 'in education there should be no class discrimination'; thus he took the right of education and of being educ. from the hands of the privileged class and made it possible for the poor and obscure as well as the rich and noble to avail themselves of the opportunity of learning. His insistence on principle and virtue rather on mere learning enabled many of his disciples to become advisers to kings and dukes in many states. Shortly after the estab. of his academy many rival schools were founded by other sages, but the fact that only his school has fl. throughout succeeding ages proves the soundness of his teaching, which has not only bound the Chinese nation as a cultural entity, but has also dominated the culture of China's neighbours such as Japan, Korea and Indo-China, where up to the last century Confucian Classics formed the main part of national education. See also CHINESE LITERATURE. There is a trans. of the *Analects* by A. Waley, 1938. See E. Chavannes, *Les Mémoires historiques*, vol. v, ch. 47, for life of C.; see also R. F. Johnston, *Confucianism and Modern China*, 1934; Lin Yutang (ed.), *The Wisdom of Confucius*, 1930; M. Collis, *The First Holy One*, 1948; A. Doebelin, *Confucius*, 1948; H. G. Creel, *Confucius: the Man and the Myth*, 1951.

Confusion, Circle of, see CIRCLE OF

Cong, Cross of, one of the chief treasures of the National Museum of Ireland, see DUBLIN. It is probably 12th cent. metalwork and was originally made as a reliquary for a fragment of the True Cross.

Congé d'Elire (in Anglo-Fr. *conge de estire*) means leave to elect, and is applied

in England to the warrant or licence from the Crown to the dean and chapter of a cathedral, authorising them to elect a bishop or archbishop, as the case may be, to a vacant see.

Conger Eel (*Conger*), muscular, voracious fish of the family Congridae. In colour it is usually whitish below and a dark blue-grey above, whilst its length varies from 3 to even 10 ft. It has no pelvic fins or scales, but its dorsal fin is continuous and stretches very far forward. These eels have wide mouths, sharp, closely packed teeth, and free tongues, and though their flesh is coarse are quite edible. They are widely distributed over the temperate and tropical seas.

Copyright National Museum, Dublin
THE CROSS OF CONG

Congestion, localised excess of blood in the arteries, veins, or capillaries. It is to be distinguished from plethora, or general excess of blood. C., or hyperaemia, may be classified as arterial or venous, active or passive, inflammatory or atonic, functional or hypostatic; or if associated with different parts, as cerebral, spinal, pulmonary, renal, hepatic, etc. Arterial or active hyperaemia is caused by the increased flow of blood to a part; it may be inflammatory, when the blood is in excess for the purpose of eliminating irritating substances; or functional, when it is due to the normal action of some organ. Venous or passive hyperaemia is caused by delay in the return of the blood to the heart; it may be atonic, when it is due to the enfeebled or

obstructed state of the circulatory system; or hypostatic, when it is due to the action of gravitation. The last two states are necessarily often associated.

Active hyperaemia may be caused by nervous disturbance due to emotion, as in blushing; by increased functional activity; or by local external stimulation, as the application of heat, poultices, etc. The symptoms are redness in the adjacent parts and a throbbing which eventually becomes painful. If long continued, a possible effect is hypertrophy of the tissues affected, owing to the excess of nourishment; while a sudden hyperaemia may result in the rupture of blood-vessels and the exudation of blood into the neighbouring parts.

Passive hyperaemia may be caused by loss of power in the heart due to old age, debility, or valvular disease. It may also be induced by the action of cold which constricts the veins and capillaries without affecting the deeper lying arteries; or by applying a ligature or tight bandage to a limb or other part. The most dangerous conditions are occasioned by embolism, or the blocking of a blood-vessel by a fragment of tissue carried along with the blood-stream; or thrombosis, which is the sudden clotting of the blood at some point in the course of a vessel. The surface symptoms of passive hyperaemia include a deepening of the colour to purple. The possible effects are exudation of blood into adjacent parts or necrosis of tissues owing to failure of the nutritive functions of the blood.

C. of the lung is a stage of heart disease and of pneumonia, and may occur by reason of the settlement of venous blood in the base of the lung when the heart is enfeebled by old age or the exhausting effects of fevers, etc., resulting in hypostatic pneumonia. C. of the kidney is active when there is irritation from drugs such as cantharides, or from microbic poisons; it is passive in heart and lung disease or when the *vena cava* is obstructed by tumours. C. of the liver and digestive tract is a normal condition during the process of digestion. It may become excessive through the use of rich or stimulating food. C. at the rectum may lead to the formation of haemorrhoids or piles. C. of the brain is often due to embolism or thrombosis, in which case it is known as apoplexy and is characterised by varying degrees of loss of consciousness and paralysis according to the site of the vessels involved. C. is sometimes induced for remedial purposes, as in the application of poultices, hot air, etc. See BIER'S CONGESTION TREATMENT.

Congleton, municipal bor. of Cheshire, England, on the R. Dane, 8 m. SW. of Macclesfield. Its prin. manufs. are textiles and machine tools. Moreton Old Hall lies 4½ m. SW. of C.; it is a property of the National Trust. Dating from between 1559 and 1589, it is generally considered to be one of the most perfect specimens of the 'black and white' architectural style in England. Pop. 15,500.

Conglomerates (from Lat. *conglomerare*,

to form into a ball) is the geological name for consolidated gravels or bouldery deposits, many of which were formed as beach deposits. C. consist of rounded pebbles, which owe their smooth surfaces to attrition during transport in the water, set in a matrix of finer material. In some beach deposits the boulders and pebbles make practically the whole of the rock and the interstitial material is reduced to the spaces between the tightly packed pebbles. In other C. the pebbles are scattered through a rock composed for the most part of finer grained material; the term 'boulder bed' can be used for

the C. mouth, which was believed to be the outlet of the Niger R., but the expedition ended fatally. Later 2 expeditions under Cameron and Grady went to the assistance of Livingstone, who d. at Lake Bangweulu. Cameron's expedition led politically to the opening-up of the country under the auspices of King Leopold, and in 1877 Stanley made his famous voyage down the C. from the Lualaba to the sea. The actual source of the riv. is still disputed. Geographically the Lubudi, which flows into the Lualaba above Bukama, is the headstream of the C., as from there to the mouth of the C.

E.N.A.

THE HEADWATERS OF THE RIVER CONGO

rocks with a few boulders very much larger than the particles making up the bulk of the rock. The pebbles in a conglomerate are usually of hard and resistant rock such as quartzite, chert, flint, sandstone, gneiss, or granite. C. may be formed also under continental conditions, by streams, as screes or talus cones, or as fanglomerates on the margins of inland plains. In some continental C. the pebbles are less well rounded than in marine C. The form of the conglomerate bed may indicate the way in which it originated, as may the nature of the adjoining rocks.

Congo, second riv. of the continent of Africa in point of drainage area (1,425,000 sq. m.), and also in point of length (about 3000 m.) whilst in volume of water it is surpassed only by the Amazon and the Mekong. The mouth of the C. was first discovered in 1482 by Diogo Cão, the Portuguese explorer, who estab. a settlement. Nearly 400 years later a Brit. expedition under Capt. Tuckey surveyed

the riv. valley shows normal development. But if the source of the C. is to be found in the headstream of its furthest trib., the C. may be said to rise in a high table-land between Lakes Tanganyika and Nyasa at an altitude of 5000 ft. Its 2 headstreams, the Chozi and Chambezi, after their union, enter Lake Bangweulu, and on their exit at the S. corner are known as the Luapula, which soon hurls itself over the Mumbatuta Falls. With a breadth varying from 300 to 1150 yds., the Luapula passes through Lake Mweru (2800 ft. high), and in its journey across the Mitumba Mts falls some 1000 ft. Soon afterwards the main riv. is joined by the Lualaba and Lubudi, together with 2 other streams from the W. Up to the Stanley Falls, 2 rapids only—those at Nyangwe and Ukassa—make the C. unnavigable. Stretching now often over a m. from bank to bank, it receives from the E. the Lukuga, which drains Lake Tanganyika, and further N. the Lira and

Urindi, coming from the forest tracts. The Middle C., which enters the alluvial plain of W. equatorial Africa at an elevation of 1300 ft., runs mainly in a westerly direction till it turns sharply southward near Bangala. Of the S. tribes, the Lomami, which pursues a course mostly parallel to the Upper C., is the chief, whilst the Lulonga joins the main stream many m. to the W. Other affluents on this side are the Ruki and the streams of the great Kasai system, including the Lukeni, Sankuru, Lulua, Djima, and Kwango. Joining the Middle C. on the right or N. bank are the great Aruwimi and Ituri, which rise near Lake Albert and water the equatorial forests, the Rubi, and the Ubangi or Welle, which is far the largest trib. on this side. Below the Ubangi is the Sangha, which flows into the C. with a southerly direction. There are many lacustrine expansions along the Middle C., the last being that of Stanley Pool, which is 1000 ft. above sea level. This part of the riv. is navigable for some 1020 m. Above Man-yaanga, on the Lower C., there are about 20 rapids in a course of 90 m. From this place to Isangila, a distance of 70 m., the riv. is navigable, whilst below 10 more falls intervene. During this part of its course the C. drops 850 ft. in 146 m. Round the non-navigable sections of the riv. railways have been constructed to carry freight, etc. From Matadi to the Atlantic, which the great riv. finally reaches with a S.-westerly course, the distance is c. 90 m., and may be covered by ocean vessels. The C. alone of African rive. can boast of a true estuary, the bottom being a great canyon extending 100 m. out to sea and obtaining in some places a depth of 4000 ft. below the normal sea level. At its mouth the C. is 8 m. wide. See T. A. Barnes, *The Wonderland of the Eastern Congo*, 1922.

Congo, Belgian, formerly **Congo Free State** and now a colony of Belgium. Its coast-line is only 25 m., but its whole area is some 925,780 sq. m. The B. C. is bounded on the N. by Fr. Equatorial Africa, on the NE. by the Sudan, on the E. by Uganda and Tanganyika, on the SE. by N. Rhodesia, on the SW. by Angola, and on the W. by the Atlantic. The central zone of the colony is a great table-land with an average altitude of 3000 ft. above sea level. It is a well-watered country, covered with wooded savannahs and forests which grow in the riv. valleys, especially towards the E. and NE. of the state. The forest region, stretching from Lake Albert to the mouth of the Aruwimi, known variously as the Great Congo, the Stanley (from its discoverer), and the Pygmy (from the small people inhabiting it) Forest, covers an area of 25,000 sq. m. Insect and animal life of brilliant colour and every variety of form flourish. The long mt. chain, known as the Mitumba Mts., which has peaks varying in height from 5000 to 10,000 ft., runs from the SE. boundary in a N.-easterly direction to Lake Tanganyika, and then northward past Lake Kivu to Lake Albert. The Bambara Hills, to

the W. of Tanganyika, are an offshoot of this range. The W. slopes descend gently to the C. basin, but the E. face is often very abrupt. The Crystal Mts. follow the coast-line. N. of Lake Kivu, the W. shores of which are in the colony, are sev. volcanoes which belong geographically to the Nile basin. The C. R., dealt with in another article, is the most important physical feature of the state, as it is also largely responsible for its commercial development. Rubber is obtained from the lianas of the forest. Giant baobabs grow on the savannahs, and in the forests many timber trees, such as teak, ebony, mahogany, besides bamboo palms and resin-yielding trees, and great euphorbias and orchillas are plentiful. There are abundant plantain and banana trees, and in some parts cotton and coffee plants are indigenous. Crocodiles and hippopotami are found in great numbers in the riv., whilst red buffaloes and antelopes wander in the open country, and in the forests a great variety of wild animals abounds, including the chimpanzee and other monkeys, the lion, elephant, jackal, leopard, etc. Storks, parrots, and ibises are quite common, and terns, hawks, and herons are found by the banks of the C. Ants, mosquitoes, spiders, etc., exist everywhere, whilst dragonflies and butterflies are noted for their gorgeous colourings.

The great humidity of the climate, combined with the heat, discourages European settlements, although in 1955 there were 89,311 whites, including 69,813 Belgians; 2002 British; 4503 Portuguese; 258 S. Africans; and 1955 French. Situated in the zone of the equator, the ann. variation of temp. is slight. The coldest month is July, the hottest Feb., the average ann. temp. being 90° F. In the W. of the colony rain falls regularly between Oct. and May, the rest of the year being the dry season. It will therefore be seen that along the lower reaches of the C. the period of heavy rains coincides with that of the greatest heat, so that it is not surprising that fevers are much more prevalent here than in the central plateaux, where, moreover, the precipitation is dispersed fairly evenly over the whole year. The rainfall varies, rising sometimes to 38 in.

Communications. There were (1953) 74,000 m. of roads (20,000 m. first class); and 3100 m. of railway line stretched from Matadi, the most important port on the lower Congo, to Dolo on the Stanley Pool. There is also a line from Stanley Falls to the Nile and from Stanley Falls to Nyanagwe on Lake Tanganyika. The R. Congo (q.v.) is navigable from its mouth to Matadi (c. 90 m.) by ocean going vessels. The next 250 m. as far as Stanley Pool (Leopoldville) is impeded by rapids. After the Pool, for 1000 m., as far as Stanley Falls, the riv. is again navigable. Together with the many and great tributaries, 6300 m. of waterways are open to shipping. Air mail services are well developed locally, and there are frequent services to Europe, to the Federation of Rhodesia, and to S. Africa. Wireless

stations are estab. at 150 points. Agriculture is still very undeveloped. There are, however, cocoa, coffee, rice, rubber, and tobacco plantations, and maize, manioc, and sugar-cane are also grown. Cotton is being increasingly cultivated and exported. Oil palms are abundant and supply an ever-increasing trade in palm oil and palm kernels. Rich deposits of uranium, radium, zinc, iron, cobalt, copper, and copper ore are found in Katanga, especially the S. dists. Diamonds are found in the Kasai dist. and include both gem and industrial varieties. Gold mines are worked at Kilo and the Mboga dist., Lake Albert (30 m. E. of Kilo), and also at Ruwe in Katanga. Other minerals worked include manganese, zinc concentrates, and tin. Large radium deposits occur in the Elisabethville Prov., where the large copper deposits are found. Bakuma is the centre of a rich tin region. Diamond-bearing gravels are exploited in the S. The gathering of the caoutchouc from rubber vines is the staple industry. Other exports, 75 per cent of which are sent to Belgium, are ivory, palm oil, coffee, rice, cocoa, timber, and white copal. Food, machinery, clothing, and arms are the chief imports.

The inhab. of the colony belong to the Bantu-Negro stock, but the small Pygmy bands, distributed in the great forests, probably are the survivors of the aboriginals of Central Africa. In the E. there are a number of tribes of Hamitic stock. They all speak different dialects of Bantu, but most of them understand Swahili. Elaborate funeral rites and the propitiation of countless malignant spirits are the chief articles of religion. The Bantu pop. is given at 12,026,159. Chief tns are the cap., Leopoldville, pop. 110,000 (16,564 whites); Matadi (400 whites); Elisabethville (11,006 whites).

Cameron's expedition in 1875 led to the formation of the Association Internationale Africaine under the auspices of Leopold II, king of the Belgians. The association was to suppress slavery and to civilise Africa, and a great impetus was given to the movement by the discoveries of H. M. Stanley (q.v.) in 1877. In 1885 the C. Free State was given international status by the treaty of Berlin. Before slavery could be suppressed, war took place between the Belgians and the Arab traders under Tippoo Tib. To aid the state to recover financially from the effects of the war Leopold adopted the concession system for exploiting the natural resources of the country. The system led to many abuses and the C. Free State was formally annexed by Belgium in 1908. The state became an absolute monarchy. A governor-general, with civil and military powers, represents the king in Africa. At home a colonial minister, advised by a colonial council, now supervises the government of the state, which for administrative purposes is divided into 6 provs.; the provs. are divided into 18 dists., the dists. into 123 ters. A univ. centre has been estab. at Kisantu, and technical and agric. colleges have been estab., chiefly to educate

recruits for the armed forces of the state. European children (14,036) are educ. at 67 schools, and native children (1,053,119) at 24,577 schools (1953). A univ. was estab. at L'Avanture, near Leopoldville, in 1954, and another (a state univ.) at Elisabethville in 1956. In 1927 some ter. in SW. B. C. area 3500 sq. km., was ceded to Portugal in exchange for an area of 3 sq. km. in the C. estuary. The cattle country of Ruanda-Urundi, formerly in Ger. E. Africa, is included in the Belgian administration of the C. under mandate from the League of Nations. See also CONGO. There is a dearth of books in English on the Belgian Congo, but the Board of Trade and Foreign Office publications contain up-to-date statistics. Sev. travel books of doubtful value to the student have been pub.

Congo, French, see FRENCH EQUATORIAL AFRICA.

Congo Red, see DYE.

Congregation (Lat. *cum*, with, *gregare*, to gather into a flock), collection of people, the term usually being applied to those gathered together for public worship. In the Rom. Catholic Church it denotes certain bodies of men—such as cardinals—who meet together with a special object connected with the affairs of that Church. Thus there is the C. of the Council, which enunciates the formal interpretation of the Council of Trent; the C. of the Propaganda, which looks after missionary affairs; that of the Holy Office of the Inquisition, which judges matters of faith; the C. of the Index, forbidding the reading of certain books; and sev. others. The term is sometimes applied to a body of men who undertake to observe certain rules, but are under vows less strict than those of the monks, as the Passionists and others. It also signifies a certain number of monasteries which band together in an autonomous federation: thus in the Benedictine order there were the C.s of Bursfeld and St Maur. The univs. are governed by bodies known as C.s, composed of all resident Masters and Doctors. The Congregationalists obtained their name from the fact that they believe in the basis of government being laid down by each C. for itself.

Congregation of the Holy Office of the Inquisition, see OFFICE, HOLY.

Congregationalism, name given to that part of the Protestant Church which, in organisation, is based on independency, in the sense that each body of worshippers or congregation is locally governed and answerable only to itself. It is one of the most important of the Free Churches in the United Kingdom, and occupies an equally important position among the Protestant non-episcopal churches of the U.S.A. Regarded generally, it is one of the three great systems of eccl. gov. and organisation as contrasted with Episcopacy on the one hand and Presbyterianism on the other. In England, the original home of the principles of C., its rise and development were very gradual, and began in a separatist movement from the Church as under the supreme headship of the Crown. In Mary's reign small

secret congregations met under Protestant clergy, and without them if such were not obtainable; in Elizabeth's reign these meetings increased and, realising that no real chance of reformation was coming, began definitely to arrange themselves in local bodies and conform only to what they held to be the real teaching of the N.T. Robert Browne (1550-1633) stands out as the most important figure and leader of the separatist Puritans; after great persecution he and as many of his congregation as were able emigrated to Zeeland in Holland. Here they were tolerated, but owing to differences among themselves this community broke up. Persecution in England gave them extra strength, but again differences arose; Smyth, one of the Zeeland community, became a Baptist, and a Baptist community settled in England; John Robinson, whose views were identical in the main with those of modern C., differed from Robert Browne, and started large and for a time flourishing communities. During the Civil war the Independents, as they now began to be called, grew and estab. themselves widely and firmly, and had a great influence in resisting the estab. of Presbyterianism. The real hist. of religious liberty may be regarded as beginning at that time and through them. Cromwell was a follower and supporter of them, especially in their political views, and the Protectorate saw them firmly settled. The Restoration forced them, with the Baptists and Eng. Presbyterians, into Nonconformity. The hist. of early C. is closely connected with the Puritan migration to America (*see below*). The Toleration Act, 1689, gave freedom of religious thought to all parties, and this was followed by a period of stagnation or apathy, not only confined to them, to be stirred to a greater spiritual enthusiasm under the inspiration of the Methodist movement of the 18th cent., when the numbers of Congregational bodies increased enormously. The 19th cent. was marked by a tendency to combination. In 1811 the Congregation Union of Scotland was formed, and in 1831 the Congregational Union of England and Wales. In 1896 the Congregationalists and the Evangelical Union combined in Scotland. The Congregational Union is one of the prin. members of the Free Church Council, founded in 1893. It supports home and foreign missions, the London Missionary Society especially owing much to it. All social reform movements are supported by it. The Memorial Hall in Farringdon Street, London, is the official centre. There are about 4200 churches and mission stations in Great Britain, with over 1000 churches in Brit. dominions; there are also churches in many parts of the European continent. The most recent (1956) statistics give 220,000 members in England, 121,000 in Wales, and 35,500 in Scotland. The International Congregational Council first met in London in 1891 and was fully organised, 1949, with headquarters at the Memorial Hall, London.

The hist. of Amer. C. begins with the

arrival in 1620 of Wm Brewster, elder of the refugee Church in Leyden, whose small band founded Plymouth in the modern Massachusetts, though strictly this group were Separatists. The enthusiasm that marked the early years of Amer. C. waned and it was not until 1734 that the 'revivalist' work of Jonathan Edwards (followed by that of Whitefield in 1740) roused fresh zeal. But the Edwardian standpoint was followed by nearly fifty years of apathy, during which interest centred mainly on doctrinal controversy. The 'New England Theology' of Edwards, Bellamy, and Timothy Dwight soon became predominant, and was generally in vogue at the beginning of the 19th cent. The 'Literal' school of Chauncy and Mayhew, however, rapidly grew in importance, and as early as 1805 was recognised in Harvard College as predominant. C. has never, however, made much headway in the S. states, the influence of the above theological schools, which emerged out of the old Calvinistic theology of the early New England settlers, being more or less confined to New England states. But it has spread to the W., although it was not until about 1850 that Amer. Congregationalists began to unite and to spread their distinctive policy in the W. states and ters. There has, in the last few decades, been a spread in the community of innovations in doctrinal opinions, and a wider diversity of belief, with the result that 'Evangelical' (popular sense) rather than 'Calvinistic' is the more appropriate definition of Amer. Congregational preachers and churches. Besides some 500 foreign mission churches, there are at the present date about 5500 Congregational churches in the U.S.A. More than 600 of them are in the state of Massachusetts, which is the stronghold of C., no other state reaching the 400 mark. The members of the body number 1,350,000. In 1931 the Congregational Churches united with the Amer. Christian Church. In 1956 a merger was agreed with the Evangelical and Reformed Church. *See R. W. Dale, History of English Congregationalism, 1907; A. Peel, A Brief History of English Congregationalism, 1931; and G. G. Atkins and F. L. Fagley, History of American Congregationalism, 1942.*

Congress (Lat. *congressus*, an assembly; from *cum*, together, and *gradus*, a step). In its diplomatic sense a C. means a gathering together of sovereigns or their representatives to discuss questions of international interest. Famous C.s of the past were those of Munster and Osnabrück, which resulted in the treaty of Westphalia, 1648, and at the end of the Thirty Years War; of Radstadt, at the end of the Sp. Succession war, in 1713; of Vienna, at the end of the Napoleonic wars in 1815; of Paris, in 1856, at the end of the Russian war; and of Berlin, in 1878, at the close of the Russo-Turkish war. But the name C. has come to be applied in Federal states to the legislative assembly which directs national or federal as contradistinguished from state or prov. concerns (*see article below*). Still

more recently the name has become associated with the Indian Nationalist or Home Rule movement (see INDIAN NATIONAL CONGRESS) and the Trades Union C., to which body are affiliated most of the British trade unions (see TRADES UNION CONGRESS).

Congress, Library of, see LIBRARY OF CONGRESS.

Congress of the United States, the National Legislature, consisting of the Senate and the House of Representatives. The Senate numbers 96 members, each state electing 2 members for a period of six years, one-third retiring every two years. The House of Representatives consists of 435 members from the states, elected on a basis of pop., including a delegate from Alaska, a delegate from Hawaii, and one resident commissioner from Puerto Rico. The C. is subject to the constitution, which it may not amend save by a two-thirds majority in each House, followed by approval by three-fourths of the states in the Union; and it is not concerned with the executive power, which is decided by popular election. Its legislative power is limited by the existence of the govts. of the individual states, which it may not overrule. The Supreme Court of the U.S.A. has the right to nullify any Act of C. which is judged unconstitutional. Within the constitution the powers of C. are: (1) to levy taxes, duties, imports, and excises; (2) to borrow money on the credit of the U.S.A.; (3) to regulate commerce, foreign and interstate; (4) to establish a uniform rule of nationalisation and uniform laws on bankruptcy; (5) to coin money and to fix the standard of weights and measures; (6) to provide for the punishment of counterfeiting the securities and current coin of the U.S.A. (a resulting power of C. includes the whole of the Criminal Code); (7) to establish post offices and post roads; (8) to promote the progress of science and the useful arts; (9) to constitute tribunals inferior to the Supreme Court; (10) to punish piracies and felonies on the high seas and offences against the law of nations; (11) to declare war; (12) to raise armies; (13) to maintain a navy; (14) to call forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions; (15) to provide for organising, arming, and disciplining the militia; (16) to exercise exclusive legislation over the national capital; and (17) to make all laws which shall be necessary and proper for carrying into execution the foregoing powers. Within these terms C. has to deal with a vast amount of legislation. Bills are proposed by private members, and the committee system has been introduced for reporting on and sorting out those which merit immediate consideration. The President has the power of veto (see ACT). C. meets once a year, but the President may convene one or both of the Houses in special session. The first session lasts from Dec. of the odd-numbered years until the summer; the second session lasts from Dec. of the even-numbered years until 4 Mar. C. came into being after the adoption of the

Federal constitution, and arose out of the old continental C. held since 1789.

Congreve, William (1670-1729), dramatist, b. Bardsey, Yorks. He was educ. at Kilkenny school, where he was a contemporary of Swift, and at Trinity College, Dublin. His father was a lieutenant in the Irish Army and his father's home was Lismore Castle. C. himself was b. on the estate of his great-uncle on his mother's side, Sir John Lewis. Intending to go to the Bar, he left Ireland and came to London, where he entered himself as a student of the Middle Temple; but he soon abandoned law for literature. He made his debut as a man of letters with a novel, *Incognita or Love and Duty*

WILLIAM CONGREVE

Reconciled, 1692, pub. under a pseudonym. He next turned his attention to the stage, and his first comedy, *The Old Bachelor*, was produced, 4 years after it was written, at Dury Lane in Jan. 1693. This was sufficiently successful to justify the management in putting up, in Nov. of the same year, his second play, *The Double Dealer*, which proved very popular. Some time after, Betterton and others of the Drury Lane company seceded, and opened a new theatre in Lincoln's Inn Fields on 30 April 1695, with C.'s *Love for Love*. This proved so much to the liking of the public, and consequently so profitable to the managers, that C. was given a share in the theatre, he, for his part, undertaking to produce a play every year. With this condition, however, he did not comply. Indeed, he wrote only 2 more pieces, a tragedy, *The Mourning Bride*, played at the Lincoln's Inn Theatre in 1697, and a comedy, *The Way of the World* in 1700. *The Way of the World* was received coldly, but the author assured his sympathisers that he was indifferent. His other literary work was the composition of poems not of serious importance.

He rendered some service to letters by assisting Dryden in his trans. of Juvenal, 1692, and Virgil, 1697, of which assistance Dryden made due acknowledgment. C., in company with Wycherley, Vanbrugh, and Dryden, was severely mauled in Jeremy Collier's *Short View of the Immorality of the English Stage*, 1698. The other writers kept silent—Dryden afterwards admitted the justice of the reproof—but C. replied in the same year in a pamphlet *Amendments of Mr Collier's False and Imperfect Citations* (from C.'s plays), which Collier answered vigorously and effectively.

C. had ample means, derived from sinecures, for from 1695 to 1707 he was commissioner for licensing hackney-coaches, an office which 10 years later he exchanged for the more lucrative commissionership of wine licences. In 1714 he exchanged this position for that of secretary for Jamaica, worth about £700 a year, which he held conjointly with a place in the pipe-office, that brought him in nearly as much. He had lived with Mrs. Bracegirdle—there were rumours that he married her—but on his death he left her a legacy of only £200, and left the duchess of Marlborough, who did not want money, the bulk of his estate, worth about £10,000. The duchess spent £7000 of the money on a diamond necklace. All this has prejudiced C.'s reputation as a man; but his legacy to the wealthy duchess is accounted for by the fact that the money was destined for her daughter who was his child. For how otherwise could he, without scandal, have transmitted it! The duchess bequeathed the legacy to the daughter, Mary. Mrs. Bracegirdle, to whom C. was faithful for 10 years, and who left him for the wealthy Lord Scarsdale, had retired in easy circumstances 20 years before C. d. After 1710 C. was afflicted with bad sight and bad health. He met his death as the result of injuries received in a carriage accident, and was buried in Westminster Abbey.

C.'s plays are chiefly remarkable for polished dialogue coupled with a cynical heartlessness and a fashionable licentiousness. *The Way of the World*, his masterpiece, scintillates with an arctic brilliance. In few plays is the art more adroit, the wit more polished; yet in few is there less of real human interest. It was the fault of C.'s age, perhaps, that he could not deviate from the restrictions of artificial comedy into those broader scenes of life and that wider outlook which lift Vanbrugh, despite his inferior technique, almost to the level of C. C. has not the robustness nor audacity of Wycherley, but in his own mode and sphere he is unsurpassed. *The Way of the World* ran for over 100 nights at the Lyric, Hammersmith, in 1923, and has been put on more than once in recent years. The long run of *Love for Love*, revived during the Second World War, showed that C.'s popularity as a dramatist had actually, in 1944, reached again the pitch it once attained in his lifetime. J. C. Hodges's *William Congreve: the Man*, 1944, helps towards a better understanding of C.'s early success as a playwright

and of his subsequent motives and character, besides confirming various facts concerning his birth and youth. Hitherto, C.'s reputation as a man has suffered from Voltaire's statement that C. referred to his own works as 'trifles,' and told Voltaire that he would rather be considered 'a gentleman who led a life of plainness and simplicity' than a dramatist. But C.'s estimate of his own work, which disgusted Voltaire, was not due to false modesty or to snobbishness. 'Being a thorough artist and also a detached unambitious man, he considered the comedies which had made his reputation "trifles"; even *Love for Love* he thought "homely fare," though for *The Way to the World* he made no such apology.' There are eds. of C.'s plays by A. C. Ewald (1887), W. Archer (1912), and J. W. Crutch (1927). C.'s *Complete Works*, including the adaptation of Molière's *Monsieur de Pourceaugnac*, *Squire Trelooby*, written in collaboration with Vanbrugh and Walsh (1704), ed. by Dr Montague Summers, was pub. in 4 vols. in 1923. See Sir E. Gosse, *Life of William Congreve*, 1888, 1924; D. C. Taylor, *William Congreve*, 1931.

Congreve, Sir William (1772–1828), inventor of the C. rocket which was successfully employed at the siege of Copenhagen, Lord Gambier's engagement in the Basque Roads (1809), and at Leipzig (1813), where the Rocket Troop of the Royal Artillery did yeoman service. Besides publishing three treatises on his rocket, which was later superseded by Hale's, C. patented many other inventions, including a process of colour printing, pyrotechnic improvements, a smoke-consuming device, and a gun-recoil mounting.

Coni, see CUNEO.

Conia, **Conine**, or **Conifine** (C₈H₉N), alkaloid contained in the seeds of the spotted hemlock (*Conium maculatum*). It is a colourless, oily liquid with a penetrating smell, boils at 187° C., turns brown on exposure to the air, and is soluble in alcohol. It is strongly basic; the principal salts are conifine hydrochloride and conifine hydrobromate. The alkaloid and its salts are strongly poisonous; moderate doses produce motor paralysis without loss of consciousness, and larger doses cause death by paralysis of the organs of respiration. Small doses are valuable in acute mania, delirium tremens, and tetanus.

Conic Sections, curves which are formed by the intersection of a cone by planes in different directions. See GEOMETRY, *Higher Pure G.*

Conical Projection, system by which points, lines, and areas on the surface of a sphere or other solid are represented by corresponding markings on the surface of an enveloping cone. As the earth is a spheroid, it is impossible to represent accurately on a plane map the relative distances of points on the earth's surface. A cone, however, is a surface which can be unrolled, or spread out on a plane, to form a sector of a circle. If, therefore, the earth is imagined to be enveloped by a cone touching a certain parallel of

lat., the distances on that parallel are accurately rendered on the map when spread out, while the inaccuracy increases as the regions on the earth's surface become more remote from that parallel. In such a map the meridians are represented by straight lines converging to the pole, and the parallels by circles having the vertex of the cone as centre. The method is particularly applicable to maps of the polar regions.

Coniferae, most important class of Gymnosperms, consisting of about 400 species of resinous trees and shrubs, now grouped under the families Pinaceae, Cupressaceae, and Taxaceae. They are mostly erect evergreens, except larch (*Larix*), and usually grow in dense forests in temperate and sub-tropical parts and mts of the world. Stems are usually freely branched, leaves simple and usually small, flowers always unisexual, the male in cones or catkins on the main axis, the female in cones with naked ovules on the surfaces of the scales; fertilisation is by means of a pollen tube. The class furnishes softwood timber, resin, turpentine, tars, etc., and a few species produce edible seeds. See W. Dallimore and A. B. Jackson, *A Handbook of Coniferae, including Ginkgoaceae*, 1923.

Conil, Sp. vil. in the prov. of Cádiz, on the Atlantic, at the mouth of the Salado. It has sardine and tunny fisheries. Pop. 5500.

Conine, or **Coniline**, see **CONIA**.

Coningham, Sir Arthur (1895-1948), air marshal, b. Brisbane, Australia, and educ. at Wellington College, New Zealand, and at New Zealand Univ. Enlisted in Canterbury (New Zealand) Mounted Rifles, 1914, but after service in the Middle E. was invalided out of the army, 1916. Later he joined the Royal Flying Corps, serving with great distinction in France as a fighter pilot. Commanded a flight of aircraft in 1925 on the first flight from Cairo to Kano (Nigeria), thus opening the way to an air route across Africa. Awarded A.F.C., 1926. Held sev. important posts before his transfer in 1941 to the Middle E., where he was put in command of the air forces in Libya, later known as the desert air force. He and Sir A. Tedder (q.v.) were the primary designers of the air side of the plan by which the action of all three services was integrated; for though such a system had long existed in theory, it was first applied in Libya. In Feb. 1943 C. was assigned the work of concerting the air operations in support of the Brit. First and Eighth Armies in Tunisia. With the acting rank of air marshal C. was then put in command of the NW. African tactical air force and continued to command the tactical air forces in the field in Sicily and Italy. In 1944 he was appointed air officer commanding the R.A.F. second tactical air force, which operated with the Brit. and Canadian Armies on the W. front. After the war he became air officer commanding in chief, Flying Training Command. Killed when travelling as a civilian passenger in an aircraft, which was lost on a flight from the Azores to Bermuda.

Conisbrough, tn in Yorkshire, England, 5 m. from Doncaster, celebrated for its ruined Norman castle. Rhinoceros bones have been found here. Pop. 18,500.

Coniston, vil. on the shores of C. Lake in the N. Lonsdale div. of Lancashire, England. There are slate quarries in the vicinity. John Ruskin resided at Brantwood, his property in the par., and is buried in the churchyard. Pop. 1100.

Coniston Grits and Flags belong to the Ludlow group, which is the geological name of one of the upper sub-divs. of the Silurian rocks in Great Britain. They occur in the Silurian area of the Lake Dist., Cumberland, being named after Lake C.

Coniston Lake, one of the smaller lakes in the Eng. Lake Dist., much visited on account of its natural beauty and associations by tourists from Grasmere and Ambleside. It is situated in N. Lancashire, 14 m. W. by N. of Kendal, with which it is connected by the railway, and 9 m. W. of Bowness on Lake Windermere. The breadth is only $\frac{1}{2}$ m. compared with a length of 5 m., the NW. extremity being overlooked by the round-backed landmark known as C. Old Man (2633 ft). Perch and trout are fished from its waters. Brantwood, once the home of Ruskin, stands some way above its E. shore. The most picturesque view of the lake may be obtained from the rising known as Tarn Hawes.

Conium, see **HEMLOCK**.

Conjeveram, see **KANCHIPURAM**.

Conjugal Rights, see **MARRIAGE**.

Conjugation: 1. Term in grammar applied to a verb to denote its different forms. These forms may be obtained by inflection or by the use of particles and other words, the latter giving the periphrastic form of the verb. Verbs are conjugated to express differences of voice, mood, or tense.

2. Term used in biology for a process which leads to the rejuvenescence of cells or to the reproduction of their kind, and is common only to the lowest forms of animals and to plant life. Among the animals to which this method of reproduction is common may be mentioned the *Amoeba*, *Paramecium*, and *Vorticella*; among the plants, the *Spirogyra*.

Conjunctions, in grammar, are words used as connectives between one word and another, or one sentence and another.

Conjunctiva and **Conjunctivitis**. The C. is a mucous membrane lining the inner surface of the eyelids, and covering the anterior surface of the eyeball, except the cornea (see *under* **EYE**). The former is called the palpebral, and the latter the ocular, part. The C. is very subject to inflammation of varying degrees of severity. The cause of this may be irritation from any cause such as smoky atmosphere or exposure to dust or too bright light. C. is often associated with the infectious diseases, particularly measles. A highly infectious form of C. is prevalent in schoolchildren and is caused by the Kochs-weeks bacillus. The eye becomes bloodshot and there is a watery discharge which later becomes purulent.

'This form of C. has long been known as 'pink eye.' It yields to treatment with penicillin drops and penicillin eye-ointment. See also TRACHOMA.

Conjuring, art of producing apparently miraculous effects by tricks or illusions, so as to deceive the audience. They may be done by sleight of hand and dexterity, combined with a momentary diversion of the attention of the spectators induced by the performer. Large numbers of tricks with cards, coins, etc. are performed solely by sleight of hand; the prin. basis of these is the concealment or rapid passing of a card, coin, or small object in or to the palm of the hand; these tricks are elaborated by means of mechanical contrivances, objects concealed in the sleeves, etc., and with specially made or marked packs, etc. They are styled tricks of legerdmain or prestidigitation. Another class are those based on natural phenomena unappreciated by the audience, such as the effect of combining chemical substances, etc. Further, many wonderful feats, especially of E. jugglers and conjurers, are attributed to hypnotism and the undoubted power of thought transference and suggestion. Elaborate code signals explain many other tricks. Further we get the illusions proper, the vanishing figures, automatic figures, speaking heads, and all the devices of the modern scientific conjurer and wonder-worker. C. is often styled white magic, to distinguish it from sorcery or black magic. C. or magic, is a very ancient art; the people of the E. delighted in and feared their magicians. The Syrians and Babylonians, and especially the ancient Egyptians, were exceedingly clever conjurers. The ancient Greeks and Romans also delighted both in C. and juggling, and from ages past till to-day the Hindus have been experts in the art. From China and Japan have come many elaborate and beautiful tricks with birds in cages, gold-fish, and the like. The mechanical figure has a long hist., and so has the production of spectral figures or phantasms, obtained by reflection on smoke or on mirrors. Considerable interest was aroused in recent times by the offer of J. N. Maskelyne of a large reward for an imitation of his famous box-trick; the result was a lengthy legal suit carried to the House of Lords. The successful imitator won his case, though his box was not the same as Maskelyne's.

The wonders of the medieval sorcerers were worked on many of the principles developed and improved to-day, when every branch of physical science, chemistry, optics, mechanics, and electricity is called to the aid of the conjurer or illusionist. J. E. Robert-Houdin (1805-71) was one of the most famous of modern conjurers. His Temple of Magic in Paris was the scene of many marvels, in which he used electromagnetism; though a German, Döbler, in 1842, was the first to use electricity in his trick of lighting 200 candles at once by the firing of a pistol. Houdin, it may be recalled, was sent to Algiers by the Fr. Gov. to prove that the

marabouts were not in league with heaven. The production of objects, of which the rabbit from the hat is the most familiar, has long been a favourite, and has had endless modifications and elaborations. In modern Egypt the street and bazaar conjurers abound. Many of their tricks are performed with mirrors, and in special cases hypnotism and thought-reading plays a part. Disappearing figures appeared in England as early as Chaucer, and in the 16th cent. spectral illusions were exhibited in the Colosseum. In the 18th cent. a vanishing figure was produced with the aid of mirrors in France. The illusion of unsupported figures floating in the air was first produced by the Chinese. Roger Bacon was said to have a speaking head of brass, and throughout the Middle Ages we have allusions to man's feats of so-called magic and sorcery which are eclipsed by the white magicians of to-day. Few tricks have surpassed Maskelyne's 'Vanishing Lady,' or his automaton, Psycho, and other performing figures. See L. Hoffman, *Modern Magic*, 1877; E. H. Jones, *The Road to Endor*, 1920; H. Houdini, *Paper Magic*, 1922; W. Goldston, *Great Tricks Revealed*, 1935; J. Maskelyne and A. Groom, *The Book of Magic*, 1936; J. Maskelyne, *White Magic*, 1937; W. B. Gibson, *Professional Magic for Amateurs*, 1948.

Conkers may not be as old as horse-chestnuts or boys, but it is an ancient combination of the two. Each player gathers a horse-chestnut, bores it through the centre, bakes it in the oven, and threads it on string knotted at one end. One player holds the conker hanging waist high while the other strikes with his own. Players strike alternately and the one whose conker shatters loses. A one-victory conker which beats a 'fiver' becomes a 'sixer' and so on.

Conkling, Roscoe (1829-88), Amer. politician and lawyer, b. Albany, New York. From 1859 to 1863, and again from 1865 to 1867, he sat in Congress as Republican representative. His final resignation was due to his election as U.S. senator, a position he occupied for fourteen years (1867-81). As regards the conduct of the Civil war and the treatment of the S. states he proved an energetic supporter of the policy of Lincoln and Grant, and consequently an opposer of Johnson's reconstruction policies. In 1880 his vigorous championship of Grant and his rivalry with Blaine (q.v.) led to a split in the Republican ranks. His resignation of his senatorship took place in the following year. He had a protracted dispute with Garfield on the question of the New York patronage.

Conn, Herbert William (1859-1917), Amer. biologist, b. Fitchburg, Massachusetts. From 1905 he was bacteriologist of the Connecticut State Board of Health and director of the state laboratory. He made a special study of the bacteriology of dairy products, publishing sev. works on that subject. Other works include *Evolution of To-day*, 1886; *The Study of Germ Life*, 1897; *The Study of Life's Mechanism*, 1899; *The Method of Evolution*, 1900;

Agricultural Bacteriology, 1901; *Social Heredity and Social Evolution—the Other Side of Eugenics*, 1921.

Conn, Lough, lake in the co. of Mayo, Rep. of Ireland. The R. Castlebar flows into L. C., which empties itself into the R. Moy.

Connaught, Prince Arthur (Arthur Frederick Patrick Albert) of (1883–1938), only son of Arthur, Duke of Connaught and Strathearn (q.v.); b. Windsor Castle; married, 1913, Princess Alexandra Victoria, Duchess of Elfe, whose mother was the eldest daughter of Edward VII. He entered the army, serving in the Boer and First World Wars. He was Governor-General of the Union of S. Africa, 1920–4.

The Times

THE DUKE OF CONNAUGHT

Connaught and Strathearn, Arthur William Patrick Albert, Duke of (1850–1942), Brit. prince, seventh child and third son of Queen Victoria, attended the Royal Military Academy at Woolwich in 1866 and entered the Royal Engineers in 1868, being transferred to the Rifle Brigade the following year. He was made Duke of C. and S. in 1874. In 1879 he married Princess Louise Marguerite of Prussia (d. 14 Mar. 1917). Appointed major to the 7th Hussars in 1875, he became lieutenant-colonel of the Rifle Brigade in 1876. During the expedition to Egypt in 1882 he led the Guards Brigade at the battle of Tel-el-Kebir, earning a threefold mention in dispatches and receiving at the same time the order of C.B. In 1886 he received the Bombay command, being also, by virtue of his office, a member of the governor's executive council, and in 1890, on his return, was appointed to the command of the S. dist. as a lieutenant-general, and three years later he became general. In 1900, when Lord Roberts went to S. Africa, the duke took his place

as commander-in-chief of the army in Ireland, and in 1902 was promoted field marshal. From 1904 to 1907 he acted as inspector-general of the forces, and was commander-in-chief in the Mediterranean, 1907–9. In 1910 he represented the king on the occasion of the opening of the Union Parliament in S. Africa. In 1911 he became Governor-General of Canada, a post he held till 1916. In 1920 he went to India as the king's representative to inaugurate the new prov. legislative councils of Madras, Bengal, and Bombay. A study of his life, by Sir George Aston, was pub. 1929. He had three children: Princess Margaret (1882–1920), wife of the then crown prince of Sweden; Prince Arthur of Connaught (q.v.); and Victoria Patricia, b. 1888, who on her marriage to Capt. (later Adm.) the Hon. Alexander R. M. Ramsay in 1919 was authorised to renounce her title of princess.

THE ARMS OF CONNAUGHT

Connaught (Cennacht), W. prov. of the Rep. of Ireland, comprising the cos. of Leitrim, Sligo, Mayo, Roscommon, and Galway. Area 6610 sq. m. See articles on individual cos. for pop. and topography.

Connaught Rangers. The old 88th Foot was raised in Connaught in 1793, to which circumstance it owed its title. In 1881 the old 94th Foot was linked to the 88th under the title of the C. R. In consequence of the inauguration of the Irish Free State some Irish regiments were disbanded in 1922, the C. R. being one. The regiment was with Abercrombie in the 1801 Egyptian campaign, and had 12 honours for the Peninsular war. It went through the Crimean campaign and helped to restore order in the Central Provs. during the Indian Mutiny. In 1877–9 it was fighting in S. Africa, and again 1899–1902. During the First World War it raised 6 battalions which fought in France, Flanders, Macedonia, Gallipoli, Palestine, and Mesopotamia. See H. F. N. Jourdain and E. Fraser, *The Connaught Rangers* (3 vols.), 1924–8.

Connecticut, one of the six of the New England states and of the original thirteen states of the U.S.A. It is bounded on the W. by New York, on the N. by Massachusetts, on the E. by Rhode Is., and on the S. by Long Is. Sound, the area, including land and inland waters, being 5009 sq. m.

The chief rivs. all flow in a southerly direction through gently undulating lands. The W. section rises to 2355 ft at Bear Mt and includes the Litchfield Hills. There are three riv. valleys of importance in the state—the Thames, Housatonic, and the Connecticut—each of the rvs. of which has numerous small tribs. C. was ravaged by disastrous floods in 1955, but is rapidly rebuilding affected tns and cities. The E. of C. consists mainly of hills with narrow and deep riv. valleys. In the N. the country is mountainous, but

carpets, hosiery, leather, boots and shoes; firearms, ammunition, cutlery, textiles, hardware, jewellery, chemicals, hats, boats, and wire products. C. ranks high in the matter of education. Yale Univ. has over 1000 teachers and 8000 students; the Wesleyan Univ. and the C. College for Women are other important colleges. C. is said to have been the first community in the world to form a written constitution by a social compact. This constitution was confirmed by Charles II in 1662. The General Assembly consists of the

Camera Press

THE HORACE BUSHNELL MEMORIAL HALL, HARTFORD, CONNECTICUT

the valley of the C. R. is broad and fertile, being mostly of Triassic formation, whereas the greater part of the rest of the state consists of rocks of granite and gneiss. Sandstone and feldspar are quarried at Portland. The climate of the state is subjected to extremes of heat and cold, while the soil in the N. part is fertile, and in the S. sandy. 1,900,000 ac. are classified as forest land. Agriculture is restricted to general farming and the growing of specialised crops. The best lands are in the C. lowlands, where shade-grown tobacco is extensively cultivated. Hay is one of the most important products, and dairy produce and fruit farms are also a source of wealth, and some cereals are grown. C. is a very important manufacturing state, and its position, together with the facilities afforded by its rvs., has largely contributed to this. Its manufactures are many and varied, the chief being brass, cotton, silk, and woollen goods;

Senate of 36 members and the House of Representatives of 279 elected for two years. The prin. cities are: Hartford, 177,390; New Haven, 164,443; Bridgeport, 158,700; Waterbury, 104,480; Stamford, 74,290; New Britain, 73,726; Norwalk, 49,600; and Meriden, 44,088. The pop. of C. is 2,007,280. See O. Shepard, *Connecticut, Past and Present*, 1939.

Connecticut River, largest riv. (345 m. long) in New England, U.S.A. Rising in the extreme N. of New Hampshire, it forms a boundary between that state and Vermont, crosses Massachusetts, and finally C., where it enters Long Is. Sound at Saybrook, 30 m. E. of New Haven. Its general course is always southerly. For ships of light draught it is navigable as far as Hartford (50 m. up). Extensive hydro-electric and flood-control projects include a new dam at Wilder, Vermont, and Fifteen Mile Falls Dam at Barnet,

Vermont. The lower valley is a rich agric. region; onions and shade-grown tobacco are produced in Massachusetts and C.

Connective Tissue, tissue of mesodermal origin present in every organ of the body and binding together and supporting the other elements of an organ. C. T. is composed mainly of inter-cellular substance with collagenous or white, elastic or yellow fibres, arranged in bundles or lattice-like patterns. Fatty tissue is also present in C. T. The density and strength of C. T. vary with the stresses and strains it has to bear in performing its function. See also **Tissue**.

Connellsville, city of Fayette co. in SW. Pennsylvania, U.S.A., situated on Youghiogheny R. and served by sev. railways. Here most of the coking coal for iron smelting in America is produced. There are many manufactories. Pop. 13,300.

Connemara (the Bays of the Ocean), known also as Ballynahinch, forms the westernmost div. of co. Galway, Rep. of I., and is itself subdivided into Joyce co. In the N., C. proper in the W., and Iar-Connaught in the S. In length it reaches for 30 m. whilst its breadth varies from 15 to 20 m. It is noted for its quarries of a green variety of marble. Kelp gathering and weaving are important local industries; tourists and artists are attracted by its wild scenery of bogs and mts, lakes and inlets, whilst anglers are certain of good sport.

Connorsville, city, cap. of Fayette co., Indiana, U.S.A., on Whitewater R., 20 m. SW. of Richmond. It is a railway centre with machine shops, and manufs. automobiles and parts, metal products, and kitchen equipment. Pop. 15,600.

Connétable de France, name used at different periods in Fr. hist. for different offices. Under the early kings it was applied to a dignitary at court, but in the reign of Philip II the commander-in-chief of the army was known as the C. Such was the C. until Richelieu removed him in 1627. But Napoleon revived the office in 1804, giving it to his brother Louis. It was finally done away with when the line of Bourbons was restored.

Connington, J. J., pseudonym of Alfred Walter Stewart (1880-1947), scientist and detective story writer, b. Glasgow, son of a prof. Educ. at Glasgow Univ. and Marburg, he became Prof. of Chemistry at Queen's Univ., Belfast. His *Recent Advances in Organic Chemistry*, 1908, went through sev. eds. A few of his many popular detective stories are *Nordenholz's Millions*, 1923, *Murder in the Maze*, 1927, *The Two Tickets Puzzle*, 1930, *The Ha-Ha Case*, 1934, *For Murder Will Speak*, 1938, and *Jack-in-the-Box*, 1944. *Alias J. J. Connington*, 1947, is an autobiography.

Connolly, James (1870-1916), Irish Socialist and rebel, b. near Clones, co. Monaghan. He was the son of a labourer, who in 1880 took his family to Edinburgh. He worked as a 'devil' in the *Evening News* office, then in a bakery and a mosaic-tile factory; then was in turn tramp, navy, and pedlar. He returned to Edinburgh as corporation dustman.

He joined the Social Democratic Federation and went to Ireland in 1896 as their emissary. He estab. the Irish Socialist and Republican party, lectured in Great Britain and the U.S.A., and returned to Ireland in 1910. With James Larkin he organised a strike of transport workers, 1913. Three years later he took part in the Easter Week rising in Dublin. Captured by the Brit. he was executed at Kilmainham jail, 12 May 1916. See R. M. Fox, *James Connolly: the Fore-runner*, 1947.

Connor, Ralph pseudonym of Charles William Gordon (1860-1937), Canadian clergyman and novelist, b. Glengarry, Ontario. He was educ. at Toronto Univ., studied divinity at Knox College, and was ordained in 1890. From then to 1893 he did excellent work as missionary among the lumbermen and miners in the Rocky Mts. and it is on the experiences gleaned during these years of service and adventure that most of his works of fiction are based. Of his novels the best known are *Black Rock*, 1898; *The Sky Pilot*, 1899; *The Pilot at Swan Creek*, 1905; *The Dawn by Galilee*, 1909. His later works included *The Arm of Gold*, 1933; *The Girl from Glengarry*, 1934; *The Rebel Loyalist*, 1936; *He Dwelt Among Us*, 1936. His *Autobiography* appeared in 1938.

Connotation and Denotation, words used with reference to terms or names. The C. of a term implies certain qualities possessed by the object of which the term is a name. Comprehension and intension are words used to express the same thing. The D. of a term shows how many particular objects the name can be applied to, 'extension' being used as synonymous with D. For example, when the term dog is used the C. of that term implies certain characteristics as to size, hairy coat, shape of the animal, fidelity, and other attributes, and it could not be applied to anything else which did not possess all these attributes in conjunction. That is to say the word dog, when used, calls up certain attributes to anyone hearing the term. The D. of this same term dog is the number of particular animals to which this name can be applied, which, of course, excludes everything not possessing the essential characteristics necessary to place it in this class. The C. of a term determines its D. Thus, when the term dog is used it can be applied to all animals having hairy coats, a particular size, shape, and certain other characteristics. If, however, the C. is increased, the D. is decreased. So the term white dog, which adds another quality, namely white, will apply to fewer animals, as all dogs of other colours will be excluded. All terms have D., but proper names are generally thought to have no C. in that they do not imply any particular attributes.

Conodonts, microscopic translucent toothlike fossils which occur mainly in Palaeozoic rocks. They differ from scolecodonts (the silico-chitinous teeth of polychaete worms) in being composed of calcium phosphate. Though their zoological affinities are uncertain, they are useful as index fossils.

Conolly, John (1794-1866), physician, b. Market Rasen, Lincs. He studied medicine at Edinburgh; M.D., 1821. He practised at Chichester and at Stratford-on-Avon. In 1827 he went to London and was prof. of the practice of medicine at Univ. College from 1828 to 1830, when he moved to Warwick and was appointed visiting inspector to Warwickshire asylums. In 1832 he co-operated with Sir Charles Hastings and Sir John Forbes in founding the Provincial Medical and Surgical Association (afterwards British Medical Association, q.v.). In 1838 he moved to Birmingham and in 1839 to Hanwell, where he was resident physician to the Middlesex Asylum until 1844, and afterwards visiting physician. Here he introduced humane methods of treatment and dispensed with mechanical methods of restraint. His best works were *Indications of Insanity*, 1830; *Construction and Government of Lunatic Asylums*, 1847; *Treatment of the Insane without Mechanical Restraint*, 1856. See memoir by Sir J. Clark, 1869.

Conon: 1. Gk mathematician, fl. at Alexandria about 250 BC. He is said to have named the constellation known as *Coma Berenices* (q.v.).

2. Athenian admiral, played a conspicuous part in the latter half of the Peloponnesian war, when the glory and supremacy of his native city were already waning. In 406 BC he was chosen as one of the 10 commanders who succeeded the fallen Alcibiades. After the disastrous defeat at Aegospotami in 404 BC, C. was obliged to seek refuge with his friend Evagoras, King of Cyprus. When war broke out between Persia and Sparta, C., together with the satrap Pharnabazus, became commander of the Persian fleet, and in 394 regained his former reputation by overcoming the Spartans off Cnidus. But his noblest acts of patriotism were the restoration of the long walls and of the fortifications of the Piraeus, and the expulsion of the Laedaemonian harpists from many of the seaboard garrisons of the Aegean. Some say he d. in Cyprus about 390, others that Tiribazus, the Persian, had him assassinated, when he came on an embassy from Athens, as a proof of his loyalty to Sparta.

'**Conqueror**,' name of many Brit. battleships. The most famous were those of Boscawen's victory in Lagos Bay (1579), of Byron's action with d'Estaing (1779), and of Rodney's encounters with de Guichen (1780) and de Grasse (1782). There was also a C. at Trafalgar (1805), and at the capture of Simonoseki, Japan (1864). A dreadnought of this name was built in 1911-12 and fought at Jutland (1916).

Conquest (Lat. *conquirit*, to obtain). In Scots law, heritable property which came into a person's possession by purchase, gift, or in any other way unconnected with his capacity of heir, from a stranger, or from a relative to whom he would not by law have succeeded, is called C. But the distinction between C. and heritage proper has been

rendered devoid of practical significance since the Conveyancing Act, 1874, provided that the fees of C. should descend in all respects in the same way as fees of heritage.

Conquistadores (Sp. 'conquerors'), collective term for the Sp. conquerors of America. The title is applied especially to the great leaders who conquered the natives of Peru, Mexico, and other parts of Sp. America, such as Cortés, Bilbao, Almagro, and Pizarro.

Conrad I (d. 918), Ger. king, elected to the throne in AD 911 as the direct line of the Carolingians was extinct. He belonged to a distinguished Franconian family. His reign was a succession of wars. Both the Magyars and Normans from without and the stem-duchies from within effectively opposed his schemes of unification, and later the Bavarians and Swabians waged continuous warfare with him.

Conrad II (c. 990-1039), emperor of the Holy Rom. Empire, and founder of the Franconian or Salian line, was a descendant of Otto the Great. In 1024, on the death of Henry II, C. was crowned king by his chief supporter, the archbishop of Mainz; but he had to deal with many rival claimants. In the following year C. assumed the Lombard crown at Milan, and after defeating the inhab. of Pavia and Ravenna was crowned emperor at Rome in 1027 by Pope John XIX. In 1032 he acquired Lusatia, having worsted the Poles in sev. engagements, and the next year he was duly crowned King of Burgundy at Peterlingen.

Conrad III (1093-1152), Ger. king, and founder of the Hohenstaufen dynasty, was actually chosen King of Italy in 1128, but, finding it impossible to make good his claims against those of Lothaire of Saxony, he finally recognised the supremacy of the latter in 1135. However, Lothaire d. two years later, and in 1138 the Ger. princes, fearing the growing strength of the Guelph party, offered him the crown. During his reign Saxony, Burgundy, and Bavaria were in a state of continuous civil disorder. Meanwhile Italy was also a prey to the quarrels of the Guelphs and Ghibellines and other factions. Subsequently C. went on a crusade, but left Palestine in 1148 broken in health and d. at Bamberg.

Conrad IV (1228-54), Ger. king, was the son of Frederick II. Chosen king in 1237, he subsequently led the anti-papal party on his father's behalf during the Ger. wars. After his father's death (1250), leaving his dominions in a state of anarchy, C. marched into Italy, captured Capua and Naples, and was preparing to return to Germany with a large army when he d. of fever.

Conrad V, see CONRADIN OF SWABIA.

Conrad, Joseph (1857-1924) novelist writing in Eng., b. at Herdiczew in Podolia, Ukrainian prov. of Poland then under Russian rule. He was the only child of Apollo Nalecz Korzeniowski and his wife Evelina Bobrowska, and was christened Józef Teodor Konrad Nalecz Korzeniowski. His parents were of the landowner class,

and his father was involved in the secret national Polish movement. When C. was 3 his father was arrested and exiled to N. Russia, his wife and child being allowed to go with him under the same conditions of banishment. C.'s mother *d.* in exile in 1865; 2 years later his father, a sick man, was given conditional parole, and he *d.* in Cracow in 1869, leaving the orphaned C. in the care of his maternal uncle, Tadeusz Bobrowski. Between the ages of 15 and 17 C. astonished his uncle by expressing a determination to go to sea, a strange calling to people belonging to

JOSEPH CONRAD

an inland country and devoted to agriculture, but he persisted and in the autumn of 1874 he travelled to Marseilles to become a seaman. After some experience on 2 sailing ships, he became 1 of a syndicate of 4 young men who bought the 60-ton *Tremolino* and sailed her on contraband activities until she was deliberately wrecked as described in a chapter in *The Mirror of the Sea* (the vol. of *Memories and Impressions* pub. in 1906). More of this phase of C.'s life is told in the story *The Arrow of Gold*, 1919. C.'s first Eng. ship was the *Mavis*, which he joined at Marseilles in April 1878, and it was aboard that vessel that he arrived at Lowestoft 2 months later and saw England for the first time. After some coastal trips in another ship, he joined, as ordinary seaman, a 'wool-clipper' sailing to Australia, returning to London on a steamship in 1880, he passed examination as mate in June of that year. From then on he served as officer on several ships, voyaging to many parts of the world, particularly across the Indian Ocean, and

in and around the Malay Archipelago and the gulf of Siam. These are, more or less, the scenes of some of his best-known stories: *Almayer's Folly*, 1895; *An Outcast of the Islands*, 1896; *The Nigger of the 'Narcissus'*, 1897; *Lord Jim*, 1900; *Youth and The End of the Tether*, 1902; *Typhoon* and *Falk*, 1903; *The Secret Sharer* and *Frya of the Seven Isles* (pub. in *'Twixt Land and Sea*), 1912; *Victory*, 1915; *The Shadow Line*, 1917; *The Rescue*, 1920; and others. C. became a naturalised Brit. subject on 19 Aug. 1886, and on 11 Nov. 1886 he obtained his master mariner's certificate. His account of his seamanship examinations is given in *A Personal Record*, 1912; which contains, in C.'s revealing yet reticent way, reminiscences of both his life at sea and his youth and ancestry in Poland. His last ship was the *Torrens*, a renowned sailing vessel, which he left in Oct. 1893.

Because many of C.'s stories have a setting of the sea and ships, based very often on his own experiences, he has frequently been regarded as a sea-story writer only; but even those stories most concerned with ships and seamen are grounded in C.'s deep insight into human character and the relation of man's innate waywardness and weakness to the simple virtues of fidelity and courage. In stories like *Lord Jim*, *Youth*, *The Secret Agent*, and *Victory*, indeed in almost all C.'s writings, the reader is brought face to face with man alone against the forces of nature or fate, against evil fellow beings, or against a flaw in his own being. The uniqueness of C. in Eng. fiction owes much to an outlook and temperament peculiar to his origins, and his glowing, convincing writing style to the fact that Eng. was not his native language. He belongs both to romanticism and realism; his descriptions of people and places, rich in colour and simile, make one literally *see* what is happening, and, for all the grandeur of his language, he can be detached to the point of irony. C. began writing in 1890 (*Almayer's Folly*), while in the Belgian Congo Free State through which he travelled to take command of a riv. steamer; from his experiences there he was physically weakened but psychologically awakened. Years later he gave his Congo story in one of his finest books, *Heart of Darkness*, 1920, which evokes with bitter irony the tragedy of the lost souls, white or black, in that torrid, fever-ridden land in the early days of its 'development.' *Almayer's Folly*, having been read by Edward Garnett, was pub. in April 1895. Encouraged to continue writing, C. settled down to a shore life, marrying Miss Jessie George of London in 1896; they had 2 sons, Borys, b. 1899, and John Alexander, b. 1906. His early books were appreciated by a discriminating public and praised by eminent writers; but none of his books attracted a wide circle of readers until *Chance*, 1913; which has been called the most Eng. of his books, yet is essentially a C. novel both in theme (the 'aloneness' of de Barral, the financial swindler, of his daughter Flora, and of

Capt. Anthony) and in construction (the shifting time sequence and the changing presentation from the points of view of different characters, including the 'narrator,' Marlow, who figures in other C. stories). Part of the action of *Chance* takes place at sea, but there are other novels in which the sea plays no part at all, or very little part, and which show to the full his power of penetration into the minds and motives of men, and his great artistry as a constructive novelist. *Nostromo*, 1904, is his longest, and in some ways his greatest novel, the tremendous tale of political intrigue and ambition set around a silver mine on the seaboard of a S. Amer. republic; and 2 stories of revolutionaries and agents provocateurs are among his best: *The Secret Agent*, 1907, a sombre, all-comprehending story of conspiracy, attempted outrage, and family murder, set, behind a quiet exterior, in the underworld of Soho; and *Under Western Eyes*, 1911, mainly enacted in Geneva, wherein the Russian exiles of those days lead, in an atmosphere of ideas and ideals, a tragic life of political crime, treachery, and self-punishment. His last 2 novels, *The Rover*, 1923, and *Suspense* (unfinished and pub. posthumously), 1925, are of the Napoleonic period; set in the Mediterranean, some of the characters have their prototypes in friends of his youthful days. C. lived most of his writing life in Kent, his last house being Oswalds, in the vil. of Bishopsbourne, where his death occurred suddenly, on 3 Aug. 1924. See H. Walpole, *Joseph Conrad*, 1916; F. M. Ford, *Joseph Conrad, a Personal Remembrance*, 1924; *Life and Letters of Joseph Conrad* (ed. G. Jean Aubrey) 1927; *Letters from Conrad, 1895-1924* (ed. E. Garnett) 1928; R. Curle, *The Last Twelve Years of Joseph Conrad*, 1928; Gustav Morf, *The Polish Heritage of Joseph Conrad*, 1930; R. L. McGrover, *Joseph Conrad's Mind and Method*, 1931; E. Crankshaw, *Joseph Conrad, Some Aspects of the Art of the Novelist*, 1936; *Conrad's Prefaces to his Works*, with introduction by E. Garnett, 1937; M. C. Bradbrook, *Joseph Conrad, England's Polish Genius*, 1941; O. Warner, *Joseph Conrad*, 1951; G. Jean-Aubry, *The Sea Dreamer*, 1957; J. Baines, *Joseph Conrad*, 1959.

Conrad, Michael Georg (1846-1927), Ger. writer, b. Franconia, Bavaria. He studied modern languages and pedagogy, and taught for 3 years in Geneva. Afterwards he became a journalist in Paris and Munich. His literary studies include: *Parisiana*, 1880; *Französische Charakterköpfe*, 1881; *Flammen für freie Geister*, 1882; *Mme Lutetia and Lutetias Töchter*, 1883; *Von Emil Zola bis Gerhart Hauptmann*, 1902. His impressionist work in the naturalist manner won him the name of 'the foremost apostle of Zola.' Among his novels are *Totentanz der Liebe*, 1884; *Die klugen Jungfrauen*, 1889; *Was die Isar rauscht*, 1889-98; *Fantasio*, 1889; *Majestät*, 1902, dealing with the relations of Ludwig II and R. Wagner. He also wrote some dramas, and pub. a vol. of poetry, *Salve Regina*, 1899.

Conrad von Hötzenendorf, Franz, Baron (1852-1936), military commander under Austro-Hungarian Empire; b. Vienna, 11 Nov. 1852, son of a colonel, served against Bosnian insurrections of 1878 and 1881. A close friend of the Archduke Franz Ferdinand. Appointed chief of general staff, 1906, reorganised artillery. In 1908-9 was for war with Serbia, in 1911 with Italy—overridden by Aehrenthal, in Nov. 1911 was dismissed. Reappointed, 1912; set pace for First World War after Sarajevo murder. Broke Russians on Gallicia front, 1915, made field marshal. Displaced by Emperor Charles, commanded on It. front; was defeated S. of Asiago, 15 June 1917. Retired, a baron. Wrote memoirs, *Aus Meiner Dienstzeit*. D. at Mergentheim, 26 Aug. 1935. See von Glaise Horstenau, *Collapse of Austria-Hungary*, trans. 1930.

Conrad von Würzburg (Würzburg) (d. 1287), famous Ger. poet and troubadour. Little is known of his life, but he seems to have spent some time in Strassburg, and later in Basel, where he d. He was influenced by Gottfried von Strassburg, and his work reached a far higher level than that of most of the Middle High Ger. poetry of the period. Among his works are legends of Alexius, Silvester, Pantaleon; *Der Welt Lohn*; *Die goldene Schmiede*; *Klage der Kunst*; two long epics, *Der Trojanische Krieg* and *Partenopier und Meliur*. His shorter verse romances are better—*Engelhart und Eneltrut*; *Das Herzemaere*, familiarised by Uhland's *Kastellan von Coucy*. Examples of his shorter poems may be found in Lambel's *Erzählungen und Schwänke des Mittelalters*, 1883. See Pfeiffer, *Germania*, iii, 1867; Golther in *Allgemeine Deutsche Biographie*, xlv, 1898, under 'Würzburg.'

Conrad, Hermann (1862-90), Ger. writer; studied in Berlin, Leipzig, and Würzburg, and early started upon a literary career. He was a leader of the new 'storm-and-stress period,' and a zealous supporter of the naturalistic tendencies of his time. His sketches, *Brutalitäten* and *Lieder eines Sünders*, appeared in 1886 and 1887. He also wrote the romance *Phrasen*, 1887, followed by *Wilhelm II und die junge Generation*, 1888. His *Adam Mensch*, 1889, caused a great sensation, and involved C., Walloth, and Alberti in a lawsuit for transgressing public morality. C. was acquitted, but d. during the judicial proceedings.

Conradin of Swabia, or Conrad V (1252-1268), Ger. king, b. near Landshut, Germany, was the last of the Hohenstaufen dynasty, son of Conrad IV. His empire was exposed to the hereditary enmity of the Pope by a long minority under Louis of Bavaria. In 1267, unopposed, and supported by the Ghibelline faction, C. entered Rome, but was defeated at Tagliacozzo in 1268 by Charles of Anjou. He was executed at Naples.

Consaburum, see CONSUEGRA.
Consalvi, Ercolo (1757-1824), It. statesman and cardinal, b. Rome and educ. at Frascati. He was made a cardinal and secretary of state by Pius VII, and in 1801

he negotiated the Concordat with Napoleon in Paris. His subsequent refusal to be present at the marriage of Napoleon and Marie Louise led to his banishment and dismissal from office. C. was reinstated, 1814-1823, and governed the Papal states liberally and humanely. The Romans named him 'the great cardinal' for all the benefits conferred upon them. C. retired on the death of Pius VII, 1823; he was recalled by Leo XII, and accepted the honorary office of prefect of the college *de propaganda fide*, but *d.* soon afterwards at Rome. See J. A. M. Crétineau-Joly, *Mémoires du Cardinal Consalvi*, 1864.

Consanguinity (Lat. *cum*, together, and *sanguis*, blood), or kindred, is the relationship between persons of the same blood. This relationship may be lineal or direct, that is, the relationship which subsists between ascendants and descendants who are in a direct line one with the other, or it may be collateral or indirect, that is, the relationship between two persons sprung from a common ancestor, root, or stock, but not descended one from another. Laws of inheritance, descent, and in most countries of marriage are largely governed by the ties of C. They differ naturally according to place and country. Thus in parts of the U.S.A. the C. of uncle and niece does not prohibit marriage as it does in France (according to the Code Napoleon), England, etc., and—to take an example on the opposite side—the old canon law would not allow persons to marry between whom there was only the seventh degree of C.

Conscience, Hendrik (1812-83), Flem. novelist, *b.* Antwerp. At first a soldier and civil servant, he became one of the most popular Flem. writers, whose influence on the literary revival of Flanders was considerable. He wrote more than 100 novels, which have been trans. into most European languages. His historical and sociological novels bear evident traces of Romanticism. He excelled also in his stories of Flem. village life. Among his best known works are *De Leeuw van Vlaanderen*, 1838, *Jacob van Artevelde*, 1849, *Bavo en Lieveken*, 1865, *Kerels van Vlaanderen*, 1870. See E. de Bock, *H. Conscience en de opkomst van de Vlaamsche romantiek*, 2nd ed. 1943.

Conscience, knowledge within oneself. In ordinary language and in moral theology C. means the inward recognition of what is right or wrong in one's own actions, a moral sense of consciousness. In ethics, however, it has had various special applications; or rather it has, in various schools of moral philosophy, been regarded from different points of view. Thus it may mean simply an ordinary judgment of one's own conduct, using the same criteria or standards, however gained, as one uses in forming judgments about other things and applying them to one's own actions. It is in this sense a moral consciousness applied to oneself and to one's own actions. On the other hand, it has been pushed to an extreme so that it becomes an intuitive, infallible natural faculty of the mind, a law to itself. The theory that C. is an infallible faculty of

the mind is one tenet of the intuitionist school of ethical philosophy. According to this school, C. as a special faculty at once recognises what is right or what is wrong, whether or no the person acts on its dictates. The part played by C. as a prin. factor in an ethical system has been chiefly discussed and emphasised by the Eng. schools of philosophy. Shaftesbury (1671-1731) drew a close parallel between the sense of beauty and the sense of what is right or wrong: as C. is a faculty in the sphere of art, so also is it a faculty in the sphere of action; it is a moral sense which determines the value of actions; and it is mainly non-reflective. Francis Hutcheson (1694-1746) developed the moral sense; but he tends to separate its working into two parts, one acting deliberately or deductively, one instantaneously or intuitively, a feeling of satisfaction or dissatisfaction according as actions are good or bad. The moral sense, though acting both deliberately and intuitively, is not, however, the standard of judging moral actions; that is, the general well-being of society, the 'greatest happiness of the greatest number.' It is in Joseph Butler (1690-1772) that we find C. developed in an ethical system to its fullest. He analyses the nature of man into the passions or affections: self-love and benevolence and C. The last is a universal principle of reflection, and virtuous action consists in following its dictates; it judges self-love as that which has weighed the passions in the balance and decided which is to its real interest. C. therefore has an absolute power, and it is in the law of our nature, and virtue consists in following it. When analysed further, Butler's C. seems to have no real basis; it does not connect with the will or practical reason. The utilitarian school of ethics dominated Eng. moral philosophy, and the intuitionists, both in the moral sense school and in Butler's C. school, ceased to have influence. Henry Sidgwick in his *Methods of Ethics*, 1874, reconciled the utilitarians and the C. or moral school; the C. or moral sense recognises the general good of the greatest number as the rule of moral conduct. See also ETHICS, and the names mentioned above.

Conscience, Courts of, which were superseded by co. courts, were at one time estab. at Westminster and other commercial centres by local acts of Parliament for the recovery of small debts, usually under £5.

Conscience Money is the term which is given to various sums of money received by the Chancellor of the Exchequer from anonymous persons who have deliberately evaded their obligations, more especially as regards taxes.

Conscientious Objector. This term came into prominence during the First World War, and was applied to those who claimed that they objected on moral or religious grounds to military service in a fighting capacity. Special measures were taken to deal with them in the Military Service Act of 1916 (see CONSCRIPTION), and whilst there was no doubt about the sincerity of the views held by some, there were many who found

in it a convenient excuse to avoid going to the front. Under the Representation of the People Act, 1918, C. O.s were to be disqualified from voting for five years after the First World War unless they satisfied the central tribunal that they had fulfilled certain conditions, such as employment in work of national importance. This provision, however, proved a dead letter, and other penalties imposed on C. O.s, such as loss of seniority in the civil service, were later rescinded. Provision was made in the Military Training Act of 1939 for the exemption of C. O.s on their allocation to some suitable form of national service, but only where the objector could satisfy the court of his bona fides. C. O.s in the Second World War were released from further obligations by the National Service (Release of Conscientious Objectors) Act, 1946.

Conscription. What is termed C., or in other words the compelling every man eligible in the country to make himself efficient for service in the ranks of the national army and take his place therein when necessary, was brought into being in modern times by Napoleon in 1798. It was adopted by Prussia in 1806 after the destruction of its army by the Fr. at Jena, and in that country the system was so perfected that in theory it had, just before the First World War, the most complete fighting machine ever seen. The *modus operandi* in most countries is that every man on reaching a certain age—eighteen, nineteen, twenty, or twenty-one—has to take his place in the ranks and undergo a specified period of military training. In some countries all those liable and found fit to serve are enlisted. This prevailed in Germany before 1914 and prevails in France to-day. The exceptions are mainly only sons or eldest sons of widows, and clergymen, etc. This is not quite the same in all countries; for instance in Spain (prior to the Civil war) and Portugal, where C. is in force, every man is not directly called upon to serve, but each locality is obliged to furnish a certain number, and on a certain day a ballot is taken, and those who draw numbers corresponding to those required are taken if found fit; anyone can find a substitute, and by this means no rich man's son need ever serve. There is no standing army in Switzerland, but every able-bodied citizen serves in the militia, which is called up for ann. service for a few weeks. The best conscriptive countries have so legislated that suitable work is found for the conscript when he leaves the colours, and, furthermore, his period of service is never so long as that of men in a voluntarily enlisted army, such as the Regular Army of Great Britain. Arguments in favour of and against C. will be found in Lord Roberts, *Fallacies and Facts*, etc., 1911, and Ian Hamilton's *Compulsory Service*, 1910. In the First World War, when whole nations as well as their armies soon became involved directly or indirectly in the struggle, the voluntary system of recruiting the armies of necessity broke down. Under that system in England thousands of young men at once responded to

appeals and patriotically left their homes and businesses. Others in far distant corners of the earth also returned to Great Britain, prompted by the same motive. But it was only a matter of time before this spontaneous supply was exhausted and other measures had to be taken to recruit field armies at all commensurate with the vast and growing extent of the military operations. In 1915 there was agitation in Great Britain in favour of C., but Parliament hesitated to adopt an institution which had always been repugnant to Brit. tradition. Lord Derby was then appointed to direct the recruitment service according to a plan which involved an element of compulsion by the introduction of tribunals to decide the appeals in individual cases, enlistment being a condition precedent to any right of appeal. This method was successful up to a point, but the supply of unmarried men, upon which the 'Derby Group System' at first mainly relied, soon gave out, and at length Parliament agreed to compulsory service and the first Military Service Act was passed early in 1916. This brought into operation a universal machinery for sifting the manhood of the nation and for hearing appeals for exemption. As the war continued other Acts were brought into force which had for their object the finer 'combing' of the nation as one source after another was drained.

In the U.S.A. those who had closely studied the effect of the war upon the man-power of Great Britain were not slow to advocate some form of compulsory service as soon as war was declared against Germany. In May 1917 the Selective Service Act was passed, under which 1,000,000 men were authorised to be enlisted for 'selective service.' As in Great Britain, the process of passing the men through the medical and physical tests disclosed many surprising facts regarding the general fitness for military service of millions of Amers. With the armistice compulsory service in the U.S.A. and Great Britain ceased.

In view of the threatening situation in Europe in 1938-9 the Brit. Gov. in April 1939 decided to introduce a system of compulsory military training as necessary for the safety of the country and the fulfilment of undertakings given to certain countries in Europe (France, Poland, Greece, etc.). The fact was that no one seriously doubted but that Germany, under the domination of the Nazis, was aiming at the hegemony of Europe and that no time was to be lost in improving the nation's military resources. At this time there was Labour and Liberal opposition to C., both parties opposing the Military Training Bill, 1939, on the ground that the Prime Minister, Mr Neville Chamberlain, had 'violated' his pledge and that C. was not necessary; but what weighed most with Labour was the fear that military compulsion might be extended into industrial compulsion, which, in effect, is precisely what did happen in 1940 when, in the face of great national danger, the Ministry of Labour

and National Service was empowered in the national interest to direct persons to various employments. The third reading of the Military Training Bill, 1939, was carried by 283 votes to 133. The general council of the T.U.C. co-operated with the gov., and the T.U.C., while still condemning compulsory military training, authorised trade unionists to serve on committees and tribunals to be set up under the Bill. Under Acts passed in 1939 and 1940 the gov. conscribed men between 20 and 41 for both military and industrial service, and women between 20 and 30 for industrial service. It was at liberty, under the Emergency Powers Act of 1940, to go even beyond these limits, but it preferred not to do so without receiving express permission from Parliament. For this purpose Mr Churchill, on 2 Dec. 1939, moved in the Commons that the obligation for national service should be extended to include the resources of woman-power and man-power still available. The reason for the crisis was that the great supply plants had now largely been built and it was urgent that they should be fully staffed. Among changes he now proposed were to raise the age limit for military service from 41 to 51 and to lower the minimum limit from 20 to 18½, at the same time making recruits of 18 liable for service abroad. Boys and girls between 16 and 18 were also to be registered, with a view to enrolment in various youth organisations. Regarding women, the gov. proposed to take powers to draft unmarried women between 20 and 30 not only into industry but also, under certain limitations, into the women's auxiliary forces: the Women's Royal Naval Service, the Women's Auxiliary Air Force, and the Auxiliary Territorial Service. On 9 Dec. the minister of labour moved the second reading of the new National Service Bill which embodied the proposals outlined by Mr Churchill. National service under this Bill included service in the armed forces, civil defence, and industry. Civil defence included the Police War Reserve, the National Fire Service, and the Civil Defence Reserve, but the minister of home security could add any organisation he deemed fit. The idea of conscribing women for military service was repugnant to some members, and an amendment was moved to exclude them from the scope of the Bill; but this was rejected without a div., and the Bill passed its remaining stages without opposition. Under legislation enacted before Sept. 1939, power existed in Australia and in the Union of S. Africa to require all men to render military service in time of war. Similar legislative provision was made in Canada and New Zealand after Sept. 1939. Men were called up under these provisions in Canada, Australia, and New Zealand. In 1945 they were no longer being called up in Canada or New Zealand and only boys of 18 were then being called up in Australia. Powers were also taken in many other parts of the Empire to call up men for military service, and were used in varying degrees.

The National Service Act, 1947, introduced a scheme of compulsory service in the armed forces for all male Brit. subjects between the ages of eighteen and twenty-six, to operate from 1 Jan. 1949, by which date the existing transitional arrangements had ended. National service men, or, in other words, conscripts, served eighteen months whole time or with the colours, and five and a half years in the reserve, with a period of ann. training. A further Act passed in 1950 increased the period of full-time service to two years but reduced the reserve liability to 3½ years. The Defence White Paper issued in 1957 set as an objective the ending of compulsory service in 1962.

In the U.S.A. President Roosevelt on 30 May 1940 stressed the need to train Amer. manpower for the forces and industry. A Bill for selective training and military service, sponsored by the National Emergency Committee, was introduced into Congress in June (1940). It proposed registration of all men from 18 to 64, numbering 40,000,000, of whom men between 21 and 45 would be eligible for 8 months' compulsory military training, those chosen being selected by lot. Both Gen. Marshall, chief of staff, and war secretary Stimson advocated compulsory military service as soon as possible. The Bill, however, made such slow progress in the Senate Military Affairs Committee that Roosevelt declared (2 Aug.) that he favoured a selective training Bill and described C. as the fairest and most effective means of obtaining man-power. He said that the 13 months' locway in 1917-18 during which the U.S.A. had been luckily able to build up an army of 4,000,000 men without attack from a foreign power would never happen again. The National Defence Advisory Commission supported the Military Training Bill, which was at length passed (with amendments) by the Senate Military Affairs Committee on 5 Aug. Amendments restricted the registration age from 21 to 31 years of age, in place of from 18 to 64, which would have affected over 40,000,000 men. With the restricted age-groups a total of 12,000,000 were affected, but deducting workers in essential industries and agriculture and men with dependants, only 4,500,000 remained for immediate selection. The Bill was enacted on 19 Oct. (1940). In the House of Representatives the Military Affairs Committee adopted C. as applying to all men between 21 and 45 but omitted any provision for the C. of industry. Final approval was given to the Bill in the House on 7 Sept., after it had reaffirmed an amendment to defer its operation for 60 days. But in the Conference Committee of both Houses unanimous agreement was reached on 13 Sept. on the main controversial points, including the deferment amendment, which was dropped, thereby enabling the first 400,000 men to be called up as soon as the registration machinery was ready. The conference adopted amended provisions for the C. of industrial plant to the effect that a manufacturer must accept and execute a 'fair

and just' terms orders for national defence materials when called upon to do so by the President. The conference report was finally approved by both Houses on 14 Sept. On 16 Sept. President Roosevelt signed the Bill. The 1940 Act was superseded by a Selective Service Act passed in 1948. This last was in turn replaced by a Universal Military Training and Service Act adopted in 1951. Under the 1951 Act men reaching the age of 18½ years can be drafted for a period of 2 years' service. See D. Hayes, *Conscription Conflict*, 1949.

Consecration, making sacred, the solemn appropriation or dedication of any thing or person to the service of God. The C. of the clergy is called *ordination* except in the case of bishops. The C. of members of religious orders is named *profession*. In the Old Testament not only men and beasts were consecrated to the Lord but also houses, fields, and the walls of Jerusalem (Lev. xxvii.; Neh. xii. 27). At the exodus from Egypt the first-born males in Israel, whether of man or beast, were sanctified to God, i.e. were consecrated or devoted to Him for sacrifice, the children, however, being redeemed (Exod. xiii.). In Christian ecclesiology C. is resolvable into (1) the dedication of persons or things to the service of God with appropriate ceremonies; (2) the formal declaration that in consequence of being devoted to God they are now sacred; (3) the imparting in the case of some persons (e.g. by ordination) of spiritual character and powers. In the context of the Eucharist the term is used (4) for the blessing of the bread and wine, which in Catholic and Orthodox theology effects a substantial change in them (see EUCHARIST; MASS; REAL PRESENCE; TRANSUBSTANTIATION). The term C. is used for the ordaining of bishops, and for the hallowing of altars, chalices, patens, etc., but especially of churches. Christianity had prevailed for some time before separate buildings were erected for divine worship; when these were erected simple rites of C. followed, and by the time of Constantine these rites had developed into numerous and imposing ceremonies.

In England, the legal effect of the formal C. of a church by a bishop is that it can only be used for sacred purposes. If desecrated by an act of sacrilege, it needs to be blessed again; but it cannot be sold or put to secular use without lawful authority and even an Act of Parliament, in the case of the Estab. Church. For that reason buildings required only for temporary use are often not formally consecrated, but blessed in a lesser degree known as dedication. In a dual-purpose building, used both as church and parish hall, sometimes the sanctuary only is dedicated and partitioned off. For burial ground see BURIAL ACTS.

Consequina, see COSEQUINA.

Consent, a defence in certain criminal offences involving assault (e.g. rape) unless obtained by fraud or duress. C. is no defence to a charge of incest, or to the abuse of a female lunatic, or to a charge of

indecent assault on any young person under the age of 13. In the Scots law of contract, following the Rom. law of consensual contracts, some contracts may be binding by mere C. without other formalities. Such contracts include partnership agreements, sale, barter, location (hire), and mandatam (bailment). For its legal connotation as a synonym for collusion in the law of divorce, see COLLUSION.

Consentia, see COSENZA.

Conserrans, see COUSERANS, LE.

Conservation, Soil, see SOIL EROSION, also IRRIGATION; ORGANIC HUSBANDRY. *Conservative Club*, see CLUBS.

Conservative Party, name of one of the chief Brit. political parties. The name implies that the essential characteristic is that its purpose or tendency is to maintain and preserve existing institutions. It was first given by J. W. Croker in the *Quarterly Review*, Jan. 1833, as a more appropriate term than Tory (q.v.). It was not at first welcomed by members of the party. The disruption of the Liberal party at Gladstone's first Home Rule Bill led first to the formation of the Liberal Unionist party, the name adopted by those Liberals who dissented from the policy; when these joined with the C.s in Lord Salisbury's first gov., the name Unionist was used for both wings of the new party. In 1912 the two separate party organisations coalesced, and Unionist became the formal accepted name for the former Liberal Unionist and C. P.s; but with the grant of dominion status to Ireland (see IRISH FREE STATE) the alternative name Unionist has been dropped, except in Ulster and to some extent in Scotland. The C. P. are the lineal descendants of the Tory party as re-modelled by Disraeli, who may be regarded as the founder of modern Conservatism. He foresaw the need for party organisation, and after the second Reform Act, 1867 (which gave the vote to workers who were householders), he inspired the formation of local associations. It was Disraeli who strengthened the party machine by the creation of the Conservative Central Office in 1870.

The hist. of the Tories goes back to the Restoration, but it is only towards the end of the 18th cent. that the party system begins to assume a form anything like that of to-day. The Tory party of the 18th cent. was long in humiliating opposition, a consequence of the Jacobite leanings of its leader, Viscount Bolingbroke. Branded for 50 years as Jacobites, the Tories were not favoured by Hanoverian sovereigns, whose first minister was always a Whig. But during the Amer. war the party was re-created, Tory and sovereign taking the common if illusory view that the Amer. colonies should remain part of the Brit. Empire. Thereafter for the next 2 decades the outstanding features of the Tory regime were the Six Acts, passed to meet the difficult social conditions following Waterloo, and the Catholic Emancipation Act of 1829. Then came 10 years of opposition until Peel led the Tory administration of 1842, with Gladstone as

his Lieutenant. It was on the rock of the Corn Laws that the party finally foundered. Disraeli was opposed to the repeal of these laws; with Derby he led the Young England party, the germ of the modern C. P. (see under BEACONSFIELD), and Peel was forced, in 1846, to embrace free trade; but eventually the Tory party turned against him over the Coercion of Ireland Bill, which was thrown out. With Gladstone Peel then went over to Lord John Russell's group; the split was complete; and Disraeli was left to reorganise the remains of the party. To Disraeli, who consistently supported Lord Ashley in his factory reforms, is due the marked progress in social legislation and the lead in imperial policy, resulting in drawing the self-governing dominions into closer alliance with the mother country, which have been the salient features of Conservatism in recent years.

The aims of the C. P. as stated by Disraeli are 'the preservation of our institutions, the maintenance of our empire, and the amelioration of the condition of the people.' These aims summarise a whole policy, and indeed they still represent the aspirations of modern Conservatives. The present Prime Minister, Mr Harold Macmillan, in acknowledging his election as Leader of the Party, used Disraeli's phrase to describe the party's standpoint: 'We must be conservative to conserve all that is good and radical to uproot all that is bad.'

Between the two world wars, except in 1924 and 1929-31, the C. P. was either in power or forming the dominating group in 'National' govts. A good deal of social reform was carried out, and a protectionist trade policy, based on imperial preferences, adopted in 1932. The C. P. obtained a large majority at the general election in 1935, but Baldwin and his successor, Neville Chamberlain (q.v.), found themselves in growing difficulties with a certain section in their party over re-armament and the Hitler threat. Anthony Eden (q.v.) had resigned in 1938 following a difference over policy, and Churchill (q.v.) who had pursued an independent line for some years, continued to oppose Chamberlain and in particular denounced Munich. When the Second World War broke out Chamberlain called on Churchill and Eden for support.

In 1940 Chamberlain resigned and a Coalition gov. took office, with a Conservative, Churchill, as Prime Minister; but in the general election in 1945 the party was heavily defeated and went into opposition. Between 1945-50 the C. P. reviewed its policy and pub. documents like the 'Industrial Charter' which modernised its constructive thinking, although its members would claim that its essential principles remain unaltered. It gained many seats at the general election in 1950, virtually wiping out the Socialist majority, and at the general election in 1951 regained power. In 1955 Eden, Churchill's successor as Prime Minister and party leader, increased the C. majority in the general election, an

almost phenomenal achievement for a party in power.

The modern Conservative party, while opposed to State ownership and its extension, has not repealed the Acts of its predecessors except in the cases of steel and road transport. It abolished rationing and repealed the numerous controls left over from the war. Its general economic outlook is bound up with free enterprise. It maintains full employment and safeguards social security, of which it was part author during the period of Coalition. In imperial policy it is assisting colonies to advance to self-government and full nationhood. See Earl Birkenhead, *Toryism*, 1903; Geoffrey Butler, *The Tory Tradition*, 1914; W. F. Moneyppenny and G. E. Buckle, *The Life of Benjamin Disraeli, Earl of Beaconsfield*, 1910-30; André Maurois, *Life of Disraeli*, 1927; Lord H. Cecil, *Conservatism*, 1928; Arthur Bryant, *The Spirit of Conservatism*, 1929; Blanche E. C. Dugdale, *Arthur James Balfour* (2 vols.), 1936; L. S. Amery, *The Framework of the Future*, 1944; Quintin Hogg (Lord Hailsham), *The Case for Conservatism*, 1947; Winston S. Churchill, *Life of Lord Randolph Churchill* (new ed.), 1952.

Conservators of the Peace, predecessors of the modern justices of the peace, but invested with powers far inferior to those of the latter. They were the authority to take surties for peace and good behaviour.

Conservatory (Fr. *conservatoire*, It. *conservatorio*) name originally given to schools founded, mainly in Italy at first, to maintain and educate orphans and illegitimate children (Lat. *conseruare*, to preserve). Music was an essential part of the education, and thus many of these charitable institutions became virtually music schools, and later their name transferred itself to such schools. The first for which a definite date is given was the Conservatorio di Santa Maria di Loreto in Naples, founded in 1537, and among three other similar schools afterwards estab. in the same city was the Conservatorio di Sant' Onofrio, noted for its teachers, such as Alessandro Scarlatti and Durante. Of these four Murat united the two remaining into the Real Collegio di Musica for pupils of both sexes. In Venice there were sev. C.s for girls at an early date, but these disappeared with the decline of the Venetian rep. and the centre of musical training for N. Italy was transferred to Milan, where a large C. was estab. in 1808 by Prince Eugène Beauharnais. The Ecole Royale de Chant et de Déclamation was founded in Paris (1784) for training opera singers. During the revolution the Institut National de Musique was erected (1793), the name changing to Conservatoire de Musique (1795). Another famous continental institution is the Conservatorium at Leipzig, founded by Mendelssohn (1843). Other important European C.s (including those in existence before the Second World War) are at Prague (founded 1811), Vienna (1816), Brussels (1833), Cologne (1849), Munich, Stuttgart, and Berlin (founded by Joachim 1869).

Corresponding Eng. institutions are the Royal Academy of Music (founded 1822, incorporated by charter 1836), the Royal College of Music (1882), and the Guildhall School of Music (1880). The chief in U.S.A. is the National Conservatory of Music of America (New York, 1885). There are 2 in Boston (1887, 1870).

Consett, urban dist. and tn of co. Durham, England, 12 m. from Durham. There are extensive iron works (first started in 1837) and coal mines, and some farming and horticulture is still carried on. Included in the dist. are Shotley Bridge, famous in the 18th cent. for sword-making by Ger. cutlers; Medomsley, whose par. church dates from the late 12th cent.; Iveston; Leadgate; and Ebohester, on the site of a Rom. camp, with an 11th-cent. par. church built of Rom. stone. The author Surtees (q.v.), creator of 'Jor-rocks,' was b. at Hamsterley. Pop. 38,900.

Conshohocken, bor. of Montgomery co., Pennsylvania, U.S.A., on the Schuylkill R., 13 m. from Philadelphia. Founded in 1830, it was incorporated as a bor., 1852. It has large cotton, woollen, and rolling mills, foundries, furnaces, surgical instrument works, stone quarries, steel mills, and boiler shops. Pop. 10,922.

Considérant, Victor Prosper (1808-93), Fr. Socialist, b. Salins, the chief advocate of Fourierism, gave up his career in the army to devote himself to propagating his political beliefs. He ed. the *Phalange* and *Phalanstère*, journals setting forth Fourier's views. Having obtained financial assistance from an Englishman, Young, he estab. a socialist colony in the dept Eure-et-Loire, 1832, but the experiment failed. In 1854 he went to Texas, and founded a socialist community, La Réunion, near San Antonio, but this enterprise also ended in failure. He returned to France, 1869, and d. in obscurity. His socialism was based on voluntary co-operation, and was not revolutionary in character. Among his works are *La Destinée sociale*, 1834-8, dedicated to Louis Philippe; *Débatte de la politique*, 1836; *Principes du socialisme*, 1847.

Consideration. All contracts not under seal require valuable C. to make them enforceable. The generally accepted legal definition of valuable C. is 'some right, interest, profit, or benefit accruing to one party, or some forbearance, detriment, loss, or responsibility given, suffered, or undertaken by the other.' A specialty contract (i.e. one under seal) is said to require no C. because of the legal dogma that a deed imports C., a fiction which probably owes its origin to the peculiar sanctity which has attached to deeds (or charters as they were once called) from the earliest days of the Eng. legal system. No simple contract can be enforced unless supported by valuable C. For example, A promises verbally or in writing not under seal to give B £100 for no C.; B cannot enforce the promise against A. Again, A owes B £100, and pays him £75 which B accepts 'in full satisfaction.' B can, none the less, sue A for the remaining

£25, though it would be otherwise if A had paid £75 and given in addition some article, however trifling, by way of C. C.s are sometimes divided into valuable and good C.s. A good C. is that of natural affection between blood-relations, but it is not sufficient to maintain the validity of a conveyance of property against the claim of a subsequent purchaser for value. C. need not be adequate to the promise offered by the other party to a contract, but must be of some value; it must be legal, e.g. money loaned to gamble in differences on the Stock Exchange could not be recovered (see DIFFERENCES); and it must not be past, but must be either present or future (see also EXECUTORY). As a corollary of the above rules it is to be noted that neither motive nor moral obligation amounts to C., therefore if A saves B's life and B afterwards promises A £100 out of gratitude, A cannot recover the money from B or out of B's estate. Lastly C. must move from the promisee, which may be differently expressed by saying that no stranger to the C. can take advantage of a contract though made for his benefit (see CONTRACT). See G. C. Cheshire and C. H. S. Fifoot, *The Law of Contract*, 1956.

Consignment, commercial term used of the dispatching of goods for delivery to a purchaser; it is particularly used in the shipping of goods. The person dispatching goods is the consignor, and the person to whom they are dispatched is the consignee. See BILL OF LADING.

Consistory Courts, which were founded by William I, now exist in every diocese of England. They are eccles. courts controlled by chancellors appointed by a bishop or archbishop. Their business is now almost restricted to the dispensing of faculties for which application is still made according to forensic procedure. Until the Act of 1857 they assisted in exercising jurisdiction over testamentary and matrimonial disputes. By an Act of 1892 a clergyman accused of immorality may be tried in a consistory court.

Consolato del Mare, see CONSULATE OF THE SEA.

Console, in architecture, an ornamental bracket (see also MODILLION).

Consolidated Fund, the fund of the national exchequer comprising the produce of the extraordinary revenues of the Crown. The fund was so named from the fact that it was consolidated out of what previously had constituted distinct funds—the aggregate, the general, and the S. Sea funds. It was first formed in 1786, and afterwards by the 56 George III c. 98 the Irish exchequer was amalgamated with it, and it then became the C. F. of the United Kingdom. The whole of gov. expenditure is met from the fund, including supply services and the interest of the national debt. In addition, the annual provision for the Queen's civil list, the salaries and pensions of judges and other officials are paid out of the fund. The receipts which go to make up the C. F. are taxes and other revenue items, the proceeds of all gov. borrowing,

repayments, advances, etc. The main heads of revenue comprise the following: customs (q.v.), excise (q.v.), death duties (q.v.), stamp duties, income tax, surtax, profits taxes, post office receipts, and miscellaneous items. These various receipts are all paid to the Exchequer account at the Bank of England, and may not be paid out except by statutory authority. See W. R. Anson, *Law and Custom of the Constitution*, 1886-92.

Consolidated Goldfields of South Africa. This company was formed in 1892 by the amalgamation of other similar undertakings, of which Cecil Rhodes (q.v.) was the leading spirit. It originated as the Goldfields of S. Africa Company, formed by Cecil Rhodes and Charles Rudd to exploit concessions given by Lobengula, the famous Matabele king.

Consolidation Acts, or Consolidation of Statutes, species of codification, or digest. The avowed object of a Consolidating Act is to incorporate in one repealing Act all the existing law on any one topic, together with necessary amendments, but otherwise without making any change in the pre-existing law whether statute or common law. Many C. A., however, either from faults inherent in draughtsmanship, or from the difficulty of giving adequate expression to ill-considered amendments, fall short of accomplishing this ideal: and, further, many sections being really based upon the *rationes decidendi* (principles of decision) of reported cases either do not give effect to the spirit of the decision, or fail of universal application, either because the decision was appropriate only to the facts of the particular case or because the necessary elimination of those facts in the section renders the statutory language ambiguous. Examples of C. A. are the Criminal Law Consolidation Acts, 1861, Bills of Exchange Act, 1882; the Sale of Goods Act, 1893; Children Acts, 1908-33; Companies (Consolidation) Act, 1929.

Consols, consolidated annuities (see CONSOLIDATED FUND). An Act of 1751 consolidated certain perpetual and lottery annuities bearing interest at 3 per cent, and these consolidated annuities formed the basis of the C. The interest on C. was reduced in 1888 to 2½ per cent. and in 1905 to 2¼ per cent. The value of these C. when first issued against existing securities was £9 m., but this amount was increased later to over £400 m. By 1888 this figure had been reduced by purchase in the market and by conversions into terminable annuities to £323 m. In 1889 Goschen, the Chancellor of the Exchequer, redeemed this stock. Since the First World War C. have formed a small part of the total national debt of Great Britain. The term C. has in late years been applied to certain other securities, such as New Zealand 5 per cent C. These are so named by dealers on the exchange because the word is less cumbersome than consolidated stock.

Consonance, in music, see CONCORD.

Consort, see CHAMBER MUSIC; CONCERT.

Consort (Lat. *consors*, partner, sharing in), literally one who throws in his lot

(*sors*) with another. In Eng. constitutional law the term is applied to the husband or wife of the reigning sovereign, viewed in a public capacity, as sharing to a certain extent in the royal prerogative. The title has been familiar in England since it was conferred on Prince Albert in 1857 by letters patent. A consort is a subject of the sovereign, and may be guilty of treason against the latter. A queen consort is entirely independent of her husband's control, and is regarded in legal proceedings as a *feme-sole*. She has her particular revenue, and certain exemptions and privileges. See ROYAL FAMILY.

Conspicuous Gallantry Medal, instituted for award to men of the Royal Navy and Royal Marines who performed exceptional acts of bravery in action during the Crimean war. In 1874 it was re-instituted for award for similar purposes and made applicable to any campaign. It is virtually the naval counterpart of the military Distinguished Conduct Medal.

Conspicuous Service Cross, Brit. decoration, instituted in 1901. See DISTINGUISHED SERVICE CROSS.

Conspiracy may be defined in law as an agreement between two or more persons to do an unlawful act or to do a lawful act by unlawful means. Much obscurity has always characterised what seems now to be definitely regarded as a substantive offence. The difficulty in principle lay in the confusion arising from the fact that, generally speaking, nothing can be unlawful, civilly or criminally. In two or more persons which would not be unlawful if done by one person, or if done without such previous agreement. The substantive wrong of C. was really developed as an action on the case (q.v.) or, in other words, was inducted from the consequential damage generally following on a conspiratorial agreement. Something more was required, however, than the mere fact of damage, for damage *sine injuria* (q.v.) is necessarily no wrong, and the injurious element was deduced generally from the fact that such agreements as were held to be C.s were characterised by some ultimate malicious object or wrongful means of execution. While, therefore, defining C. in the above manner it must always be remembered that to agree to persuade a man, *without unlawful means*, to do something he has a right to do, or to abstain from doing what he has a right to abstain from doing, can never be actionable, although done to the prejudice of a third person, and although done with a malicious motive. C. as a criminal offence is classed by text writers under three heads: (1) where the end is in itself a crime; (2) where the means are unlawful but the end is lawful; (3) where the end is to injure a third person or a class, though, if the wrong were inflicted by a single individual, a civil wrong only and not a crime would be committed. The whole gist of C. is the *combination*, so that a single person could only be convicted if his fellow conspirators were either dead, unknown, or not in custody for some

reason or other. It is now settled law that agreement by two or more persons to do certain acts may be criminal, although those acts if done by one person might not render him liable to any proceedings whatever. It is clear, e.g., that numbers may coerce and intimidate where a single individual could effect nothing. In regard to (1) above, a C. to commit murder is dealt with by a statute which makes it punishable with imprisonment up to ten years. Unlawful interference with trade by combinations and especially by combinations of workmen against employers form the most striking example of C.s under (2). Workmen may lawfully combine to protect their interest, but may not, theoretically at all events, interfere with the right of such of their class as do not wish to join the combination. The Conspiracy and Protection of Property Act, 1875, expressly makes punishable as crimes by imprisonment not exceeding three months, or a penalty not exceeding £20: (a) coercion of a person by violence or intimidation manifested either towards himself, his wife, or children, or his property; (b) persistently following a person about from place to place; (c) hiding his tools or other property; (d) picketing, i.e. watching or besetting a person at his house or place of business, or the following a person about in the streets in a disorderly manner by two or more persons. This has been altered by the Trades Disputes Act, 1906, which allows peaceful picketing for the purpose of communicating information by persons acting in furtherance of a trade dispute; (e) wilful and malicious breaking of his contract of service by an employee of a gas or water company, with the knowledge that such breach will cause a failure of gas or water; (f) wilful or malicious breach of contract endangering human life, or tending to cause serious bodily injury or expose valuable property to destruction. By the combined operation of section 3 of the Act of 1875 and section 1 of the Act of 1906, trade disputes stand above the ordinary law in some of their probable consequences; for if, in connection with such a dispute, two or more persons combine to do an act which if done by a single individual would not be punishable criminally, they will not, merely because of their number, be liable either to criminal proceedings or to a civil action. See also COMBINATION, LAWS OF. See F. Pollock, *The Law of Torts*, 1929; Sir W. O. Russell, *Crime: a treatise on felonies and misdemeanours*, 10th ed. by J. W. C. Turner (2 vols), 1950.

Constable, Archibald (1774-1827), founder of the *Edinburgh Review*, 1802, which he managed for 24 years, and indirectly of the publishing firm which still bears his name. He pub. Scott's first original work in 1805, and gave him £1000 for *Marmion* (1807). C. & Co. also pub. most of Scott's prose works from 1813 to 1826. In 1825 C. failed for about £250,000. This failure, together with that of the printers, Ballantyne & Co., involved Scott in the heavy loss of £120,000. C. purchased the copyright of

the *Scots Magazine* in 1801, and the copyright and stock of the *Encyclopaedia Britannica* in 1812. *Constable's Miscellany* was started in 1827. See J. G. Lockhart, *Memoirs of the Life of Sir Walter Scott, Bart.*, 1837-8, and Sir L. Stephen's biography of Scott in the *Dictionary of National Biography*, 1889-91.

Constable, Henry (1562-1613), Eng. poet, graduated from St. John's, Cambridge, 1580. He early turned Rom. Catholic, and spent much of his time abroad in Paris. In 1598 he was trying to form a new Eng. Catholic college in Paris. C. came to London without permission, 1603, and was confined in the Tower for about a year. He was a friend of Sidney, Harington, and Bolton. His *Diana: the Praises of his Mistress in certain sweet sonnets* was pub. 1592, and is a series of 23 sonnets, praised by Jonson and others. C. also wrote 16 *Spiritual Sonnettes to the Honour of God and his Sayntes* (these were first printed by T. Park from MS. in 1815), and *The Shepheard's Song of Venus and Adonis, in England's Helicon*, 1600. W. C. Hazlitt collected his works in 1859.

Constable, John (1776-1837), landscape painter, was the son of a mill-owner of E. Bergholt, Suffolk. Even in the days when he attended Dedham Grammar School all his spare hours were devoted to painting. Thus, although he was at first sent to work in the windmill, his father soon yielded to his passion for art, which had been fostered by his friendship with Sir George Beaumont and by his study of Claude's 'Hagar and Ishmael', and in 1795 allowed him to go to London to consult Joseph Farington, R.A., whose modern fame has been established by the discovery of his MS. diary in 1921. The final result of this visit, during which he was taught etching by J. T. Smith (q.v.), was that in 1799 he entered the Royal Academy schools, and definitely embraced the career of painting. Three years later he exhibited for the first time at the academy. In 1816 he married Mary Bicknell, after a weary period of waiting due to the opposition of her relatives. The year 1819 is important not only as the date of his election as an associate of the Royal Academy, but also as that in which he received £8000 in legacies—a timely gift which considerably relieved his monetary anxieties. Two years later he gained a gold medal at the Paris Salon for his splendid picture 'The Hay Wain,' and in 1825 he won another at the Lille exhibition for his 'White Horse.' His financial position was finally estab. in 1828 by an inheritance of £20,000 from Mr Bicknell, but any gratification he might derive from this gift was at once swallowed up in the inconsolable grief which he felt at the loss of his wife in the same year. He never recovered from the shock of her death, and his own death in 1837 was due as much to nervous depression as to any physical weakness. The greater part of his life had been spent in London, latterly at Hampstead. His work may be studied in the national collections at Trafalgar Square, S. Kensington, and Millbank. Like

most young painters, he began by observing 'truth at second hand,' copying Claude and Ruysdael and imitating the technique of Girtin, Gainsborough, and the old Dutch masters. This period of apprenticeship lasted till 1806, the year of his visit to the Eng. lakes. The altar-piece which he executed in 1804 for Brantham church is in the manner of Benjamin West, at that time president of the Royal Academy, and a kind patron to C. From 1806 to 1809 he was for the most part engaged in copying portraits by Hoppner and Reynolds,

JOHN CONSTABLE
From his self-portrait.

and seriously studied the science of oil-painting. The turning-point in his career was his exhibition of 'Dedham Vale' in 1811, in which he first gave his talent free scope and began to develop his striking originality. C. was thus a long while reaching his artistic maturity. His range of subjects was limited, being mostly restricted to the scenery of Suffolk, Salisbury, Hampstead, and Brighton, but he really knew the old mills and rustic bridges, the great trees and waterways, the corn-fields, and above all the skies that he depicted. His experience as a miller must have taught him to study the clouds; at least he is unequalled in his presentation of the sky in April before a heavy shower, or of the lowering clouds that presage the storm's approach. Truthfulness is the salient feature in his detail, his broad composition, and his atmospheric effects. His pictures seem to breathe the life of the farmyard and

the fields. Their fresh, natural colours are not the least of their merits. In his vivid tones C. was following the example of Rubens and Claude, so that it is untrue to regard him, as was not infrequently done, in the light of an opponent of the old masters. His technique influenced Delacroix, Corot, and indirectly the French impressionists, and modern criticism values highly his small swift sketches made from nature for their directness of handling. C.'s reputation rests on his faithful portrayal of the beauties of Eng. landscape and rustic life, and especially of the light-and-shade effects of rain clouds through which the sun's rays are doing their best to penetrate. It is a pity that Ruskin in his admiration of Turner and the Pre-Raphaelites should have been blinded to the true greatness of C. High prices are given for his pictures. Thus 'Dedham Mill' was sold in 1848 for £550; and a free study in pencil by C. for his picture 'The Leaping Horse' was sold in the same year for £40. The mezzotints of David Lucas (1855) are among the finest engravings after C. Among his many pictures are 'The Leaping Horse,' 1825, perhaps his masterpiece; 'The Cornfield,' 1827; 'Dedham Vale,' 1828; 'Hadleigh Castle,' 1829; 'Salisbury Cathedral,' 1831; and 'The Valley Farm,' 1835. See C. R. Leslie, *Memoirs of the Life of John Constable*, 1843; C. J. Holmes, *Constable and his Influence on Landscape Painting*, 1902; A. B. Chamberlain, *John Constable*, 1903; H. W. Tompkins, *In Constable's Country*, 1906; E. V. Lucas, *John Constable, the Painter*, 1924; S. Key, *John Constable, his Life and Work*, 1948.

Constable (from Late Lat. *comes stabuli*, count of the stable, marshal), word of widely different meanings in different countries and at different periods in the same country: (1) In France in the Middle Ages the C. of France had the chief command of the army and jurisdiction in military offences; he also had the control of all matters relating to chivalry. One of the most celebrated holders of the office was Bertrand du Guesclin. The office was finally abolished in 1814. (2) In England the lord high C. appointed after the Conquest as an officer of the Crown, had duties not dissimilar to those of the C. of France. For centuries the office was hereditary in the families of the earls of Hereford and Essex, and afterwards of the dukes of Buckingham. The office has been extinct since the attainder (q.v.) of the Duke of Buckingham in the reign of Henry VIII, although it is revived *ad hoc* on such special occasions as coronations. (3) High C.s were appointed in England from the reign of Henry VII. They were chosen at the court-leets of the hundred over which they presided. They were appointed to keep the peace in their sev. dists., but are now virtually abolished. (4) Petty or par. C.s were appointed to maintain the peace in manors, vils., and tithings when increasing pop. made the duty too onerous for high C.s alone. Par. C.s were practically abolished by the County Police Acts of

1839 and 1840, which estab. the co. constabulary, and provided that par. C.s should only be appointed by the magistrates of general or quarter sessions when deemed necessary. (5) Special C.s are sworn in by justices in cases of special emergency. The necessity for both high and petty C.s has been obviated to a great extent by the institution of (6) the modern police force, which dates from the Metropolitan Police Acts of 1831 and 1840, and, so far as bors. are concerned, the Municipal Reform Act, 1835, and the Municipal Corporations Act, 1882. *See* POLICE.

Constance (Ger. *Konstanz*), Ger. tn in the *Land* of Baden-Württemberg (q.v.), on the Rhine at its exit from the Lake of C. (qq.v.) 77 m. S. of Stuttgart. Originally a Celtic, and later a Rom., settlement, it became a bishopric in the 6th cent. In 1183 Frederick I (q.v.) made peace at C. with the Lombard tns, and in 1192 the tn was made a free city of the empire. Some of the sittings of the Council of C. (q.v.) of 1414-18 were held in the cathedral and others took place in the *Kaufhaus*, the Merchants' Hall—Jerome of Prague and John Huss (qq.v.) were condemned at this council and were burnt at the stake in 1416. The tn was occupied by the Austrians in 1548, and it was besieged by the Swedes in 1633, during the Thirty Years' War. In 1805 it became part of Baden. Its bishopric was suppressed in 1821. There is a fine Romanesque cathedral, begun in 1052; a Renaissance *Rathaus*; an old Dominican convent, now a hotel; and there are some anct mansions. The house in which the peace of 1183 was signed still exists. In the Middle Ages C. was famous for its linen industry; it has now various textile and metal manufs., and has a large lake trade—much of it with Switzerland. Pop. 47,000.

Constance, Council of. This council was called together for the purpose of reforming the Church. The Emperor Sigismund and Pope John XXIII, with many Church dignitaries and men holding high office in the state, sat on this council, which lasted from 1414 to 1418. There were at the time 3 popes, Gregory XII and Benedict XIII sharing their power with John, and as the object of the council was to secure unity in the Church the only course open was to do away with this div. of rule, which was effected by the deposition of all three and by the election of Martin V. The general reform, however, which had been hoped for was not brought about, although it was decreed that councils were to be called periodically and that in the case of schism the final decision should lie with them.

Constance, Lake (Ger. *Bodensee*), lies between Switzerland, Germany, and Austria. It is about 45 m. long, 8 m. broad, and 1300 ft above sea level. Area 208 sq. m. At its NW. extremity it divides into two, the N. branch being called the Überlingen Lake and the S. the Untersee. This lake has sev. tribs., the largest one being the Rhine which flows right through it, while among its smaller ones are the Argen, the Schussen, and the

Aach. L. C. sometimes rises considerably above its usual height owing to the melting snow, but it is hardly ever frozen over. There are 2 is. in the lake, Reichenau and Mainau, both belonging to Germany, and sev. tns on its banks, the chief being Bregenz, Lindau, Friedrichshafen, Überlingen, C., Romanshorn, and Rorschach. There is a regular steamboat service on the lake.

Constans I, Flavius Julius, Rom. emperor (337-50), youngest son of Constantine the Great and Fausta. Made Caesar in 333, he became joint emperor with his brothers, Constantine II and Constantius II, in 337, Italy, Africa, and W. Illyricum falling to his share. In 340 he defeated Constantine, who fell in battle near Aquileia, thus becoming master of the whole W. He favoured Athanasius, who was proscribed by the Arians, but C. was weak and depraved in character. He was killed while hunting in Gaul by an emissary of the usurper Magnentius.

Constans II, Flavius Heraclius (650-668), Byzantine emperor, elder son of Constantine III, ruled 641-68. He lost Syria, Cyprus, Rhodes, and Africa to the Saracens and Arabs, being defeated by the latter at sea, off Lycia, 655. He also fought unsuccessfully against the Slavs around the R. Danube, and lost N. Italy to the Lombards, 641. His attempts to reconquer Italy, 662, and make Rome the empire's cap. were futile. In order to end controversy between the Monothelites and the orthodox C. issued an edict forbidding all discussion of the subject. C. was probably assassinated. His son, Constantine IV (Pogonatus), succeeded him.

Constant, Jean Joseph Benjamin (1845-1902), Fr. painter and writer on art. He studied under Cabanel. Quite early he exhibited in the Salon; his 'Hamlet' was bought (1869) by the Fr. Gov. He began to paint Oriental subjects during travels in Spain and Morocco; his best E. pictures, the 'Prisoners of Morocco,' 1878, now in the Bordeaux museum, and 'The Last Rebels,' in the Luxembourg collection, are sensuous in feeling and colour. He decorated later the ceiling in the Opéra Comique and the ceiling of the Hôtel de Ville, Paris; and dramatic panels in the New Sorbonne. There is a fine series of his portraits, for which he was highly esteemed, in the Toulouse museum. He painted a portrait of Queen Victoria which was exhibited at the Royal Academy in the year of her death (1901). Among his works are 'Samson et Dalila,' 1872; 'Mohammed II,' 1876; 'Le Jour des Funérailles,' 1889; and portraits of M. Hanotaux, 1898; Pope Leo XIII, M. de Blowitz, 1902; and Queen Alexandra, 1901.

Constant, in mathematics, a quantity that never changes its value throughout an investigation or process (in contradistinction to variable quantities) often used, as in the differential calculus, to determine a series of changeable values. An absolute C. is one whose value is exactly the same under all circumstances

(e.g. any cardinal number); an arbitrary *C.* is an undetermined *C.* in a differential equation, keeping the desired value assigned to it unchanged during all changes in the value of the variables. Examples: circular *C.*, *C.* of aberration, gravitation, tidal *C.s.*, etc.

Constant de Rebeoque, Henri Benjamin (1767-1830), Fr. statesman and novelist, b. Lausanne of Huguenot parents and settled in Paris at the beginning of the Revolution. The influence of Mme de Staël and Talleyrand may be traced in his *Mélanges de littérature et de politique*, 1829. *C.* was expelled from France in 1802 along

HENRI BENJAMIN CONSTANT

with Mme de Staël for denouncing the military ascendancy of Napoleon, and lived for a time at Weimar in the society of Goethe and Schiller; but he modified his views, and in 1814 returned to support the Bourbons and constitutional liberty. His chief work is *De la religion*, 1824-30, in 5 vols. (he was a rationalist in religion); he wrote also *Cours de politique constitutionnelle*, 1817-20, in 4 vols. His celebrated novel *Adolphe*, 1816, a more or less autobiographical account of his relationship with Mme de Staël, is one of the first analytical novels of modern literature. His novel *Cécile* was first discovered and ed. in 1951. See *Journal intime de B. Constant* (covering the period 1804 to 1816), 1894; *Le Cahier rouge* (autobiography from 1767 to 1787), 1907; G. Rudler, *La Jeunesse de B. Constant*, 1909; *Adolphe* de B. Constant, 1935; C. Du Bos, *Grandeur et misère de B. Constant*, 1946; H. Nicolson, *Benjamin Constant*, 1949.

Constanța, Constantza, or Kustenji, seaport on the Black Sea, at E. end of

Trojan's Wall, is the prin. port of Rumania, and exports large quantities of grain, petroleum, and livestock. It has a fine harbour, opened in Oct. 1910. There are nearly 3 m. of quays, and a pipe-line runs to the Rumanian oil fields. The commerce of the port amounted to 2,000,000 tons in 1927. Tomi, famous as the place of Ovid's exile, was its anc. name. A battle was fought between Russians and Turks at *C.* in 1854, and it was severely damaged in the First World War, being occupied by a Germano-Bulgar army in Oct. 1916. In the Second World War the Russians launched an offensive in Rumania against the Ger. and Rumanian forces on 22 Aug. 1944, and captured *C.* on 29 Aug. Pop. (1948) 79,000.

Constantia, tn in Cape Prov. lying under Table Mt.; originally an old Dutch wine farm and founded by Simon van der Stel about 1690. From this place derives the name of a famous Cape wine which enjoyed great popularity in Europe during the 18th cent.

Constantina, Sp. tn in the prov. of Sevilla. It has lead mines, and a trade in agric. produce, timber, and cork. Pop. 11,000.

Constantine II, see CONSTANS I.

Constantine III (612-41), Byzantine emperor, son of the Emperor Heraclius. He succeeded his father in 641 and *d.* in the same year. His short reign was full of disorder and constant internal strife. He is said to have been poisoned by his stepmother.

Constantine IV, Pogonatus (648-85), Byzantine emperor, son of Constans II, whom he succeeded in 668. The earlier part of his reign was occupied by a campaign in Sicily, where a usurper had been declared emperor. Immediately after he had successfully dealt with this, he was occupied in a struggle with the Arabs, who were finally forced to sue for terms. Though a capable and energetic ruler and a good soldier, he was unable to prevent the settlement of the Bulgars and the setting up of a Bulgar kingdom (679).

Constantine V, Copronymus (719-75), Byzantine emperor, son of Leo III the Iconoclast, whom he succeeded in 741. He did much to encourage trade, restore prosperity, and strengthen the empire, but is remembered especially for his religious policy. He forced the iconoclastic doctrines to be upheld throughout the empire, and so caused a break with the papacy, which from this time ceased to be dependent upon the emperors, and looked for help rather to the W. and the Franks. He also engaged in sev. campaigns against the Arabs, Avars, Slavs, and Bulgars.

Constantine VI (770-97), Byzantine emperor, Isaurian dynasty. He succeeded in 780, at the age of ten, and the empire for the next few years was ruled by Irene, the empress-mother. Eventually his mother caused *C.* to be seized and blinded and she subsequently reigned alone. His reign was disastrous, and during it the Arabs and Bulgars won many successes. It is chiefly notable for

the fact that the general council of Nicaea was held during it, 787.

Constantine VII, Flavius Porphyrogenitus (905-59), Byzantine emperor, the son of Leo VI. He succeeded his father in 912, and during the early part of his reign the empire was administered by Romanus Lecapenus, with the help of C.'s mother, Zoë. In 944 C. at last obtained real power. He wrote a number of books, and these give much information on this period. His *De Administrando Imperio* was written to aid his son Romanus in the gov. of the empire. By this same son he is said to have been poisoned.

Constantine VIII (d. 1028), Byzantine emperor, brother of and co-ruler with Basil II. From 1025 until his death C. ruled alone, devoting himself to a life of pleasure, and giving little attention to the affairs of state.

Constantine IX (d. 1055), Byzantine emperor. He was a soldier, who owed his throne to Zoë, the widow of Romanus III, whom he married. C. was emperor 1042-55. He neglected the defence of the empire, and spent huge sums in erecting magnificent buildings. During his reign Byzantine influence in Italy practically disappeared, owing to the conquest of Lombardy by the Normans, and the rift between the W. and E. Churches became complete.

Constantine X (1007-67), Byzantine emperor. He ruled from 1059 but failed to justify the hopes that had been placed in him. During his period of rule the empire was fiercely attacked by the Turks and Magyars. C. spent the greater part of his time in devotion to philosophic trifles, and neglected the military security of the empire. The last hold of the empire on Italy was lost in this reign by the capture of Bari.

Constantine XI, Palaeologus (1404-53), Byzantine emperor, son of Manuel II. When Mohammed II attacked Constantinople in 1453, C. led the final desperate resistance, having only about 9000 men in his garrison, and the help of 700 Venetians and 2 Venetian ships. When the city was carried by storm, 29 May, C. was killed in the fighting. This marked the end of the Byzantine Empire.

Constantine I (1868-1923), King of the Hellenes, b. at Athens, eldest son of King George I. In 1889 he married Sophia Dorothea, sister of the Emperor William II of Germany. For the disastrous result of the Gk campaign in Thessaly 1897, C. as generalissimo was held responsible; nevertheless he became commander-in-chief, and so remained till 1909, when the Military League compelled his retirement, and he went to Paris. On the rise of Venizelos, 1910, C. recalled, was made inspector-general, and in 1912-13 he successfully commanded the forces in Macedonia. The assassination of his father, 18 Mar. 1913, brought C. to the throne. He was successful against the Turks and Bulgarians in Macedonia and Thrace; and before the year ended his dominions were double those of his father in area. He remained neutral in

the First World War, but showed such partiality to the central powers that Venizelos resigned, Mar. 1915, coming back, however, with a large parl. majority. Eventually C. was deposed, 1917. After 3 years in Switzerland he was recalled by plebiscite, and returned, Dec. 1920. He prosecuted in Asia Minor a campaign that ended disastrously, Sept. 1922. A year later there was an insurrection in the army, and C. abdicated in favour of his son George (q.v.).

Constantine, Pope (708-15), journeyed to Constantinople to confirm decrees of the Quinisextine Council at the invitation of Justinian II.

Constantine, cap. of the dept. of C. in the E. of Algeria. The tn is picturesquely situated at an altitude of 2150 ft above sea level, on an entirely isolated chalk rock, which is washed on 3 sides by a stream flowing through a deep ravine. C. consists of the European quarter and the old Arab quarter, which has preserved an intense local colour. The work of the native saddlers and shoemakers is famous, as also the woollen stuffs made here. It has railway communication with Bona, Philippeville, Algiers, Biskra, Tebessa, and Tunis. C.—in Rom. times called Cirta—was a city of the Maesylli in Numidia, and the cap. of Syphax and of Massinissa and his successors. In the Jugurthine war Adherbal was besieged here by Jugurtha and slain in 112 BC, and the tn compelled to surrender. It was destroyed in AD 311, but was rebuilt by C. the Great in 312, was taken by the Arabs in 710, and by the Fr. in 1837. The pop. of the tn. is 148,720, of whom approx. 45,000 are Europeans; of the dept. 2,704,100 of whom 70,000 are Europeans.

Constantine the Great, see **CONSTANTINUS I**.

Constantinople, see **ISTANBUL**.

Constantinople, Councils of. Of the eight oecumenical councils convoked previous to the great schism, the first was held at Nicaea, and the second, fifth, sixth, and eighth were held at Constantinople. The first council of C. (AD 381), of 150 bishops under Pope Damasus and Emperor Theodosius I, confirmed the Nicene Creed and condemned Apollinarianism—a heresy directed against the divinity of Christ. The second council of C. (553), of 165 bishops under Pope Vigilius and Emperor Justinian I, condemned the Nestorian heresy. The fifteen anathematizations on Origen, sometimes ascribed to the fifth oecumenical, belong to a council held at Constantinople in 543. The third council of C. (680-1), under Pope Agatho and Emperor Constantine Pogonatus, defined a human and a divine will in Christ, thus terminating Monothellism. The fourth council of C. (880), of 102 bishops under Pope Adrian II and Emperor Basil, is only recognised as oecumenical by the Church of Rome. It condemned Photius, who had seized the see of Constantinople, but the Photian schism was successful, and no other general oecumenical council was held at Constantinople. The chief work of the C. of C. was in matters of the theology of the Incarnation, but their

decisions show a wide scope. See also COUNCILS, CHURCH.

Constantinus, Rom. serving as a common soldier in Britain in the reign of Honorius (AD 395-423). His troops proclaimed him emperor in 407, and overran most of Gaul. Honorius acknowledged him as emperor in 408, to win his support against the Goths. C. then advanced into Italy itself, hoping to depose Honorius. The rebellion of his general, Gerontius, compelled him to return to Gaul, where Honorius's general and son-in-law, Constantius, defeated both at Arles. C. was executed.

Constantinus I, Flavius Valerius Aurelius (Constantine the Great) (c. AD 288-337), b. in Moesia, son of Constantius Chlorus and Helena, first Christian emperor of Rome (306-37). After serving under both Diocletian and Galerius (q.v.) C. joined his father in Britain, and was proclaimed emperor in York by the legions on Constantius's death there (306). Galerius only granted him the title Caesar, reserving that of Augustus for his own son, Severus. In 307 C. married Maximian's daughter Fausta, but in 309 he put his father-in-law to death for plotting against him. In 312 C. marched against Maxentius, an aspirant to the Rom. Empire, who was thrice defeated in Italy and finally drowned in the Tiber while trying to escape. C. was converted about this time by the apparition of a cross in the sky with the legend *en tout nika* (by this conquer). This story is told by Eusebius, who professes to have had it from the lips of C. himself, and also, with much variation in details, by Lactantius. Being now supreme in the W., C. promoted order and prosperity among his subjects, and encouraged Christianity. In 323 he defeated Licinius, another aspirant to the Rom. Empire, one near Adrianople and again opposite Byzantium, becoming sole emperor of both E. and W. In 325 he assembled a general council at Nicaea, at which Arianism was condemned and the Nicene creed adopted. C. transferred his cap. from Rome to Byzantium about 328, naming the tn after himself Constantinople. He is said to have had himself baptised in 337, having 3 years earlier proclaimed Christianity the State religion. There is, however, much discussion as to his Christianity or Paganism. See Eusebius, *De Vita Constantini* (trans. 1846); E. Gibbon, *The Decline and Fall of the Roman Empire*, 1776-88; J. B. Bury, *History of the Later Roman Empire*, 1889; J. B. Firth, *Constantine the Great*, 1905; C. B. Coleman, *Constantine and Christianity*, 1914.

Constantinus I (Chlorus, the pale), Flavius Valerius, Rom. emperor, father of Constantine the Great, b. c. AD 250. In 293 Diocletian and Maximian chose Galerius and C. to help them with the administration of the empire, each receiving the title Caesar. Gaul, Spain, and Britain were assigned to C. On the abdication of Diocletian and Maximian in May 305 C. became emperor of the W., Galerius of the E. He was a brave soldier and an able, humane, and just

ruler. He d. at Eboracum (York) during an expedition against the Picts.

Constantius II, Flavius Julius (AD 317-61), third son of Constantine the Great, who by will left his empire to his sons Constantine II, C. II, and Constans I as Augusti, with his nephews Dalmatius and Hanniballianus as Caesars and Nobilissimus respectively. On their accession, 337, C. is said to have allowed the murder of Dalmatius and Hanniballianus. Thrace, Macedonia, Greece, the Asiatic provinces, and Egypt were allotted to him. He had been Caesar under Constantine I as early as 333. Throughout his reign he was at war with the Persians, and often defeated by them, notably in 348. When in 350 the revolt of Magnentius resulted in the death of Constans I, C. defeated the former at Mursa on R. Drave, 351, and in Gaul, 353, becoming master of the whole empire. In 355 C. made his cousin, the apostate Julian, Caesar and commander in Gaul. In 357 he visited Rome for the first time. He favoured the Arians, and banished the orthodox bishops. When Julian was proclaimed emperor by his troops in Gaul, C. moved west to oppose him, but d. near Tarsus in Cilicia.

Constantius III, Rom. soldier, native of Illyria. He captured Constantine the Tyrant in AD 408, and held the rank of general by 411. He put down the rising of Attalus, 416. C. married the sister of Honorius, who made him partner of his empire, 421. For seven months C. was emperor of the W., but Theodosius II, emperor of the E., refused to acknowledge him. While preparing to make war on Theodosius C. d. at Ravenna. His son became Valentinian III.

Constantza, see CONSTANTIA.

Constanz, see CONSTANZE.

Constellation, group of fixed stars conceived generally as representing some mythological figure. The stars may be regarded as forming the framework of these imaginary figures; thus in the well-known N. C., Ursa Major (The Great Bear), a portion of which is called the Dipper, the Plough, or Charles's Wain, the rough parallelogram formed by four bright stars forms the body of the imaginary bear, whilst the three other bright stars starting in a curve from the top of the parallelogram constitute the tail. The origin of the C.s is lost in the mists of the past, but it would seem that the Chaldeans were the first to give names to groups of stars. From them this star-lore was passed on to the Greeks, and mention is made of sev. C.s by Homer and Hesiod. About 366 BC a Gk astronomer, Eudoxus of Cnidus, described a list of C.s which is substantially the same as that in use at the present day, and his work was versified by Aratus, the Gk poet who in his *Phenomena* mentions 45 C.s. Ptolemy mentioned 48 star-figures: 21 N. of the ecliptic; the 12 signs of the Zodiac (q.v.); and 15 S. of the ecliptic. Of course the ancients, not knowing of the S. terrestrial hemisphere, were equally ignorant of the S. celestial hemisphere. The S. C.s were gradually added during the 16th, 17th, and 18th cents., the chief workers in this

field being Petrus Theodori (d. 1596), Bartolaeus (1624), Hevelius (1690), and Lacaille (1752). The total number of C.s is now 88, and their boundaries have been fixed. This very necessary work was done by a committee of the Brit. Association appointed in 1840, and presided over by Sir J. Herschel. The International Astronomical Union fixed the C. boundaries definitely in 1928. See under specific names; STARS; ZODIAC; also ASTRONOMY.

THREE CONSTELLATIONS OF THE NORTH

Constipation, stoppage or irregular or incomplete emptying of the bowel. The intestinal contents are propelled onwards by rhythmic muscular contractions of the bowel (see PERISTALSIS). Peristalsis is aided by physical activity and by adequate and suitable food intake. The residue which reaches the lower bowel after digestive extraction of the bowel contents is complete is known as faeces. The faeces collect in the rectum, distending it and causing a desire to defaecate. Acute C. may be due to a blockage of the lumen of the bowel, and is then a symptom of the disease causing the obstruction. Temporary C. may be due to some intercurrent general illness or a change of food habit. Chronic C. usually starts from neglect regularly to evacuate the bowel when this is indicated. This leads to overloading and overstretching of the lower bowel and, in turn, to a loss of tone or contractile strength of the musculature of the bowel wall. A vicious circle is thus set up.

Constitución, tn, cap. of C. dept, Maule prov., on the coast of Chile, situated at the mouth of the Maule R., 115 m. NE. of Concepción. It is a railway terminus (Talca 56 m.) and a favourite seaside resort. Some ship-building is done there, and the chief products are grain and timber. A dangerous bar exists in the roadstead caused by the R. Maule washing down large quantities of sand. Pop. 7000.

Constituencies, see ELECTORATES.

Constituent Assembly, Russian, democratically elected representative assembly which met in Petrograd 18 Jan. 1918 and was dispersed by the Bolsheviks after a single session. The demand for a C. A. to estab. a democratic system in Russia had been common to all radical parties. After the abdication of Nicholas II and his brother in 1917 the Provisional Gov. (q.v.) was preparing elections to the

C. A., to which it was to surrender power. The Bolsheviks accused the gov. of delaying the elections and used this as a pretext to seize power and set up their own gov., which they at first also called 'provisional.' The elections to the C. A., based on universal, equal, and direct franchise, secret ballot, and proportional representation, were held in most constituencies on 25-27 Nov. 1917; in seceding regions they were postponed, and in some 100 constituencies were not in the end held. The Bolsheviks lost the election, securing 9.8 million votes out of 41.7 million cast. Socialist Revolutionaries received 17 million, Mensheviks 1.4 million, Constitutional Democrats 2 million votes. Various non-Russian parties received a total of 7.6 million votes, of which 5 million were cast for Ukrainian parties. About 2 million went to minor parties and the rest cannot be identified. Of 707 elected deputies, 370 were Socialist Revolutionaries, 175 Bolsheviks, 40 Left Socialist Revolutionaries (pro-Bolshevik), 16 Mensheviks, 2 Popular Socialists, 17 Constitutional Democrats, 86 representatives of national parties, and one is unknown. Sev. leading Constitutional Democrat and Socialist Revolutionary deputies were arrested on arrival in Petrograd, and the Constitutional Democrat party was outlawed before the C. A. met. At its single session the elected chairman could not preserve order, and the guards—sailors headed by an anarchist—were openly hostile. When the Bolsheviks' demand that the C. A. should recognise the Soviet Gov. and all its decrees was rejected, they walked out, followed by the Left Socialist Revolutionaries. The remaining deputies hastily debated and approved an Address to the Allied Powers, a Resolution on the State Structure of Russia, and a Land Law, after which the meeting was dispersed by the guards on orders from the Bolshevik Gov. The idea of upholding the authority of the C. A. was used by the Socialist Revolutionaries in the ensuing civil war, and an ephemeral anti-Bolshevik Gov. was estab. by a committee of C. A. members in Samara in 1918. See O. H. Radkey, *The Election to the Russian Constituent Assembly of 1917* (Cambridge, Massachusetts), 1950; W. H. Chamberlin, *The Russian Revolution* (New York), 1954; L. B. Schapiro, *The Origin of the Communist Autocracy*, 1955.

Constitution, in politics, a system of law estab. by the sovereign power of a state for its guidance. Its main objects are to fix the limits and define the relations of the legislative, judicial, and executive powers of the state, both among themselves and with reference to the citizens of the state, regarded as a governed body. In the countries of continental Europe, since the foundation of the U.S.A., or at least since the first Fr. Revolution, the idea of a C. has been generally that of a written public law, promulgated by the sovereign power. In Great Britain it is the whole body of the public law, customary as well as statutory, which is continually being modified

by the general will as interpreted and expressed by the parliamentary representatives of the nation. A constitutional monarchy is one in which the sovereign is restricted in his powers by the nation's representatives; the granting of a C. accordingly means the transforming of a monarchy more or less absolute into a constitutional state. The C.s of modern Europe are political systems of establishing the gov. of a nation by the nation itself. The first historical type of a C. as expressed in Magna Charta, is a direct emanation of the feudal system. Later it was amended, enlarged, and assured by successive agreements between the nation and its sovereign, and although it has never been written, the Brit. C. stands in our days a great deal firmer and less vulnerable than the European C.s for which it has been a pattern. The Eng. C. rests on a pact; it is the normal and uninterrupted development of the principle of respect for the rights of corporations representing the nation. Other C.s, notably that of the Fr. Republic, are based on the right of the whole body of the citizens to govern themselves. These two principles differ greatly. The necessity of a C. is accentuated not only in all federated republics (most of the existing republics are federated or quasi-federated), but also in all other federated states, such as was formerly the case with the federated monarchies of Germany. In those federated states the C. has, in some way, the character of a treaty concluded between the different states combined in one federation, and thus it is quite different from any ordinary law. The pattern of the C. of a federal republic is that of the U.S.A., adopted before the outbreak of the Fr. Revolution. The other Amer. republics are wavering between the Fr. system and that of the U.S.A., but favour the former. There have been still more complicated constitutional systems, such, for example, as that of Austria-Hungary, a dual monarchy composed of two different countries practically independent of one another, but ruled by the same monarch. There may also be a confederation of sev. monarchies, as was the old Ger. confederation, broken up through the issue of the Austro-Prussian war of 1866. Absolute monarchies had no C.s, but were in certain ways ruled by traditions, such as the succession to the throne, to which every absolute ruler had to submit. These traditions, which Louis XIV and the most powerful of the Russian autocrats had to observe, were for absolute monarchies what the C. is in constitutional states. In the present cent., until the advent of totalitarianism and the era of neo-dictatorships, all modern states enjoyed more or less liberal C.s, which, however, differed very much in character from one another, but might be generally classified as (1) constitutional monarchies; (2) unitarian republic (France); and (3) federal or quasi-federal republics (U.S.A., Germany, U.S.S.R., Switzerland, Australian Commonwealth, Brazil, Mexico, etc.)—though, as is shown below, many apparent federal republics

are really unitary states. Modern constitutional monarchies in Europe, before the Second World War, were Great Britain, Belgium, Holland, Denmark, Norway, Sweden, Italy, Spain, Rumania, and Bulgaria. Most of these remained unchanged after the war, but Italy rejected the king and became a republic. Spain had ceased to be a monarchy in 1931. In Rumania the C. of 1866 (as modified in 1923), which proclaimed the state of Rumania as a constitutional monarchy, was restored by royal decree of 31 Aug. 1944; but the king was forced to abdicate in 1947 and a People's Republic was proclaimed. Before the First World War Germany, Austria-Hungary (the dual monarchy), Serbia, and Greece were also constitutional monarchies, as were also, conditionally, Russia and what remained of Turkey in Europe. In Greece a plebiscite estab. a republic from 1924 to 1935, in which latter year the monarchy was restored. The Ger. invasion of Greece in 1941 forced the king into exile, and after the war he set up a regency pending a plebiscite on the issue of monarchy or republic, the people in 1946 choosing to retain the monarchy. France is the one avowedly unitarian republic in existence, but many other federal states are in effect unitary. In France the new C. of the Fr. Union was adopted after the war. It provides for three organs of gov. At the head is a president of the union, who presides over the Supreme Council of the union, composed of the members of the gov. and of representatives of the member states; the third organ of gov. being an assembly of the Fr. Union consisting of representatives of metropolitan France and of the member states.

Developments since the First World War. Through the world-wide upheaval of the First World War the structure of many national C.s considerably changed. The three or four prin. causes effecting these changes may be briefly enumerated: First, the further development of political democracy, a growth that had been going on before the war, but which the war intensified. The U.S.A. was to a great extent the arbiter of the settlements reached after the war and the initiator and supporter of European efforts at reconstruction and integration; consequently Amer. ideas of political democracy had a wide influence among European statesmen when they came to overhaul their constitutional machinery. The influence of the ideals of President Woodrow Wilson was immense in the years of reconstruction immediately after the fighting, and Amer. distrust of 'this king business' gave added impetus to the republican movement throughout Europe. The Ger. (Weimar) C. owed much to these ideals. Second, there was the impact of the feminist movement. Here again the war did but intensify a pre-war movement, and the aid that women rendered their countries was sufficient at its close to ensure in most European countries that women's franchise should be estab. as part of the constitutional machinery. France was the sole great European

country that made no concession to this movement. Third, the economic repercussions of the war and the post-war depression. In all the countries of the combatants, victors and vanquished alike, who should pay for the war was the paramount issue of politics, and the unrest that ensued on the attempted solutions of this problem strengthened the influence of Russia and fostered the growth of socialist parties throughout the world (much intensified after the Second World War). This, in its turn, brought about in countries like Hungary and Bavaria short-lived attempts to imitate the Russian revolution. The counter-revolutionary forces awakened by these premature attempts—forces like Fascism in Italy, the Magyar movement in Hungary (see HUNGARIAN REVOLUTION), the National Socialist and Heimwehr movements in Germany and Austria respectively—were anti-democratic and anti-feminist. Where these movements triumphed in Europe the general disposition was to abolish, or at least to suspend, the former C.s. The Fascists (see FASCISM) in Italy, under the leadership of Mussolini (q.v.), entirely re-formed the It. C., the new corporate state there no more resembling the former C. of Italy than the C. of the U.S.S.R. resembles the C. of Tsarist Russia. In Spain the director of Primo de Rivera (q.v.) was content to suspend the C., but after his death the country became a republic, only to revert after the Civil war to a dictatorship. For Amer. C. see H. C. Hockett, *A Constitutional History of the United States*, 1939. For the C. of various countries see Dodd's *Modern Constitutions* (2 vols.), 1909, and *Select Constitutions of the World* (Irish Stationery Office, Dublin, 1922). See also E. Jenks, *The Ship of State*, 1939; W. Friedmann, *The Crisis of the National State*, 1943; K. C. Wheare, *Federal Government*, 1946.

Modern Federal and Quasi-Federal Constitutions. Recent years have seen the emergence of a strong movement for the federal form of C. as offering some hope of avoiding the anarchy of extreme nationalism (q.v.). This movement seemed to reach its climax at the time of Clarence Streit's *Union Now*, 1939, a well-reasoned plea for the association of some fifteen democratic national states in a world federation. But many of these states, such as Czechoslovakia and Austria, subsequently lost their sovereign status, and in any case this and other schemes inspired by W. ideas arbitrarily excluded partly or wholly non-European nations of great actual or potential strength such as Russia and China. Where there already existed strong common interests, common social and religious ideals, and geographical contiguity, a closer constitutional association naturally followed, as, for example, in the case of the sev. Amer. and Australian states. In these cases federation merely effectuated a common desire for closer constitutional bonds to achieve common defence and common economic interests, while leaving the constituent states as much autonomy as was consistent with

the overriding powers of the federal gov. An approach to federalism was the League of Nations with its covenant (q.v.) designed to check aggression through consultation and sanctions and an international military force. The failure of the League to check aggression made federal idealism of the kind envisaged by Briand (q.v.) in his dream of a super-European state seem too visionary. The founding of the United Nations Organisation has meant that national C.s must surrender some element of their sovereignty if U.N.O. is to prove effective.

A modern federal C. sometimes, though not always, represents a stage in a development from a loose association to a unitary state. The Ger. Confederation gave way to the federal Reich of 1870, to the more firmly knit federation of 1919, and eventually to the unitary state of Nazi Germany. The only true federal C.s existing to-day are those of the U.S.A., the commonwealth of Australia, and Switzerland. The new C. for the Soviet Union proclaimed in 1936 proposed a degree of decentralisation for the constituent republics that was not carried out in practice. The war partly explained the need to centralise power in the All-Union gov.; but it is in any event doubtful if the gov. of a socialist or other 'planned' economy can permit much real autonomy to local or regional authorities, however much they may differ socially, economically, or culturally.

The C. contemplated for India by the Government of India Act, 1935, was also quasi-federal. This Act provided for what was called a federation of India, composed of Indian states under their princes, and the provs. of Brit. India, the latter ruled by Indian ministers operating a system of responsible cabinet gov., not dissimilar from that of the Canadian provs. But, as in Canada, where the federal principle was modified by unitary elements in the form of control by the general executive over the prov. executive and legislature, so in the Indian C. the Governor-General of India was vested with powers of intervention in the affairs of the prov. govts., which modified the application of the purely federal principle; but at the same time that principle was introduced into the Act of 1935 to such an extent that it may be said to be the distinguishing characteristic of the C. contemplated by that Act (see K. C. Wheare, *Federal Government*, 1946). Part II of the Government of India Act, 1935, relating to federation, did not come into force on the attainment of Indian independence in 1947, and the Central Gov. carried on under the provisions relating to the transitional period. See also INDIA.

Totalitarian Constitutions. The distinguishing mark of the totalitarian C.s, and equally indeed of the Communist C. of the U.S.S.R., is the single-party dictatorial system of gov. based on the 'totality of the state,' as opposed to the liberal conception of the state which restricts the authority of the state to certain spheres of life, while leaving as many others as possible to the free decision

of the individual. The 'total state,' whether Fascist or Communist, extends the sphere of state influence over the whole life, private as well as public, and demands full submission of the individual to the requirements of the state. The National Socialist Germany of Hitler's day, and the Fascist Italy of Mussolini's, are the archetypes of totalitarian states. The Reichstag, elected in 1933, set aside the Weimar C. by yielding absolute power to Hitler. An Enabling Act of 1933 provided that the cabinet might make laws by ordinance, including even such laws as were not in accord with the Weimar C., which was not formally abrogated. In 1943 a decree was issued prolonging the life of the then existing Reichstag till 1947, but this body was in no sense a representative institution, nor had it any power of legislation or even debate. It met solely to effect the will of the chancellor Hitler, in whose personal dictatorship all the activities of the country, political, economic, industrial, etc., were *gleichgeschaltet* (totalitarianised). This, the working C. of Germany, provided for a leader and Reichskanzler, who was the supreme commander of the army and was also the leader in all political activities, both in the Reich and in the states. Under this quasi-C. freedom of speech and of thought and of the press was abolished, and equality before the law limited by the so-called Aryan paragraph, which arbitrarily granted full civic rights only to 'Aryans' (q.v.), while personal freedom from arrest, so familiar to Eng. political science from the passing of the Habeas Corpus Act, was curtailed by the activities of an officially recognised secret police. The constituent states of Nazi Germany were also deprived of their constitutional rights, for by the Unification Act of 7 April 1933, the federal states were all brought under the rule of governors directly responsible to Hitler; and by an Act of 1934 the sovereign rights formerly possessed by the federal states passed under the jurisdiction of the minister of the Interior, and the Reich Cabinet arrogated to itself the promulgation of new constitutional laws for the federal states.

The Fascist C. introduced in Italy, which prevailed until the Second World War, represented a radical transformation of the fundamental statute of the kingdom granted on 4 Mar. 1848 by King Charles Albert to his Sardinian subjects. By that statute or charter the executive power of the state belonged exclusively to the sovereign and was exercised by him through responsible ministers; the legislative authority was vested conjointly in king and Parliament, the latter being bicameral and consisting of a Senate and deputies. But under Mussolini's Fascist regime the Chamber of Deputies was replaced by a Chamber of Fasci and Corporations (see also CORPORATIVE STATE) composed of the 150 members of the National Council of the Fascist party and of the 500 effective members of the National Council of Corporations. The duties of the Chamber were performed by the full assembly, by the budget general

commission, and by the legislative commissions. There was also a Grand Fascist Council, which was composed of the *quadriviri* of the march to Rome as life members and various ministers and other dignitaries appointed for as long as they held their respective offices. This Grand Council existed to co-ordinate all the activity of the regime resulting from the Fascist revolution and to give its opinion on the lines of conduct of the Fascist party. Its approval had to be obtained on all questions of a constitutional nature, including those connected with the succession to the throne and the prerogatives of the Crown. In 1938 the position of the Duce or leader was incorporated in the C. of Italy. The Chamber, with the Senate, co-operated with the gov. in framing legislation. The executive power was exercised nominally by the king through the gov., but in fact by the Duce, who was only theoretically responsible to the king for the general political direction of the gov. The ministers were responsible both to the king and to the chief of the gov., i.e. to the Duce, for the actions of their respective offices. Thus, while It. Fascism served as a model to a number of similar movements in other countries, and in particular to Ger. National Socialism (q.v.), there was a somewhat higher degree of liberality in the Fascist C. of Italy than in that of Nazi Germany, where eventually Hitler placed himself above the law altogether and so made no pretence to rule constitutionally at all. For where in a Fascist or any other authoritarian state there is no real legislative body there is in effect no constitutional law; in the history of political science, absolutism has long given place to constitutional gov., and constitutional law has become supreme because only in virtue of its acceptance can the legislative body be constituted. See Sir W. R. Anson, *The Law and Custom of the Constitution*, 1886-92, 1922-35; S. G. Chrimes, *English Constitutional History*, 1948; A. V. Dicey, *The Law of the Constitution*, 9th ed. 1952; Sir Ivor Jennings, *The Queen's Parliament*, 1954; H. R. Greaves, *The British Constitution*, 3rd ed. 1955.

'Constitution of Athens,' one section of a lost work (*Politeia*) by Aristotle on the constitutional hist. of 158 states. It was known only by quoted fragments until 1890, when three rolls of papyrus (now in the Brit. Museum) were found in Egypt, containing a MS. copy of the 'C. of A.' made about ad 100. Aristotle's authorship is not now seriously disputed, and the date is put between 328 and 325 bc. The 'C. of A.' is divided into two sections. The first gives the hist. of the constitution up to the expulsion of the Thirty (404 bc). The second describes the state officials, their appointment and functions in the writer's own day. The beginning of the MS. is missing; the last section is mutilated, but can be reconstructed almost wholly from fragments. See the eds. of F. G. Kenyon (1891) and Sir J. E. Sandys (1912). There is a trans. (together with Aristotle's *Politics*) by John Warrington in Everyman's Library.

Constitutional Club, one of the leading Conservative political clubs. It is situated in Northumberland Avenue, London, W.C., and was estab. in 1883. It has 2500 members.

Constitutional Democrats (abbr. *Cadets*), Russian political party, formed in 1905 by left-wing liberals, mostly professional people. Its most prominent leader was Milyukov (q.v.). C. D.s were the strongest single party in the first State Duma in 1906, dominating its proceedings, and they were the main opposition party in the subsequent Dumas. In 1915 the C. D.s entered and greatly influenced the Progressive Bloc in the Duma, which united all parties except reactionaries and socialists with the aim of replacing the existing gov. by one which would command the confidence of the country. Having failed to achieve this they played a prominent part in the February revolution of 1917 and in the Provisional Gov.; they withdrew from the latter in July and were outlawed by the Bolsheviks soon after they seized power. See also DUMA; PROVISIONAL GOVERNMENT.

Consubstantial (from Lat. equivalent of Gk *homo-ousios*), of one and the same substance, essential being. The word is applied in Christian theology to the Three Persons in the Holy Trinity, each of whom possesses the whole Divine Being. The general council of Nicaea (AD 325) rejected the teaching of Arius (q.v.) (that the Son is of a separate Being or nature created by the Father) and endorsed that of St Athanasius (q.v.) that He is *homo-ousios* with the Father. It was found necessary to coin this unscriptural term to define and protect the scriptural teaching concerning the Unity of God and the deity of Christ, and it was incorporated in the Nicene Creed (q.v.).

Consubstantiation, the union of two metaphysical substances; the doctrine of the Real Presence of the (metaphysical) substance of the Body and Blood of Christ together with the bread and wine in the Eucharist. The term is opposed to the Catholic 'transubstantiation,' and means strictly the transition or union of two metaphysical substances originally distinct into one common substance; substantial conjunction, or one substance out of two. The name is often applied to the Lutheran doctrine of the Real Presence, but should rightly be ascribed to John of Paris and Rupert. It is sometimes called impanation (q.v.).

Consuegra (anc. *Consaburum*), Sp. tn in the prov. of Toledo. It has an anc. castle and Rom. remains, and manufs. textiles. Pop. 9600.

Consuetudinary, or customary, law, as opposed to written or statute law, is that law which is derived from the customs of remote antiquity. Such is the common law of Scotland, and many of the principles of the Eng. common law (q.v.) are based upon immemorial usage, e.g. the custom of borough-Eng. (q.v.). See also CUSTOMS.

Consul, title of the two highest ordinary magistrates in the Rom. rep. After the expulsion of the kings in 510 BC this

office was instituted, and the first to hold it were Lucius Junius Brutus and Lucius Tarquinius Collatinus. Probably the title was at first that of praetor. The C.s were elected for one year by the *Comitia Centuriata*, and until 367 BC only patricians were eligible. The inauguration of fresh C.s was accompanied by elaborate ceremonies, including a procession to the Capitol and a sacrifice to Jupiter. The power of the C.s was considerable, but it

A CONSUL OF THE SIXTH CENTURY

was exercised jointly. They gave their name to the year, and assumed a semi-regal state. Their insignia were the *toga praetexta*, the *sella curulis*, and the twelve lictors, each carrying a bundle of rods (*fasces*, q.v.). To the C.s belonged the supreme command of the army, the regulation of war and peace, the judicial headship, the disposal of the treasury, and the assembling of the Senate. They could only be challenged when they again became private men at the end of their term of office. In cases of great danger, complete authority was given to a dictator, or else absolute power was temporarily voted to the C.s by the Senate. The consular power was gradually restricted. In 494 BC, when the office was still confined to the patricians, the *tribuni plebis* were appointed, with right of appeal to them from the C.s. Then in 367 BC, by the famous *Lex Licinia*, it was enacted that one C. must be a plebeian. Previous to this the appointment of censors, in 443, had removed the duties of that office from their hands, and in the same year (367) the appointment of praetors freed them from

many of their judicial functions. During the civil wars the consular office lost its original character, and it survived as the mere shadow of its old self in the W. until AD 534 and in the E. till 541.

Consul (mercantile), public officer maintained by the State in foreign countries to supervise the commercial business of the state. Early in the 12th cent. the custom grew up among the merchant city states of Italy of sending such representatives to other lands, and especially to the E. The custom extended to France, but then almost died out, to be revived in the 16th cent. Even then, not till the 19th cent. did it become universal. A C. is primarily concerned with commercial and mercantile matters, and does not rank as a diplomatic agent. He cannot therefore enter on his duties without the sanction of the gov. of the country to which he is sent. His first duty is to exhibit his commission to these authorities, and to receive their permission to enter on his duties. C.s are divided into consular agents, C.s general, C.s, and vice-C.s, and are immune from taxation unless they are themselves directly engaged in trade. The consulate is considered as part of the Brit. Empire, and so all acts officially performed by the C. are valid in our courts of law. He can perform all the acts of a notary general. It is his duty to protect the rights of his countrymen in that part; to protect them from aggression, and to secure the redress of grievances sustained by them. If he is unable to perform these duties he must report the matter to the Brit. ambas. at the cap. In addition he has to send home annually a report to the secretary of state for foreign affairs containing the returns of the trade for the different ports within his consulate, and other matters of a similar nature. Of late years it has also been his duty to send home a report of anything of importance to trade which may occur at any time, and these reports, pub. by the Board of Trade, provide valuable information to those interested in foreign trade. He holds, also, a general supervisory duty over Brit. ships and sailors.

Consulate of the Sea (Consolato del Mare), famous code of maritime law, supposed to be a compilation of the laws and trading customs of various It. cities (Venice, Pisa, Amalfi, Genoa) and the cities with which they traded (Marseilles, Barcelona, and others). The exact original date is not known, but the laws are thought to have been collected during the 11th, 12th, and 13th cents. The earliest known ed. was pub. at Barcelona, 1494. This was trans. into Eng. by Sir Travers Twiss, 'The Customs of the Sea,' forming an appendix to *The Black Book of the Admiralty*, 1874.

Consumption, see PHTHISIS.

Consumption, in economics, the use of goods or services, the enjoyment of utilities. The div. of the constituent members of a community into consumers and producers, for purposes of discussing economic questions, is misleading; for all, in a modern state, are both. State regulation of C. has, in the past, taken the form

of sumptuary laws, regulating the kind of goods, especially luxuries, such as clothes, etc., which classes of the community are allowed to adopt and use. To-day, in the post-world-war period of shortages, it takes the form of a purchase tax, the main object of which is to limit the production and C. of 'luxury' as opposed to 'utility' goods.

'Contact,' see ARMY NEWS SERVICES.

Contactors, powerful switches for opening or closing high-power electric circuits on load. They are usually electromagnetically operated.

Contagion (Lat. *tangere*, to touch), the communication of disease by micro-organisms from source to host by direct contact and without any intervening transmitting agent or vector. Venereal disease (q.v.), leprosy (q.v.), and impetigo (q.v.) are examples of C. When a disease due to a micro-organism is transmitted from reservoir to host by means of an intermediary agent or vector it is called infection (q.v.). Some diseases may be communicated by either C. or infection; others are purely contagious or purely infectious. See INFECTION and BACTERIA.

Contagious Diseases of Animals Acts, see DISEASES OF ANIMALS ACT.

Contango, see STOCK EXCHANGE.

Contarini, name of one of the twelve families who elected the first doge of Venice, AD 697. This family was one of great importance, among its noted members being sev. doges (from Domenico, 1043-73, who rebuilt St Mark's, to Alvise, 1676-84), men of letters, painters, statesmen, and soldiers (7 C. fought at Lepanto): Andrea Contarini, doge from 1367 to 1382; ended the war between Venice and Genoa by reconquering Chioggia.

Gasparo Contarini (1483-1542), bishop of Bologna and diplomat, was made a cardinal by Pope Paul III, 1536. He was Venetian ambas. to the Diet of Worms, 1521, accompanying Charles V on his travels, and concluding the emperor's alliance with Venice, 1523. As papal legate at the Diet of Ratisbon, 1541, he tried to effect a reconciliation between Protestants and Catholics.

Giovanni Contarini (1549-1605) was a Venetian painter of portraits and historical pictures. See J. Fontana, 'Sulla patrizia famiglia Contarini in *Il Gondoliere*, 1843.

Conte, literally a story, from Fr. *conte*, to narrate. Though not yet Anglicised this word is often used in Eng. literary criticisms. C. is strictly a generic term, covering both long and short stories, but is more generally used for a short tale dealing entirely with one set of ideas. The word is used in France as early as the 13th cent. to mean an anecdote artistically told. It is especially applied to tales of wonderful adventure and to fairy-tales. Various collections made these C.s popular in the Middle Ages, such as the *Gesta Romanorum*. It is also the title of one of the divs. of the works of La Fontaine, whose tales are identical in general character with those which diverted Europe from the days of the *fabliau* writers, through the period of

the It. *novellieri* to that of the second great group of Fr. story-tellers ranging from Antoine de la Salle to Béroalde de Verville. Like the *Contes Drôlatiques* of Balzac their subjects are light love, the cunning of wives, the deception of husbands, and the breach of vows by ecclesiastics. In his *Contes Drôlatiques* Balzac, in the fresh and wonderful language of the Merry Vicar of Meudon, has given us a marvellous picture of Fr. life and manners in the 16th cent.

'Contemporary, The' (Russian *Sovremennik*), journal founded by Pushkin in 1836. In 1847-66 it was owned and ed. by Nekrasov and during this period was the leading radical monthly in Russia; it played an important role in shaping the views of the radical intelligentsia (see INTELLIGENTSIA).

'Contemporary Review,' monthly pub. founded in London in 1866. In 1870 J. Knowles became editor, gaining as contributors, among others, Gladstone, Tennyson, Manning, Huxley, Ruskin, Froude, Bagehot, and Morley. The *Review* deals with contemporary political, theological, literary, and social questions.

Contempt of Court, term of wide import. Blackstone shortly defines it as consisting in a disobedience to the rules, orders, or process of a court, or against the king's prerogative. In this definition, however, the primary and secondary meanings are liable to be confounded. To disobey the order of a court is to flout the prerogative of the Crown as the fountain of justice (see CROWN). Hence it is that so many and diverse acts may constitute C. of C., e.g. refusing without justification to answer questions properly put by counsel, abusing the judge, assaulting an officer of the court, insulting a litigant or his counsel whether in court or in a master's office, sending libellous or scandalous letters, or offering bribes to a judge or any other officer of the court; tampering with a receiver appointed by the court to administer property, or publishing comments on cases *sub judice* (i.e. undecided), or where the hearing was *in camera*; or disregarding injunctions, decrees, orders, judgments, and so forth, where at all events it is in the power of the person so disregarding to carry out the order. C. of C. has always been regarded as a quasi-criminal matter. Hence the court has power to commit the offender to prison or impose a fine. Different courts have different degrees of power to commit. The queen's bench (q.v.) has the widest power. It can attach for contempts offered to inferior courts. But every superior court of record, e.g. any div. of the high court and the assize courts, has power to commit for every kind of contempt committed against its own authority. Other and inferior courts, like co. and quarter sessions courts, are restricted to punishing contempts committed, as it is said, *in facie curiae*, i.e. in open court. Punishment is not often severe for C. of C. In many cases, especially where the contempt is one of the court itself, an apology and payment of costs incurred by the contempt

will be deemed sufficient extenuation, provided the offender makes reparation by doing that the omission of which constituted the C. of C.

'Contemptible Little Army.' During Sept. 1914 a Brit. Expeditionary Force Routine Order was issued in which was pub. a copy of an order reputed to have been issued by the Ger. emperor, referring to the Brit. Army as 'Gen. French's contemptible little army.' This description was naturally seized upon by all who were directly interested in securing recruits and it proved to be a most effective piece of propaganda. No 'title' among veterans is more honoured than that of an 'Old Contemptible,' and an association of ex-soldiers now bears that name. In 1925 the matter was referred to the ex-Kaiser at Doorn, who denied ever having used such an expression with reference to an army, the high value of which he had always appreciated.

Content: 1. Term used to indicate the aggregation of attributes which constitute the meaning and are expressed in the definition of a given concept.

2. Paper signed by a ship's captain stating the ship's destination, stores shipped, etc. It has to be given to the custom house officer before the ship can clear outwards.

Conti, Nicolo de, It. traveller of the 15th cent. He acquired a knowledge of Arabic in Syria, and then started on his travels, first going to Babylonia and Bassora, then to the Malabar coast, Ceylon, Sumatra, Java, and S. China. For an account of his travels see *India in the Fifteenth Century*, 1857, which contains an Eng. trans. made by J. W. Jones for the Hakluyt Society; and also Ramusio's *Navigazioni e Viaggi* (pub. 1550, 1556, 1559).

Conti, House of, cadet branch of the house of Bourbon-Condé. Eléonore de Roye married (1551) Louis of Bourbon, the first prince of Condé, uncle of Henry IV, and brought him C. The title was renewed in favour of Armand de Bourbon (1629-66), second son of Henry II, prince of Condé, younger brother of the great Condé. His son, François Louis de Bourbon (1664-1709), a distinguished soldier, was elected King of Poland after Sobieski d. (1697), but never obtained the throne. The elder brother of François, Louis Armand (1661-85), fought in Hungary with Turenne and Prince Eugene. François Louis's grandson (1717-76) was also a candidate for the Polish throne. The family died out in 1814.

Continent (Lat. *continere*, to hold together), a word in physical geography, originally applied to a large tract of land which holds together or contains. The word is now used in contrast to the great oceans, and is applied only to the seven continents, Europe, Asia, N. America, S. America, Africa, Australia, and Antarctica. The continents make up 55,786,000 sq. m., the oceans 141,050,000 sq. m., of the surface of the earth.

Cs. are skirted by a continental shelf or terrace lying less than 600 ft below sea

level and extending up to 600 m. out from the coast. The shelf is absent or narrow where young mt. chains run near the coast of the continent as in W. America; the width of the shelf averages 45 m. Beyond the continental shelf the sea bed falls rather rapidly and forms the continental slope leading down to the very much deeper water of the ocean (average depth 12,500 ft.). See CONTINENTAL SHELF.

The continental slopes are one of the most pronounced geographical features of the crust of the earth and mark the true geological margin of the continents. The material of which continents are formed is not the same as the rock underlying the deep oceans. C.s are underlain by some 20 m. of predominantly granitic, sedimentary, or metamorphic rocks whose mean density is approximately 2.84, below which more dense material having a density of 3 or more is reached. This dense matter forms the mantle of the earth. Below the oceans the mantle approaches to within 3 m. of the sea bed. The overlying rock forming the top 3 m. of the suboceanic crust is at present regarded as basalt covered by sediments. The C.s with their very much greater thicknesses of relatively light matter may be regarded as gigantic rafts supported by the denser substance of the mantle of the earth.

Continental Congress. The C.C. of the U.S.A. was inspired by the advice and activities of the celebrated Samuel Adams in the initial stages of the resistance of the colonies to Grenville's Stamp Act of 1765. The historical importance of the meetings of the C.C. of America lies in the fact that their proceedings made manifest to the world the solidarity of the different states or provs. in their attitude towards England. The first C.C., which met at Philadelphia in 1774, was formed of delegates from all the colonies except Georgia. It was intended to be a federal body composed of states' representatives which should meet annually and whose functions were primarily to concert the best means for forcing 'the British Parliament to come to proper terms.' It had no executive powers, and indeed, like all unconstitutional or provisional assemblies (cf. CONVENTION), it had no certain *locus standi* or functions whatever. Its first act was to address a petition to George III promising loyalty in consideration of the redress of the grievances, and in the Declaration of Rights it set forth in characteristically democratic terms the collective opinion of the colonists in regard to their rights and liberties. No adequate response was met with from the Brit. Ministry, and the second Congress, which met in 1775, proceeded with greater vigour, and gave reality to the *united* or *confederated* resolutions of the delegates by raising a continental army and appointing Washington as the commander-in-chief. The third Congress met at Philadelphia in May 1776, and by passing the celebrated Declaration of Independence on 4 July severed the last tie of allegiance with Great Britain. Its position being by

now more certain, it passed laws for the colonies; and assumed all the executive functions of a provisional gov. The C.C. continued to act as the federal legislative body until 1783, when the Articles of Confederation and Perpetual Union between the states, having been ratified by most of the states, provided, though in a vague manner, for a div. of powers between the sev. states and a congress of delegates from them. See *Cambridge Modern History*, vol. vii. *passim*.

Continental Drift. The conception of C. D. was first put forward in detail by Alfred Wegener in 1910. He suggested that in early geological times all the continental masses were grouped together in a single huge continent which he named Pangaea. By degrees Pangaea was broken up by fissures and rifts and the separate fragments drifted apart until they attained their present distribution over the surface of the globe. The lines of evidence which have been adduced by Wegener and others in support of the idea of C. D.s are too complex to be summarised easily. They include the fact that certain geological structures, such as mt.-belts, appear to be abruptly cut off by the present continental margins. For example, the structures associated with the Appalachian Mts of E. N. America run out to the Atlantic shore off Newfoundland. On the other side of the Atlantic a deeply eroded mt. chain of the same age runs out to sea off the British Isles, and it has been argued that these two ranges are broken fragments of a once continuous chain which were separated by the westward drift of the Americas. Other arguments depend on the past and present distribution of animals and plants. Certain fossil species of land or fresh-water animals are found in parts of the world which are now widely separated, and the problem of how they migrated across the intervening oceans could be solved by supposing that at the time when these species first evolved the drifting of the continents had not yet opened up the space now occupied by those oceans. Several of the continents of the S. hemisphere (collectively known as Gondwanaland, q.v.) show evidence of a period of Upper Palaeozoic glaciation, and the distribution of the ice sheet is not easy to explain unless we suppose that the continents were at that time much closer to each other. See A. L. Du Toit, *Our Wandering Continents*, 1937; A. Holmes, *Principles of Physical Geology*, 1944.

Continental Shelf, the term used to describe the extension of the continental land masses beneath the shallow seas bordering them. The continental shelf is made up of the same kind of material as the continents themselves. At its outer margin, where the sea's depth is of the order of a 100 fathoms, a relatively steep slope—the continental slope—leads down to the floor of the ocean basins proper, which are made up of a different association of rocks.

Continental System, method adopted by both France and England, and provoked by the Berlin Decree of 1806,

by which Great Britain was declared to be in a state of blockade, and all commerce or intercourse with her was forbidden to France and her allies. This decree, naturally, only declared a paper blockade, since the naval position of France and her allies forbade the adoption of any more stringent method. The Order in Council of 1807 issued by the Brit., naturally attempted to make reprisals. No vessel belonging to any neutral nation was to enter, or have commercial dealings with, any Fr. port or any port belonging to the allies of the Fr. In 1807 Napoleon issued the Milan Decree, which stated that any ship of any nation which had been searched by, or had paid duty to, the Brit. lost thereby its nationality and could be seized by the Fr. or the allies of the Fr. The Russian war of 1812 was a direct outcome of the refusal of the Russians to comply with the decrees of Napoleon any longer. Napoleon himself found that he was continually forced to give permission for the breaking of his own decrees, since, without Brit. goods, he himself could not get on. The scheme finally broke down, however, owing to the supremacy of Britain at sea, and her control of the markets of the world. The Eng. system, however, was an essential cause of the Amer. war of 1812.

Contingent Liability. In contra-distinction to a debt or liquidated demand, a C. L. is one that only arises at the happening of a certain event, e.g. a covenant (q.v.) by a debtor to assign after-acquired chattels to secure a debt creates a liability on the debtor to assign the chattels as soon as he acquires them. Any C. L. to which a debtor is subject at the date of a receiving order against him, or to which he may become subject before his discharge, is a provable debt, e.g. a surety has a right of proof in respect of his C. L. as surety for the debtor.

Contingent Remainder. In law, a term used for an estate in remainder upon a prior estate, limited to take effect, either to an uncertain or unascertained person or upon an uncertain event. If land is granted to A for life, and to B and his heirs at A's death, B's interest is called the remainder. A remainder given to an unborn or unascertained person, or upon some further contingency (when C shall return from abroad) is a 'contingent' as opposed to a 'vested' remainder (given to an ascertained person, and ready to go into effect upon determination of the precedent estate). Though such a remainder is an estate in expectancy (future), it is considered a present interest, and may be transferred to another party by modern legislation. See *Contingent Remainders Acts, 1845 and 1877*.

Continuation Schools. Institutions where education beyond the national minimum is provided. In the 19th cent. they were schools of further training for boys and girls who had completed the course in the elementary day school. They are to be found, governed by diverse conditions, in Great Britain, Canada, Australia, U.S.A., Central Europe, and Italy. In most countries they were set up

in an attempt to help to solve the problem of half educ. children entering adult industrial life. Instruction, therefore, was to be not only vocational but also social, moral, and physical. In Germanic countries the development was very thorough. Children leaving the elementary schools went to one of sev. types of C. S. Some were part-time schools, others full-time. They received there some technical or craft training in addition to general education. Most children, in consequence, received some kind of formal education up to the age of 18. In U.S.A. the majority of C. S. came into existence after 1919, and wage earners between 14 and 17 or 18 years who had not taken a high school course had to attend a continuation school for 4 to 8 hours a week. As the proportion of Amer. boys and girls who complete the full high school course rises these regulations become less necessary. Today the school leaving age is 16 in 40 states, and 17 or 18 in the remainder. Many students then proceed to junior colleges, so that almost a quarter of the age group (18-22) are attending institutions of higher learning. In England the C. S. were first organised as a system of continued elementary schooling (not secondary) for voluntary students. Both the Fisher Act of 1918 and the Butler Act of 1944 laid down that there should be continued part-time education for all children up to the age of 18. The recommendation that day C. S. should be estab. where all young workers should be obliged to attend for a certain period each week, either to continue their general education or to be given technical instruction in subjects related to their employment, was partly embodied in the 1918 Act. Economic difficulties prevented its implementation. According to the 1944 Act co. colleges were to be estab. as centres 'for providing for young persons who are not in full-time attendance at any school or other educational institution such further education, including practical and vocational training, as will enable them to develop their various aptitudes and capacities and will prepare them for the responsibilities of citizenship.' Again post war economies made it impossible to implement this part of the scheme. Nevertheless nearly 20,000 young workers are released by their employers to attend courses at day C. S. Whilst some general civic education is provided it is perhaps true to say that most of the training is technical or vocational. See Sir M. E. Sadler, *Continuation Schools in England and Elsewhere*, 1908; Edith A. Waterfall, *The Day Continuation School in England*, 1923; E. W. Knight, *Education in the United States*, 1929; R. W. Ferguson and A. Abbott, *Day Continuation Schools*, 1935; P. L. Kitchin, *From Learning to Earning: Birth and Growth of a Young People's College*, 1944; *Further Education*, Min. of Ed. pamphlet No. 8, 1947. See also **FOLK HIGH SCHOOLS**.

Continuity, principle by which it is assumed that appreciable changes in progressive phenomena correspond to inappreciable changes taking place at

inappreciable intervals. In psychology the principle involves the idea of a stream of consciousness; that no state or consciousness is fixed, but is arriving out of a previous state and already developing into a subsequent state. In graphical mathematics, a function is said to be continuous at a point if it is defined in an interval containing that point and has a limit at the point which is equal to the function of the point. The function is said to be continuous throughout an interval when it is continuous at every point of the interval. In hydrodynamics the principle of C. assumes that a fluid is absolutely homogeneous and devoid of viscosity; this leads to relationships

Continuous Spectrum, *see* X-RAYS, BETA PARTICLES, and SPECTRUM AND SPECTROSCOPE.

Contour, term used in physical geography, meaning an outline. C. lines are lines drawn on maps at fixed intervals, and indicate the form of the surface of the ground, each line passing through points at the same altitude above sea level. These lines will be near to each other if the slope of earth is a steep one, and are further apart where the slope is less acute.

Contraband (Fr. *contrebande*, from Lat. *contra*, against, and Low Lat. *bannum*, a proclamation), term applied to illegal traffic in general, and hence to goods

CONTOUR AND SECTION

which are only approximately true in the more practical science of hydraulics.

Continuo, in music, is the part for a keyboard instrument (organ or much more often harpsichord) used in musical performance during the whole period when compositions were based on a thorough-bass (q.v.). The word is an abbreviation of the It. term for this, *basso continuo*, and it means literally a bass part that goes on all the time, as written down by the composer, with harmony added above by the keyboard player to fit in with that of the other parts, usually indicated by figures to ensure its correctness. During the whole thorough-bass period (roughly 1600-1750) the art of C. playing was very highly developed by performers specially skilled in it, and it was to a great extent an art of improvisation, since apart from the prescribed harmony the player was free to make his part as decorative and even contrapuntal as he could. This kind of C. playing is now rare, though a renewed interest in the correct performance of old music has shown a tendency to revive it. Cs are now usually played from parts fully written out by modern editors.

smuggled into a country. More generally the term is reserved for C. of war, the name applied to certain commodities which, during time of war, it is forbidden for neutral nations to supply to either of the belligerents. C. of war includes, without any doubt, all directly military implements, such as guns, ammunition, tents, and military stores of all kinds. But unless there are special treaties between nations, which give an accurate definition of the word, much doubt is apt to arise as to the further use of the term. It is clear that articles which could only be used for peace purposes must be excluded, but there are a great number of things which, while normally so used, might give one army a distinct advantage over the other. In 1904, during the Russo-Jap. war, Russia contended that coal, flour, grain, rails, and wood and iron beams were all C. if directed to a belligerent, whether they were to be used for warlike purposes or not. Russia further claimed the right to seize any coal ship cruising in waters near the scene of war, whether or not it was destined to one of the belligerents. Great Britain and America protested against almost all of these claims, and

secured from Russia the admission that food-stuffs were only conditional, and not absolute, C.; that is to say that the destination in this case is more important than the nature of the goods. During the Napoleonic wars the Brit. Gov. insisted on the right of either belligerent to stop and examine neutral ships which were suspected of carrying C. goods. Unless it acts in contravention of the generally received customs of nations, the Admiralty court (sitting as a prize court) of each belligerent has the right of deciding what is C. of war and what is not. Various agreements exist between the U.S.A. and European countries as to the various articles to be included, and the variations between these can only be seen by reference to the actual terms of the treaties. So far as ordinary trade is concerned neutral powers may carry this on with either belligerent, except in cases of blockade. The Second Hague Conference came to no decision on the subject of C., but the matter was extensively dealt with in the conference of London (1908-9).

On the outbreak of the First World War Great Britain adopted the Declaration of London (q.v.) with certain modifications which were again varied in Oct. 1914. Under these modifications conditional contraband was made liable to capture on board vessels, even though bound for neutral ports, if the goods were consigned to order, or if the ship's papers did not indicate the consignee of the goods, or if the goods were consigned to persons in enemy ter. or in ter. occupied by the enemy. Similar tests were applied to absolute contraband by an Order in Council of 30 Mar. 1916. These, and other modifications adopted by the Allied powers, altered the Declaration of London beyond all recognition, and it was eventually abandoned in July 1916 by another Order in Council which declared that the principle of continuous voyage or ultimate destination should be applicable to both contraband and blockade. The justification for this departure lay in the fact that the relief of the civil pop. by such goods as foodstuffs might cause an increase to the military or naval forces of some other foodstuffs which the civil pop. would normally have consumed. This view, which regards modern warfare as affecting the whole of the pop. of a combatant, was held by eminent Amer. jurists early in 1914. During the First World War the distinction between absolute and conditional C. was shaken to its foundations, despite the fact that in theory the distinction was correct. But like other theories in international law it dates from a time when armies were small and comprised only a negligible fraction of the total pop. of a country. In the First World War, however, 'when every fit male in each belligerent state became a member of the military forces, when the whole country with all its resources was gradually mobilised, and the means of communication were nationalised and developed to an unforeseen degree, it was widely contended that the distinction between absolute and conditional C. was

out of date, seeing that a belligerent gov. could at any moment, and would if necessary, lay its hand on and requisition all articles in the country which were, or might be, of use for carrying on the war' (Oppenheim).

At the beginning of 1939 conditional C. was declared generally to comprise all kinds of foodstuffs, feed, forage, and clothing, and articles and materials used in their production (but the foreign ministers of the Amer. republics at Panama on 3 Oct. 1939 registered opposition to the placing on lists of C. of foodstuffs and clothing intended for civilian pops. and not destined directly or indirectly for the use of a belligerent country or its armed forces). There are two groups of articles which must always be recognised as free. Those which serve exclusively to aid the sick and wounded may never be treated as C., even if their destination is hostile. They may, however, in case of urgent military necessity, and subject to the payment of compensation, be requisitioned if they are destined to ter. belonging to or occupied by the enemy, or to his armed forces. The unratified Declaration of London laid down this rule and it was adopted in the First World War. Similarly, articles intended for the use of the vessel in which they are found or for the use of her crew and passengers during the voyage are free.

Contraband Control in the Second World War. As soon as war between the Allies and Germany broke out C. control bases were estab. by the Brit. Gov. at Kirkwall, Weymouth, The Downs (N. Foreland), Gibraltar, and Haifa. The Ger. Gov., by way of countering the effective Brit. blockade, announced that, since the Brit. C. list included goods that were not war materials, Germany would also include such goods. With regard to conditional C., Germany would follow Britain's example and take into consideration the possible destination of goods beyond the neutral port to which they were consigned. By mid Oct. 1939 the Brit. C. control had intercepted and detained nearly 350,000 tons, but the detection of C. was then becoming more difficult because the consignments were no longer openly sent to Germany, but to neutral agents. With the object of expediting the passage of neutral cargoes the Brit. Gov. decided to reintroduce the system of navicerts, as in the First World War. Under this system the navicert ensured the consignment for which it was granted an undisturbed passage to its destination. In effect the navicert was a commercial passport for goods, which was issued by Brit. Gov. representatives before they left the neutral port of shipment. Naval officers and customs officials were instructed that, subject to any delay caused by other cargo carried, such consignments as were covered by navicerts or letters of assurance should suffer as little detention as possible, unless reasons for suspicion as to their ultimate destination should arise after the goods had been shipped. By the end of Nov. 1939 the

allied C. control had detained approximately 736,000 tons of goods destined for the enemy, of which 476,000 tons had been captured by Britain and 260,000 by France. In the subsequent years of the war Ger. overseas trade was virtually swept from the seas. See J. B. Moore, *A Digest of International Law*, 1906; F. H. Bray, *British Rights at Sea under the Declaration of London*, 1911; Earl Birkenhead, *International Law*, 6th ed. 1927; L. Oppenheim, *International Law*, 1928; D. T. Jack, *Studies in Economic Warfare*, 1940.

Contraception, see BIRTH CONTROL.

Contract, an agreement enforceable at law. There must be at least two parties to a C., and they must be *ad idem* on the terms, i.e. there must be mutual assent; further, to constitute a C. there must be both the offer of a promise or a proposal, and the acceptance of that offer or proposal. C.s are divisible into (a) specialties or C.s under seal, and (b) simple or parol. Specialty C.s must be written, sealed, and delivered; in practice they are always signed, though originally the seal stood for a signature. If delivery is made subject to a condition and to a person not a party to the deed, the document is known as an *escrow*, and only takes effect on fulfilment of the condition. A deed requires no consideration (q.v.), because it is said to import a consideration. Very often a deed merely gives more formal effect to a simple C., in which case the simple C. is said to be merged in it. Parties to a deed are *estopped* from denying the truth of statements contained in it, unless fraud, duress, or mistake be proved. C.s made by corporations, with certain exceptions such as in matters of daily occurrence or the hire of servants, promises made without consideration, and leases for three years on which less than two-thirds of a rack-rent is reserved, or for any term over three years, are only enforceable if entered into by deed. Simple C.s comprise every C. written, verbal, or implied from conduct which is not a specialty. A simple C. requires a consideration (q.v.) to support it. With certain exceptions where writing is required, no particular form is essential to a simple C. Certain simple C.s must be in writing: these comprise (1) bills of exchange (including cheques) and promissory notes; (2) C.s of marine insurance; (3) assignments of copyright. As a rule transfers of shares in registered companies (q.v.) should be in writing: they are also very often made under seal. Certain other simple C.s are not enforceable unless evidenced by writing; although they may be good as a defence to an action, either by way of set-off or counterclaim. These include: (a) a promise to answer for the debt, default, or miscarriage of another, i.e. a C. of guarantee or suretyship; and (b) a C. concerning any interest in land. The requirement made by the Statute of Frauds, 1677, and section 4 of the Sale of Goods Act, 1893, that certain other classes of C. should only be enforceable if evidenced by writing, was abolished by the Law Reform (Enforcement of C.s) Act, 1954.

It is to be noted that there are certain C.s which the law will not enforce at all, and these include C.s which are absolutely void, or are voidable at the option of one of the parties. C.s tainted by fraud are voidable at the instance of the defrauded party, but, of course, may be enforced against the fraudulent party, because no one may take advantage of his own fraud. A void C. is one which has no legal validity at all, and in fact may be said to be only the semblance of a C.; for example, where A contracts to sell a thing to B under the impression that B is C. Some C.s are said to be void for illegality as being either contrary to public policy or forbidden by statute, but not all void C.s are illegal. The distinction between void and illegal C.s is important, because unless the cause of avoidance is pleaded the court will not set the C. aside, but in the case of illegality the court will refuse to enforce the C. of its own motion. Illegal C.s include, *inter alia*, those of an immoral nature, agreements for the sale of public offices, agreements to defraud the revenue, agreements contrary to the course of justice, e.g. champertous (see CHAMPERTY) agreements, agreements to commit a crime. A betting C. is not illegal; it is merely unenforceable (see GAMING). A C. in general restraint of trade is void, i.e. a man cannot validly undertake not to carry on any business at all. These C.s frequently arise where one person has learnt his profession or trade from another and is about to set up in competition. Such a person may validly restrain himself from carrying on a particular business for ever or anywhere, but a court of equity requires that the C. be reasonable in all the circumstances. Not every person has capacity (q.v.) to enter into C.s for the loan of money, or for supplying goods, other than necessities, and C.s are generally void if made with an infant.

At common law, speaking generally, all C.s with an infant other than for necessities, or in certain cases C.s deemed to be for the infant's benefit, are voidable at his option. In the case of voidable C.s, those which involved some continual obligation on the infant like partnership agreements, or C.s to pay calls as a shareholder, were, and indeed are, valid against an infant on his reaching 21, unless he expressly repudiates them; but those C.s which do not involve any continual obligation are only binding on the infant on his attaining 21 if he ratifies them. The question as to what constitutes necessities is one of fact, depending on the circumstances of each particular case. A married woman can contract in all respects as if she were a single woman, and may sue and be sued on her C. This is the effect of an Act passed in 1935 which did away with the limitation of a married woman's contractual capacity to the extent to which she owned separate estate, and also abolished the immunity from her debts of property subject to a restraint on anticipation. A C. with a lunatic is voidable only if the other party knowingly took advantage of the lunatic's state of mind. But in any case a lunatic

may ratify a C. on regaining his sanity of mind, so as to bind himself on it. A C. with a corporation, in order to bind the corporation, must generally be under the corporate seal. The exceptions are (1) in C.s relating to matters of trifling importance or daily occurrence or urgency, where they fall within the scope of the business of the corporation; (2) simple C.s made by the agents of trading corporations and relating to the objects for which the corporation was created; (3) companies registered under the Companies Act, 1948, may validly enter into C.s in writing, or by parole in cases where such C.s would be valid if entered into by private persons. C.s by an urb. dist. council of a value exceeding £50 must be under seal. In any case a corporation can enforce its C.s whether under seal or not. For the assignment of rights under a C. see CHOICE IN ACTION. The assignment of duties or liabilities under a C. is only allowable with the consent of the creditor or party to whom the duties or liabilities are owed. A breach of C. necessarily gives a right of action for damages. Where the breach goes to the root of the C. the injured party may treat the breach as a discharge of his own liability under the C. and resist any action on the C.; he may also sue or counterclaim for damages, and claim payment for any work done by him in pursuance of the C., provided the C. be severable. In some cases, generally agreements for the sale or purchase of an interest in lands, he may bring an action for specific performance (q.v.). But where the breach is partial only there is no right to rescind, unless the parties have expressly agreed that breach of a single term shall give a right to rescind, and in any case if one party shows clearly during the subsistence of a C. his intention no longer to be bound by it, that of itself gives a right to the other to consider himself exonerated from further performance. Damages for breach of C. are assessed so as to place the injured party as far as possible in his original position. The general rule is that damages should be such as may fairly and reasonably be considered as arising naturally from such breach of C., or else such as may reasonably be supposed to have been in the contemplation of both parties at the time they made the C. as the probable result of the breach of it. Damages may be given for prospective or anticipated loss as well as loss already sustained. A C. is terminated either by agreement, or by performance, or by breach tantamount to discharge of the other party, or by lapse of time. A substituted agreement so as to terminate the original C. must be supported by consideration (q.v.). Lapse of time bars the right to sue on a C., though the C. remains valid and subsisting for all other purposes (see LIMITATIONS, STATUTES OF). C.s to do impossible things are void, *ab initio*; where, too, the performance of a C. depends upon the continued existence of a given person or thing, there is always implied in the C. a condition that impossibility of performance arising from

death or the loss of the thing excuses performance where it is clear that the parties must have known, *ab initio*, that its existence was essential to the contract. Fraudulent misrepresentations, i.e. false representations of fact made with knowledge of their falsity, discharge the injured party from the C., and give a right to sue for damages (see FRAUD).

An innocent misrepresentation as to a material fact gives a right to rescind; but not a right to damages, except (a) as to misstatements in a company prospectus in reliance on which the injured party has taken shares; (b) an agent who induces another to contract with him by representing himself as vested with an authority he does not in fact possess may render himself liable to an action at the suit of such other person. Unilateral error will not, as a rule, excuse the party making the mistake from his liability under a C. A person must take the consequences of his failure to express himself according to his own intentions, if what he did say would have led any reasonable man to form the conclusions arrived at by the other party as to his meaning. But where the error was induced by the other party, the mistaken party will be entitled to rescind. A mutual mistake as to the identity of the thing about which a C. is made would render the C. null and void (see MISTAKE); and generally, where a mistake is mutual, a court of equity can amend the C., and rectify it in accordance with the true intentions of the parties. C.s induced by undue influence and duress are voidable at the option of the injured party. See G. C. Cheshire and C. H. S. Fifoot, *Law of Contract*, 1956; R. Sutton and N. P. Shannon, *Contracts*, 1956.

Contract Bridge originated in the U.S.A., where it was adopted on a large scale in place of Auction B. about the year 1927. The Portland Club Laws of C. B. were first pub. in 1929 and International Laws were agreed in 1933. C. B. differs from Auction in three important respects:

1. Only those tricks count towards game for which the declarer has contracted; surplus tricks are scored above the line.

2. A new feature named vulnerability has been introduced: the side which has won one game is liable to heavier penalties for failure in its contracts.

3. Substantial bonuses are awarded for successful slam contracts.

These innovations give an increased advantage to skilled partnerships.

In the early days of C. B. a player made the call which appeared to indicate the most suitable contract, and the more powerful his hand, the higher his bid. It soon became apparent that high bidding cramped the exchange of information between partners and led to the invention of the 'forcing bid,' a bid which compelled partner to respond however valueless his cards until a game or higher contract had been reached. The opening bid which performed this service most satisfactorily was the lowest bid of all, viz. 1 Club, and this primary 'force' became

the foundation stone of many artificial systems. The 'artificial' 1 Club was gradually ousted by the 'forcing' Two bid and by the 'artificial' 2 Clubs which achieved similar results. Conventional bidding, i.e. bids to which particular meanings are attached, is now accepted as an integral part of C. B.

Simultaneously with bidding systems were promulgated methods of card-valuation, and various writers on Contract Bridge claimed to have discovered an abacus whose employment would enable players to value their hands with accuracy. The widest publicity was given to a method named by its author, Ely Culbertson, the 'honour-trick count.' It had been known for many years that in every deal a fraction more than eight out of thirteen tricks are won by cards of honour rank. To provide a ready-reckoner Culbertson advised his readers to concentrate on exchanging information about their high cards and to ignore distributional values. He counted an ace or a King-Queen as one honour-trick, and reduced proportionately the values of other combinations of honours. Thus with the knowledge that they held 8½ honour tricks between their two hands, partners could safely contract for a slam.

Culbertson's method, to which instead of to partnership skill he attributed his many successes, has now been ousted by an even cruder system of calculation, which was devised in the days of Auction B. by Milton Work. Honour cards are given arithmetical values—4 for an ace, 3 for a King, 2 for a Queen, 1 for a Knave or two tens. By teaching that with 25 or more points between their hands partners should be in a game contract and with 33 points should bid a slam, Work provided the simplest yardstick to card-valuation ever devised. His system is erratic in making a King (3 points) the basic trick-taker, because without the support of aces or other honour cards Kings do not win the share of the 13 tricks which Work allotted to them, and aces are worth more than 4 points apiece owing to their trick-promoting power. But subsequent attempts to provide a more accurate way of reckoning values have been too complicated to have popular appeal.

The laws of C. B. originally pub. by the Portland Club were changed by agreement with the U.S.A. in 1935. Graduated penalties were abolished, and the bonuses for slams were reduced to bring them into proportion with the new under-trick penalties. The last revision of the laws became effective in 1948 and was promulgated by the Portland Club, the European Bridge League, and the National Laws Commission of America, who jointly hold the copyright. The latest code simplifies the interpretation of the laws and mitigates a number of penalties for errors in correct procedure. C. B. has greatly increased its popularity through the growth of duplicate B. In this form of C. B. competing players hold the same cards as their opponents and each deal stands by itself for scoring purposes.

There are no part-scores to influence the bidding, which is thereby greatly simplified. A bonus is awarded in each deal for game, slam, or part-score, and the presence or absence of vulnerability is fixed beforehand. An attempt was made by the Portland Club to encourage duplicate rubber B.; but the start already obtained by duplicate B. in America and the establishment of international championships prevented the growth of duplicate rubber B., which survives in one annual tournament between London social clubs.

The future of C. B. in its present form largely depends on the restriction of artificial methods in bidding and play. The gulf between rubber and duplicate C. B. is widening, through failure of the authorities to devise a new system of scoring for C. B. which would reproduce the conditions in which rubber C. B. is played. Only those developments have acquired popularity which appeared to make the game easier, and more difficult varieties of C. B. such as C. Whist and Five-suit B. died because they placed a higher premium on skill. The only variant to survive is known as Goulash: when hands are passed out they are arranged in suits by each player and re-dealt without shuffling 5, and later 3, at a time. The result of the deal is to produce freak distributions in which one hand may consist of an entire suit, and to introduce an element of speculation into bidding which does not exist in ordinary C. B. See H. Phillips, *Complete Contract Bridge*, 1949; E. Culbertson, *Contract Bridge Complete*, 1954; G. C. H. Fox, *Sound Bidding at Contract*, 1954, and *Duplicate Bridge*, 1955; Edward Mayer, *Money Bridge*, 1955.

Contract Note, document sent by a stockbroker to his client specifying that a named amount of stock, shares, bonds, etc. has been bought at a stated price, together with the amount of brokerage charged and the stamp necessary. The Brit. stamp duties on C. N.s are on a graduated scale, from 6d. for stock or security valued at £5 and not exceeding £100, 1s. above £100 to £500, and so on to a maximum of £5 for over £20,000.

Contraction, in physiology, a phenomenon which is peculiarly characteristic of the cells constituting muscular fibre. Under certain conditions a chemical change takes place in the cell which alters its shape, diminishing its length and increasing its diameter. The result is a state of tension on the points of attachment of the cell to the adjacent tissue. In yielding to this strain the tissues give rise to movement in that part of the body. Thus the C. of the cells of the biceps flexes the forearm, while the C. of the extensor muscles tends to straighten it. C. may be tonic, when it is prolonged and equable; or rhythmic, when the C. occurs in periods alternating with periods of relaxation. Tonic C. is often caused by changes in the muscle as a part of its life without any reference to nervous stimuli. Rhythmic C. is usually in response to stimuli conveyed by the nerves from the central nervous system. It appears probable, however, that some muscles

have the power of alternately contracting and relaxing by virtue of their own constitution. Thus, warm strips of heart muscle, taken from the animal immediately after death, continue to show a rhythmic pulsation if kept warm and supplied with oxygen. If a muscle is too frequently stimulated, the accumulation of waste products causes a lessened sensibility, which constitutes muscular fatigue. See **MUSCLE**.

Contractions, see **ABBREVIATIONS**;
PALAEOGRAPHY; **SHORTHAND**.

Contralto, term in music to denote the lowest or deepest kind of female voice, the compass extending from F or G below the middle C to F or G above the treble stave. The term is a contraction of the It. *contra* (against) *alto* (high) and means, quite literally, a lower voice set against a high one, probably in vocal duets originally. In other languages the voice is generally called by some derivative of *alto* only, but in English this is still understood to mean a masculine voice, the 'male alto' of the church choir and the glee (q.v.), and the literal meaning of 'high' is preserved in this sense, since this kind of falsetto is the highest male voice.

'**Contrat Social**' (Social Contract), title of Rousseau's chief work, pub. in 1762. It did a great deal to bring about the Fr. Revolution. See **ROUSSEAU**.

Contravallation, see **COUNTERVALLATION**.

Contreras, tn of Federal Dist., Mexico, 10 m. SSW. of Mexico City. Here, in 1847, Maj.-Gen. Winfield Scott defeated the Mexicans. This led to the victories of Churubusco (q.v.) and Molino del Rey, and the fortified hill of Chapultepec succumbed. On 17 Sept. the city of Mexico was occupied by Amer. soldiers. Pop. 7800.

Contrexéville, Fr. spa in the dept of Vosges, on the R. Vair. The waters are used for kidney, liver, and arthritic diseases. Pop. 1100.

Contributory Pensions, name applied to those pensions to which the aspirant contributes from salary or wages a certain agreed percentage during working lifetime. There are many instances of contributory pension schemes in the Brit. Empire and U.S.A., and there is a marked tendency towards an increase of them. The Brit. civil service pensions are not, however, fixed on a contributory basis, although it is generally, but not officially, recognised that the scales of emolument in the various grades have been fixed with the knowledge that in ordinary circumstances a pension follows at sixty years of age. In the teaching profession, the univs. and education authorities have, as a rule, based their pension schemes on contributory lines. Old-estab. business houses, banks, public utility companies, and insurance companies have done the same. The contribution is made by the simple process of deducting the required amount from the monthly salary payment. By far the greatest undertaking which has yet been attempted in respect of C. P. is that of the Brit. Gov. with the Widows',

Orphans', and Old Age Contributory Pensions Act, 1925. By that Act all contributors to the insurance scheme, male and female, who were between sixty-five and seventy years of age on 2 Jan. 1928, or who had attained the age of sixty-five after that date, were entitled to an old age pension of 10s. per week, irrespective of means (provided that they had been continuously insured for not less than five years). A similar pension was payable to the wife of a contributor entitled to such a pension as from the date of her husband receiving his pension, or, if she had not then attained the age of sixty-five, as from the date on which she attained that age. That Act and later amending Acts provided pensions for widows of 10s. a week, with allowances for children under fourteen years, or sixteen years if at school, at the rate of 5s. a week for the eldest child and 3s. a week for each other child. The Acts also provided for a pension of 7s. 6d. a week for the orphan children (i.e. if both parents were dead) of insured married men and widowers and of insured widows while under the ages mentioned above. The Act of 1925 and most of the subsequent Acts down to 1935 were repealed and re-enacted by the consolidating Act of 1936 on C. P. for widows, orphans, and persons between sixty-five and seventy. The rate under this Act was still 10s. a week. The Pensions (Voluntary Contributors) Act (popularly called the 'Black-coated Workers' Act), 1937, extended pension rights to some 2,000,000 independent workers—shopkeepers and professional and other persons of small means, i.e. whose total income did not exceed £400 (man) and £250 (woman), not more than half unearned. 'Initial' entrants were eligible if under 55 on 5 April 1937, at weekly contributions of 1s. 3d. for a man (or 10d. for widows' and orphans' pensions only) and 6d. for a woman. But after the beginning of 1939 only entrants under 40 were able to join the scheme, on a weekly contribution scale increasing with 'entry age,' viz. up to maxima of 2s. 11d. (man) and 11d. (woman) for age 39.

In general, all males between the ages of 16 and 65, and, following the Old Age and Widows' Pensions Act, 1940, all females aged 16 to 60 (instead of 65 as theretofore), who were employed within the meaning of the National Health Insurance Acts and did not hold certificates of exemption from health insurance, were required to insure for both health insurance and C. P., but certain classes of person could insure as voluntary contributors—such entrants after 1937 having the option to insure for either health or pensions or both, thus breaking the 'interlocked' system theretofore applicable alike to compulsory and voluntary contributors. Under the National Insurance Act, 1946, a retirement pension is payable for life to an insured person who is over pensionable age, has retired from regular employment, and has paid the prescribed number of contributions. See also **NATIONAL INSURANCE ACT (1946)**.

Control, Allied, was the term applied during (and for some time after) the First World War to that single control which was exerted in certain services, apart from naval and military, for the common good of the Allied peoples. At the beginning of hostilities tentative efforts, at once timid and limited, were made towards some sort of common organisation. In Aug. 1914 the Commission Internationale de Ravitaillement (C.I.R.) was estab. in London. Representatives of the buying depts of the Allies were members of this commission, which proved its usefulness from the start. It placed orders with Brit. manufacturers who turned out all kinds of war equipment—uniforms, guns, munitions, etc. It provided a certain check on exploitation and kept down prices by the elimination of unnecessary competition. In placing orders the C.I.R. had due regard to the separate needs of the different Allies. In short, this commission was a Brit. organisation set up to assist and watch over Allied purchases in the Brit. market. But the Allies' great effort in control is perhaps best represented by shipping, and the control which was eventually estab. in this service will go down to hist. as the classic example of A. C. Up to the end of 1917 each country was its own purveyor of transport. This system was, however, modified in certain respects, as Great Britain, having more national tonnage at her disposal than the other Allies, was able to allot certain tonnage to France and Italy for the conveyance of war material. By the end of 1917 the Brit. Ministry of Shipping (a war-time organisation) had performed its work so efficiently that every Brit. ship was under its control both as to its cargo and its destination. The Ger. submarine campaign caused the efforts of the Allies to be still further extended in watchfulness and effectiveness, and following a conference in Paris in Nov. 1917 the Allied Maritime Transport Council was estab. This became the supreme instrument of A. C. in shipping. For some time after the formation of the A.M.T.C. the actual shipping arrangements proceeded on the old lines, but the agreement mentioned above had already tended towards single control. The Wheat Executive was already buying and distributing on an Allied basis. The A.M.T.C. gradually assumed supreme command and performed its functions admirably to the end of the war. In the Second World War much the same objects were accomplished by setting up a Ministry of Economic Warfare as soon as the war broke out, and by the agreement made between the Brit. and Fr. Govs. to pool their resources (*see also* LEND LEASE). A Ministry of Shipping was set up a few weeks after the beginning of the war, plans for such a body to co-ordinate the activities of the merchant fleet having been made by the Board of Trade before the outbreak of the war.

The term A. C. was also applied to certain services performed by the Allies' Commission of Control in Germany and

other ex-enemy countries in the way of supervising the carrying out of those clauses of the treaty of Versailles which provided for the reduction of ex-enemy forces to a definite total of effectives, and for the limitation of their munitions output.

Controlled Establishments, term applied to Brit. industries placed under state control in time of war. At the outbreak of World War I Brit. railways and shipping were taken over by the gov. (the term C. E. was brought into use by the Munitions of War Act, 1915). Under the 1915 act all firms producing munitions became directly controlled by the gov. By the end of 1916 state control had extended into a systematic supervision of all branches of national production, and by 1918 state control for industry was complete. After the armistice, however, C. E. were gradually decontrolled. On the outbreak of World War II in 1939 a Ministry of Supply (q.v.) was estab. with purchasing powers extending to all manner of commodities, and later a Ministry of Production (q.v.) was instituted in 1942.

Controller, apparatus for starting, accelerating, braking, and reversing series motors, especially for traction. The usual drum-type C. has a vertical

shaft carrying a cast-iron drum with projections on which are mounted insulated copper strips which make contact successively with contact fingers as the drum is turned by the handle at the top. Between the fingers, resistances are inserted. The diagram shows the fingers 1, 2, 3 . . . 8, the copper strips rolled out flat, the motor M and field F. In the position shown, the motor is disconnected. Turning the drum until the line AA covers the fingers, the current flows to 1, through the connector AP, through the resistances 2-6, field, armature, 7, QA, 8. The voltage supplied to the motor is reduced by the drop across the 4 resistances, and the motor starts slowly. As the drum is turned further so that BB, CC . . . cover the fingers, each move cuts out one of the resistances, the motor accelerating till full

voltage is supplied, when EE, is covering the fingers. This simple design may be developed to allow for reversal and braking and for series-parallel connection.

Controller of Stamps is the short title given to the officer in charge of that branch of the Board of Inland Revenue which deals with stamp duties payable on certain legal documents (e.g. leases, share transfers). The office of the C. is in Bush House, Strand, London. *See also* REGISTRAR; STAMP DUTIES.

Controller of the Navy, once an important official of the Navy Board, whose duties related to the supply of material

pyramidal shape. They were formerly thought to be molluscs, but are now regarded as scyphozoan coelenterates. Their geological age is Cambrian to Triassic.

Conurbation, a modern term for the gradual merging together or coalescence of formerly independent townships. *See also* TOWN AND COUNTRY PLANNING.

Convalescent Homes are institutions carried on in connection with ordinary general and special hospitals. Their function is to provide convalescent treatment (i.e. involving at least regular medical supervision and nursing care) for

SYON HOUSE, MIDDLESEX

(a modern building erected on the site of the pre-Reformation convent)

required by the fleet. He was chairman of the Navy Board till its abolition in 1832, when his title and duties were transferred to one of the sea lords of the Admiralty. Before the First World War the Third Sea Lord was C. of the N.; but in 1912 the C.'s dept was reorganised, its work distributed amongst other depts, and the title dropped. The C.'s dept has never been revived, and its work is still distributed in accordance with the reorganisation of 1912. But when, with increase of Admiralty business during the war, Sir Eric Geddes joined the Board of Admiralty (1917), he was given the title of C. Sir Alan Anderson succeeded him as C. when Sir Eric Geddes became First Lord; but in 1918 Sir Robert Horne joined the Board of Admiralty in succession to Sir Alan Anderson and took the title of Third Civil Lord; whereupon the title of C. was once more assumed by the Third Sea Lord and is still borne by him. *See also* ADMIRALTY.

Conulariids, extinct marine animals with a chitinous shell generally of elongated

patients discharged from hospital but requiring a period of rest and recuperation after illness or operation. In cases where medical supervision and nursing care are not required, facilities for rest and recuperation are provided by what are generally referred to as recuperative holiday homes.

Convallaria, *see* LILY OF THE VALLEY.

Convenae, *see* COMMINGES.

Convent, assembly of persons gathered together in retirement from the world, and also the house in which such a community dwells. In this wider sense it denotes either a monastery or a nunnery, or the fraternity or sisterhood of an abbey or priory; but the word as used to-day means a Christian nunnery where devout women spend their lives in prayer and works of charity and education. Most of the Eng. nunneries before the dissolution of the 16th cent. belonged to the Benedictine order. The most important of these were Shaftesbury (Dorsetshire), which, traditionally, was founded by Alfred, and became extremely wealthy;

Barking (Essex), founded by Erkenwald, bishop of London, in the 7th cent., Ethelburga being its first abbess; **Amesbury (Wiltshire)**, founded in Saxon times, and refounded by John in 1199; **St Mary, Winchester; Malling (Kent); Markyate (Bedfordshire); Catesby (Northamptonshire); Clerkenwell**, founded in the 12th cent.; **St Helen's (London)**, founded in the 13th cent.; **Stratford-at-Bow; Chatteris (Cambridgeshire); Polesworth (Warwickshire)**. The Cistercian nunneries were smaller. The chief of these were **Tarrant (Dorsetshire)** and **Swine (Yorkshire)**. The Augustinians and Dominicans disputed the ownership of the large nunnery at **Dartford**, founded in 1355. **Syon (Middlesex)**, founded in 1414, was among the wealthiest religious houses in England; it was held by the **Brigitine** (see **BRIGIT, Sr**) branch of the Augustinians. The **Poor Clares** (see **CLARE, Sr**), or female Franciscans, held sev. houses, the largest being in London, near Aldgate, founded by **Blanche of Navarre**, wife of **Edmund of Lancaster**, at the close of the 13th cent. See also **ABBAY; MONASTERY; PRIORY**.

Conventicle, term originally applied to a meeting of the monks in a monastery, but acquiring a special use at and after the Reformation as applied in a disparaging sense to meetings of Eng. and Scottish Nonconformists, such as the **Covenanters**.

Convention, term applied by Eng. constitutional lawyers to an extraordinary meeting of the Houses of Parliament at a time of national crisis in contradistinction to a meeting in session initiated by the writ of the sovereign. Instances of such C.s in Eng. hist. are the Parliament summoned by **Gen. Monk** to restore **Charles II** to the throne in 1660, and that summoned by the **Prince of Orange** in 1689 before he was made King of England. In **Fr. hist.**, the body which took the place of the national legislative assembly in 1792, proclaimed a rep., and in the course of its 3 years' duration passed a number of revolutionary measures, was called the **National C.** In military matters, a C. denotes a treaty made between the commanders of 2 opposing armies concerning the terms on which a temporary halt in the fighting shall take place. The last C. of this nature in which Great Britain has been concerned was the much-abused C. of **Cintra** made in 1808. In **U.S.A. hist.** the most celebrated C. was that presided over by **Washington**, which met at **Philadelphia** in 1787. Twelve of the 13 states (**Rhode Is.** excepted) sent delegates, among whom were such men as **Madison, Sherman, Randolph, the Pinckneys, James Wilson, and Morris**. The great work was the making of the **U.S.A. constitution**. In **U.S.A. politics** the term also applies to meetings of party supporters preceding a presidential election to nominate electors. See **ELECTIONS**.

Convention Treaties are treaties entered into between different states under which they each bind themselves to observe certain stipulations contained in the treaties. In 1843 two Acts were passed giving effect to conventions between

Queen Victoria and the King of the Fr. and the **U.S.A.** for the apprehension of certain offenders. The Act relating to France legalised a convention providing for the surrender of persons accused of murder, forgery, or fraudulent bankruptcy who may escape to France. The Act relating to the **U.S.A.** was similar in its nature, but the specified crimes included in addition piracy, arson, and robbery, but not fraudulent bankruptcy. See **EXTRA-DITION**.

Convergence, in mathematics, see **SERIES**.

Converse, in logic, the proposition which is obtained by turning the subject of another proposition into the predicate, and the predicate into the subject. Only universal negative and particular affirmative propositions can be so treated. For instance, if we assert that no birds are quadrupeds, it must be equally true that no quadrupeds are birds; again, if it be asserted that some Englishmen are scientists, it must be true that some scientists, at least, are Englishmen. On the other hand, universal affirmative and particular negative propositions cannot be simply converted. If we assert that all men are mortals, it by no means follows that all mortals are men; and from the assertion some men are not Englishmen, it cannot be concluded that some Englishmen are not men. The general rule is that nothing can be concluded about the individuals of a class unless the first assertion includes all the individuals. Valid conversion is therefore simply stating the same fact in a different order of words. In **Euclid's geometry** the propositions are of the universal affirmative type, so that a C. obtained by interchanging subject and predicate is not necessarily valid, and therefore requires a separate demonstration.

Conversion: 1. In law: (a) a wrongful act depriving another of his property permanently or for an indefinite time. The restriction to the literal or natural meaning of converting property to one's own use has long been discarded in favour of the wider notion of any unauthorised assumption of the powers of the true owner. (b) In equity, conformably to the maxim that equity considers as done that which ought to be done, the effect of words in a deed or will directing money to be expended in the purchase of land, or land to be sold and turned into money, is that the money and land are considered for all legal purposes to be actually converted into land and money respectively.

2. In logic, see **CONVERSE**.

3. In theology: (a) divinely produced spiritual change of heart, or a turning of the heart towards God with heartfelt repentance leading to a general reformation of conduct. (b) Proselytism, or the act of winning new adherents to a religious faith, or of being won over to it.

Converter, iron retort used in the **Bessemer process** (q.v.) of making steel, and for obtaining metal from matter (metal sulphides). It consists of blowing air through molten iron or molten matter.

An air-blast of 15 lb. per sq. in. is introduced through one of the hollow trunnions on which it is mounted, the C. being first brought to red heat by being filled with burning coals.

Converter, Rotary, a machine usually employed for converting alternating into direct current. The coils of the armature are connected on one side to slip rings, on the other side to the segments of a commutator. The d.c. field is separately excited and the machine is run as a synchronous motor, the slip ring brushes being supplied from a.c. mains, while direct current is obtained from the commutator brushes. See ELECTRIC MACHINES.

Conveyance, in law, denotes the deed by which are transferred various kinds of property as defined by the Conveyancing Act, 1881. Property for the purposes of a C. includes real and personal property, any interest in such property, any debt, chose in action (q.v.), or any other right or interest. The term C. also includes an appointment (i.e. the exercise of the right or power given by an earlier instrument to appoint any person as owner of property), a covenant (q.v.) to surrender copyholds, and a vesting declaration made on the appointment of a new trustee by virtue of which the ownership of property is transferred to the new trustee for the purposes of the trust. Cs which simply transfer personal property are called assignments. Cs by matter of record include private Acts of Parliament and grants by the Crown. The formal parts of an ordinary deed of C. of lands, which in these days have been fortunately shorn of much of their former remarkable verbiage, are: (1) the date and names of the parties; (2) recitals of relevant facts, such as the preliminary agreement and the vendor's title; (3) the *testatum* containing the *operative words*, or words which direct attention to the object intended to be effected by the C.; (4) the recital of the consideration (q.v.), and receipt thereof; (5) the *habendum* showing the extent of the interest taken by the grantee; (6) reciprocal covenants (q.v.); (7) the signatures and seals of the parties.

Conveyancing, art of preparing conveyances (q.v.) of real and personal property, of investigating the title of the vendors of property, of making wills and testaments, settlements (see also ENTAIL) of property, and of framing the various instruments which are necessary in passing property from one person to another, so as to effectuate the intentions of the parties. By the old common law freehold lands were conveyed by *feoffment* (or gift of a *fees*) completed by delivery of possession. A number of statutes, notably the Conveyancing Act of 1881 and the Land Transfer Act of 1875, materially simplified the extraordinary intricacy of the forms or precedents once used in C. Under the Land Transfer Act, 1875, real property may be conveyed by a short form presented by rules, the transfer being entered in an official register, and a land certificate being

delivered to the transferee after the title has been officially examined. By the combined operation of the Land Transfer Acts, 1875 and 1897, and the Order in Council made under those Acts, registration of title to lands in the co. and city of London was made compulsory on sale, though the conveyance, as distinct from the registration, might, if the parties elected, still be effected by themselves or their legal agents.

The tendency of land law reform in Great Britain for many years past has been to approximate the law of reality to the law of personality. The Law of Property Act, 1922, together with some six consolidating statutes, was designed to rid Eng. land laws of the remnants of formalism and feudalism, and to introduce a revised and simplified system of deducing title. The scheme of these Acts was experimental or tentative, the object being to make a trial of the revised system of C. without registration over a period of 10 years from 1 Jan. 1926, and, at the same time, if it proved successful, to provide machinery whereby registration might be made compulsory without the necessity of obtaining the consent of the co. council of the area to which compulsory registration was to be applied (Land Registration Act, 1925). It is open to any co. council or council of a co. bor. to apply to the Privy Council for an order making registration of title compulsory in its area. There have been many Land Transfer Acts, beginning with that of 1862, many of them nugatory; and their purport was to make an interest in land transferable by conveyance by mere entry on a public register, as shares are by entry on the books of a company. The Act of 1897 ordained that transfer in this way should be imperative; but this compulsory transfer by registration was suspended from immediate operation except to a limited extent. The Land Registration Act, 1925, repealed the Land Transfer Act, 1875, and the whole of the Land Transfer Act, 1897, except Part I, which was in turn repealed by the Administration of Estates Act, 1925. Under the Land Registration Act, 1925, an Order in Council may be made extending the area of compulsory registration without any resolution of any co. council and in the face of any resolution of any co. council to the contrary, but subject to compliance with certain conditions (see further REGISTRATION OF TITLE). Since the Act of 1925 estates capable of subsisting as legal estates (i.e. as opposed to equitable estates) are the only interest in land in respect of which a proprietor can be registered, and all other interests except overriding interests (incumbrances, easements, etc.) and interests entered on the register before 1926 take effect as minor interests; but all interests (except undivided shares of land as to which there can now be no legal estate) entered on the register before 1926 which are not legal estates are capable of being dealt with under the Act. See also VENDORS AND PURCHASERS. See J. F. R. Burnet, *The Elements of Conveyancing*, 8th ed. 1932.

Conveyors and Elevators. C. are mechanical appliances for transporting material in bulk horizontally. E. are for lifting materials, but either may perform the double office in some degree. C. and E. are used for loading or unloading ships, for transfer or lifting of material in mills, in gas-works, etc. The docks of the Port of London Authority receive about 2,000,000 tons of grain p.a., with plant capable of dealing with 2260 tons/hr if working at full capacity. Manchester has a grain

off at any point for the purpose of filling bins in turn, the arrangement shown by the diagram is used. This consists of a carriage supporting drums so placed as to throw the material into the shoot at A, and by moving the carriage along the point of discharge may be varied at will. The drums, being mounted to swivel round the point B, may be taken out of use if required. A band conveyor may discharge at a terminal drum into a stationary shoot. At low speed the

elevator able to lift 350 tons/hr, with facilities for dealing with large quantities of cotton, while Swansea has plant at its docks capable of shipping 12,600 tons of coal per hr.

C. are chiefly used for the transfer of material to bins or hoppers, to breakers, or from breakers to furnaces or retorts, as in iron- or gas-works, and for the transport of refuse, as coke or clinker. They are also used for carrying bales, sacks, etc. **Band C.** are formed of bands of leather, or canvas and rubber, supported at intervals of about 6 ft upon rollers, actuated at one end by a driving drum. This type was first used for transport of grain in 1868 at Liverpool. The linear velocity of the band may be from 150 to 200 ft per min. for large coal and heavy material, up to 700 ft for grain. If it is desired to take

material carried may remain on the band as it passes round the throw-off drum, while on the other hand at high speed the material may leave the band on reaching the top of the drum. This depends upon the joint effect of gravity and the centrifugal force; the point at which these are equal will be the point where the material will leave the band. Flocculent material may be checked by air resistance in some degree. The diagram given shows results for velocities of 10 and 5 ft per sec., with a drum of 2 ft diameter. The travelling band is commonly fed from a hopper, and as rough and hard material is liable to cause injury, it is essential that the material should be fed on in the direction of motion, and preferably at the band's velocity. The band is commonly kept at a suitable tension to grip the driving drum

by a loose weighted pulley, steadied by guides, which takes up any stretch of the band, which ought not to exceed one twenty-fifth of its length. Band C., though commonly horizontal, may be inclined to as much as 1 in 2 $\frac{1}{2}$.

Tray C. are formed of a series of trays connected to form a continuous chain. The material is carried forward upon the trays, which discharge either at the end or

tipping the buckets automatically. They run at about 40 ft per min.

E., commonly used with C., are generally of the bucket type, in which buckets are spaced upon chains passing over drums at the top and bottom. The whole is mounted in a cage, having guides for the support and control of the moving parts. The elevator buckets dip into and scoop up the material to be raised at the

at any point desired, by a tipping device. Push C. consist of a trough within which the material lies, being pushed along by a series of push-plates attached to a chain running at 120 ft per min. Discharge at any point but the end is effected by slides in the bottom of the trough, any one of which being drawn allows all or a part of the material to fall through. Push C., when used to transport hot coke, are of the simplest construction, without rollers, the trough being formed with stopped or rising ends, to retain water used for quenching purposes. Cable C. consist of disks strung upon a running cable working in a continuous trough, and are

PUSH-PLATE CONVEYOR

generally used for loose and light materials, being run at low speed, not much exceeding 100 ft per min. Bucket C., in which hanging buckets are spaced along a driving chain, being supported by guides, are chiefly used for horizontal movement for some distance, with vertical movement at a given point, and are useful for lifting material above hoppers and finally distributing it to the receptacles by

bottom, and discharge at the top into shoots. For velocities of 250-350 ft per min., and clean material, the elevator may be vertical, in which case there will be an effective throw-off into the shoot, but for such material as coal, ore, or coke, for which speeds of from 50 to 160 ft per min. are desirable, the elevator should be sloped at 45-75 degrees with the horizon.

BUCKET ELEVATOR

Pneumatic E., in which air under pressure or with suction is used, are applied for the raising and transfer of grain. London has E. of this description able to deal with 1000 tons/hr, in addition to bucket E. Though convenient and readily adaptable to picking up at various parts of a ship's hold, the pneumatic method is not economical of power. An old form of elevator, known as the Archimedeian

screw, now but little used, raises material by the rotation of a worm, or of a helically formed surface, working in a cylindrical tube. By the screw's rotation the material is carried up the sloping case and discharged at the top. The pitch of the screw influences the inclination at which the casing may slope. The angle which this makes with the vertical should be somewhat greater than the angle of pitch, plus the angle of repose of the material. The same device working horizontally is sometimes used as a conveyor. The power required to work C. and E. is generally provided by electro-motors. In inclined coal E. the power absorbed may be as much as four times that corresponding to the work of lifting the material, and in grain E. about two and a half times. For C. dealing with 50 tons per hr, the h.p. absorbed may be taken approximately as:

Band C., grain	$2 + \frac{L}{35}$
" " minerals	$2 + \frac{L}{30}$
Push-plate C. (with rollers)	$2.5 + \frac{L}{25}$
" " " (without rollers)	$2.5 + \frac{L}{15}$
Tipping tray C.	$2.5 + \frac{L}{20}$
Screw C.	$3.0 + \frac{L}{8}$

L being the length of conveyor in ft. A variety of elevator for loading ships, known as *coal hoists*, receives the wagons from rails (which may be above the quay level) and, either raising or lowering them to a given height, discharges the wagons by bodily tipping the contents down a shoot into the vessel's hold. They are commonly worked hydraulically, the act of tipping being effected by an oscillating ram. Hoists of this description are capable of dealing with wagons of 30 tons gross weight, and are made to work up to 700 tons per hr. They are also arranged to receive wagons at the quay level, and after lifting and discharge to deliver them at a high-level railway viaduct along which they gravitate to siding level, an arrangement favourable to speedy working. Steel belt C. employ a steel band instead of the usual canvas or rubber belt. They are far superior to the other type, and much heavier loads can be supported upon them. The belt consists of finely tempered steel sheets about 300 ft long, 1-2 ft wide, and 1 mm. thick, riveted together to form a continuous band. The belt is not so flexible as the canvas or rubber conveyor, thus the sag due to its own weight is less, and consequently fewer rollers are required to support it. If boards are placed alongside it the amount carried on it can be increased enormously. Another great advantage is that it can convey materials at higher temps. than can the rubber conveyor,

substances heated up to 200° F. not affecting the belt unduly.

During recent years the use of continuous-belt C. in factories has been generally adopted, the articles which are assembled being passed down a long line of workers seated on either side; when the conveyor reaches the end the finished article is taken off. This has enabled the rate of production to be increased enormously. See ESCALATORS; LIFT.

Convocation (Lat. *convocatio*, a calling together), term usually restricted to assemblies of the graduates of certain univs. or of the clergy. In England the name is particularly given to an assembly which is called together by the archbishops of Canterbury and York, each within his own eccles. prov., pursuant to a royal writ. A C. is summoned whenever Parliament is about to sit, and is continued as long as Parliament continues. The assemblies consist of two houses, the Upper and the Lower. The Upper House consists of the bishops and their archbishops; the Lower consists of the deans and archdeacons of every cathedral, the provost of Eton (in the case of Canterbury), proctors sent by the cathedral chapters, and proctors elected by the clergy of the diocese. The origin of C. is unknown, but by the time of Edward I it had reached its fully developed form, the writ issued by the monarch to the metropolitans then being identical in form with that now issued. From this time till 1664 the clergy reserved the right of taxing themselves, and one of the chief duties of C. was the voting of subsidies to the Crown. The independence of C. was marked until the reign of Henry VIII, when that monarch secured the doubtful admission from C. that it 'is, always has been, and ought to be summoned by authority of royal writ.' Owing to a lack of submission shown by the Lower House in 1717, C. was prorogued, and, except on unimportant occasions, its powers remained in abeyance until 1852. It then resumed its sitting, and its activity is steadily increasing. C. is concerned primarily with doctrinal and spiritual matters, whereas the Church Assembly (q.v.) is a legislative and administrative body. See A. F. Smethurst, *Convocation of Canterbury*.

Convolvulus, typical genus of the family Convolvulaceae, consists of about 180 herbaceous and shrubby plants growing in temperate and sub-tropical climates. Many of these are twining plants with large, white, trumpet-shaped flowers, and contain a milky latex. *C. arvensis* is the common bindweed found in Britain; it grows in a sandy soil, and the flowers have a sweet fragrance. *C. scammonia*, a native of the Levant, has a rhizome which yields a resinous juice, from which the purgative drug known as scammony is obtained. In the U.S.A. the plants are known as morning glory.

Convoy (Late Lat. *convivare*, to accompany), in the navy, the name given to one or more ships of war sent to protect a merchant fleet from the attacks of a

national enemy or from pirates. In military service the C. is strictly a train of wagons stocked with provisions or supplies for war. The term is also used for a detachment of troops or escort appointed to protect such a train or sometimes people.

Towards the end of the First World War, owing to Germany's unrestricted submarine campaign, practically all ocean-going vessels voyaged to or from Great Britain in C.s, and such C.s included neutral vessels. Very soon after the outbreak of war in 1939 the C. system was in full operation again, and by the beginning of Dec. 1939 Churchill, first lord of the Admiralty, was able to announce that less than 1 ship in 750 had

in infants more readily than in adults, the infant cerebral tissue being more subject to minor causes of dysfunction. Thus teething and digestive upsets may cause C. in babies. Nevertheless medical advice should be sought. First-aid treatment of C. consists in preventing the patient from injuring himself and maintaining a clear airway by removing false teeth and preventing the tongue from falling back.

Conway, William Augustus (1789-1828), actor, b. London. His most famous parts were Shakespearian, including Othello, Henry V, and Mark Antony, and he created the part of Prince Zerbino in *The Noble Outlaw*, 1815. He had a romantic friendship with Mrs Piozzi, ending his

Imperial War Museum: Crown Copyright
A BRITISH CONVOY AND ESCORT, 1942

been sunk in C., although subsequently losses were considerably higher. The C. system, however, was undoubtedly responsible for saving hundreds of thousands of tons of merchant shipping that, sailing without armed protection, would have been an easy prey to U-boats. See also ATLANTIC, BATTLE OF; NAVAL OPERATIONS IN THE SECOND WORLD WAR.

Convulsionaries, see JANSENISM.

Convulsions, involuntary contractions of an extensive group of muscles due to cerebral disturbance. See also under EPILEPSY. The disturbance of cerebral function may be due to local damage of brain tissue as in apoplexy (q.v.); or brain tumour, or brain injury as in fractured skull and concussion; or inflammation as in meningitis (q.v.) or encephalitis (q.v.) or brain abscess; or to some chemical or organic toxin circulating in the blood. Thus strychnine poisoning may cause C. and so also may uraemia (q.v.). There is usually loss of consciousness during a true convulsion, together with loss of control over the bladder, so that water is passed involuntarily. In a hysterical convulsion loss of consciousness and loss of control do not occur. C. occur

picturesque career by committing suicide by drowning off Charleston, U.S.A.

Conway, Conwy, or Aberconwy, seaport, mkt tn, and municipal bor. of Caernarvonshire, N. Wales, on a steep slope at the estuary of the R. Conway, 12½ m. from Bangor, 22 m. from Caernarvon. It is one of the most striking of tns in Britain. It is surrounded by strong walls with battlements and towers. C. castle, one of the grandest feudal fortresses of Britain, was built by Edward I (1284) to check the Welsh. It has very thick walls and 8 vast towers. The Cistercian abbey (1185) was removed by Edward I to Maenan, near Llanwrst. Its ruins are still to be seen, and the anct church at C. is said to be substantially the abbey church; it has a magnificent 15th cent. rood screen. Plas Mawr, an old Elizabethan mansion, is now the home of the Royal Cambrian Academy. The castle was held for Charles I during the Civil war. The remains of the Rom. fort of Conovium are 4½ m. from C. The site was excavated in 1926-7, showing that it was probably built about AD 112. Pop. 11,250. (See illustration, p. 760.)

Conway of Allington, William Martin Conway, first Baron (1856-1937), traveller,

mountaineer, and writer, from 1901 to 1904 Slade prof. of fine arts at Cambridge. Travelled in the E., the Himalaya, the Alps, Spitzbergen, and also the Bolivian Andes, when he ascended Sorata, Illimani, and Aconcagua, and explored the glaciers of Tierra del Fuego. M.P. (Unionist) for Combined Eng. Univs., 1918-31. His works include *Climbing and Exploration in the Karakoram-Himalayas*, 1894; *The Alps from End to End*, 1895; *The First Crossing of Spitzbergen*, 1897; *The Bolivian Andes*, 1901; *Aconcagua and Tierra del*

Lecturer in 1839 and instituted dean of Llandaff in 1845.

Cony, see CONEY.

Conybeare, William Daniel (1787-1857), geologist and divine, b. London, grandson of John C. (1692-1755), dean of Christ Church, Oxford, and bishop of Bristol. Educ. at Westminster School and Christ Church, Oxford. Fellow of the Geological Society, 1811, F.R.S. First to describe ichthyosaurs. Many geological pubs. He is, however, chiefly remembered for his *Outlines of the Geology of England and Wales*, written in collaboration with W. Phillips, 1822. Appointed Bampton

way, she received a civil list pension of £100. Sev. of her lyrics, such as 'The Rover's Song' and 'The Old Arm-Chair,' were very popular. Her works included 4 vols. of verse (1835-45); *Jottings from my Journal*, 1860; and *New Echoes and other Poems*, 1864.

Cook, Frederick Augustus (1865-1940), Amer. explorer, b. Callicoon Depot, New York, son of a Ger. immigrant who changed his name. Drove a milk wagon to pay his college expenses; graduated in medicine at New York Univ. Surgeon to Peary Arctic Expedition, 1891-2; led two expeditions along the W. coast of Greenland, which were failures; ship's doctor on Belgian Antarctic expedition, 1897-9. In 1903-6 led expedition to ascend Mt McKinley, Alaska, and claimed to have reached the summit, but other explorers openly doubted his claim. In 1909 he startled the world by his announcement that he had reached the N. Pole, assisted

by two Eskimo, one of whom he called Etukisook. A few days later Lt (afterwards Adm.) Robert Peary, U.S.A. Navy, returned after his discovery of the Pole, and denounced C.'s claim. Sworn statements by companions and accomplices discredited his pretensions; and, after his alleged proofs were rejected by Copenhagen Univ., he sank into obscurity. In 1922 he was sentenced to 14 years' imprisonment for fraud in connection with a concern called the Petroleum Producers' Association, and served 5 years of his sentence, which was commuted by President Hoover. Wrote *My Attainment of the Pole*, 1911; *Return from the Pole* (ed. F. J. Pohl), 1953.

Cook, Captain James (1728-79), celebrated navigator, b. Marton, Yorkshire, where his father was first an agric. labourer and then a farm bailiff. He was apprenticed, when only a little over 12, to a haberdasher at Staithes, a vil. near Whitby, but left him owing to a dispute and boarded a ship as collier's apprentice and was very soon made mate. In 1755 C. joined the navy and from then onwards his success in life was assured. On the recommendation of Sir Hugh Palliser he was appointed successively master of 3 sloops, in the last of which he served in the St Lawrence, being present at the capture of Quebec. He was employed in sounding the St Lawrence and pub. a chart of the riv. from Quebec to the sea. In 1763 he surveyed the coast of Newfoundland and the next year was appointed marine surveyor of Newfoundland and Labrador. In this capacity he pub. in the *Philosophical Transactions* an observation of a solar eclipse near Cape Ray. The charts and observations which he drew up on this Newfoundland expedition attracted the attention of the Royal Society, who invited him to take part in an expedition for the purpose of making an observation of the transit of Venus. For this purpose he received a lieutenant's commission and set sail in the *Endeavour*, a vessel of 370 tons, accompanied by sev. scientific men, including Sir Joseph Banks (q.v.). On 13 April 1769 he reached Otaheite (or Tahiti), where he erected a makeshift observatory and succeeded in making the necessary astronomical observations. From Otaheite he sailed in quest of the great continent which for centuries had been supposed to exist in the S. ocean (see TERRA AUSTRALIS INCOGNITA) and reached the is. of New Zealand, which had remained unexplored since their first discovery by Tasman in 1642. His efforts to reach the interior were baffled by the hostility of the natives, but during the ensuing 6 months he circumnavigated the is. and estab. the existence of the channel dividing New Zealand into two large is. From New Zealand he sailed to New Holland (Australia) and came in sight of Botany Bay, after narrowly escaping disaster on the Great Barrier Reef. Here again the natives were hostile, but, nothing daunted, C. explored the coast and took possession of it in the name of Great Britain, naming it New S. Wales. Thence he sailed to New Guinea and to Batavia,

where his much-battered ship was repaired. He arrived in England on 11 June 1771, and was at once promoted to captain's rank and put in charge of a second expedition. He now started out in command of the *Resolution*, a ship of 462 tons, and a smaller ship, the *Adventure*, of which the combined crews numbered 193 men, the object of the voyage being to pursue the quest of the great S. continent. Setting sail from Plymouth on 13 July 1772, he touched at Madeira and the Cape of Good Hope and explored the specified lat. He made the first crossing of the Antarctic Circle 16 Jan. 1773, but was driven N. and, after wintering at the

CAPTAIN COOK

Engraving from a painting by Dance.

Society Is., so naming them in honour of the Royal Society, he made further explorations eastward and, turning northwards, navigated the S. tropic from Easter Is. to the New Hebrides and discovered the is. which he named New Caledonia. C. always showed a kindly interest in the natives and his kindness mostly won their confidence, as for instance in Tahiti. As a good example of his interest in the natives of the Pacific there may here be mentioned the case of 'Omali,' as he was known to his Eng. friends. Omali was a young native of Huahine, in the Society Is., whose intelligence and engaging manners had brought him in 1773 to the notice of Capt. Furneaux, commanding the *Adventure* and C.'s second in command. With C.'s concurrence, Omali was taken in the *Adventure* to England, where he was received by George III, and for 2 years was lionised by London society as an attractive specimen of the 'noble savage' recently popularised by Rousseau; and finally, in 1776, brought back to Huahine by C., who took good care that the chiefs should make an appropriate grant of land

to a fellow islander who had received the gift of a sword of honour from the King of England. In 1774 C. sailed as far as the Fiji Is., anchoring off Vatoa or Turtle Is. in S. Lau. After yet another attempt, during which he reached his most southerly lat. in lat. 70° 10' S., long. 105° 54' W. on 27 Jan. 1774, he gave up hope of finding land and sailed for home. Arrived back in England once more, he was promoted to the rank of post-captain, made a member of the Royal Society, and awarded the Copley Medal. He had cruised for more than 3 years in the Pacific and S. oceans and during the whole voyage he lost only 1 man through scurvy, an unparalleled triumph of discipline coupled with a scientific realisation of the causes of that disease. Above all, he had dealt the death-blow to the age-long myth of the unknown S. continent, a negative result of his explorations the political implications of which were as important as the geographical (see on this Cook and the Opening of the Pacific, by James A. Williamson, 1946). The attention of the gov. was now directed to the discovery of a N.-W. passage and C. volunteered to lead the expedition. His last and fatal voyage was begun on 25 June 1776, C. sailing in the *Resolution*, and his second in command, Capt. Clerke, in the *Discovery*. In the course of his voyage he discovered the Sandwich Is. (or Hawaiian Is.), which he named after the earl of Sandwich; he then proceeded to America, penetrating into what was afterwards called C.'s Inlet. Prevented from proceeding any further by a wall of ice, he returned to the Sandwich Is., where he met a premature end in 1779 in Kealakekua Bay in the Is. of Hawaii in a dispute with the natives about one of the boats of the *Discovery* which had been stolen. To recover the boat C. had seized the person of the king until reparation was made. He landed the next day, when a scuffle ensued which compelled the party of marines who had accompanied him to retreat to the boats, C. being the last to withdraw, and when he was nearing the shore he was struck from behind, the marines being unable to render any assistance. It is one of the ironies of hist. that the man who of all Pacific explorers was the most humane and considerate towards natives should have lost his valuable life in an unimportant encounter with a few pilfering natives. C., in addition to his achievements as a navigator, performed great services for his country in his geographical and scientific investigations. In 1934 his cottage in Great Aylton was presented to the Gov. of Victoria, and transported to Melbourne for re-erection in the Fitzroy Gardens. The original deeds transferring the land to him and bearing his signature are also in the possession of the Victorian Gov. His works are *An Account of a Voyage round the World* (first printed in John Hawkesworth's *Voyages*, 1773, ed. by W. J. L. Wharton, 1893); *A Voyage towards the South Pole and round the World*, 1777; *A Voyage to the Pacific Ocean*, 1784. See A. Kitson, *Captain*

James Cook, the Circumnavigator, 1907; G. Campbell, *Captain James Cook, R.N., F.R.S., Circumnavigator of the Globe*, 1936; H. Carrington, *The Life of Captain Cook*, 1939; J. B. Muir, *The Life and Achievements of Captain Cook*, 1939; J. A. Williamson, *Cook and the Opening of the Pacific*, 1846.

Cook, Sir Joseph (1860-1947), Australian free trade statesman, b. Silverdale, Staffordshire, England. At the age of 9 he worked in a coal mine. He went to Australia in 1885, and in 1891 was elected for Hartley in the New S. Wales Legislature. He was postmaster-general, 1894-8; and minister of mines and agriculture, 1898-9. Became a member for Parramatta in Commonwealth Parliament, 1901; and so remained for 20 years. He was minister for defence in Deakin's (q.v.) Gov., 1909-10. On the defeat of Fisher's (q.v.) Labour Gov. in 1913, C. became Prime Minister, but with a minority in the Senate, so that he soon had to resign. He held office under W. M. Hughes as minister of marine, 1917-20; and as commonwealth treasurer, 1920-1. He was a representative of Australia at the Versailles Peace Conference, 1919. From 1921 to 1927 he was high commissioner in London for the commonwealth; and in 1922 senior Australian delegate to the third assembly of the League of Nations.

Cook, Thos., & Son Ltd., great Eng. firm of tourist agents. The founder, Thomas C. (1808-92), was b. at Melbourne in Derbyshire, and was successively a gardener's help, a wood-turner, a printer, and a Bible-reader and local missionary. In 1836 he became a total abstainer and took a great interest in the temperance movement, founding the *Children's Temperance Magazine* in 1840. It was in connection with this subject that he first conceived the idea of organising parties for travelling. He persuaded the Midland Counties Railway Company to take 570 passengers from Leicester at a return fare of one shilling, this being probably the first publicly advertised excursion. This experiment was so successful that Thomas C. continued to organise such parties, and gradually enlarged his operations. In 1865 the business was removed from Leicester to London. In 1866 the first tours to the U.S.A. were arranged, and in 1869 to Palestine. In 1882 the services of the firm were commissioned in the suppression of Arabi Pasha's rebellion to convey Sir Garnet Wolseley and his suite to Egypt and transport the sick and wounded. In 1884 it conveyed Gen. Gordon to the Sudan, and later in that year the Gordon relief expedition, which included 18,000 troops. Shortly afterwards the firm organised the Moslem pilgrimage from India to Mecca and Medina. On the death of J. M. Cook in 1899, the control of the business passed to his sons, one of whom, Frank C., was chairman until his retirement in 1929. A fusion of interests was arranged in 1928 between T. C. & Son Ltd and its associated companies—including that of T. C. & Son (Bankers) Ltd and the Compagnie Internationale des Wagons-Lits et des

Grands Express Européens—and the business was then organised on a greater scale than ever. Since 1948 the control of the company has been vested in the Brit. Transport Commission. The headquarters of the firm are in Berkeley Street, W.1.

Cook, Mount, in the centre of the Alps in the S. Is. of New Zealand, is the highest mt. peak in Australasia, its altitude being 12,349 ft. It is covered with perpetual snow, and rises in the shape of a pyramid above the other neighbouring

Rarotonga each month, and various small vessels trade among the outer is. Geographically, the group falls into two parts: the Southern Cook Is.—Rarotonga, Mangala, Mauke, Mitiaro, the Hervey Is. (Manuae and Te Au-O-Tu), Takutea, Aitutaki, and Atiu; and the Northern Cook Is.—Suwarrow, Palmerston, Penrhyn (Tongareva), Manihiki, Rakahanga, Pukapuka, and Nassau. Main exports are citrus fruits, tomatoes, copra, bananas, and pearl-shell; the total value of exports in 1953 was £351,542. Pop. in 1954, 15,657.

E.N.A.

COOK ISLANDS: HULA DANCERS OF RAROTONGA

peaks. The Rev. W. S. Green nearly reached its summit in 1882. Frye ascended it in 1895, and Turner in 1906. See Freda, du Faur, *The Conquest of Mount Cook*, 1936; R. L. G. Irving, *Ten Great Mountains*, 1940.

Cook Islands, archipelago of small is. in the Pacific, lying between the Society and Samoan Groups, between lat. 8° and 22° S. and long. 156° and 167° W. The group, whose is. vary from high volcanic to coral atolls, is fertile and beautiful, and inhabited by an attractive and intelligent race of Polynesians. The is. were discovered by Capt. Cook in 1773, and declared to be under Brit. protection in 1888. In 1901 they formally became part of the Dominion of New Zealand. They are administered by the dept. of is. ters. of the New Zealand Gov. at Wellington, through a resident commissioner at Rarotonga. The New Zealand Gov.'s merchant vessel *Mauī Pomare* calls at

Cook Strait, strait between N. and S. Is., New Zealand, discovered by Capt. Cook in 1770. A project to cross it with a submarine power transmission cable was formulated in 1956.

Cooke, Benjamin (1734-93), composer and organist, son of a London music-seller. He composed anthems and other sacred music, a highly original setting of Collins's 'Ode on the Passions,' and also popular glees, 'How Sleep the Brave' and 'In the Merry Month of May.'

Cooke, Sir William Fothergill (1806-79), engineer, served in Indian Army (1826-1831), studied medicine at Paris and Heidelberg, and then took up telegraphy, going into partnership with Prof. Wheatstone in 1837. They made a special study of railway signals, and in 1845 patented the single-needle apparatus. C. formed a company in 1846, and he and Wheatstone received the Albert gold medal in 1867.

Cookers, see COOKERY.

Cookery, art of dressing and preparing food for human consumption by the application of heat. The names given to different kinds of C., which are considered below, arise from the various degrees and kinds of heat to which the raw materials employed are exposed during this process.

THE EFFECT OF COOKING ON FOOD.—Cooking increases the value of certain foods in numerous ways, but destroys some vitamins, particularly vitamin C (antiscorbutic), therefore fresh vegetables and fruit should be taken daily to make up for this loss in cooked food. Performed while the material is fresh, cooking considerably postpones the beginning of putrefaction, and it kills harmful germs which may have infested the substance. The process brings out the flavour of the raw material in such a way as to make it more pleasing to the palate, thus increasing appetite and, by stimulating the flow of the gastric juices, materially aiding digestion. Lastly, and most important, the main aim of C. is, by recognition of and attention to the laws of chem. involved, to render food more digestible than in its uncooked state. Research and experience have evolved various general principles which may be applied to the various classes of food. One of the chief of these, for instance, applies to the coagulation of albumen, a substance present to a large degree in animal foods. Coagulation of albumen, as seen in the white of a soft-boiled egg, is desirable, and is always attained by exposure to a gentle heat, but continued exposure to a temp. at or above the boiling-point results in the hardening of the albumen into a leathery substance extremely difficult of digestion. Thus in cooking meats the aim of the cook should be to obtain a thin outer covering of this hardened albumen, which will prevent the escape of the meat juices, by first applying considerable heat, but, to prevent the toughening of the interior which would be consequent upon hardening of the albumen throughout, removing to a lower temp. as soon as this protective shell has been formed. All starchy foods are rendered more digestible by the application of dry heat, which converts the insoluble starch into soluble dextrin and sugar. The science of C., to which considerable attention is now paid in schools, institutes, polytechnics, etc., under the general title of Domestic Science courses, is of comparatively recent origin, being practically a product of the 19th cent. The same may be said of the development of C. as a fine art, since the methods employed in the preparation of food for even the famous feasts of auct. and medieval days were few and more or less crude, depending for success on the hearty appetites and unrefined palates of the people, while the lower classes cooked their food in the most primitive fashion. Early and medieval E. feasts seem to have been distinguished by the immense quantities consumed, both of food and drink, rather than by the quality of the

dishes served, while such recipes as have reached us are remarkable for the number and apparent incongruity of the ingredients employed. The art of C. may be said to have begun in Italy at the time of the Renaissance, and from there spread to France, which soon became its headquarters. The cultured simplicity of It. C. seems to have been introduced into France by Catherine de' Medici, and was developed by famous chefs whose names are immortalised in the titles of their inventions, under the patronage of Louis XIV and Louis XV. Fr. C. still remains the ideal of high-class culinary operations.

METHODS OF COOKING.—*Broiling*, probably the earliest known process of cooking meat, consisted in exposing the surface to direct heat, so that the outside of the meat was well browned, and the inside rendered tender and juicy. The primitive method of broiling meat was by burying it in hot ashes; but the process, when now used, is performed over a clear fire on a gridiron or similar appliance. The meat is turned during broiling by a pair of tongs, as a fork would cause the juices to escape. Small birds, such as quails, may be excellently broiled in about 10 min.; white meat as a rule requires longer cooking than red.

Grilling is not so well done before a fire as over it, as one side of the meat is in the former case exposed to a current of cold air. The average time for grilling is 5 min. for a steak 1 in. thick, 10 min. for a steak 1½ in. thick, and 20 min. for a steak 2 in. thick; but many foods such as steak, cutlets, bacon, fish, etc., can be cooked in a few minutes under a gas or electric griller.

Roasting is really the application of the principles of broiling to larger joints of meat, for which it is an economical process and one producing excellent results. As in broiling, exposure to the greatest heat should come at the beginning of the cooking, so that the meat juices are sealed up and the joint, when cut, exudes a rich, reddish gravy. The interior of the joint should then be allowed to cook in a rather gentler heat, by means of which the fibres are loosened, the connective tissue is changed into gelatin, the fibrin and albumen are oxidised, and the fat cells broken. The fat and tissues on the surface of the meat become caramelised and browned, and acquire a distinctive odour and flavour. The joint should be frequently basted with melted fat in order to prevent evaporation of the watery portion of the meat juices. Meat roasted before an open fire is much more wholesome than when baked in an oven, as the volatile empyreumatic oils produced on the surface are allowed to escape. Roasting is, however, possible only before an open range. The time required for roasting is from 15 to 20 min. for each round of meat, white meat taking longer than red. Meat can be roasted in a thick saucepan by melting sufficient fat to cover the bottom, and when hot putting in the meat, browning it on all sides, covering with a lid, and continuing to cook over a low heat.

Baking is now the usual substitute for roasting meat in an oven. It is placed in an open tin and heat applied all round at once, instead of to one side at a time; but baked meat, owing to the reabsorption of the volatile products which cannot escape in the closed oven (this does not apply to ventilated ovens, such as gas and the latest electric stoves), is neither so digestible nor so delicate in flavour as roasted meat. Baking is also applied to

meat, and various other ingredients, such as root vegetables and herbs, may be added to the meat and cooked together with it. Since none of the constituents of the materials used can escape, stewing is a most economical method of cooking, and is rendered doubly so by the fact that coarse and tough meat may be rendered palatable, tender, and digestible by its means. In many ways it is the ideal method of cooking meat, but success

PANEL FROM THE BAYEUX TAPESTRY
(Illustrating the preparation of meat for a feast)

other kinds of food besides meat, e.g. fish is more appetising when baked. It can either be wrapped entirely in greased paper, so retaining all the flavour, or laid in a greased casserole, with dabs of fat placed on top. Pies containing either meat or fruit are usually baked, and a meat pie possesses many advantages over plain baked meat, since the surface is protected from charring by the crust, and the meat practically stews in its own juices. All forms of pastry, such as pasties and open tarts, are baked, and require a hot oven. The latter should be placed at the top of the oven to begin with, but after the material has risen sufficiently removal to a cooler lower shelf is usually advisable to ensure thorough cooking of the interior. The heat of the oven should also be reduced. Especial care should be taken to close the oven door gently during the early stages of cake baking, or the risen mixture may collapse. Cakes require a wide range of temp. Plain cakes and scones are baked at a high temp.; rich cake mixtures and ginger-breads are baked at a lower temp. Similarly the initial cooking temp. for plain yeast mixtures is high, while richer varieties are baked at lower temps. Milk puddings are baked in a slow oven. Modern electric or gas stoves are fitted with heat regulators which automatically maintain the oven at any desired temp. and in consequence less attention is necessary during the actual cooking of the food.

Stewing is the slow cooking of food in a little liquid in a closed vessel. It is the method recommended for tough fibrous

depends on keeping the temp. below about 180° F. Lean meat is best for stewing; it should be cut into convenient pieces and slightly browned by frying in fat previous to being placed in the stewpan. It should then be covered with water or stock, and set to cook for 3 to 5 hrs., particular care being taken to prevent boiling, so that the albumen does not harden, and the meat cooks in its own gradually extracted juices. Vegetables, flavourings, and thickening matter may be added as desired. The principle of stewing is also employed in the making of broth, and of soup or beef tea. Meat and bones for the making of soup should be placed in cold water and gradually raised to boiling-point, so that the escape of meat juices into the liquid is not hindered by hardening of the albumen. Since, however, it is not desired to eat the solid constituents, bone stock is boiled slowly for several hours in order to extract the gelatinous matter. It is this gelatine which causes soup to form a jelly when cold, but contrary to belief it has no great food value. By the addition, however, of vegetables, and starches such as corn-flour, barley, oats, etc., or nitrogenous matter such as cheese, macaroni, beans, or lentils, thick or cream soups are nourishing, as well as stimulating. Vegetable water or vegetable stock also makes a good basis for soups. Stewing is also a common method of cooking fruit, by making a syrup of sugar dissolved in warm water, and adding the fruit, which is cooked gently, but not boiled.

Braising is a combination of stewing and baking, or pot roasting. It is an

excellent method of cooking meat, because the cheaper cuts or tougher joints become tender after being treated this way. The meat is fried, after removing the surplus fat, in a small quantity of hot fat for a few minutes until the outer covering is sealed and browned all over, and then it is removed from the pan. A liberal quantity of sliced root vegetables is lightly fried in the fat, and then placed in a saucepan or casserole, with water or stock half covering them; seasoning and a *bouquet garni* being added. The meat is then placed on top of the vegetables, and the saucepan or casserole covered with a lid; the contents being cooked over a low heat or in a slow oven for 2 to 3 hrs. Poultry, game, and root vegetables may also be cooked this way.

Boiling, or cooking by immersion in boiling water. This method is used for fresh or salted meat, game, and poultry. The temp. of the water should, however, be reduced 5 min. after the immersion of the meat (i.e. sufficient time to seal the outer covering), otherwise there is a serious risk of toughening of the connective tissue if boiling is continued. Coagulation of proteins, as in the case of the egg, takes place in a temp. of about 180° F., and an egg cooked in this temp. for 10 to 15 min. is more easily digested than one kept at boiling point. The usual method of cooking eggs by boiling for 3½ min. is far from ideal, as it allows the albuminous white to become overcooked while leaving the yolk underdone. A much better plan is to place the eggs in boiling water (half a pint to each egg) and leave them in the gradually cooling water for about 20 min. The same can also be said of meat, and it is desirable to see that the temp. of the water does not rise much above that required for the coagulation of egg protein. This method can also be applied to fish, but to retain the flavour steaming or baking is preferable.

Certain semi-liquid foods, such as milk puddings, jams, and jellies, are cooked by boiling the substance itself, constant stirring being necessary in such cases to prevent burning. Allied to boiling is *steaming*, for which the food is placed in a covered vessel having a perforated bottom which fits tightly over a saucepan of boiling water. Steaming takes rather longer than boiling, but is preferable in many ways, giving a finer flavour, and preventing the surface of puddings from becoming sodden through contact with water.

Vegetables should not be cooked too long, or at too high a temp., otherwise valuable vitamins and salts are lost. They can be steamed; cooked conservatively, i.e. in a little water; or braised. Most vegetables when grated can be eaten raw with salad or in sandwiches, and they are very nutritious taken this way. Green vegetables should be fresh; washed thoroughly, care being taken not to bruise the leaves; and they should not be left in water for more than a few minutes. Root vegetables should be scrubbed, and if necessary peeled very thinly.

Conservative cookery is the method

recommended for vegetables, as only a little water is used and the flavour, valuable salts, and vitamins are retained, or conserved. Green vegetables should be shredded coarsely and put into very little boiling water (about ½ pint to 1½ lb. of vegetables), covered with a lid, and tossed occasionally to prevent burning. Attention is needed during this method of cooking, which does not take more than 10 to 15 min. The vegetables should be removed from the heat immediately they are cooked, and eaten at once. When cooking spinach it is unnecessary to add any water. A teaspoonful of fat may be added during, or after, cooking the vegetables. Carrots are delicious sliced and sautéed (i.e. cooked in a little hot fat) for a few minutes, a tablespoonful of water added, and then cooked for about 10 min. in a covered pan. Vegetables are more appetising and nutritious when cooked conservatively than by the old method of boiling them in plenty of water. Potatoes are more nutritious when cooked in their skins, after being well scrubbed. They can be boiled gently or baked in the oven. The reason for cooking potatoes in their jackets is that the layer nearest the skin is considerably richer in mineral matter and protein than the outer flesh and central core; and the flavour is enhanced when potatoes are cooked this way. If it is impossible to retain the skins, then potatoes should be peeled very thinly, and conservatively cooked. The water in which vegetables are cooked can be salted, iodised salt being recommended; but soda must not be added as it destroys vitamins. Vegetable water should not be thrown away, but used for soup or gravy.

Vegetables can be cooked in a waterless steamer, but boiling is preferable as there is less loss of vitamin C. Steam pressure cooking has the advantage of economy of fuel, food, and time, but it is considered by some dieticians and doctors to destroy valuable substances in the food owing to the high temps. used (212°–280°).

Frying, or cooking by hot fat, is of 2 kinds, wet and dry. The former, which is much the preferable, is done in a deep frying kettle containing lard, butter, dripping, or cotton-seed or olive oil. The fat should be gradually heated up to almost 400° F., when it is perfectly still and gives off a faint bluish vapour; the articles to be fried are then immersed, being usually enclosed in a wire basket for ease in handling. Fried food should be crisp, golden-brown in colour, and non-greasy, any superfluous fat on the surfaces being removed by placing the articles on absorbent paper. Fish, cutlets, croquettes, fritters, potatoes, chops, etc., are delicious when well cooked in this way, and many foods are, for this method of cooking, first rolled in beaten egg and breadcrumbs or in batter. Dry frying is performed in a shallow frying-pan the bottom of which is covered with hot fat. It has many disadvantages; the food is apt to be unequally cooked, greasy, and charred, and has to be constantly turned. Bacon, sausages, chops,

etc., are cooked thus in their own escaping fat, while eggs, cold potatoes, and pancakes may be dry fried in a little dripping or lard. This method of frying is also known as *sauting*. All fried food should be served immediately it is cooked.

PROCESSES ALLIED TO COOKERY.—Other forms of C. include *blanching*, i.e. putting food into boiling water for a few minutes, and then plunging into cold. This helps to remove easily the peel of tomatoes, peaches, almonds, etc. Another way of blanching is by putting the food into cold water, bringing it to the boil, and plunging again into cold water: this method is used in the preparation of certain kinds of offal. To *caramelize* is to heat sugar gently until it turns brown, when it can be used for caramel custard or caramel rice; *parboiling* is partly or half boiling, the cooking being continued in another way. For instance, potatoes are more easily digested if parboiled before roasting, also a bullock's heart is rendered more tender when cooked in this manner. *Pasteurising* is the quick raising of the temp. of milk to 145° F., and keeping it there for about half an hour, then cooling it rapidly; *scalding* is heating a liquid just below boiling-point: milk, for instance, is treated this way to prevent it becoming sour quickly in hot weather; *searing* is forming a coating over the surface of meat; *soucing* is cooking food slowly in vinegar and spices: herrings and mackerel can be cooked this way; and *sterilising* is boiling. Milk is often treated this way to prevent souring, and to kill harmful germs, but at the same time vitamin C is destroyed. 'Steam under pressure is a much more effective method of sterilising material containing bacterial spores, and a temp. of 115–20° C. for 15 min. is always to be relied on for sterilisation' (C. E. Dukas).

BEVERAGES ASSOCIATED WITH COOKERY.—Tea, coffee, and cocoa are the beverages generally taken in Britain. Tea is the most popular and has the most varieties, dependent upon its place of growth, and according to the different leaves from which it is produced. Chinese teas have the most delicate flavour, Indian teas have the greatest degree of astringency, particularly Assam tea, which is usually used for blending with milder varieties, Ceylon teas have a rich flavour. In judging a tea one should look for a reddish-golden coloured liquid, the infused leaves should be of a bright coppery tint and evenly extracted, and there should not be much stalk with the leaves, which should not be completely unrolled after 5 min. infusion. The proper method for making tea is important; fresh water should first be brought to the boil, and the teapot thoroughly warmed so as to maintain the temp. in order to extract the finest flavour from the tea. Infusion should not be more than about 5 min., and after this the liquid, without the leaves, should be poured off into another hot pot; otherwise too much tannic acid is extracted, along with other bitter substances. Coffee is consumed on the Continent and in America more than in

Britain. There are sev. varieties of bean, such as Mocha, Mysore, Jamaica, Kenya, Ceylon plantation, Costa Rica, Java, and Brazil. Fr. coffee usually contains chicory, which is the root of the wild endive. It is not detrimental to health, and is considerably cheaper than coffee beans. Coffee should be made strong and hot, and the beans should be freshly roasted and ground. For *café au lait* 1 part of milk to 1 of coffee is about the proper proportion. Coffee is sometimes served iced. Cocoa has a certain proportion of fat and starch, and because of the latter it should be boiled for 1 or 2 min. before serving.

There is no food value in tea or coffee, and excessive indulgence, especially in the former, may affect the nervous system or the digestion. Tea and coffee are stimulants, and it is therefore better not to take them at night. Cocoa has very little food value, except when made with milk and sugar. Certain proprietary preparations which contain malt extract, eggs, milk, and cocoa are sometimes used as substitutes for the above beverages.

Fruit drinks can be made from fresh fruits or canned fruits, and are very refreshing when served iced. Barley water may be added to make a demulcent drink suitable for the sick room, or as a beneficial drink in hot weather.

COOKING UTENSILS.—Various kinds of utensils for special forms of C. have been devised and perfected. Nowadays, however, gas and electrical equipment is used increasingly, owing to its cleanliness and saving of time. Refrigerators are used for storing and keeping food fresh; and various types of thermometer are available for testing the temp. of ovens, milk, sugar, and fruit during preserving. The following are some of the small electrical appliances which are available, either in Britain or America, for the preparation and cooking of food and beverages: bean cutters; boiling rings; boiling plates; breakfast cookers; chafing dishes; casseroles; coffee mills, percolators, and brewers; double saucepans; drink mixers; egg poachers, or steamers; food mixers; freezers; hot cupboard; hot-water urns; ice-cream freezers; domestic, tourist, and whistling kettles; mincing machines; mixers; potato peelers; roasters; steamers; automatic toasters; warming plates; and waffle irons.

COOKERS.—There are a variety of cooking stoves: *oil cookers* with or without wicks; *solid fuel cookers*, which burn coal, coke, wood, peat, or a smokeless fuel such as anthracite, coke, or charcoal; *gas cookers*, working from a mains supply or using *Calor Gas*, which is a portable fuel, delivered in small steel cylinders, the gas being stored in liquid form; and *electric cookers*. *Solid fuel cookers* include the cottage and kitchen ranges, made of cast-iron, and sometimes coated with enamel; *combined cookers* can be fitted in a living-room, in appearance are like an ordinary fireplace, and are available in various colours. The one fire heats the room, an oven, a hot chamber for plates, boils and grills, and provides hot water for

baths, etc. *Back-to-back* grates have an open fire in a sitting-room (which can be shut off) with the oven and hot plate in the kitchen, and this stove also supplies hot water. *Stored-heat* cooking stoves are usually made of cast iron with heavy iron or steel blocks above the fire. The stoves are covered with a highly glossed vitreous enamel, and contain hot plates which can be covered with insulating lids when not in use; there are separate ovens for roasting, stewing, warming plates, etc. The stoves are insulated with asbestos, and consequently the kitchen never becomes over-heated. The first cost of the stored-heat cooking stoves is high, but there is considerable saving in fuel and labour. Unfortunately they are not usually designed to heat water, but water heaters may be provided. *Gas* cookers are usually the open type of cooker, or the enclosed streamlined cabinet type, which is easier to clean and has a better appearance. They are made of cast iron or steel, with a vitreous-enamel finish. The majority of those in Great Britain are of the vertical design, i.e. with the grill and oven under the hot plate. The horizontal, table-top design, which raises the oven to an easier working level, is not so popular as it occupies more floor space. Many cookers are fitted with a thermostatic control, i.e. by the turning of a dial desired temp. can be maintained. A simmering burner is a useful addition. *Electric* cookers are also made in vertical or horizontal designs, and most are thermostatically controlled. In order to obtain the utmost efficiency and economy it is essential to use the ground base utensils. There may be glass inner doors to the oven, or drop-down doors, and some models are fitted with time switches and control clocks. The fireless cooker, in which food previously heated to boiling-point is kept at a high temp. for hours by surrounding it with a thick layer of non-conducting material, such as felt or hay, deserves to be better known than it is.

THE KITCHEN should be well equipped and planned. Anything from 12 to 18 hrs per week is spent on the preparation and cooking of meals in the ordinary household, and an additional 7 to 10 hrs on washing up. It is, however, possible to reduce this to a minimum by the rearrangement of big equipment and utensils. The ideal kitchen need not be a large room, 8 ft by 10 ft or 8 ft by 13 ft being quite large enough for easy and efficient working. In fact in some Amer. flats a space 6 ft 4 in. by 4 ft 2 in. has been successfully converted into a completely equipped kitchen by careful planning and utilisation of every piece of wall space. Recommendations for the ideal kitchen are light-coloured, washable walls, tiled or enamel painted; floors covered with linoleum, or composition flooring, with something warm for the worker to stand on; good ventilation and light; all doors flush, i.e. no ledges for collection of dust; the cooker, cabinet, and refrigerator adjacent to the sink, which can be double or single with double

draining boards; and built-in cupboards reaching to the ceiling to avoid dust traps. All working surfaces should be covered with plastic or other non-absorbent material.

The foods and drinks we are accustomed to consume may not, in fact, be the best for us. Varying costs of different foods often govern their general use; but habit can also be an important factor (e.g. tea drinking, and tobacco smoking). At the beginning of the last century tea was consumed at an average of about 1½ lb. per head of the pop. per annum, but now it is about 6 times that amount; and in Britain more tea is consumed than in all other European countries together. It is well sometimes to consider our general diet, together with the effects of cooking, in relation to health. Good C. is now recognised, as has been said, as a science and an art, and the study of kindred subjects, such as diet, food, and nutrition, will give the student, cook, or housewife useful facts as a basis to work on, so enabling a proper selection to be made from the foods that are available at the time, and preparing them to the best possible advantage. See *FOOD AND DIET*; *HOMEMAKING*; *PRESERVING*; *PRESSURE COOKERY*; *SALAD*; *VITAMINS*. See books on C. by Sir J. Elliott, 1539, and Abraham Veal, 1575; R. May, *The Accomplished Cook*, 1665; Dr. Pegge, *Forme of Cury*, 1780; A. Brillat-Savarin, *Physiologie du goût*, Paris, 1825; Mrs. Beeton's C. books; R. Hutchinson and V. H. Mottram, *Food and the Principles of Dietetics*, 1933; E. and L. Bunyard, *The Epicure's Companion*, 1937; A. L. Simon, *André Simon's French Cook Book*, 1938; W. G. R. Hume, *The Constance Spry Cookery Book*, 1956.

Cookham, par. and vil. in Berkshire, England, on the Thames, 27 m. from London. A great fishing resort. Pop. 4500.

Cooking Utensils, see *COOKERY*.

Cookstown, mkt tn of co. Tyrone, N. Ireland, 13 m. N. of Dungannon, and a centre of the linen industry. Its main street is 1½ m. long. Pop. 4200.

Cooktown, coast tn in Queensland, Australia, situated at the mouth of Endeavour R., 1359 m. N. of Brisbane. Industries: cotton, peanuts, fruit growing, pastoral (cattle), timber, mining—tin and gold. Pop. 406.

Coolbrith, Ina Donna (1847–1928), Amer. poet, b. Illinois. Her parents early in her youth migrated to California, where she spent most of her life. For 20 years she was a librarian. Much of her poetry is coloured by her experiences of life in the

mining dists. of California, and recalls the work of Bret Harte, with whom she was associated in editorial work on the *Overland Monthly*. She has been called the Sappho of the West, and the esteem in which her poetry was held earned for her the title of poet laureate of California, which was conferred on her by the governor and legislature in 1895. Chief publs.: *A Perfect Day and other Poems*, 1884; *The Singer of the Sea*, 1894; *Songs from the Golden Gate*, 1895.

Coolgardie, tn of W. Australia, situated 360 m. from Perth. It was an extremely busy mining centre following the sensational gold finds in 1892-3. Its output of gold, however, has greatly declined and its pop. is to-day only 1540. It is, however, an important railway junction on the transcontinental line, and its aqueduct is part of the pipe-line 350 m. long that supplies water to the W. Australian goldfields.

Bachrach

CALVIN COOLIDGE

Coolidge, (John) Calvin (1872-1933), twenty-ninth president of the U.S.A., b. Plymouth, Vermont, of old farming stock, son of John Calvin C. He was admitted to the Bar in 1897. He was a member of the Massachusetts House of Representatives 1907-8, mayor of Northampton 1910-11; member of Massachusetts Senate 1912-15 (president thereof 1914-15); Lieutenant-governor of Massachusetts 1916-17-18; governor of Massachusetts (two terms) 1919-20. In this capacity he dealt firmly with the Boston police strikers of Sept. 1919. In 1920 he received the Republican nomination for vice-presidency of the U.S.A., and he assumed office on 4 Mar. 1921. On the death of President Harding he was sworn in as

president (3 Aug. 1923). He was re-elected for the term beginning 4 Mar. 1925, and ending 3 Mar. 1929. As president, C. inherited two scandals from his predecessor—the maladministration of a bureau for war veterans and an attempt to hand over public oil lands to private companies. C. allowed these matters to go to the courts and the guilty ones to be punished. During his term a considerable portion of the national debt was paid off, the income taxes were reduced, and the country enjoyed unexampled prosperity.

Coolidge, Susan, pseudonym of Sarah Chauncey Woolsey (1835-1905), Amer. writer of children's stories, b. Cleveland, Ohio. Her father's uncle, brother, and nephew were all presidents of Yale. Educ. at private schools in Cleveland, she lived in New Haven, Connecticut, from 1855 to 1870. She is best remembered for her books for girls, which have become classics. They include *What Katy Did*, 1872, *What Katy Did at School*, 1873, and *What Katy Did Next*, 1886; and, among many others, *Eyebright*, 1879, *Cross Patch*, 1881, *Clover*, 1888, and *Just Sixteen*, 1889. She also ed. the letters of Frances Burney and of Jane Austen and wrote a short hist. of Philadelphia.

Coolidge Tube, see X-RAYS.

Coolies (from Tamil *kuli*, hire, or from *Koli*, the name of an aboriginal tribe of India), name applied to the unskilled labourers of India and E. Asia, and especially to labourers of this class who have emigrated to other countries, usually under contract. Much difficulty was found in the Brit. sugar-producing colonies after the abolition of slavery in finding labourers for the plantations. The white man was physically unable to undertake the duty, and the emancipated black was unwilling to do so. In these circumstances it was suggested that the overstocked Asiatic countries might supply the need, and agents were sent to India and China to negotiate for the importation of labourers. This traffic started after 1834, and was officially recognised by the Brit. Gov., under whose jurisdiction it mostly fell, 10 years later. There were, however, an enormous number of abuses in the system, and those who knew it well stigmatised it as slavery. Many of the C. were attracted by elaborate promises, and some were kidnapped. They were taken over closely packed in ships and under conditions vividly recalling the slave ships, and on arrival they were practically sold by auction. The only points in which they differed from slaves were in having a regular wage paid to them and in being engaged for only 7 years. The cruel oppression which characterised the whole coolie system soon brought a series of reforms. In 1854 the Brit. governor at Hong Kong forbade Brit. subjects and Brit. vessels to engage or be engaged in the exportation of Chinese C., and his action was confirmed in the following year by the Chinese Passengers Act, which made most stringent regulations for the trade, particularly with regard to the actual sea voyage. After this the business

of importing C. into S. America and the W. Indies was transferred to Portuguese traders, and was carried on from Macao. From this port the old system was resumed, and became, if possible, still more of a slave trade. The extension of the trade to Canton led to a fresh outburst of indignation, and further legislation was carried out, this time by the Portuguese authorities. This was practically inoperative, however, and things continued with periods of reform and deterioration until 1866. In that year a conference was held by representatives of the Brit., Fr.,

CHINESE COOLIE

B.N.A.

and Chinese Govs. China insisted that the contract should include the payment of the C.' return fare at the expiration of 5 years, and this put an immediate stop to the trade with the W. Indies, where permanent labourers were required. From this period the C. for Brit. colonies were drawn largely from India. Immigration of C. from India was prohibited in 1838, but the ban was removed in 1845, when the introduction of E. Indians into Brit. Guiana and Trinidad under indenture started. It continued annually—except in 1849–50—under the supervision of the Colonial and Indian Govs., being regulated by the Indian Emigration Act of 1883. This Act allowed emigration only to certain colonies where good treatment was assured. These were Brit. Guiana, Natal (then a colony), Jamaica, and most of the other Brit. W. Indian is.; the Fr. colonies of Guadeloupe

and Martinique, Dutch Guiana (or Surinam), and the then Danish (now Amer.) W. Indian is. of Sant Croix. The immigration of Indian C. into the W. Indies was, however, terminated by the Gov. of India in 1917. Until recently coolie labour was employed in Singapore on work on aerodromes, but it has now ended (see Annual Labour Report of Singapore for 1947). After 1904 a large number of C. were imported from China by the Transvaal authorities for work on the Rand, much against the wish of the Boers. This led to many difficulties and complications, largely on account of the compound housing plan. See CHINESE LABOUR QUESTION.

Cooma, tn in New S. Wales, Australia, 268 m. SSW. of Sydney, at an altitude of 2700 ft. With high mts in the vicinity, it is the centre of an Alpine region on the flanks of the pastoral dists. of the Monaro and Murrumbidgee R.s. C. is the H.Q. of the Snowy Mts Hydro-Electric Authority (q.v.). Pop. 7240.

Coomaraswamy, Ananda (1877–1947), writer on Indian and Sinhalese art; b. Ceylon, educ. London Univ. He worked for 3 years in the mineralogical survey dept of Ceylon, but, conscious of the threat to the survival of the traditional arts of India and Ceylon, he returned to England to join a movement of protest at the destructive effects of industrialism and the impact of European art on Indian culture, and for 45 years he was engaged in reconciling the W. with Indian art and thought. Fellow for research in Indian, Persian, and Mohammedan art at the Museum of Fine Arts at Boston, where he built up collections of oriental art and produced elaborate and scholarly catalogues of them. The list of his pubs. shows him as the pioneer in a largely uncharted field: *The History of Indian and Indonesian Art*, pub. by the Royal India Society, of which he was one of the founders, 1910, and by the Boston Museum; *Rajput Painting* (2 vols.), pub. by the Oxford Press in 1916, which marked an epoch in the appreciation of Kangra painting in the W.; and *The Transformation of Nature in Art*, 1934.

Coomassie, see KUMASI.

Coon, see RACCOON.

Cooper, Abraham (1787–1868), painter whose work, consisting of over 400 pictures, is mostly battle scenes and race-horses. The best-known are those of 'Waterloo', 'Bosworth Field,' and 'Marston Moor.'

Cooper, Sir A. Duff, see NORWICH, VISCOUNT.

Cooper, Anthony Ashley, see SHAFTESBURY, EARLS OF.

Cooper, Sir Astley Paston (1768–1841), surgeon, b. Brooke, near Norwich. He early devoted himself to the study of anatomy, attending first the lectures of John Hunter and then at St. Thomas's Hospital, where in 1789 he was appointed demonstrator of anatomy. In 1800 he became surgeon to Guy's Hospital. His paper on perforation of the tympanic membrane for relief of deafness due to obstruction of the Eustachian tube (1801)

earned him the Copley medal of the Royal Society, of which he was elected fellow in 1805. He pub. his great work *On Hernia* in 1804-7. In 1820 he removed a small tumour from the head of George IV and was rewarded with a baronetcy. C. was perhaps the greatest surgeon of his day, a masterful operator and indefatigable worker, and an unaffected, courteous, and generous man. Besides teaching at Guy's and St. Thomas's, he is said to have dissected on every day of his working life. He was a pioneer in the surgery of the blood vessels, in experimental surgery, and in the surgery of the ear. He was first to ligate the abdominal aorta (1817) and performed many other daring operations. President of the Royal College of Surgeons (1827), vice-president of the Royal Society (1830). His other works include *Dislocations and Fractures*, 1822; *Diseases of the Breast*, 1829; and *Anatomy of the Thymus Gland*, 1832. See G. Keynes, *Life and Works*, 1922; life by R. C. Brock, 1952.

Cooper, Edith Emma, see FIELD, MICHAEL.

Cooper, Sir Edwin, R.A. (1873-1942), architect, b. Scarborough, was articled in Yorkshire and began practice 1897. With a succession of partners he won numerous public competitions, leading to a most prosperous career. His chief buildings were Marylebone Town Hall, 1911; the Port of London Building, 1912; the Star and Garter Home, Richmond, 1924; the headquarters of Lloyds, 1929, and the National Provincial Bank, 1931, both in the City of London; various buildings at Tibury, etc., for the Port of London Authority; the Guildhall and Law Courts at Hull; and sev. hospitals.

Cooper, Gary (real name Frank James Cooper) (1901-), Amer. actor, b. Helena, Montana; educ. at Dunstable School, England, and Iowa College, Grinnell; married Sandra Shaw (née Veronica Balfe), actress. He worked as a newspaper cartoonist and an advertising salesman. College dramatics led to screen work as an extra, followed by small parts in short subjects. His first feature film was *The Winning of Barbara Worth*, and since then he has made many famous films, including *The Devil and the Deep*, *Farewell to Arms*, *Design for Living*, *Lives of a Bengal Lancer*, *Beau Geste*, *Sergeant York* (Academy Award best performance 1941), *For Whom the Bell Tolls*, and *High Noon* (Academy Award best performance 1952).

Cooper, Gladys (Mrs Merivale) (1889-), actress and actress-manageress, b. Lewisham, London, daughter of Charles Wm Frederick C. Married, first, H. J. Buckmaster (marriage dissolved); secondly, 1928, Sir Neville Arthur Pearson (marriage dissolved); thirdly, 1937, P. Merivale (d.). Her first London appearance was at the Vaudeville, 1906, as Lady Swan in *The Belle of Mayfair*. Has appeared in the following (under alias): *The Dollar Princess*, 1911; *The Importance of Being Earnest* (Cecily Cardew); *Man and Superman* (Violet), 1912; *Milestones* (Muriel Pym); *Broadway Jones*, 1914; *Half an Hour*; *The*

Admirable Crichton (Lady Agatha), 1917; *Trelawney of the Wells* (Clara); *The Man from Blankley's*, all-star (Marjory), 1918; *The Second Mrs Tanqueray* (Paula), 1923; *Magda*; *Peter Pan* (Peter), 1924; *The Last of Mrs Cheyne*, 1927; *The Indifferent Shepherd*, 1948; *Relative Values*, 1951; *A Question of Fact*, 1953; and *The Chalk Garden* (on Broadway), 1955. She has also appeared in a number of films.

Cooper, James Fenimore (1789-1851), Amer. novelist, b. Burlington, New Jersey, of a Quaker family. Brought up in a wild area near Otswego Lake, he gained an intimate knowledge of Red Indian lore. Educ. at Yale, he served for some years in the navy, but he gave that up in 1811, and devoted all his attention to literature. His first book which found its mark with the public was *The Spy* in 1821; this he followed with *The Pioneers* in 1823. He also wrote *The Pilot* in 1823, which estab. him as a leading author, although *The Last of the Mohicans*, 1826, is generally considered to be his masterpiece. At this time C. went to live in France, where he wrote for the *National* on Amer. questions. Whilst he was in Paris he wrote *The Prairie* in 1827 and *The Red Rover* in 1828.

In the year 1833 C. went back to America, where he wrote in rapid succession *Gleanings in Europe*, 1837-8; *Home-ward Bound*, 1838; *The Pathfinder*, 1840; *Mercedes of Castile*, 1840; and *The Deerslayer*, 1841. In 1839 he wrote *The History of the Navy of the United States*. Among his later novels were those of a trilogy known as the Littlepage MS.: *Satanstoe* and *The Chain-bearer*, 1845, and *The Redskins*, 1846. The last years of C.'s life were spent in heated warfare with his critics, and lawsuits followed, from which he nearly always emerged victorious. See life by T. R. Lounsbury, 1882; also Margaret M. Gibb, *Le Roman de Bas-de-Cuir*, 1927; R. F. Spiller, *Fenimore Cooper: Critic of his Time*, 1931; H. W. Boynton, *James Fenimore Cooper*, 1931.

Cooper, Peter (1791-1883), Amer. educationist, manufacturer, and philanthropist, b. New York. He worked with his father in various trades, and in 1828 estab. the Canton Iron Works in Baltimore; in 1830 he constructed the first locomotive in America. He then estab. a factory in New York and furnaces and foundries in Pennsylvania and New Jersey, and did much work in the laying of the first Atlantic cable. As a philanthropist he founded the Cooper Union, an institute in New York to provide for the education of the poorer people. In 1876 he was the presidential candidate of the Greenback Party.

Cooper, Samuel (1609-72), miniature painter, b. London; studied under his uncle, John Hoskins. He painted the portraits of Oliver Cromwell, Charles II, and of most of the celebrated men of the time. He gave to the miniature some of the quality of the large oil portrait and has been termed a Van Dyck on a small scale.

Cooper, Thomas (1805-92), Chartist and poet, b. Leicester. He headed the Chart-

ists in Leicester in 1840, ed. the *Midland Counties Illuminator*, and lectured in the pottery dists. during the riots of 1842, being arrested on a charge of conspiracy and sedition, and imprisoned in Stafford jail for two years. While in prison he wrote *The Purgatory of Suicides*, his longest poem. *The Triumphs of Perseverance* appeared in 1847, and his two novels, *Alderman Ralph* and *The Family Feud*, in 1853 and 1855 respectively. After his release from prison he lectured on politics in London, and on Christianity, and wrote an account of his own life in 1872. See life by R. J. Conklin, 1936.

Cooper, Thomas Sidney (1803-1902), painter, b. Canterbury. He began to earn his living as a coach-painter and as a scene painter, and afterwards became a drawing master in Canterbury. In 1831 he settled in London, and showed his first pictures at the Royal Academy in 1833, enjoying an unprecedentedly prolonged career as an exhibitor. His name is mostly remembered for his hundreds of pictures of cattle or sheep. Some of his works are in the Tate Gallery, the National Gallery, and the Victoria and Albert Museum. A.R.A., 1845, R.A., 1867.

Cooperage: 1. The term applied to the system carried on by Dutch and other foreign vessels called copers about the middle of the 19th cent. of illicitly selling drink and tobacco to the fishermen of the North Sea. The six fishing powers at the international conference at The Hague, 1887, prohibited the sale of spirits in the North Sea, and in 1888 the North Sea Fisheries Bill was passed by the Brit. Gov., prohibiting the sale of spirits to fishermen.

2. An ancient craft, known to and practised by the Romans. It is the art of making barrels and vessels of similar shape, which are constructed by means of curved staves fastened together by hoops, each stave being widest in the centre and tapering towards each end. There are several branches of the industry, and for each branch special coopers are employed. The wet cooper makes casks and barrels for holding liquids, and he is the most skilled of all the coopers; the dry cooper makes vessels for holding dry goods; and the white cooper makes such utensils (now seldom used) as churns, pails, and washing-tubs, where the sides are usually straight and not curved as in the cases of casks and barrels. Machinery is now largely employed in making barrels.

Co-operation. Hardship endured by the industrial pop. in the later 18th cent. and beginning of the 19th cent. and attributed to the working of the competitive system led to the advocacy of C. as an alternative industrial system. Somewhat nebulous early ideas have since been refined and there has emerged a Co-operative Movement in Britain embracing over 12,000,000 individual consumers and about 250,000 farmers. Co-operatives are now known to every continent, and have their place in the advanced as well as the less developed economies. The number of individual co-operators

throughout the world is c. 150,000,000. Activities of co-operatives today include distribution and production by consumer co-operatives; credit, banking, and insurance; marketing of farmers' produce and supply of their requirements and services, e.g. petroleum, transport, and electricity; organisation of co-operative rural communities; workers' productive and service societies and handicraft societies; fishermen's societies for marketing and supply; housing societies for erection and financing; miscellaneous societies including those concerned with health services. Figures in this article relating to the consumer societies are all for 1956; agric. and colonial figures relate to 1955.

Robert Owen (1771-1858) in Britain is sometimes referred to as the father of C. He advocated co-operative industrial communities and productive societies which would support such communities. He organised co-operative congresses. Whilst most of his co-operative experiments failed, many of his supporters played a part in laying the foundation of the movement which later developed. Dr Wm King of Brighton (1786-1865) in his paper, *The Co-operator* (1828-30), gave a much more coherent account of co-operative aspirations and ideas. The Rochdale Pioneers, who opened their store in Toad Lane in 1844, harnessed the co-operative idea to practicalities. By basing C. on consumer effort, their society and the many which followed its ideas had much wider appeal. Basic principles of the Rochdale Pioneers have been defined as: (1) open membership; (2) democratic control—one man one vote; (3) payment of limited interest on capital; (4) distribution of surplus in proportion to transactions. Operation of these principles marks off co-operatives from other types of enterprise. A co-operative is a voluntary institution. In it capital is subservient to human interests in the society. Each member of a society is a shareholder but no member under present law may hold more than £500 share capital. Profit is eliminated in the ordinary sense of the term. The society exists to serve its members, and membership is not exclusive.

Co-operatives also aim at resisting consumer exploitation by observing fair standards themselves and supporting legislation likely to safeguard the consumer. There is no special code of co-operative law in Britain. Societies are registered under the Industrial and Provident Societies Acts, 1893-1954, which do not apply exclusively to co-operative societies. Use of the word 'co-operative' is restricted under the Companies Act, 1948, and Prevention of Frauds Act, 1939.

In Britain the strongest element of the Co-operative Movement is the consumer retail society, of which there are 947 with some 12,070,600 members. Sales amounted to £908 million in 1956 of which £680 million was on foodstuffs. Societies operate 27,467 shops including 529 departmental stores. The number of

societies has been declining since the beginning of the century through amalgamations. Brit. consumer co-operatives are the largest in the world—the London society has some 1,238,700 members; membership of 14 societies exceeds 100,000. No new societies have been started in recent years, development taking place through existing societies, the Co-operative Wholesale Society (C.W.S.) and the Scottish Co-operative Wholesale Society opening retail branches.

Dividends on purchases amounted to £44,500,000 (equivalent to 1s. 0½d. per £ of sales) and are paid out in cash or transferred to members' shareholding accounts. Share capital in retail societies was £246,071,413, loan capital £46,720,676, and reserves £33,538,190. Surplus capital is usually invested in the wholesale societies. Retail societies have to be regarded as popular banks as well as trading institutions; they are often agents of the C.W.S. bank and have their own small savings banks. Originally opposed to credit trading, societies today offer hire purchase and other credit facilities for non-food purchases. The pay roll of retail societies is 286,507 workers. Local federations of consumer societies provide milk, baking, laundry, and other services; the turnover is £29,277,542.

The Co-operative Wholesale Society, Manchester, is the national trading and manufacturing organisation of co-operatives in England and Wales. Estab. in 1863, its trade today amounts to £444 million. 200 factories are operated, mainly to prepare consumer goods. Turnover was £444 million; productions, £142 million; pay roll, 52,000. A similar organisation was set up in Scotland in 1838, the Scottish Co-operative Wholesale Society (or S.C.W.S.), Glasgow, to serve co-operatives in Scotland; turnover was £86 million; productions, £27 million; pay roll, 13,742. Both organisations are engaged in banking operations, the C.W.S. since 1872, the S.C.W.S. entering the business in 1949. The C.W.S. and S.C.W.S. are partners in a joint undertaking for tea, cocoa, and coffee which has estates in S. India and Ceylon. The Co-operative Insurance Society—premium income £40 million—is also a joint undertaking, and other important national societies are the Co-operative Permanent Building Society and Co-operative Press Ltd.

About 32 co-operative co-partnership societies are engaged in clothing, footwear, and printing trades, etc. Here workers are members and shareholders, and have a say in management and share profits as workers. Nowadays capital is supplied by retail societies whose needs the productive societies supply (turnover is £5½ million, pay roll, 4265). Productives have their own separate Co-operative Productive Federation at Leicester.

Co-operative Union (1869) is the association of retail societies in the Brit. Is.; H.Q. are at Holyoake House, Manchester. Membership consists of retail societies, the wholesale societies, the Co-operative Insurance Society, the Co-operative

Permanent Building Society, and the Co-operative Productive Federation. The Union does not engage in trade but is an advisory, representative, and educational body. Its ann. meeting is the Co-operative Congress and between times it is controlled by a Central Executive.

Co-operatives were pioneers of adult education, and larger retail societies still have education departments. The Co-operative Union has estab. a residential college at Stanford Hall, Loughborough, where Brit. co-operators and overseas students are trained. The National Co-operative Education Association was set up in 1948. Guilds have been estab. with societies for men and women to enable fuller discussion of co-operative and public affairs. The Women's Guild has played a conspicuous part in safeguarding women's interests since its foundation in 1883.

The Co-operative Party was estab. in 1917 primarily to defend the interests of co-operative societies in Parliament and bring co-operative ideas to influence political policy. The Party is closely linked with the Co-operative Union. Its relations with the Labour party are governed by an agreement reached in 1946. 21 Co-op-Labour M.P.s sit in the Commons. Co-operative M.P.s normally follow the Labour Whip. The Co-operative Union is a member of the National Council of Labour along with the T.U.C. and the Labour party.

Agric. produce marketing and service societies number 235 (188,000 members) in England; 86 (49,021 members) in Wales; 71 (36,051 members) in Scotland; 35 (8873 members) in Ulster; 302 (98,868 members) in the Irish Rep. A federation of agric. co-operatives in Great Britain and Ireland was estab. in 1943. National Agricultural Organisation Societies operate for each country, whilst England has recently estab. its Agricultural Co-operative Central Association, London. There are 49 (2315 members) fisheries co-operatives in England with an Advisory Organisation Society in London. 150 self-build housing societies have been set up in recent years attached to the National Federation of Housing Societies.

The International Co-operative Alliance (I.C.A.) (1895) has H.Q. in London, and is a category A non-government member of the United Nations Economic and Social Council. An International Congress is held every three years. The I.C.A. collects and disseminates information on co-operatives, and formulates international co-operative policy. Thirty-nine nations including Britain, France, and other European countries are members, as well as the movements of the U.S.A., Canada, U.S.S.R., and Commonwealth tera, such as Malaya and Ghana. I.C.A. membership consists of 42,400 consumer societies with 62,242,260 members; 259,624 credit societies with 34,163,216 members; 53,501 agric. societies with 13,390,149 members; 10,429 workers' productive societies, 6016 building societies, 5233 miscellaneous societies—in all 377,293 societies with 120,312,647 members. The

International Labour Office, Geneva, has a Co-operative Division.

Substantial development of co-operatives in the dependent ters. of the Brit. Commonwealth has occurred since 1946. Membership of these societies operating in twenty-five ters. numbers 1,168,581; credit societies total 4330, marketing 3533 with turnover of £51 million, consumer societies 787; a total of 9440 societies. Developments are notable in Cyprus, Nigeria, Ghana, and Malaya. The Colonial Secretary appointed a Co-operative Adviser in 1946. Great importance is attached to co-operatives in the Colonies on account of the training they provide in elementary democratic association, self-reliance, and in understanding basic economic problems. At this stage in most ters. there is usually a Co-operative Dept. or Officer not only to register societies but also to promote their development, and advise them where necessary. One of the first problems of Colonial co-operatives is to relieve populations from indebtedness through credit societies. Agric. marketing societies follow. These societies had a turnover of £51 million in 1955. A large portion of coffee and cocoa produced in African ters. is handled by co-operatives. The consumer societies develop as expendable income of pops. increases. Handicraft, school, maternity services, and fishery societies are among the activities of the miscellaneous group. In a great many dependencies national or regional co-operative unions have been estab. which in time should take over most of the functions performed by the Co-operative Depts, making the movements completely autonomous.

In the Irish Rep. there is a revival of interest in C. and a National Council has been set up in Dublin, where there are agric. organisation and wholesale societies. Co-operative creameries number 200 with turnover of over £30 million. Belfast has a strong consumer society.

Friedrich W. Raiffeisen (1818-88) of Heddesdorf, Germany, is regarded as the pioneer of the agric. credit society. Herman Schulze-Delitzsch (1808-83), a Ger. economist, conceived the idea of urban credit societies for the workers. It would be difficult to identify any particular group or individuals with the start of agric. co-operatives. Edward Owen Greening (1863-1922) in England and Sir Horace Plunkett (1854-1932) in Ireland did much to show what co-operatives could do for the countryside. Technical developments, better transport, and the emergence of large centres of pop. led farmers in Europe and elsewhere to create co-operative organisations to assist them in meeting changed conditions. Most European countries have both urb. and agric. co-operative movements. Consumer societies are particularly strong in Finland and Sweden. Denmark's co-operative marketing organisations are world famous. Housing co-operatives in France, the Netherlands, and Sweden are important. Co-operatives in countries beyond the Iron Curtain function but are

under direction of the political regime. This applies also in the case of the U.S.S.R. where the co-operatives have 32,000,000 members. Societies only function in the rural areas. Spain and Portugal also have co-operatives operating under state control. One of the most interesting centres of co-operative development today is Israel, where almost every type of co-operative is to be found. Co-operative communities (*Kibbutz* and *Moshav*) give reality to the ideas of the co-operative pioneers.

Both in the U.S.A. and Canada C. is mainly a rural movement—credit, marketing, and supply. Turnover of Canadian marketing, purchasing, and service co-operatives amounted to \$986 million in 1954. The state of Saskatchewan has a Co-operative Dept. Consumer societies are not strong in the cities of N. America. St Francis Xavier Univ., Nova Scotia, has centred attention on co-operatives as a Christian way of achieving social justice.

Workers' productive co-operatives are to be noted in Mexico, where sev. daily newspapers are pub. by such societies. There, also, are to be found the *ejidos* communities. In Brit. colonies and other Caribbean ters. co-operatives are operating and may have a big future. They are establishing their own federation. Argentine, Brazil, Venezuela, Colombia, Peru all have co-operative institutions, but these have not so far exercised much influence on the national economies.

Members of the Indian Civil Service closely studied European C. at the beginning of the century and introduced these ideas into India. From India, C. has spread to Burma and Ceylon and to different parts of Asia. The new constitution of India lays claim that its purpose is the estab. of a Co-operative Commonwealth. Whilst C. is generally developed in India, there is scope for its making a much fuller impact on the economy, and this may come about as a result of recent planning.

China has industrial, agric., and supply co-operatives—98,000 retail shops are operated. Japan has strong credit, agric., and fishery co-operatives. Dr Kagawa has lent his support to the co-operatives.

S. Africa, Australia, and New Zealand have agric. co-operatives for supply and marketing. Co-operatives in their various forms have proved amazingly adaptable to conditions all over the world. They provide an alternative to nationalisation as well as to capitalist enterprise. By providing opportunities for democracy to extend into trade and industry and by giving practical expression to the idea of equity they have won universal confidence. Their potential is enormous, and more recently thought has been given to states organising on co-operative lines to control supplies and services on a mutual basis, e.g. international waterways. See AGRICULTURAL CREDIT; BUILDING SOCIETY; CO-PARTNERSHIP; FISHERIES; OWEN, ROBERT. See also G. D. H. Cole, *Century of Co-operation*,

1944; M. Digby, *World Co-operative Movement, 1948, and Agricultural Co-operation in Great Britain, 1949*; W. K. H. Campbell, *Practical Co-operation in Asia and Africa, 1951*; E. M. Hough, *The Co-operative Movement in India, 1953*; P. Greer, *Co-operatives: The British Achievement, 1954*; J. Bailey, *British Co-operative Movement, 1955*; International Labour Organisation, *The Co-operative Movement and Present-Day Problems* (Geneva), 1955; *Report of the Chief Registrar of Friendly Societies, Part 3—Industrial and Provident Societies* (Her Majesty's Stationery Office, annually).

Co-operative Societies, see CO-OPERATION.

Cooper's Creek, or **Barcoo River**, rises in Queensland, Australia, and flows S. for some distance, then takes a westerly turn and flows by means of a delta into Lake Eyre. In the dry season it usually dries up, but in the rainy season there is a series of detached pools and lagoons.

Cooper's Hill, ridge on the borders of Surrey and Berkshire, England. Here stands the Commonwealth Air Forces Memorial, designed by Sir Edward Maufe, and opened by Queen Elizabeth II in Oct. 1953. C. H. is the scene of Sir John Denham's best-known poem, pub. in 1642.

Cooperstown, vil. in New York state, co. seat of Otsego co., made famous by Fenimore Cooper (see his *Correspondence*, ed. by his grandson).

Co-ordinates of a point are the lengths of two adjacent sides of a parallelogram formed by drawing straight lines from the point parallel to two fixed intersecting straight lines called the axes. The use of C. forms a branch of mathematics called *Analytical Geometry*, which consists of the application of the principles of algebra to geometry. See *GEOMETRY, Analytical*.

Co-ordination, Insulation, in electric supply networks, the design of insulation and protective gear with respect to breakdown strength such that the strength at any point is proportional to the importance of a breakdown at that point, as measured by the extent and magnitude of interruption of supply that would arise from such a breakdown. In any house installation, the insulation and the fuses should be so adjusted that a fault in any group blows the fuse for that group before the insulation is damaged or a main fuse is blown. In an interconnected system, a fault in any section should isolate that section before it affects other sections. In case of lightning disturbances, the protective gap should flash over before dangerous voltages arise in the lines.

Coorg, area in India lying between Mysore State and W. coast dists. of S. Kanara and Malabar in Madras State. Formerly a chief commissioner's state, C. is now a separate state administered direct by the Central Gov. of India. It consists mainly of forests and hills, among which the R. Kaveri rises. The prin. tn is Merkara. C. was involved in the fighting between the Brit. and Hyder Ali (1773) and Tipu Sultan (1782-3), whom the people resisted gallantly. In 1834

the people requested the Brit. to remove their hereditary rajah and to assume control.

Coornhert, Dirck Volckertsen (1522-90), Dutch scholar and copper engraver, b. Amsterdam. In 1564 he became tn clerk of Haarlem. Taking part in the struggle against Sp. rule in 1566, he drew up the manifesto of William of Orange and was imprisoned at The Hague by the Spaniards in 1568, but escaped to Cleves, where he found a living as an engraver. Recalled in 1572 he became secretary of Holland in the service of William of Orange for a short time, but his dislike of war drove him back to Cleves, where William continued to employ his services. His chief prose work is *Zedekunst, dat is wellevenskunst*, 1586. He trans. into Dutch from Cicero, Seneca, Boethius, the *Odyssey*, and Boccaccio; but his Dutch version of the N.T. from the Lat. of Erasmus was never completed. He is credited with great influence in establishing the literary language of Holland, and as an opponent of Calvin he was one of the first to fight for religious tolerance.

Coorong, The, arm of salt shallow water near the mouth of the R. Murray, S. Australia; it is about 100 m. long, and 2 m. broad, and is separated from Encounter Bay (36° S., 139° E.) by a narrow isthmus.

Coot, water-fowl (*Fulica atra*), slate-grey below, sooty black above, with a white bill joining a white patch on the forehead. It has 4 toes, not fully webbed. In coloration the sexes are alike, but the male is slightly the larger. They are widely distributed on inland waters in the Brit. Isles, Europe, N. Africa, Asia, and Australia. Their nest is built on water-plants and is made of dry rushes. The eggs are stone colour with brown specks, and are about 2 in. long.

Cootamundra, tn in Harden co., New S. Wales. Wheat of an excellent quality is grown in the neighbourhood. Pop. 5820.

Coote, Sir Eyre (1726-83), soldier, b. in the co. of Limerick. He entered the army at an early age, and went to India in 1754. While there he urged Clive to fight the battle of Plassey, defeated the Fr. at Wandiwash, and by his capture of Pondicherry in 1761 completely overthrew the Fr. in India. On his return to England he was knighted. In 1779 he returned to India as commander-in-chief; he defeated Hyder Ali at Porto Novo in 1781, and so saved Madras for the second time. See life by H. C. Wylie, 1922; E. W. Sheppard, *Coote Bahadur*, 1956.

Cootehill, tn of co. Cavan, Rep. of Ireland, on the R. Annalee. Pop. 1500.

Copaiba, or **Copaiba**, oleo-resin, its two chief constituents being resin and volatile oil. This substance is a secretion of trees which are natives of the W. Indies and Amazon valley. Each tree yields a large quantity of the oleo-resin, so much sometimes that it bursts the trunk with a loud noise. It is characterised by an aromatic odour, which is not at all unpleasant, and by a bitter taste. C. has been used as a urinary antiseptic.

Copaïs, or **Topollas**, formerly a lake of Boeotia in Greece. Area 135 sq. m. The lake, enclosed by mts and a mere marsh in summer, was drained in 1886 by tunnels connecting it with the Euripus through two other lakes. The reclaimed land produces cotton, grain, and good pasturage.

Copal, resinous substance obtained from trees and used in making varnishes. It is usually of a light yellowish colour, generally transparent, is found in pieces which are round in shape, and is brittle. It is partially soluble in oil of turpentine, but to be entirely so it has first to be heated, which process it undergoes before being dissolved in this oil or linseed oil for producing varnishes and lacquers. It is found in the E. Indies, S. America, and Africa. The variety known as Fossil C., the product of trees long since dead, is found in the regions around Zanzibar where it is dug up in the form of pebbles or nuggets.

Copalchi Bark, obtained from a shrub of Mexico and Central America, the *Croton pseudo-China* or *niveus* (Euphorbiaceae), allied to the cinchona. It is used as a febrifuge, as a substitute for quinine.

Copán, tn of C. dept, Honduras, on the C. River in Central America. Remarkable ruins, including a temple, truncated pyramids, monoliths with carving and hieroglyphics, and the ceremonial Great Stair, stand near by, testifying to the magnificence of the Mayan Old Empire city of C. C. is a tourist centre in a mountainous dist. Pop. 1000.

Co-parceners (Co-partitioners) (1), at common law female co-owners claiming title by descent to an estate, or inheritance in land, or co-owners of either sex claiming title *through females*; less frequently (2) by custom tenants in gavelkind (see GAVELKIND). As to (1), if a man dies intestate, leaving females as his next heirs, these take his freeholds of inheritance equally, for the rule of primogeniture does not, generally speaking, apply to females. This form of tenure has now been abolished, though a knowledge of its incidents and implications is required by lawyers in tracing title.

Co-partnership in industry is commonly defined as the endeavour to give some formal and practical expression to the underlying partnership between Labour, Capital, and Management in all industrial enterprises. It often finds this expression in some measure of profit-sharing (q.v.), joint consultation, and employee shareholding. These devices are not, however, synonymous with C., because the loyalty and co-operation of employees is not something that can be bought by management; they have to be earned. In creating a spirit of C. within an enterprise a management will seek to demonstrate that its motives are not entirely selfish, hence profit-sharing; that ownership is not the monopoly of any group within the society, hence employee shareholding; and that responsibility, in the different degrees appropriate to their differing functions, attaches to all the members of

the group involved in the enterprise, hence joint consultation. The wide scope of C. makes the keeping of statistics difficult. The Ministry of Labour and National Service conducted an enquiry during 1955, on the basis of definitions rather less rigid than those used in earlier enquiries, and found (*Ministry of Labour Gazette*, May 1956) that 421 enterprises (including 111 co-operative societies) employing 611,713 persons had C. arrangements in which 389,433 employees participated. The Report also mentioned a further 130 firms, with 163,331 employees (132,671 participating), with arrangements that escaped the definitions adopted for the compilation of the statistics but which were 'broadly of a profit-sharing character.' Comparisons with the pre-1938 reports are vitiated by the changes in definitions, but the chief alteration occurred in the gas industry where 57 C.s came to an end as a consequence of nationalisation in 1949. The Ministry's figures were based on a voluntary return in response to enquiries addressed to some 1800 enterprises, and are therefore not complete; nor was the list a representative example. The chief industries in which C.s occur are in the chemical and allied trades with 25 enterprises and 105,000 participants; engineering, shipbuilding, and electrical goods, 57 with 39,000; vehicles, 8 with 36,000; treatment of non-metalliferous mining products other than coal, 17 with 30,000; and food, drink, and tobacco, 22 enterprises with 29,000 participants. All the industrial groupings used by the Ministry of Labour for their statistics show some examples of C. (In the above figures no account is taken of the 111 co-operative societies which have profit-sharing.) As the importance of ownership declines and management becomes a profession the element of partnership in industrial enterprises is more in evidence, and trade unions reflect this change by their increasing interest in such questions as productivity. In response to the same trends Industrial C. (or as it was earlier termed, before the word took on a political significance, Labour C.) today lays increasing emphasis upon sharing information, and explaining industrial decisions. The Industrial C. Association (formerly the Labour C. Association) was founded in 1884 as an industrial society, to provide for industry the services of a clearing-house for information upon practical experience of C., and publishes in the quarterly *Jour. C. news* of developments in this field (Industrial Co-partnership Association, 36, Victoria Street, London, S.W.1).

Cope, Sir Arthur Stockdale (1857-1940), painter, chiefly of portraits, but also of landscapes; son of Charles West C., R.A. (q.v.). Educ. at Norwich and Wiesbaden, studied art at Royal Academy schools. From 1876 he contributed to the Royal Academy, and painted the portraits of King Edward VII, the last Ger. emperor, the Archbishop of Canterbury, Lord Kitchener, the Duke of Cambridge, King George V, the Prince of Wales, and

other celebrated people. His 'Some Sea Officers of the Great War' is in the National Portrait Gallery. He became R.A. in 1910; and was made K.C.V.O., 1927.

Cope, Charles West (1811-90), painter. He studied at the Royal Academy and in Europe, obtained a prize of £300 in a competition for the decoration of the Houses of Parliament, 1844, and executed sev. frescoes for the House of Lords. He was elected R.A. in 1848, and produced many wall-paintings and other works of an illustrative and historical nature.

Cope, Sir John (d. 1780), general. The date of his birth is uncertain, but he was apparently knighted before 1742, the year in which he was sent with an army to aid the Queen of Hungary. He is chiefly memorable for his defeat at Prestonpans (21 Sept. 1745) by Prince Charles, the Young Pretender. See Sir R. Cadell, *Sir John Cope and the Rebellion of 1745*.

COPE

Cope (Lat. *cappa*), vestment worn by priests in the W. Church at processions and vespers; in the Gk Church by bishops and archimandrites only; and in the Armenian Church by the celebrant at mass. In the Church of England the C. was authorized by the 24th canon of 1603 for the celebrant at Holy Communion in cathedrals and collegiate churches. It is a cloak with a vestigial hood, reaching to the ground, and fastened at the neck with a clasp or morse, often embroidered.

Cope, see CASTING.

Copeck, see KOPEK.

Copenhagen (Dan, *København*), cap. of Denmark, a flourishing city and seaport, which contains more than $\frac{1}{4}$ of the whole pop. of the country. Its name signifies 'Merchants' Haven'. This city is situated in the Sound and covers part of 2 is. The greater part of C. lies on the E. coast of the is. of Zealand, whilst the smaller part is on the is. of Amager, and occupies the N. The 2 is. are connected by the bridges Langebro and Knippelsbro. The portion of C. on the is. of Amager is called Christianshavn. There are many outlying suburbs of C. in the is. of Zealand, principally Holte, Klampenborg, Lyngby, Glostrup, Hvidovre, Rødovre, and Herlev. The outlying suburb in the is. of Amager is Kastrup with N. Europe's biggest airport. The prin. public square of C. is Kongens Nytorv, commanding a central position and facing the entrances to 12 streets. There is a colossal statue of Christian V in the centre of the square. Two important buildings, the palace of Charlottenborg and the Royal Theatre (national theatre), face the square. Two statues of the great national writers, Holberg and Oehlenschläger, stand in front of the theatre, whilst inside among other sculptures is the relief figure of 'Ophelia' sculptured by Mme Sarah Bernhardt. Strøget is the centre of the most fashionable shops, and Bredgade the main street of the court and various Embassies. A portion of the old tn of C. is cut off by artificial waterways and is called Slotsholmen or Castle Is. Here are many important buildings, such as Christiansborg Palace, which is the seat of the gov. and the Folketing (Parliament), the royal library (containing 950,000 vols and 35,000 MSS.) and the Thorvaldsen Museum—here, in an open court, lies the tomb of the famous sculptor, and here are some of the finest examples of his statuary. The cathedral church, Vor Frue Kirke (Church of Our Lady), lies in the heart of C., NW. of Slotsholmen, and is adorned with works of sculpture by Thorvaldsen, including the celebrated 'Twelve Apostles.' Not far from the church lies the univ., founded in 1479. It is a State institution, frequented by 5000 students, and possessing a valuable library with free admission to the reading room for everybody. It contains 800,000 vols. Other useful and important institutions and buildings are Denmark's Technical College, the Veterinary and Agric. College, Serum Institute, Seed-controlling Institute, Institute of Technology, College of Commerce, College of Dentistry, State Training College for Teachers, Finsen Medical Light Institute, Insuline Laboratory, botanical garden, National Museum, Ny Carlsberg Glyptothek or gallery of sculpture, sev. art galleries, the Exchange, National Bank, the Amalienborg Palace, which is the royal residence, the Rosenborg Palace, Frederiksberg Palace, and other palaces. The zoological gardens are the largest in Scandinavia. The free port is the centre of the transit trade of the Baltic

and is connected by steamship lines with every port on the globe. It is the centre of the air traffic of N. Europe. The broadcasting system is operated by the state. Shipbuilding is carried on, and there are extensive porcelain works. The hist. of C. dates back to about the middle of the 12th cent., when Bishop Absalon built a castle as a defence against the pirates. It was only a small fishing vil. then; in 1254 it obtained the privileges of a tn and in 1443 it was made the cap. of Denmark. The tn was successfully defended against the Swedes, 1658-60. Much of the old tn was destroyed by fires in 1728 and 1795. During the Napoleonic

fresh and salt water. The free-swimming forms have always a large head, and the body ends in a caudal fork. Some of the species are phosphorescent. *Cyclops* is a well-known fresh-water genus, and *Lonchidium* is parasitic on the gills of sharks. C. are the commonest Crustaceans in the sea; some of them are planktonic. Altogether there are about 6000 species of C.

Copernicus, Nicolaus (1473-1543), founder of modern astronomy, b. Thorn, in E. Prussia, then a part of Poland. After the death of his father in 1483 Nicolaus was practically adopted by his uncle, Lucas Watzelrode, afterwards bishop of

Danish Tourist Bureau

COPENHAGEN—KONGENS NYTORV

wars, C. was attacked by the Eng. in 1801 and 1807. The opening of the free port in 1894 made C. one of the most important ports in the Baltic Sea. In 1940 the Gers. invaded Denmark, troops being landed at C. and other places from warships and transports on 9 April. C. was liberated from the Gers. in May 1945, the first Allied troops to enter freed Denmark being a company of a S. Lancashire parachute battalion. Pop. 753,360 (with suburbs, 1,227,100).

Copenhagen Fields, dist. in the bor. of Islington, N. London, which in old days was often the scene of huge public demonstrations. Thus on 26 Oct. 1796, and again on 21 April 1834, great meetings were held there in favour of trade unionism. The Caledonian Market (q.v.) was built on the fields.

Copenick, see KÖPENICK.

Copepoda (Gk *kōpē*, oar, *pous*, foot), order of Crustaceans which receive their name from the fact that typically they bear six pairs of swimming feet arranged down the body rather like the oars of a boat. They are to be found in both

Ermland. In 1491 he matriculated at the univ. of Cracow, and gave himself up principally to the study of astronomy under Brudzewski. He soon abandoned his early idea of taking holy orders, and went as Polish student to the univ. of Bologna, where he studied canon law. In 1500 he himself lectured on mathematics at Rome with great success. After a short visit to his native land he went in the next year to Padua, where he studied medicine and philosophy. In 1505 he finally left Italy, and went to spend 6 years as his uncle's physician at the castle of Heilsberg. On the death of Lucas in 1512 C. went to Frauenburg, where he had been nominated canon of the cathedral in 1497. Though he never took orders, his activities in this capacity were multiform, and all his knowledge was freely laid at the disposal of the diocese. However, till the end of his life astronomy was his favourite study; and in spite of his busy life he found time to perfect at Frauenburg the system of which he had already laid the foundation at Heilsberg. His great theory was broached in 1543 in the *De Revolutionibus*

Orbium Coelestium, Libri VI, pub. at Nuremberg, and dedicated to Pope Paul III. This work demonstrates the theory, already hinted at by the Pythagorean philosophers, that the sun is the centre of the planetary system, and that the earth and the planets revolve round it. Kepler, Galileo, and others developed the system, until it was completed by Newton. According to Prof. Herbert Dingle the course of C.'s thought has been traced out by the Polish scholar, Birkenmajer, from marginal notes and amendments on the MS. of *De Revolutionibus* itself, and where observational facts failed C. supplied them himself, with an instrument of his

NICOLAUS COPERNICUS

Engraving after a picture in the possession of the Royal Society, presented 1776.

own making, though he was essentially a thinker rather than an observer. C. had been at work for more than 30 years before at last agreeing to the pub. of his work. This was not, as is often supposed, because he feared that his work would be condemned as heretical; it was rather that the idea on which his system depended appeared at that time so incredible that only those with an intimate knowledge of astronomy could be expected to entertain it for one moment. He was at last persuaded to publish his work by the earnest solicitations of many friends, including Schönberg, cardinal bishop of Capua, and Tiedemann Giese, bishop of Culm, as well as his young pupil Rheticus, who obtained permission to issue an account of the new system under the title *Narratio Prima de Libris Revolutionum*. This was the first printed work on the Copernician theory, and the resulting ridicule being less than C. had feared, he consented to the pub. of his own *magnum opus*. The Pope, Paul III, accepted the dedication of the work to himself. *De Revolutionibus* represents a complete reformation of astronomy; the discovery

of the true form of the planetary orbits by Kepler, and the conception of universal gravitation by Newton, would have been impossible without the preliminary heliocentric viewpoint which C. established. The immediate effects, however, in the sphere of philosophy and theology were not conspicuous. Generally speaking, the reaction was favourable in Rom. Catholic circles but contemptuously antagonistic among the Lutheran reformers. There was no question of persecution or suppression, and it was only when new philosophies arose that the trouble began. When the notion of an infinite universe was advanced by Bruno it was realised that the work of C. had removed the previously fatal objection to it; and when the removal of Bruno was followed by the discoveries and irrefutable polemics of Galileo, the time had come to deal with the evil at its source. *De Revolutionibus* was denounced by Luther and Melancthon as contrary to the truth—an opinion held by the popes from 1616 to 1757, with the result that it was placed on the Index and not removed from it until 1835. In the almost complete destruction of national monuments in Warsaw during the Second World War, the statue of C. by Thorwaldsen was spared. The inscription 'Nicolaus Copernicus: his Fellow Countryman' had been changed to 'Nicolaus Copernicus: the German Nation,' on the assumption that C. could be regarded as being of Ger. descent. But this disfigurement was removed with the restoration of the memorial to the Polish people. (Prof. Herbert Dingle, 'Copernicus, 1473-1543,' *Spectator*, 21 May 1943.) See L. Prowe, *Nicolaus Copernicus: Leben und Urkunden*, 1883-4; A. Armitage, *Sun, Stand Thou Still: the Life of Copernicus*, 1948.

Copertino, It. tn. in Apulia (q.v.), 9 m. SW. of Lecce (q.v.). Pop. 9000.

Copford, vil. of Essex, England, some 5 m. from Colchester, with a par. church dating from the 12th cent. The wall paintings were completed c. 1150. 'The Raising of Jairus's Daughter' is the only one remaining untouched by 19th-cent. restorers.

Copiapó: 1. Riv. in Atacama prov., Chile, c. 110 m. long, flowing W. to join the Pacific 18 m. SSW. of Caldera. The irrigation of the surrounding country and the water supply of the tn depend wholly on this riv. It is popularly regarded as the S. limit of the Atacama Desert.

2. Tn. cap. of the prov. of Atacama, Chile, 1215 ft above the sea, on C. R. 190 m. SSW. of La Serena. It is a trading centre and the prin. centre of Chilean mining, especially silver and copper, with some gold. The new national smelter at Paipote contributes to an economic revival of the dist. Pop. 21,000.

Copland, Aaron (1900-), Amer. composer, b. Brooklyn; studied with Rubin Goldmark in New York and Nadia Boulanger in Paris. Various prizes enabled him to devote himself to composition independently of any official appointment, apart from a good deal of lecturing, and he established himself as

perhaps the leading and certainly the most versatile Amer. composer of his generation. His modern and daring style is a compound of jazz and native Amer. elements and many advanced technical procedures. His numerous works include the opera *The Tender Land*; 5 ballets, including *Billy the Kid*; incidental and film music; unaccompanied choruses; 3 symphonies, and other orchestral works; piano and clarinet concertos, and symphony for organ and orchestra; chamber and piano music, and songs.

Copland, Sir Douglas Berry (1894-), economist, since 1953 Australian high commissioner in Canada, b. Timaru, New Zealand. C. was educ. Canterbury College, appointed prof. of economics, univ. of Tasmania, 1920-4; prof. of commerce, Melbourne Univ., 1924-44; prof. of economics, Melbourne Univ., 1944-5. He was Australian Minister to China 1946-8, vice-chancellor, Australian National Univ. 1948-53. Not only has C. achieved distinction in his academic career, but as economic adviser to the Australian Gov. in various capacities he has been influential in the shaping of economic policy. He has served on many governmental committees in Australia and New Zealand; he was chairman of the committee responsible for initiating the Premiers' Plan at the Loan Council meeting, 1931, commonwealth prices commissioner 1939-45, and economic consultant to the Prime Minister 1941-5. From 1925 to 1945 he was editor of *Economic Record*, and his numerous pubs. include: *Australia in the World Crisis, 1929-32*, 1934; *The Australian Economy*, 1931 (6th ed. 1946); *The Road to High Employment, 1945*; *Back to Earth in Economics: Australia, 1948*, 1948; *Inflation and Expansion*, 1951.

Copley, John Singleton (1735-1815), Amer. historical and portrait painter, b. Boston, Massachusetts. He studied at Rome, 1774, and came to England; he was made Academician in 1783. He was the father of Baron Lyndhurst (q.v.). His best-known paintings are: 'Death of Chatham' and 'Death of Major Pierson', and the latter is one of the minor classics of his period in its sense of the heroic, its vigour of composition, and technical skill. His group of the Royal Princesses at Buckingham Palace also reveals a painter of outstanding ability.

Coplin, William Michael Late (1864-1928), Amer. physician, b. Clarksburg, W. Virginia. Prof. of Pathology, Jefferson Medical College, for nearly 30 years from 1896. Director of the Dept. of Public Health and Charities, Philadelphia, 1905-7. Medical director, Jefferson Hospital, 1907-12. Author of *Text-Book of Practical Hygiene*, and of a *Manual of Pathology, including Bacteriology, the Technic of Post-mortems, and Methods of Pathologic Research* (5th ed., rewritten and enlarged), 1912.

Coppard, Alfred Edward (1878-1957), short story writer and poet, b. Folkestone. Leaving school at 9, he tried various occupations before producing his first book, *Adam and Eve and Pinch Me* in 1921. Other collections of his stories are

The Black Dog, 1923; *Fishmongers' Fiddle*, 1925; *The Field of Mustard*, 1926; *Silver Circus*, 1928; *The Gollan*, 1929; *Dunky Willow*, 1933; *Ninepenny Flute*, 1937; *Tapster's Tapestry*, 1939; *Ugly Anna*, 1944; *Fearful Pleasures*, 1946; and *The Dark-Eyed Lady*, 1947. Vols. of poetry include *Hips and Haws*, 1922, *Pelagae*, 1926, and *Yokohama Garland*, 1926; *Collected Poems* appeared in 1928. *It's Me, Oh Lord*, 1957, is the first part of an autobiography.

Copparo, It. tn, in Emilia-Romagna (q.v.), 11 m. NE. of Ferrara (q.v.). It has silk industries. Pop. (com.) 24,500.

Coppée, François Edouard (1842-1905), Fr. man of letters, b. Paris. At first a clerk in the Ministry of War and for some time dramatic critic to *La Patrie*, he acted from 1878 to 1884 as archivist of the Comédie Française, giving up this position on his election to the Academy. In his numerous collections of poetry, including *Intimités, poèmes modernes*, 1867-9, *Olivier*, 1875, his only long poem, and *Poèmes et récits*, 1886, may be found many delightful illustrations of his lyrical gifts, and especially of his skill in writing Parisian elegies and idylls. Of his plays, *Le Passant*, 1869, met with a hearty reception; but *Le kuitier de Crémone*, 1876, *Les Jacobites*, 1885, and *Four la couronne* (1895) are his more ambitious metrical dramas. Though banality of thought and sentiment not infrequently detract from the literary merits of his work, his simple, jealous patriotism, his aloofness from the prevalent style of scientific dissection, and the reality of his sympathy with the sufferings of the poor, are often moving. See *L. de Meur, La vie et l'œuvre de F. Coppée*, 1933.

Copper (symbol Cu, atomic weight 63.57, atomic number 29) is found as the metal in various parts of the world, chiefly in the neighbourhood of Lake Superior, but also in other parts of America, Cornwall, Siberia, and the Ural Mts. It is also found in combination with other elements, being an abundant element widely distributed. The name is derived from *ars Cyprum* or bronze of Cyprus, the Romans having obtained most of their metal from that is in the form of cuprous oxide (Cu₂O) it is found in Cornwall, S. America, and Australia, and is known as *cuprite* or *ruby ore*. Then again, the mineral *C. glance* is really *C. sulphide* (Cu₂S), while it is also found associated with sulphide of iron in the mineral *C. pyrites* (Cu₂S, FeS₂), and again in the mineral *purple C. ore* (3Cu₂S, FeS₂). The basic carbonate of the metal is also found in the minerals *malachite* (CuCO₃, Cu(OH)₂). These are the minerals chiefly used for the extraction of C. on the large scale; but silicates, phosphate arsenates, and the oxychlorides are also known, and by modern methods the metal may sometimes be extracted from these, especially the silicates.

Methods of Extraction: (1) *Reducing process.*—From those ores which contain no sulphur, such as the carbonates and oxides, the ore may be smelted down in a blast furnace with coal or coke, when the

ore is reduced; C. being left and carbon monoxide formed ($\text{Cu}_2\text{O} + \text{C} = 2\text{Cu} + \text{CO}$).

(2) *English method.*—With mixed ores containing sulphides the process consists of 6 stages: (a) The ores (containing on an average 30 per cent of iron and 13 per cent of C., together with sulphur and silica) are calcined in a reverberatory furnace, some of the sulphur passing off as sulphur dioxide, and the metals becoming partly oxidised. (b) The calcined ore is fused, and the C. oxides react on some of the ferrous sulphide, forming cuprous sulphide and ferrous oxide (because C. possesses a greater affinity for sulphur and a smaller affinity for oxygen than the iron). This oxide of iron then unites with the silica, either present in the ore or added, to form a fusible slag, which is run off. That which remains is known as coarse metal, and consists of a mixture of ferrous and cuprous sulphides, containing about 30 per cent of C. This is allowed to flow into water, causing it to solidify in a granular form. (c) The coarse metal is again calcined, with the same effect as in (a), some of the sulphur passing off and the metals becoming oxidised. (d) This is now fused with refinery slag, and produces nearly pure cuprous sulphide, most of the iron passing into the slag, then known as metal slag, which is run off. The remainder after this process is known as fine metal, or white metal, and contains, perhaps, 75 per cent of C. (e) This white metal is then roasted in a reverberatory furnace. Some of the cuprous sulphide is oxidised into cuprous oxide, and this reacts on the cuprous sulphide left as the temp. rises, forming C. ($2\text{Cu}_2\text{O} + \text{Cu}_2\text{S} = 6\text{Cu} + \text{SO}_2$), while any remaining ferrous sulphide is turned into oxide. The metallic C. obtained is now known as blister C. (f) This is then refined by being melted on a hearth in an oxidising atmosphere. The impurities present oxidise first and volatilise off or form a slag with the siliceous matter in the furnace bed, forming a slag which is removed. When the C. begins to oxidise it reacts on any remaining cuprous sulphide, according to the equation above, and at this stage the metal is known as dry C. This is stirred with poles of wood and anthracite thrown on the surface to reduce it thoroughly to the pure metal.

Wet Processes.—(a) *By displacement.* The burnt pyrites obtained from the manuf. of sulphuric acid contains from 3 to 4 per cent of C. It is not rich enough to be submitted to the smelting process, but it is ground and intimately mixed with 10 to 15 per cent of common salt. It is then roasted in a reverberatory furnace, a large amount of the iron being thus removed as ferric oxide, while the C. remains mainly in the form of cupric chloride. This is lixiviated with water and the C. salt goes into solution, and the C. is precipitated from this solution by means of scrap-iron: $\text{CuCl}_2 + \text{Fe} = \text{Cu} + \text{FeCl}_2$. (b) *Hydro-metallurgical.* Poor ores may sometimes be successfully treated by the hydro-metallurgical system, which consists in allowing the crushed ore

to weather in the presence of water. After some months, the C. will have become converted into soluble C. sulphate, which can be run off in solution and the C. extracted by precipitation with iron or by electrolysis. (c) *Electrolysis.* Although this method is sometimes used for obtaining C. from white metal, and even from the ore, yet it is usually employed as a means of refining the already purified metal. Such refinement is necessary for most of the purposes for which C. is used, especially in electricity. Commercial C. refined in this way is one of the purest commercial metals, its purity being about 99.9 per cent. Ingots of the metal are hung in a series of tanks containing a solution of C. sulphate acidified with sulphuric acid. These form the anodes, and thin sheets of pure C. which are also placed in form the cathodes, on which, as the current passes, pure C. is deposited. The impurities pass into solution, unless they are silver and gold, when they settle as a slime on the bottom of the tank. So this method is also used to recover silver and gold, as well as to produce a very pure C., and the value of the precious metals is frequently considerable.

Properties.—C. is a lustrous metal with a characteristic reddish-brown colour. This colour, however, is due to a thin film of oxide, and when the film is removed the colour of the pure metal is rosy pink. It is an extremely tough metal, and can be drawn out into a thin wire or hammered into a thin leaf. Small impurities considerably reduce this high ductility and malleability. When heated nearly to its melting-point it becomes brittle and can be powdered. Its sp. gr. is 8.94 (approximately). It is only slowly acted upon by dry air at the ordinary temps., but in moist air containing carbon dioxide it becomes covered with a green basic carbonate. Heated in air or oxygen it forms black cupric oxide, which flakes off the surface in scales. When volatilised in the electric arc it gives a rich emerald-green vapour. It is readily acted upon by nitric acid, and while dilute sulphuric and hydrochloric acids slowly attack it in air, strong sulphuric acid, unless heated, has no action upon it. It is an extremely good electric conductor, being second only to silver, and it is therefore used extensively in cables, for electric telegraphy, lighting, etc. It is also used extensively in electrotyping, because of its property of being deposited in a coherent form from solutions of its salts when electrolysed.

Copper alloys may be classified into: (a) Alloys with small proportions of added elements. These include arsenical C., nickel C., and manganese C., all similar in properties to pure C. but of greater strength and elasticity, and on this account used in locomotive engineering; silicon C. and cadmium C., used as hard drawn wire for electrical purposes where strength and hardness are needed together with good conductivity. (b) Soft alloys of high ductility. These include cartridge brass, Admiralty brass, and Dutch metal, used respectively for tube drawing,

condenser tubes, and ornamental purposes. (c) Hard alloys of high elasticity. Wrought phosphor bronze is the typical alloy of this class. They are useful where elasticity and resistance to corrosion are required, as in small springs. (d) Alloys for high-speed machining. Alloys containing 3 parts of copper and 2 of zinc are suitable for this purpose, being cheaper and stronger than class (b). Muntz metal or yellow metal is used as sheets for ships' sheathing. (e) High tensile brasses containing 50 to 60 per cent of C. and 35 to 40 per cent of zinc, with small additions of aluminium, nickel, or manganese. They are similar to class (d) in general characteristics, but harder and stronger, and do not vibrate under alternating stresses; hence they make good castings for marine propellers and pump rods.

See Copper Development Association, *Copper through the Ages*, 1934; E. D. Gardner, *Copper Mining in North America*, 1938; R. A. Wilkins and E. S. Bunn, *Copper and Copper Base Alloys*, 1943.

Copper Loss, in electric machines and transformers, the power lost in heating of the windings. The heat generated by a current I in a conductor of resistance R is RI^2 . This power is not only a loss, but the consequent rise in temperature beyond a certain limit weakens the insulation and may in the end cause breakdown. A maximum rise above ambient temp. (less for plant to be used in tropical regions) is usually specified. The heat loss in cables and transmission lines is usually called RI^2 loss—overhead lines are often aluminium, not copper—but in transformers (q.v.) C. L. is used to distinguish the loss from iron losses due to hysteresis and eddy currents in the core.

Copperas, or **Melanterite**, is ferrous sulphate heptahydrate, known also as green vitriol. It is prepared on the large scale by exposing heaps of iron pyrites to the action of air and moisture. The liquor which drains away contains ferrous sulphate and sulphuric acid, and the latter is made into ferrous sulphate by adding scrap-iron. It forms pale green monosymmetric crystals, $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$, and is readily oxidised on exposure to the air. It is used for making ink, for dyeing, and as a dressing for crops.

Copperhead, see **MOCCASIN SNAKE**.

Copperheads, term of opprobrium applied by men of the N. states of the U.S.A. during the Civil war to fellow Northerners who opposed the war policy of the Union Gov. Many of the latter did this because they did not believe it possible to conquer the Confederacy. In the later years of the conflict the term was largely applied to N. Democrats. In the U.S.A. there are two especially deadly snakes, the rattlesnake and the copperhead. The rattlesnake is popularly supposed to give warning when it is about to attack by rattling the cup-like horny attachments at the bottom of its tail, whereas the copperhead is a deadly silent hunter. Hence the popular origin of the term as applied to political opponents.

Coppermine River, riv., 475 m. long, in Mackenzie dist., Canada. The many

lacustrine expansions and rapids in its course render it useless for navigation. After a southerly direction as far as Lake Gras it turns NW., finally reaching Coronation Gulf, Arctic Ocean.

Copperplate, see **ENGRAVING**.

Coppet, a vil. on Lake Geneva, 8 m. NE. of Geneva, Switzerland. Here is the château where Necker and his daughter, Madame de Staël, spent part of their lives.

Copple, see **COPSE**.

Copra, commercial and native name for the dried kernel of the coco-nut (q.v.). It contains up to 70 per cent. of oil, which is used in the manuf. of edible products and soap.

Coprinus, a genus of capped fungi known as the Ink-caps, family Agaricaceae, about 200 species. *C. comatus*, the Shaggy Cap, is a common edible species.

Coprolites, term applied to fossil excreta in the form of castings or faecal pellets; they sometimes reveal what ant animals ate. They are frequently used as artificial manure. In diameter they vary from 2 to 4 in., and they often contain a large quantity of phosphate of lime. Deposits in N. Africa and N. America are most important commercially, but C. are also found in the secondary and tertiary rocks of Suffolk and Cambs.

Copronymus, see **CONSTANTINE V.**

Copse, or **Coppice** (from Gk *kolaphos* and Lat. *colpare*, to cut, through O. F. *copets*), small plantation of planted or self-sown trees, which are periodically cut over before they become timber-trees, either to beautify the landscape or more often for commercial reasons. Oak C. is valuable for making wheel-spokes, etc., ash for hurdles, hoops, and the handles of implements, hazel and willow for crates and hoops, and willow and osier for basket-making. Smaller pieces of C. wood, including chestnut, maple, elder, elm, and birch, are used in many countries for fuel and charcoal. See **FORESTRY**.

Coptic Language, the last stage of the ant Egyptian with some admixture of Greek, especially in all that belongs to Christian doctrine, life, and worship. It was divided into four chief dialects: the Sahidic or Thebaic, the Akhmimic, the Bohairic (formerly called Memphic), and the Fayumic. The earliest of these was probably the Sahidic, while the Bohairic appeared later than the others but then assumed the first place. As Alexandria was the seat of the Coptic patriarch, Bohairic became the liturgical language of the Coptic Church; by degrees it replaced the other dialects, and ultimately (about the 14th cent.) drove them out. The Bible was trans. into no fewer than three dialects before the 4th cent. Hardly any of the C. literature is original. With the exception of some sermons of Shenute, a monk of Atrépe, it consists mainly of translations from the Greek. After the Arabian conquest in the 7th cent. the C. L. began to decline. The Copts continued to use their speech in daily life and as written language until the 13th cent. (although it lingered on until the 17th), and later as the liturgical language of their Church when Arabic had been

adopted as the speech of everyday life. Spoken Coptic, now called *Zeniyah*, has survived in some Christian villages of Upper Egypt.

Copts, native Christian descendants of the anct Egyptians. The name is the Europeanised form of the Arabic *Kubt*, which probably derives from the Gk *Aiguptoi* (Egyptians). There are about 1,000,000 Copts in Egypt. They are, in general, the best educated section of the community. The hist. of the C. is intimately bound up with their faith. They claim to have received the gospel from

of great interest to students of liturgiology, and has received a good deal of attention in recent times. Except for their Monophysite heresy the C. hold the faith in exactly the same form as the Gks, with whom they share in holding the single procession of the Holy Spirit. Some few C. are Rom. Catholics and Protestants. At the end of 1937 the Abyssinian Coptic Church, which since its foundation has been under the authority of the Coptic Church of Egypt—whose patriarch nominated the archbishop and bishops of the Abyssinian Church from the Egyptian clergy—broke away from the mother Church and claimed the status of an autocephalous body. The archbishop was deposed and the Abyssinian bishops elected one of their own members as the new *Abuna*. See also COPTIC LANGUAGE AND LITERATURE; ETHIOPIA.

Copula, term in logic which expresses the relation between the subject and predicate, and is always applied to the verb 'to be,' whether expressed or implied. Example: 'Life is short,' where 'is' is the C.; whilst in the sentence 'the child grows' the C. is implied in the verb grows, viz. 'is growing.'

Coppyhold, one of the anct laws of land tenure. It existed in England until very recent years, although much modified in form. C. may be defined as holding at the will of the lord according to the custom of the manor, and dates back to feudal times. The lord of the manor bestowed a portion of his land on his labourers or villeins, who did him personal service in return for the land, which, however, often reverted back to the lord on the death of the tenant. Later on in hist. the tenant's right was observed, but many tiresome customs continued to survive, such as fines or heriots. C. was quite different from freehold in the manner in which it was conveyed. C. land was surrendered to the steward, who represented the lord of the manor; the steward then surrendered the C. to the new owner, and in each case the conveyance by surrender was made by a symbolical delivery. An Act passed in 1894 enabled C. (subject to the consent of the Board of Agriculture) to be converted into freehold. All C. land was enfranchised by the Law of Property Act, 1922, i.e. C. tenure, together with customary freehold tenure, was abolished on the terms specified in the Act.

Copying, general name given to the many processes employed for reproducing, either in actual size or on an enlarged or reduced scale, a drawing, map, plan, document, or other object, so that ideas and information may be recorded and widely circulated. Among the first people to experience the problem of C. were those responsible for teaching and spreading the Gospel, for they had no alternative but to copy by re-writing the text. For many it was a lifetime's task. The advent of printing (q.v.) from a copy set up in type marked the first stage in progress. In the early days of printing the preparation and setting-up of type was a slow, expensive, and highly skilled business which did

COPTIC PEASANT

E.N.A.

St. Mark, 1st bishop of Alexandria, but they were easily corrupted and embraced the Monophysite heresy. This was condemned by the Council of Chalcedon in 451, and immediately a fierce struggle arose between the orthodox and the heterodox. The orthodox party, being supported from Rome, were at first in the ascendant, and the Monophysites did not scruple to call in the Muslims to their aid. Thus came about the Muslim invasion in 640, and after a few years of Arabian rule the orthodox were almost entirely exterminated. A few still survive under the orthodox patriarch of Alexandria. The Coptic Christians in their turn were also cruelly oppressed by the Muslims, who forced them to submit to all kinds of degradation, and destroyed many of their churches. Having been thus cut off for so many centuries from the influence of the rest of Christendom, the Coptic Church has preserved its anct liturgies and customs almost intact. It is therefore

not meet the main need for copies from documents in their original form. This was first achieved in the early 18th cent. when a special C. ink was produced. An original prepared with this ink would yield a copy when pressed on to a damp blank sheet of paper. This process was improved by the invention of the iron C. press, and later the screw press, which produced better quality copies. These methods, though extremely slow, were fashionable for the next century and a half; then the invention of the typewriter (q.v.) so speeded the production of an original that it was possible to prepare it in about the time then required to make a copy by the press process. This challenge to inventiveness was duly accepted and resulted in the production of carbon paper which enabled copies to be prepared at the same time as the original. Carbon paper represented a great advance but had 2 major disadvantages, the limited number of readable copies and the difficulty of correcting errors made on the original and consequently on the copies.

The next stage in the development of C. was the invention of the hectographic gelatine process whereby the original was prepared with a special hectograph ink and the image was transferred by pressure to the gelatine bed. Successive copies were made by gently pressing sheets of blank paper on to the gelatine bed, and thereby transferring the image to the paper. From this developed the rotary hectographic process so commonly used to-day. In the modern rotary process a special paper original, or master as it is commonly termed, is prepared by placing a sheet of hectographic carbon paper behind the paper so that a mirror image in hectographic carbon adheres to the back of the master. The master is placed on to a drum with the image facing outwards and the drum is then rotated either manually or electrically. At the same time blank sheets of paper are fed successively into the machine, where they are moistened with a quick-drying spirit before being forced into contact with the master, which leaves an impression on the moistened sheet. By this means up to 500 copies can be obtained from one master in a relatively short time. This is the only process to permit several colours to be copied at the same time. The use of different coloured carbon paper in preparing the master enables a copy bearing information in a variety of colours to be obtained from the one run through the machine.

In the late 19th cent. the ink stencil process came into being with the invention of a sheet of waxed paper into which could be cut the original information to be copied: a special wheel, a special pen, or a typewriter being used to cut the lines or letters into the waxed sheet. The waxed sheet was placed upon a flat bed on which ink had been thinly spread. A blank sheet of paper was then laid on top of the waxed sheet and forced by a roller into contact with it. This action caused sufficient ink to rise through the cuts to make an impression upon the

blank sheet. The flat bed was eventually replaced by a rotary machine wherein the master was placed around a drum containing ink which was forced through the cuts and then on to successive sheets of blank paper. Rotary stencil duplicators are now in common use, particularly for the reproduction of typed documents. They may be manually or electrically operated and the feeding of blank sheets is automatic. Up to 5000 good quality copies may be obtained from one waxed stencil.

The development of offset lithography (q.v.) machines represented a major step in the progress of C. These machines are similar in principle to the much larger type of machine used in printing works, the main difference being the use of masters that can be prepared by hand with a special ink, or by typewriter using a special ribbon. The masters can be thin metal plates or specially surfaced paper. The process is based upon the simple fact that oil and water do not mix. The special ink, or ribbon, contains an oily substance which is deposited upon the master when it is prepared. The master is fitted to a cylinder which is rotated and brings the master first into contact with a water-moistened roller and then into contact with an ink roller. Water adheres to the blank portions of the master only, whilst the ink adheres only to the oily image. This image is transferred to a rubber-covered drum which in turn transfers the impression to the blank sheets of paper which are automatically fed into the machine. Offset lithography is a fast process, printing at a speed of 6000 copies per hour. More than 500 copies can be obtained from a paper master and up to 50,000 copies from a metal plate.

Photocopying was another major development and to-day a variety of processes provide the answer to many C. problems. Brief details of the main processes now in use are as follows:

Reflex copying. The apparatus used consists of a box containing a glass screen behind which are exposure lamps. The document to be copied is placed face downwards on a sheet of sensitised paper and both are laid upon the glass screen, the sensitised paper in contact with the glass. The lid of the box is closed, pressing the paper against the glass. The lamps are switched on for a given number of seconds. The light passes through the sensitised paper, which takes the image from the reflection of the original above it. The exposed sensitised paper is then passed through a developing and finishing process from which it emerges as a white-on-black negative from which black-on-white copies can be obtained by repeating the reflex process using the negative as the original.

Dyeing process (now widely used to produce copies of engineers' and architects' drawings and also written or typed documents). This process requires the original to be prepared on transparent or translucent material. The C. paper, known as diazo paper, is coated with a

compound containing a dye which is sensitive to light. The original and a sheet of diazo paper are fixed into an exposure box, or a rotary light source, and where light passes through the original to the diazo sheet it destroys the compound, leaving only a positive image of the original. The copy, or print, is developed by exposure to ammonia gas or by using a developing solution.

Blue print process, similar in principle to the dyeline process up to the development stage, but a different compound is used on the copy paper. The copy is developed in clean water.

Photostat. This process uses a camera but with sensitised paper instead of film. Copies obtained are negative, that is white-on-black, and can be made the same size as the original, or larger or smaller by adjusting the distance between the camera and the original.

Direct positive process (a contact process which produces black-on-white copies direct from black-on-white originals prepared on opaque paper). The original is placed upon a sheet of sensitised paper and exposed to the light. The copy is then passed through an automatic processor giving a positive copy. Double sided opaque originals can be copied by this method. A translucent copy can be made from an opaque original for subsequent use in the dyeline process.

Micro-photography is now extensively used for C. documents so that miniature copies may be distributed or stored instead of bulky originals. 16 mm. or 35 mm. equipment is used in conjunction with cinematograph film. Many copies can be taken on to one spool of film at the rate of 200 copies per minute. After processing the films are stored for future reference, occupying only a fraction of the space that would otherwise be required. Reference to the copy is made by projecting the image on to a screen.

The various processes previously described have been concerned with obtaining a number of copies on one occasion, but there are particular C. problems which require that 1 or 2 copies of original information be made on numerous occasions. To meet this need a range of addressing equipment has been developed. The 2 main types in use employ in one case a metal plate and in the other a waxed stencil. In the metal plate system the information to be copied from time to time is impressed on to the plate by an embossing machine fitted with letters and figures formed as punches and dyes. The information is copied by placing the plate into a hand or electrically operated machine which forces it into contact through an inked ribbon with a sheet of paper or printed form, thus transferring the impression. The plates can be altered by flattening out the impressions and re-embossing. Waxed stencils may be produced by hand or typewriter. The equipment used in the stencil process is similar to that used for metal plates except that ink is forced through the master to leave an impression. See also LITHOGRAPHY; PHOTOGRAPHY; PRINTING.

Copyright in original literary and dramatic or musical works means the exclusive right to reproduce a work in any material form, to publish the work, perform it in public, broadcast it directly or through a rediffusion service, adapt it, dramatise it, translate it, or re-arrange it. Thus C. covers the right to perform a work or give any acoustic representation of a work or any visual representation of it by means of any mechanical instrument; and in the case of a pub. work, the sole right to publish the work or any substantial part of it. C. also includes the sole right to produce, reproduce, perform, or publish any trans. of a particular work, to convert a dramatic work into a novel or other non-dramatic work, to convert a novel or other non-dramatic work or any artistic work into a dramatic work, to make any record, film, or other contrivance for mechanically performing or delivering any literary, dramatic, or musical work, and to authorise any of the above acts. C. in artistic works covers reproduction in any material form, publishing, televising, and transmitting by rediffusion. The whole of the law of C. is now to be found in the Copyright Act, 1956, and the rules and orders in council made in pursuance of the Act. This Act received Royal Assent on 5 Nov. 1956, and came into force on 1 June 1957.

The Copyright Act, 1956, became necessary in view of developments since the 1911 Act which it superseded. It enables the U.K. to remain a member of the Berne International Copyright Union by ratifying the Brussels amendment of 1948 and to adhere to the new Universal Copyright Convention sponsored by UNESCO. By the Act of 1956 the whole of the Fine Arts Copyright Act, 1862, the Musical Copyright Acts, 1902 and 1906, and the Copyright Order Confirmation Act, 1922, were repealed, together with the Copyright Act, 1911, except sections 15, 34, and 37. Under section 15 of the 1911 Act, the obligation on publishers to send copies of their books to the Brit. Museum and, on request, to the Bodleian Library, Oxford, the Univ. Library, Cambridge, the National Library of Scotland, Edinburgh, Trinity College Library, Dublin, and, with provisos, to the National Library of Wales is continued, though (since the obligation has nothing to do with C. as such) it will not in future be part of the Copyright Act proper. As a result of the passing of the 1956 Act the assimilation of the law of C. throughout the Commonwealth and Empire achieved by the 1911 Act has to some extent been lost.

Under the 1956 Act C. subsists in an original work if either (a) it was first pub. in the U.K. or (b) the author is a 'qualified' person, i.e. either a Brit. subject or a person domiciled or resident in the U.K. Thus a work by a Brit. subject first pub. abroad obtains Brit. C. Progress in the art of mechanical representation and reproduction has led to the extension of C. protection to sound recordings, including gramophone records (50 years from pub.),

cinematograph film (50 years from registration or pub.), and sound and television broadcasts (50 years from making).

In regard to artistic works C. now consists of reproducing in any material form, publishing, televising, or transmitting by rediffusion. Architectural works if original are also protected; maps, charts, and plans under the 1956 Act are treated as artistic and not literary works. C. is not dependent (as e.g. in the U.S.A.) on registration in any form. In the case of literary, dramatic, or musical work the period of protection is, if pub. at the author's death, 50 years from the end of the year in which the author died; if unpublished at the author's death, 50 years from the end of the year in which it was first pub., performed, recorded, or broadcast. The proviso to section 3 of the 1911 Act under which anyone might pub. a C. work 25 years after the author's death on payment of a 10 per cent royalty has been abolished in conformity with the Brussels Convention of 1948; so have the compulsory licence arrangements (1911 Act, Sec. 4). C. in artistic works is as for literary works, except for works pub. by Gov. depts and photographs, C. in which expires 50 years after pub. *Prima facie* C. belongs to the author, but in a commissioned photograph it belongs to the commissioner. In work done for a newspaper or periodical in the course of employment under a contract of service or apprenticeship the newspaper or periodical rights belong to the paper and other rights to the author; otherwise work done in course of employment in the absence of agreement to the contrary belongs to the employer. The bequest of an unpublished MS., unless otherwise stated in the will, carries with it ownership of the copyright. Unpublished copyright MSS. over 100 years old, housed in public institutions and whose author died more than 50 years ago, may, if the present copyright owner is unknown, be pub. on notice given under Board of Trade regulations. C. in anonymous and pseudonymous works extends for 50 years from pub., but if before that time the identity of the author can be estab., the ordinary term applies. C. in joint works now extends for 50 years after the death of the author who dies last.

The Act of 1956 also extends C. to a publisher's typographical arrangement for 25 years from pub. Pub. is defined as the issue of reproductions of the work to the public which must not be merely colourable but must be intended to satisfy the reasonable requirements of the public. Pub. in the U.K. or in any other Berne Union country is not treated as other than first pub. by reason of an earlier pub. elsewhere if the two pubs. take place within a period of 30 days. The performance or the issue of records of a dramatic or musical work, the construction of a work of architecture, or the issue of photographs of engravings or works of sculpture and architecture does not constitute pub. A dramatic or musical work is pub. only if copies of the play or musical composition in question are issued to the public. The unauthorised performance of a play, musical

piece, or any other work capable of representation necessarily amounts to an infringement of C. Fair dealing with any work for the purposes of private study, research, or criticism does not constitute infringement of C. Neither does the reporting of current events in a newspaper or periodical or by broadcasting or cinematograph film. The reading or recitation in public (other than by broadcasting) of any reasonable extract from a pub. literary or dramatic work is not a breach of C., although sufficient acknowledgement must be made. An author may, after parting with his C., make further use of any mould, sketch, or plan of his work, provided he does not repeat the main design of the work. Librarians of approved non-profit libraries may, under Board of Trade Regulations, supply to individuals for private study single copies of articles from periodicals or reasonable extracts from books without permission provided that the name and address of the person entitled to give such permission cannot be traced. C. material may be reproduced (other than by a duplicating process) in the course of instruction and in examination papers. It is an infringement of C. to permit for private gain a theatre or other place of entertainment to be used for the performance in public of a work without having obtained the consent of the owner of the C., unless the person so doing has no reasonable ground for suspecting that the performance would be an infringement. But certain performances in schools are defined as not being in public. The civil remedies for infringement of C. are an action of damages, together with a claim for an account of the profits, and if a repetition is apprehended the owner may also ask for an injunction. Furthermore all copies printed and pub. must be delivered up to the C. owner. The owner may also take proceedings where necessary to get possession, not only of all infringing or pirated copies of his work, but also of all plates used or intended to be used for the production of such infringing copies. An injunction may also be granted in the case of an unpublished work where the owner of the C. fears that his right is threatened or that an unauthorised pub. is intended. Under the Dramatic and Musical Performers' Protection Act, 1925, to make a record or film, directly or indirectly, from the performance of any dramatic or musical work without the written consent of the performers, or to sell or let for hire any record or film made in contravention of the Act or even to use for public performance any record or film so made, is an infringement of C. In the Second World War, the Patents, Designs, Copyright, Trade Marks (Emergency) Act, 1939, empowered the Comptroller-general of patents, etc., to grant licences for the exercise of the C.s owned by enemies or enemy subjects, and provision was made to maintain the validity of licences already obtained from enemy owners of C. when the war broke out.

The 1956 Act makes elaborate provisions governing the interaction of the new C.s in

sound recordings, films, and sound and television broadcastings, including the setting up of a new Performing Right Tribunal and a Television Copyright Organisation. Transitional provisions are detailed in the Seventh Schedule to the 1956 Act. In general they follow the principle that existing contracts are maintained, rights which have already lapsed are not revived, and potential rights under the former legislation which have not come into existence at the date of the new Act are not carried forward.

Registration at Stationers' Hall under the Act of 1842 terminated in Dec. 1923. In 1924 the Stationers' Company estab. a new register in which books and fine arts can be registered. A copy must be filed at Stationers' Hall and certified copies of the entries are issued: fees 6s. for a book, 2s. 6d. fine arts; certified copies in each case 6s. Those copies are of use in giving evidence of the existence of work on a given date in case of infringement.

In U.S.A. C. law, registration is still necessary. The application for registration must specify whether the work in which C. is claimed is of the class of books, periodicals (including newspapers), dramatic or musical compositions, maps, works of art, or reproductions thereof, drawings or plastic works of a scientific character, photographs, prints, or pictorial illustration, motion pictures, or motion picture photo-plays. Works not reasonably capable of falling under any of the above cannot be copyrighted. In 1928 C. legislation increased the C. fee for registration of all pub. works to \$2, the fee being previously \$1; but for an unpublished work the registration fee was \$1. Fees for most of the remaining C. services were also correspondingly increased. Registration fees for an unpublished work are now \$2, for a pub. work \$4. To secure registration: (1) the work must have been pub. in the U.S.A.; (2) two copies of the best ed. of the work must be sent to the C. Office, Library of Congress, Washington, promptly after pub. Books by Amer. authors must have been printed and bound in the U.S.A., but not books of foreign origin. Adherence by the U.K. to the Universal Copyright Convention made possible by the 1956 Act has been most important to Brit. authors and publishers, for without any formalities other than the printing of a copyright notice, e.g. ©, John Doe, 1958, a Brit. work in the Eng. language secures automatic copyright protection in the U.S.A.; the former requirement for manufacture of such books in the U.S.A. is abolished. The original term of C. is 28 years, but the author or his representative can, within 1 year prior to expiration, get a renewal for another 28 years, making 56 years in all. C. may be assigned by any instrument in writing.

International Copyright.—For the mutual protection of works circulated in countries other than that in which they were first pub., certain nations signed a convention at Berne in 1886. The signatories were Great Britain, France,

Germany, Belgium, Italy, Spain, Switzerland, Tunis, and Haiti, and subsequently Norway, Japan, and others joined the C. Union, but not the U.S.A., the Netherlands, or Russia. The basis of the Berne Convention was the reciprocal extension to foreign authors and publishers of similar rights to those enjoyed by native authors and publishers provided the formalities as to registration, etc., required by the country of first pub. were complied with. This convention was revised at Paris in 1896, at Berlin in 1908, at Rome in 1928, and at Brussels in 1948. The Rome text has practically superseded all previous texts; the Brussels text at 1 Jan. 1958 was effective only between 21 countries. The signatories to the Rome Convention include Great Britain and the countries of the Commonwealth and Empire (except New Zealand which still subscribes to the Berlin text), Austria, Finland, France, Greece, German Federal Republic, Spain, Denmark, Switzerland, Italy, Belgium, the Netherlands, Norway, Portugal, Poland, Sweden, Brazil, Monaco, Japan, and Liberia.

Modifications of the Berne Convention were made in its revised form in 1948, because of the increasing importance of broadcasting, television, film, and allied arts, and the convention now also protects the rights of authors in this domain. An author, for instance, may have the right (*droit moral*) to object to any distortion, mutilation, or other alteration of his works. He has also the exclusive right of authorising radio diffusion and communication to the public by loud-speaker or any other instrument of transmission. The convention has introduced a new provision that if legislation in his country permits, as in Belgium, the author shall enjoy the inalienable right to an interest in the sale of his work subsequent to its first disposal by him (*droit de suite*). Any dispute between countries concerning the interpretation or application of the convention is to be brought before the International Court of Justice.

The U.S.A. long remained outside international conventions other than the Pan-Amer. conventions between it and other Amer. states. This caused considerable confusion in international copyright which, in 1948, U.N.E.S.C.O. started to try to clear. By 1952 U.N.E.S.C.O. had succeeded in securing agreement to a Universal Copyright Convention by some 40 countries (excluding China and the U.S.S.R.). By early 1956 some 18 countries (including France, German Federal Republic, Japan, Pakistan, Switzerland, and the U.S.A.) had ratified the new convention. The Universal Copyright Convention does not affect previously existing C. conventions and that of Berne still stands. The purpose of the Universal Copyright Convention is to bridge, so far as international C. is concerned, the gap between countries of widely different legislation, culture, and development.

Under the convention each signatory agrees to give to artistic and literary works originating in the other countries

the same C. protection as it gives to such works of its own nationals, and it also lays down a minimum duration of copyright (author's life and 25 years, or 25 years from first pub. in countries calculating C. from pub. date). As previously noted, the importance of the Universal Copyright Convention to Brit. authors and publishers is that their works now gain C. protection in the U.S.A. by the use of the simple copyright notice laid down in the convention, namely the symbol ©, together with the name of the copyright owner and the year of first pub. Otherwise protection is gained throughout the Berne Union by simultaneous pub. in the U.S.A. and the author's country. Neither the U.S.S.R. nor China is bound by any international code.

See W. A. Copinger, *On the Law of Copyright*, 1870 (9th ed. in preparation, 1958); T. Dawson, *The Law of the Press*, 1927; A. Plant, *Economic Aspects of Copyright in Books*, 1934; H. A. Howell, *The Copyright Law* (U.S.A.), 1942.

Copyright Libraries. Originating with a private transaction between Sir Thomas Bodley (q.v.) and the Stationers' Company in 1610, the first Act on the deposit of books came into effect in 1662 in favour of 3 libraries—the Royal Library, and those of the univs. of Oxford and Cambridge. This number has varied in the U.K., though it has always been considered

necessary for 1 copy to be deposited in the Brit. Museum. In 1710 the number was increased to 9 owing to the Union with Scotland; the Union with Ireland increasing it again to 11. The Act of 1837 decreased it to 5. Then the Imperial Copyright Act of 1911 gave, with certain exceptions, an extra copy for the National Library of Wales. The Irish Rep. has its own copyright law.

As it now stands (section 15 of the 1911 Act, which is not repealed by the 1956 Act), 1 copy of every new book pub. in the U.K. must be deposited at the Brit. Museum within 1 month of pub. If written demand be made to the publisher within 12 months of pub. of the work, 4 complete copies must be sent to the agency named on behalf of the Bodleian Library, Oxford, the Univ. Library, Cambridge, the National Library of Scotland, and also Trinity College, Dublin (qq.v.). A further copy of the work may be demanded for the National Library of Wales (q.v.).

In other countries the number of deposit copies required by law varies greatly. In Switzerland it is voluntary; Norway, Denmark, etc., require only 1; France, 2; Poland, 7; Portugal, 13; Rumania, 15; 'but the Soviet Republic of Ukraine demands 50 or more copies of each new work.'

See R. C. B. Partridge, *The History of the Legal Deposit of Books*, Library Association, 1938. See also COPYRIGHT.

Sardar Dyal Singh Public Library,

NEW DELHI.

DATE LOANED

This book may be kept for

Fourteen days

A fine of **.06 nP.** will be charged for each
day the book is kept over-time.
